

Moist Bulk density is an indicator of the soil's ability for root development, both vertically and horizontally. Table 2 has values for bulk densities for use during reclamation of mined soils by

family soil texture classes for nonlimiting to rooting, critical to rooting, and root-limiting. As a general rule, reclaimed soils do not have continuity of pores or interpedal voids:

therefore, values in table 2 are important consideration during the reconstruction and reclamation of mined soils.

TABLE 2.—NONLIMITING, CRITICAL, AND ROOT-LIMITING BULK DENSITIES FOR EACH FAMILY TEXTURE CLASS

Family texture class	Nonlimiting bulk density	Critical bulk density g/cm <sup>3</sup>	Rooting-limiting bulk density
Sandy .....	1.60	1.69	1.85
Coarse loamy .....	1.50	1.63	1.80
Fine loamy .....	1.46	1.67	1.78
Coarse silty .....	1.43	1.67	1.79
Fine silty .....	1.34	1.54	1.65
Clayey:			
35–45% clay .....	1.40	1.49	1.58
>45% clay .....	1.30	1.39	1.47

**Caution**—Because of the diversity of soil texture, rock fragments, climate, mining equipment, and other variables during reclamation, moist bulk density values are only a guide. In spite of overall high bulk density, there are cases where good root deployment and targeted crop yields have been achieved, mainly because the pattern of pore spaces was favorable. On the other hand, there are cases in which the overall bulk density is not high and good root deployment was expected, but a very thin highly compacted layer that could not be detected in a standard test method prohibited the entry of plant roots.

**Soil Strength:** Soil strength is highly correlated to crop yields on reclaimed and reconstructed mined soils. The response is curvilinear with crop yield

decreasing as soil strength increases. There appears to be a lower and upper thresholds to the effect of soil strength on crop yield.

The mechanical impedance is at a minimum at or near 10 PSI. Therefore, the rooting volume does not change dramatically below the level of 100 PSI. Soil strength with 150 PSI range begins to impact rooting, and in the range of 280 PSI is root-limiting. Even though a reconstructed mined soil has nonlimiting soil strength for rooting, a significant difference in crop yield may occur compared to the soils on the permit area prior to mining. It must be understood that the quality of subsoil material, which is replaced during reconstruction and reclamation as well as reclamation practices, will become a dominate influence to any further

increase in yield for soils having non-limiting soil strength. The PSI values are determined by inserting into the soil profile a 3/4 inch rod with a 300 right circular cone point welded to the end of the rod.
