Subject: LOGICAL EXPLANATION—
Freedom to Innovate

Below are comments to specific issues addressed in the Court Case, http://www.usdoj.gov/atr/cases/ms-settle.htm#docs

Item #2: Someone else please invent a better operating system than Windows! Also if MS Windows has monopoly, what about Intel—would they be ''monopolizing'' the intel chip market?

Item #3: A better operating system will always win the user market.

Item #4: How ridiculous! When Netscape owned 70% of the market, was it not a monopoly?

Item #7: Java is very difficult to learn. Training is unaffordably expensive.

Item #11: Netscape is NOT the browser innovator—give credit to the real innovator, please!!! (universities!)

Item #18: Microsoft has a right to ''tie'' all ITS products together! Integrating applications makes better use of system resources.

Item #24, 25: As long as Windows is the operating system used, the creator of Windows, who is Microsoft, has the right to present it anywhich way to the users as they please—basic human right of ownership!

Additional Comments: Seems to me like other vendors like IBM and Sun and Netscape had nothing to complain about as long as THEY owned the lion's share of the market. Their products were difficult to use and hard to learn.

Microsoft brought the computing technolgy to the layman's door making it possible for the total computer illiterate people to be able to actually use the computer in effective and efficient ways, which would have been totally impossible otherwise!

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

UNITED STATES OF AMERICA,
Plaintiff, v. Civil Action No. 98–1232 (CKK) MICROSOFT CORPORATION, Defendant. STATE OF NEW YORK ex rel.Attorney General ELIOT SPITZER, et al.,Plaintiffs,) v. Civil Action No. 98–1233 (CKK) MICROSOFT CORPORATION,Defendant.

COMMENTS OF THE ASSOCIATION FOR COMPETITIVE TECHNOLOGY

The Association for Competitive Technology (''ACT'') hereby submits its comments on the Revised Proposed Final Judgment (''RPFJ'') that has been proposed by most of the plaintiffs, including the United States, and defendant Microsoft Corporation. ACT is a trade association representing some 3,000 information technology (''IT'') companies, including Microsoft, on a number of issues important to the industry. ACT's mission is to promote a vibrant, competitive IT industry and a vibrant IT marketplace in which consumers, not the government, pick winners and losers. Because ACT believes that, on balance, the RPFJ will be good for both the industry and consumers, it supports the RPFJ. ACT also opposes the radical proposals advanced by the remaining plaintiffs because they would harm the industry and serve no other purpose than to advance the interests of such Microsoft rivals as Sun Microsystems, Oracle, and AOL Time Warner.

INTRODUCTION AND SUMMARY

The purpose of a Tunney Act proceeding is to determine whether the settlement that the federal government has entered into is within the reaches of the public interest. United States v. Microsoft Corp., 56 F.3d 1448, 1460 (DC Cir. 1995) (internal quotation marks and emphasis omitted). The RPFJ easily meets that forgiving standard. Indeed, as shown in detail below, this conclusion is easily established by measuring the RPFJ against four settled principles that govern relief in all antitrust cases, and by comparing the RPFJ to the radical remedies that have been proposed by the States that have refused to consent to the RPFJ (''Litigating States'').

First, it is well settled that an antitrust remedy should be designed to protect consumers rather than advance the interests of competitors. The RPFJ will accomplish this goal. It prevents Microsoft from engaging in exclusionary or retaliatory tactics, as well as foreclosing a number of more specific paths to unfair competition. However, it is carefully crafted to ensure that Windows will remain available to consumers as a reliable operating platform.

