

Abstracts, and Pesticides in Ground Water Database - A Compilation of Monitoring Studies: 1971 - 1991 National Summary; U.S. Department of Agriculture, AGRICOLA database; U.S. Department of Commerce, National Technical Information Service) have reported residues of clopyralid in ground or surface waters.

Consequently, these data on potential water exposure indicate insignificant additional dietary intake of clopyralid and any exposure is more than compensated for in the conservative dietary risk evaluation.

3. *Non-Dietary Exposure.* Non-occupational exposure to clopyralid is limited to re-entry to treated turf grass sites. Estimated exposures for children is less than 0.05 mg/kg/day or 10% of the reference dose.

#### D. Cumulative Effects

The potential for cumulative effects of clopyralid and other substances that have a common mechanism of toxicity was considered. The mammalian toxicity of clopyralid is well defined. However, no reliable information exists to indicate that toxic effects produced by clopyralid would be cumulative with those of any other chemical compound. Therefore, consideration of a common mechanism of toxicity with other compounds is not appropriate. Thus only the potential exposures to clopyralid were considered in the aggregate exposure assessment.

#### E. Safety Determinations

1. *U.S. Population in General.* Using the conservative exposure assumptions described above and based on the completeness and reliability of the toxicity data, it is concluded that aggregate exposure to clopyralid will utilize approximately 7 percent of the RfD for the U.S. population. Generally, exposures below 100 percent of the RfD are of no concern because the RfD represents the level at or below which daily aggregate dietary exposure over a lifetime will not pose appreciable risk to human health. Thus, there is a reasonable certainty that no harm will result from aggregate exposure to clopyralid residues.

2. *Infants and Children.* In assessing the potential for additional sensitivity of infants and children to residues of clopyralid, data from the previously discussed developmental toxicity studies in the rat and rabbit and a 2-generation reproduction study in the rat were considered. The developmental toxicity studies are designed to evaluate adverse effects on the developing organism during prenatal development resulting from pesticide exposure to one

or both parents. Reproduction studies provide (1) information relating to effects from exposure to the pesticide on the reproductive capability of mating animals and (2) data on systemic toxicity. These studies indicate no evidence of developmental toxicity at dose levels below those that cause maternal toxicity.

FFDCA section 408 provides that EPA may apply an additional safety factor for infants and children in the case of threshold effects to account for pre- and post-natal toxicity and the completeness of the database. Based on the current toxicological data requirements, the database relative to pre and post-natal effects for children is complete. Therefore, it is concluded that an additional uncertainty factor is not warranted and that the RfD at 0.5 mg/kg/day is appropriate for assessing aggregate risk to infants and children.

Using the conservative exposure assumptions, it is concluded that the percent of the RfD that will be utilized by aggregate exposure to residues of clopyralid will be less than 12 percent of the RfD for all populations and subgroups. This estimate represents the "worst case" exposure for a given population (i.e. children ages 1-6), exposure is less for any other subpopulation e.g. infants. Therefore, based on the completeness and reliability of the toxicity data and the conservative exposure assessment, it is concluded that there is a reasonable certainty that no harm will result to infants and children from aggregate exposures to clopyralid residues.

#### F. International Tolerances

There are no Codex maximum residue levels established for clopyralid.
