

appreciable risks to human health. Therefore, these dietary exposures clearly would not pose a significant risk to the health of the overall U.S. population.

As previously indicated, there is no indication that AE F122006 is likely to be oncogenic. Nevertheless, an upper bound on the potential oncogenic risks was estimated using the hypothetical $Q1^*$ of 1.2×10^{-2} (mg/kg/day)⁻¹. Under the worst-case scenario in which all rice contained tolerance level residues of AE F122006, the theoretical 95% upper bound estimates of potential oncogenic risk for the overall "U.S. Population" and "Non-Hispanic Other Than Black or White" subgroup would be 1×10^{-7} and 5×10^{-7} , respectively. Taking into account the expected market share of AE F122006, the upper bounds on the potential oncogenic risks for these 2 groups would be 1×10^{-8} and 5×10^{-8} , respectively. Thus, regardless of the outcome of the ongoing oncogenicity studies, the potential oncogenic risks to the overall U.S. population from dietary exposure to AE F122006 following its use in rice are clearly negligible.

2. *Infants and children.* Data from rat and rabbit developmental toxicity studies and rat multigeneration reproduction studies are generally used to assess the potential for increased sensitivity of infants and children. The developmental toxicity studies are designed to evaluate adverse effects on the developing organism resulting from potential exposure during prenatal development. Reproduction studies provide information relating to reproductive and other effects on adults and offspring from potential prenatal and postnatal exposure to the pesticide.

FFDCA section 408 provides that EPA may apply an additional safety factor for infants and children to take into account possible increased sensitivity or based upon the completeness of the data base. No evidence of increased sensitivity to fetuses was noted in developmental toxicity studies in rats or rabbits. Although histopathology examinations from the 2-generation rat reproduction study have not yet been completed, there has been no indication of any reproductive effects or indication of increased sensitivity to the offspring. Furthermore, the proposed provisional RfD of 0.0013 mg/kg/day (which is derived from the NOAEL from the 90-day dog study and a 1,000-fold safety factor) is about 1,000-fold lower than the tentative (pending histopathology) NOAEL of 200 ppm (about 15 mg/kg/day) in the reproduction study. Thus, no additional safety factor to protect infants and children is deemed necessary.

According to the results of the dietary assessment, the population subgroup with the highest potential exposures to AE F122006 under scenarios previously described would be non-nursing infants (<1-year old). In the first, worst-case scenario, in which all rice and rice commodities contained residues of AE F122006 at the proposed tolerance levels, the potential dietary exposure to AE F122006 would utilize 4.5% of the proposed provisional RfD. Taking into account the fact that less than 10% of the rice consumed will be treated with AE F122006, the potential exposure to infants and children would utilize no more than 0.5% of the proposed provisional RfD. These values are substantially below the RfD and therefore would not pose an appreciable risk to human health.

Regardless of the outcome of the ongoing oncogenicity studies, the hypothetical upper bound estimate of potential oncogenic risk to infants and children under the worst-case exposure scenario was estimated to be approximately 7×10^{-7} . Under the more realistic scenario incorporating percent crop treated, the potential upper bound estimate of oncogenic risk would be no more than 7×10^{-8} . Thus, even under a worst-case scenario, the use of AE F122006 on rice would pose no more than a negligible risk of oncogenicity to infants and children.

F. International Tolerances

There are no Codex Alimentarius Commission (CODEX) maximum residue levels (MRLs) established for residues of AE F122006.