By contrast, many of the Litigating States' proposals seem to have been designed by Microsoft's competitors. Indeed, the companies that will benefit most from the Litigating States' efforts are the same ones that have led the campaign to scuttle settlement efforts case and to impose far-reaching restrictions on Microsoft: AOL Time Warner, Sun Microsystems, Oracle, IBM, and Apple. As a prominent commentator recently noted, Microsoft's enemies were largely responsible for instigating the lawsuit and were active behind the scenes in helping the government frame the charges and compile the evidence. Executives from Sun, AOL, Netscape and other companies testified against Microsoft. Fred Vogelstein, The Long Shadow of XP, Fortune, Nov. 12, 2001. Each of these companies dominates a particular market that is distinct enough from Intel-compatible PCs not to be a part of this case, but related enough that Microsoft's rivals fear Microsoft's competition. For example, Sun Microsystems dominates the market for server operating systems, but its market share is being eroded by lower-cost alternatives from Linux and Windows. Why Competitors Are Largely Quiet on Microsoft Settlement, Associated Press, Nov. 15, 2001; Peter Burrows, Face-Off, Bus. Wk., Nov. 19, 2001, at 104. In asking for must-carry provisions for Java, limits on technical integration and the use of Microsoft middleware, and restrictions on Microsoft's investment in intellectual property, Sun seeks to maintain its stranglehold over the server marketplace. Similarly, Oracle enjoys a privileged position in the server database market but it, too, is facing stiff competition from lower-priced alternatives that are gaining increasing favor with reviewers and customers. As Oracle tries to move into different markets, such as e-mail, where consumers expect tighter integration, it will be unable to maintain its high prices unless Microsoft's capacity for product improvement is limited. Finally, Microsoft and AOL are both dominant companies, orbiting in separate if overlapping domains. Yet both companies regard themselves as being on a collision course, as all forms of information and entertainment, including music and movies, are increasingly rendered in digital form. Steve Lohr, In AOL's Suit Against Microsoft, the Key Word Is Access, N.Y. Times, Jan. 24, 2001. An internal document makes clear that AOL is willing to take any necessary steps to gain control of the desktop, including even spreading false rumors about the stability of Windows XP. See http://www.betanews.com/aol.html.

4 Beyond these companies' own statements and court filings their views are parroted by various proxies. These include organizations that were specifically formed to hobble Microsoft, such as the misnamed Project to Promote Competition and Innovation in the Digital Age (''ProComp''), and existing trade organizations that these companies have recently joined and come to dominate, such as the Computer and Communications Industry Association (''CCIA'') and the Software Information Industry Assocation (''SIIA''). The apparently high level of coordination between these groups and the Litigating States' counsel is ample reason for skepticism when examining some of the States' arguments.

The reality is that these rivals, both directly and through their proxies, are trying to use the courts to increase their own profits rather than consumer satisfaction. This is shown by the fact that, while they condemn Microsoft for integrating its products, they, too, are vying to bring integrated products to consumers. For example, Sun's SunONE initiative tries to offer the same level of integration as Microsoft's .Net service. See SunONE, Services on Demand vision, at http://www.sun.com/software/sunone/overview/vision/. Not surprisingly, Oracle shares this vision of a global network of

centralized information and online services. It envisions an all- Oracle solution, advising businesses to ''wage their own war on complexity'' by turning to Oracle for ''an integrated, complete software suite.'' AOL is likewise promoting its ''AOL anywhere'' strategy, which makes its popular services and features available to consumers anywhere, anytime through multiple platforms and mobile devices. Clearly, these companies do not believe that selling IT products piecemeal best meets consumers' needs, yet that is what they are trying to force Microsoft to do.

Second, it is equally well settled that an antitrust remedy should be tailored to fit the conduct that has been found illegal. Here, the RPFJ carefully addresses each of the types of conduct that the Court of Appeals found illegal. It regulates the agreements that Microsoft can enter into and prevents Microsoft from retaliating against software or hardware distributors. The RPFJ also gives both computer manufacturers and consumers more choices in configuring their computers, and specifically enables them to turn off any Microsoft middleware and replace it with the middleware of their choice. And the RPFJ requires Microsoft to disclose technical information and license its intellectual property to those whose products interoperate with Windows.

