

C. Aggregate Exposure

1. *Dietary exposure*—i. *Food*. For the purposes of assessing the potential dietary exposure for all existing and pending tolerances for lambda-cyhalothrin, Zeneca has utilized available information on anticipated residues and percent crop treated. For all existing and pending tolerances the anticipated residue contribution (ARC) is estimated at 0.0002682 mg/kg/body weight (bwt)/day.

ii. *Drinking water*. Laboratory and field data have demonstrated that lambda-cyhalothrin and its degradates are immobile in soil and will not leach into groundwater. Other data show that lambda-cyhalothrin is virtually insoluble in water and extremely lipophilic. As a result, Zeneca concludes that residues reaching surface waters from field runoff will quickly adsorb to sediment particles and be partitioned from the water column. Zeneca concludes that together these data indicate that residues are not expected in drinking water.

2. *Non-dietary exposure*. Other potential sources of exposure are from non-occupational sources such as structural pest control and ornamental plant and lawn use of lambda-cyhalothrin. Zeneca has no data upon which to estimate exposure from these uses. However, given the extremely low vapor pressure of lambda-cyhalothrin (1.5×10^{-9} millimeters (mm) of mercury (Hg)) and the low use rates, it is anticipated that inhalation and dermal exposure from these uses Zeneca concludes will be insignificant.

D. Cumulative Effects

At this time, Zeneca cannot make a determination based on available and reliable information that lambda-cyhalothrin and other substances that may have a common mechanism of toxicity would have cumulative effects. Thus, Zeneca concludes that for purposes of this tolerance it is appropriate only to consider the potential risks of lambda-cyhalothrin in an aggregate exposure assessment.

E. Safety Determination

The acceptable reference dose (RfD) based on a NOEL of 0.1 mg/kg/bwt/day from the chronic dog study and a safety factor of 100 is 0.001 mg/kg/bwt/day. A chronic dietary exposure/risk assessment has been performed for lambda-cyhalothrin using the above RfD. Available information on anticipated residues and percent crop treated was incorporated into the analysis to estimate the ARC. The ARC is generally considered a more realistic

estimate than an estimate based on tolerance level residues.

1. *U.S. population*. The ARC from established tolerances and the current and pending actions are estimated to be 0.0002682 mg/kg/bwt/day and utilize 26.82% of the RfD for the U.S. population.

2. *Infants and children*. The ARC for children, aged 1 to 6 years old, and non-nursing infants (subgroups most highly exposed) utilizes 57% and 65% of the RfD, respectively. Generally speaking, the Agency has no cause for concern if ARC for all published and proposed tolerances is less than the RfD.

F. International Tolerances

There are no Codex maximum residue levels (MRL) established for residues of lambda-cyhalothrin in or on rice.
