

FRAG1, when fused to FGFR2, leads to a transformed phenotype when transfected into cells and enhanced levels of phosphorylation/activation of FGFR2. The FGFR2-FRAG1 fusion protein was isolated from an osteosarcoma. Products derived from the FRAG1 cDNA, protein or antibodies which recognize the FRAG1 antigen are likely to be useful as diagnostics, therapeutics and research reagents.

This work has appeared, in part, in Lorenzi, MV, et al. "FRAG1, a gene that potentially activates fibroblast growth factor receptor by C-terminal fusion through chromosomal rearrangement" PNAS, USA 93(17): 8956-61 (Aug. 20, 1996).

#### **Spontaneous Breathing Apparatus and Method**

A novel assisted breathing system and method has been developed to greatly decrease/eliminate work of breathing, and is under the total control of a patient.

The system includes a minitracheostomy tube, a reverse thrust gas insufflation catheter introduced through a special minitracheostomy tube to deliver well humidified air/oxygen to near the carina, and a threshold valve to limit airway plateau pressure. Inspiration is effected through spontaneous closing of the glottic opening, while expiration follows opening of the glottis. Such breathing is under the exclusive, spontaneous control of a patient to determine respiratory rate and tidal volumes. Lung inflation is hence passive, and accounts for the greatly decreased (even zero) work of breathing. Speech, cough and swallowing remain unimpeded.