To be sure, the RPFJ in some respects goes beyond the findings of illegal conduct affirmed by the Court of Appeals. Unfortunate as that may be, it should not deter the Court from adopting the RPFJ. As the District Court for the District of Columbia stated in another context: If courts acting under the Tunney Act disapproved proposed consent decrees merely because they did not contain the exact relief which the court would have imposed after a finding of liability, defendants would have no incentive to consent to judgment and this element of compromise would be destroyed. The consent decree would thus as a practical matter be eliminated as an antitrust enforcement tool, despite Congress' directive that it be preserved.

United States v. American Tel. & Tel. Co., 552 F. Supp. 131, 151 (D.DC 1982), aff'd sub nom. Maryland v. United States, 460 U.S. 1001 (1983) (mem.). Nevertheless, the vast majority of the RPFJ's provisions respond to the findings that were affirmed by the Court of Appeals. Virtually all of the proposals by the Litigating States, by contrast, address areas wholly outside the scope of this case, such as Microsoft's corporate acquisitions, the Office suite of programs and, of all things, Microsoft's conduct of its intellectual property litigation. The Litigating States' proposals should be rejected for that reason alone.

Third, any antitrust remedy should minimize ''collateral damage'' to third parties. Here, the RPFJ carefully avoids serious harm to other sectors of the information technology industry.

The Litigating States' proposals, by contrast, would inflict enormous damage on the rest of the industry. Perhaps most important, their proposals would fragment the Windows standard and, in turn, profoundly disrupt other businesses that rely upon it. The Litigating States' proposals would also weaken intellectual property protections, setting an unnerving precedent for any IT firm aspiring to lead its market, and slow the pace of research and development in the IT field. Fourth, an antitrust remedy should be easy to administer, and not be regulatory. The Litigating States, in an effort to impose their concept of ''competition'' in the information technology industry, would create a court-run agency to supervise Microsoft's every move and to judge its every action. In contrast, the RPFJ would create a more independent, more limited supervisory body that would have full access to Microsoft information, but that would not combine the roles of prosecutor and judge. This too counsels strongly in favor of the RPFJ, and against the proposals advanced by the Litigating States.

The remainder of these Comments is organized as follows. Section I summarizes and explains in more detail the four principles that are pertinent to the District Court's determination of whether the RPFJ is within the reaches of the public interest. Microsoft, 56 F.3d at 1460 (internal quotation marks and emphasis omitted). Section II applies these principles to the RPFJ and, for comparison purposes, to the proposals advanced by the Litigating States.

I. THE PROPER ANALYTICAL FRAMEWORK FOR EVALUATING ANTITRUST REMEDIES.

Antitrust law recognizes that competition gets its vigor from the urge to win. A desire to ensure that all competitors will do equally well makes robust competition impossible and sets the stage for price-fixing and similar behavior. Accordingly, antitrust law and antitrust remedies are designed to foster real competition, so that consumers and the wider economy can ultimately benefit. Thus, while competitors Î driven by their own urge to win Ï may try to misuse antitrust law to further their own goals, government agencies and courts should be vigilant to ensure that their power is used in consumersÓ interests rather than competitorsÓ. The case law on remedies generally Î and antitrust remedies in particular Î supports the goal of harnessing competition. A close reading of that case law reveals four specific principles that promote that goal, and that are dispositive here.

A.Any Remedy Must Have A Probability Of Benefiting Consumers, And Not Be Designed to Punish the Defendant Or, Worse, To Enhance The Position Of the Defendant's Rivals.

Perhaps the most important principle of antitrust law is that any remedy must be designed to benefit consumers, not just punish the defendant or enhance the position of the its rivals. The law is clear that, in a civil antitrust case, any injunctive remedy must be, as its name suggests, remedial rather than punitive. E.g., United States v. E. I. Du Pont de Nemours & Co., 366 U.S. 316, 326 (1961); International Salt Co. v. United States, 332 U.S. 392, 401 (1947); Hecht Co. v. Bowles, 321 U.S. 321, 329 (1944). Moreover, as Judge Robert Bork has shown in his famous book, The Antitrust Paradox, the entire purpose of antitrust law is promotion of consumer welfare, not the protection Î or enhancement Î of competitors. Robert H. Bork, The Antitrust Paradox 51, 56–89 (1978); see also National Collegiate Athletic Ass'n v. Board of Regents, 468 U.S. 85, 107 (1984).

It follows that any remedy must have as its principal purpose the promotion of consumer welfare. And, as the District Court recently noted, the states have the burden of establishing the efficacy of every element of the proposed relief in achieving that objective. Hearing Tr., Sept. 28, 2001, at 8, United States v. Microsoft, No. 98–1232 (D.DC). For two reasons, it is doubtful that any remedy at all is needed to protect consumers in this case. First, it appears that the particular conduct at issue in this case has never harmed consumers in any meaningful sense. The government's own witness, Professor Frank Fisher of

MIT, testified during the trial that the narrow conduct found unlawful by the Court of Appeals had not harmed consumers at all. When asked by plaintiffsÓ counsel whether that conduct had harmed consumers, Fisher replied: [O]n balance, I would think the answer was no, up to this point. Trial Tr., Morning of Jan. 12, 1999, at 29 (Fisher), United States v. Microsoft Corp., 87 F.Supp.2d 30 (D.DC 2000), aff'd in part, rev'd in part, 253 F.3d 34 (DC Cir.), cert. denied, 122 S.Ct. 350 (2001).

If Microsoft's conduct did not harm consumers even on balance it is difficult to see how any remedy is now needed to protect them. But if any remedy is needed, the Court must be careful not to risk harming consumers by adopting remedy proposals such as those advanced by the Litigating States remedies which, to paraphrase Abraham Lincoln, are of the competitors, by the competitors, and for the competitors.

Second, even if Microsoft's conduct could have harmed consumers in some way, any such risk has now abated. This entire case is premised on the assertion that Microsoft enjoys market power by virtue of the fact that a high percentage of IBM-compatible PCs use Windows as their operating system. Whether or not that was true when the case was tried, such knowledgeable industry observers as Sun's president have effectively conceded that whatever market power Windows might once have given Microsoft is now virtually a thing of the past. For example, in his January 3, 1999 interview on 60 Minutes, Scott McNealy rejected Leslie Stahl's suggestion that with its Java software, Sun now ha[d] a chance to make Windows obsolete. Instead, McNealy retorted, Windows is obsolete, [and] we have a chance to show the world that it is. 60 Minutes (CBS Television Broadcast, Jan. 3, 1999). McNealy elaborated this theme in a subsequent Wall Street Journal op-ed piece, which appeared more than two years ago. He asserted that, because of the growth of the Internet, [a]

few years from now, savvy managers won't be buying many, if any, computers. They won't buy or build anywhere near as much software either. They'll just rent resources from a service provider, primarily over the Internet. Scott McNealy, Why We Don't Want You to Buy Our Software, Wall St. J., Sept. 1, 1999, at A26. McNealy's predictions are already being borne out. A recent article

assessed the changes in the operating system market. It noted that Microsoft's main markets are maturing and the entire ground under its empire is shifting. Market researchers expect PC sales worldwide to drop [in 2001] and at best to stagnate in 2002. What is more, software is increasingly a service delivered over the Internet, meaning that operating systems are no longer central. Microsoft: Extending Its Tentacles, The Economist, Oct. 20–26, 2001, at 59. Thus, whatever market power Microsoft now possesses is rapidly being eroded, or is already effectively gone. In short, because Microsoft's present market power is limited at best and will be further eroded in the near future, there is no need for antitrust remedies. See also William E. Kovacic, Designing Antitrust Remedies for Dominant Firm Misconduct, 31 Conn. L. Rev. 1285, 1314 (1999) (explaining that rapid technological change can indicate the instability of market power, and therefore to the need for milder remedies). At a minimum, any antitrust remedy must take into account the dramatic decline in any market power Microsoft might previously have enjoyed, and be limited accordingly.

B. The Remedy Should Be No Broader Than Necessary To Address The Conduct That The Court Of Appeals Held Illegal.

Another principle that must guide the analysis of any proposed antitrust remedy is that it must be no broader than necessary to address the conduct that has been found illegal. As with all injunctive relief, the substantive prerequisites for obtaining an equitable remedy as well as the general availability of injunctive relief . . . depend on traditional principles of equity jurisdiction. Grupo Mexicano de Desarollo, S.A., Inc. v. Alliance Bond Fund, 527 U.S. 308, 319 (1999) (quoting 11A C. Wright, A. Miller, & M. Kane, Federal Practice and Procedure u 2941, at 31 (2d ed. 1995)). And one of these traditional principles of equity jurisdiction, id., is that an injunction should be no more burdensome than necessary to prevent a recurring violation of the law. See generally Madsen v. Womens Health Center, 512 U.S. 753, 765 & n. 3 (1994), and cases cited therein. This is as true in antitrust as in other areas of the law. For example, in the Lorain Journal case, which Robert Bork believes is the closest to this one, the Court noted that, [w]hile the decree should anticipate probabilities of the future, it is equally important that it ... not impose unnecessary restrictions. 342 U.S. at 156. The Court of Appeals recognized this principle when it instructed the District Court that any remedy should be tailored to fit the wrong creating the occasion for the remedy, Microsoft, 253 F.3d at 107, i.e., that it should be focused on the conduct [the court] has found to be unlawful and should be limited to provisions that are required to rectify [Microsoft's] monopoly maintenance violation, id. at 104, 105.

Consistent with these principles, since at least 1911 it has been the law in antitrust cases that ordinarily ... [an] adequate measure of relief would result from restraining the doing of such [illegal] acts in the future. Standard Oil Co. v. United States, 221 U.S. 1, 77 (1911) (emphasis added). In other words, an injunction simply forbidding the specific conduct found to

Normally, of course, a settlement is reached before a trial on the merits. In that situation, it is clear that a reviewing court cannot expand an antitrust decree to remedy perceived problems that lie outside the scope of the complaint. That was the thrust of the Court of Appeals' 1995 Microsoft decision, 56 F.3d 1448. Furthermore, any such action by a reviewing court would most likely be unconstitutional. Id. at 1459; see also Maryland v. United States, 460 U.S. 1001, 1006 (1983) (Rehnquist, J., dissenting). Here, of course, the Court of Appeals has affirmed some of the district court's findings of liability. Expanding the remedy to address issues as to which liability has not been proven let alone issues as to which liability has never been alleged would clearly exceed the District Court's power.

be illegal is ordinarily considered sufficient. Or, as the District Court recently explained, the scope of any proposed remedy must be carefully crafted so as to ensure that the enjoin[ed] conduct falls within the . . . behavior which was found to be anticompetitive. Hearing Tr., Sept. 28, 2001, at 8.

Some commentators have nevertheless argued that the District Court is obligated to terminate Microsoft's dominant market position, which they characterize as an illegal monopoly. Jennifer Bjorhus, Settlement Draws Frustration From Few Tech Giants That Spoke Out, San Jose Mercury News, Nov. 3, 2001, at 20A. But this argument rests on a misinterpretation of the pertinent case law, including the Court of Appeals' decision. Contrary to this argument, the law does not require that a remedy attempt to recreate the world as it might have existed absent the violation or deprive a defendant of the proceeds of its business. Instead, where a violation is found, the remedy, as the Court of Appeals pointed out, should be designed to unfetter' the market from the anticompetitive conduct.' Microsoft, 253 F.3d at 103 (quoting Ford Motor Co. v. United States, 405 U.S. 562, 577 (1972)) (emphasis added).

That, moreover, is why the Court of Appeals placed heavy focus on the requirement that, before a court can seek to undo an alleged monopoly, there must be a significant causal connection between the allegedly illegal conduct and the existence of that monopoly. The District Court recently echoed this same theme when it remarked that it intended to fashion an injunction that would avoid a recurrence of the violation and . . . eliminate its consequences. Hearing Transcript, Sept. 28, 2001, at 9 (emphasis added).

There is a vast difference between unfettering or unshackling a market from prior anticompetitive behavior, and attempting to reconstruct the market as it might have existed absent that conduct. The former is a legitimate objective of an antitrust remedy; the latter is not.

In the District Court's words, attempting to reconstruct the market as it might have been absent the conduct at issue goes well beyond simply eliminating the consequences of anticompetitive conduct. Antitrust law does not attempt to recreate or to maintain by detailed regulation a perfect world. Its goal is to restore competition, including legitimate competition by the dominant firm. Ford Motor Co. v. United States, 405 U.S. 562, 577–78 (1972). C.The Remedy Should Avoid Or Minimize Collateral Damage To The Rest Of The IT Industry.

Another traditional principle[] of equity jurisdiction,' Grupo Mexicano, 527 U.S. at 319, is that any relief imposed by a court should not inflict unnecessary harm on third parties. Atchison, Topeka & Santa Fe Railway Co. v. Wichita Board of Trade, 412 U.S. 800, 824 (1973) (plurality opinion); Gilbertville Trucking Co. v. United States, 371 U.S. 115, 130 (1962). In this case, there is a real risk of harm to the entire IT industry as well as consumers. As explained in the attached affidavit of ACT's president, Jonathan Zuck, (Exh. A) both consumers and IT companies derive enormous benefits from the existing Windows platform. For IT companies in general, and ACT's members in particular, that platform is unusually valuable and important for at least three reasons.

1. Constant Improvement and Addition of New Features and Functionalities. One reason Windows is so valuable to the IT industry is that Microsoft has constantly improved it. For example, as Mr. Zuck explains, each new release of Windows contains software drivers for the major new printers and other peripheral devices that have been released since the prior version of Windows. This means that developers of applications such as money management software, graphics programs, etc., do not need to create their own drivers for these devices or, worse, choose from among several competing drivers. Affidavit N 7.

Virtually everyone in the IT industry, moreover, has a strong interest in seeing this trend continue in the future. The addition to Windows of such new functionalities as voice recognition, for example, will allow software developers to add such features to their products at minimal cost. Those costs will increase dramatically and consumer benefits will be reduced if software developers are forced to develop their own voice recognition features or, worse, to port their programs to several competing voice-recognition programs. Id. N 8. 2.Windows' Uniformity and Widespread Acceptance. Uniform standards are likewise crucial to an efficient, rapidly evolving IT sector. As Mr. Zuck explains, communications and Internet standards provide the language necessary for many different computers to talk or network with one another, enabling, for example, users of the World Wide Web to locate and retrieve the information they seek. Operating systems perform a similar function, allowing hardware devices and software applications to communicate with a computer. Indeed, it is Windows' consistency that makes it so valuable.

As the Court recognized in its Findings of Fact, Windows exposes a set of application programming interfaces' that lets software interact in a consistent way with any Intel-compatible PC. United States v. Microsoft Corp., 84 F. Supp. 2d 9, 12–13 (D.DC 1999) (Findings of Fact). This means that the same software will run on all Windows-based PCs

and, by and large, all hardware devices can be used as well. Affidavit N 10. Hence, the consumer avoids the need for time-consuming, often expensive retraining, and thus has a greater incentive to learn how to use the existing system. Also, the widespread acceptance that Windows enjoys makes it easier to ensure that computer products (both hardware and software) work the way they are supposed to, and work well with each other. Operating system consistency usually means that software will operate normally even if the type of computer changes. For example, WordPerfect will function as advertised on a Windows-based Dell computer or a Windows-based Compaq computer. Id.

For these reasons, as Mr. Zuck explains, the cost per potential customer of developing a piece of software for the Windows operating system is significantly lower than the cost for the UNIX operating system. And that, of course, translates into more software and lower prices for consumers. Id. N 13.

In addition, more than any other operating system, Windows has remained compatible with software written for older Windows versions. As a result, consumers have much greater confidence that the software they purchase will work when they upgrade to a new Windows release. Hardware manufacturers and developers similarly face much less risk that their research and development expenditures will be stranded if Microsoft releases a new version. Id. N 14.

3. Windows' Low Cost to Consumers. The Windows operating system also allows the developer, or other providers of support services, to support end-users at minimal cost. As Mr. Zuck explains, each operating system not only has signature application interfaces and user commands, it also presents its own set of bugs and system errors. Thus, to provide software or

In its consistency from one computer and software program to another, Windows is markedly different from the UNIX operating system. That system is in reality a collection of similar operating systems, including Sun's Solaris, Digital's UNIX, HP's HP-UX, IBM's AIX and SCO's UnixWare. See http://www.techweb.com/encyclopedia/defineterm?term=unix. Although different versions may be desirable with respect to many products, for most computer users such a proliferation promises nothing but confusion, lost time, fewer applications, and higher prices. For example, a consumer who shifts from one UNIX-based computer to another UNIX- based computer may find that the two computers use different UNIX versions with different features, functions, and idiosyncrasies. Consequently, the consumer may have to devote considerable time and expense learning how to perform the same tasks on the second UNIX- based computer that she already knew how to perform on the first platform. Worse still, the software applications or hardware equipment she purchased for and used on the first computer may be incompatible with the version of UNIX installed on the second computer. And a UNIX user obviously has less incentive to develop skills tailored to her particular system if it is likely that she will use a different UNIX operating system in the future. Affidavit NN 11–12.

15 hardware support, a developer must train personnel to identify and understand the idiosyncrasies of each operating system under which it markets its product. These increased support costs increase prices and decrease consumer demand for products and services. Id. N 15. Consumers, moreover, obtain all of these benefits inexpensively. Compared to the cost of a typical PC, and to the cost of the software typically installed on that PC, the cost of Windows (at about 5% of the PC's price) is relatively small. A low price, coupled with all the benefits stemming from Windows' widespread use, drives up demand by making computer products more affordable and attractive to consumers. Id. N 16.

As Mr. Zuck explains, the widespread use of an inexpensive, constantly evolving operating system is particularly important in an industry as dynamic as the information technology industry, which constantly generates both new products and new uses for those products, and for which new developments such as the Internet can redraw the competitive landscape overnight. A popular operating system like Windows allows consumers and developers to act quickly and with confidence that software and hardware will work on most PCs today and in the future. And the fact that many consumers choose Windows adds a measure of stability to a highly dynamic industry.

For all these reasons, any remedy that resulted in the balkanization of Windows would have a disastrous effect on the entire IT industry. Software developers, Internet access providers, and others rely on the widely installed, constantly improving Windows platform as the groundwork for their own products. If there were no consistent platform, software developers would have to try to port their products to various operating systems, increasing those products' costs substantially, or else they would have to accept a much smaller market share.

This, too, would drive up prices because the cost of distributing software is tiny compared to the cost of developing it.

Windows' importance as a consistent platform is illustrated by the fact that, when it appeared that Microsoft might be broken up, stock prices in the rest of the IT industry fell. Kenneth G. Elzinga, David S. Evans, Albert L. Nichols, United States v. Microsoft: Remedy or Malady?, 9 Geo. Mason L. Rev. 633 (2001). Likewise, any remedy such as those proposed by the Litigating States that would fragment Windows would be unlawful because of the harm it would impose on third parties.

D. The Remedy Should Be Judicially Administrable, Not Regulatory.

Finally, any remedy should be judicially administrable and not put the courts in the position of having to oversee product design. United States v. Microsoft Corp., 147 F.3d 935, 948 (DC Cir. 1998). Some have suggested that the kinds of extreme remedies proposed by the Litigating States are in some sense alternatives to regulation. But history suggests quite the opposite.

In 1982, for example, AT&T entered into a consent decree designed to remedy what the government perceived as anticompetitive practices, and to allow AT&T to compete in new markets. Then too, the provisions of that decree were touted as an alternative to regulation. But in practice, the break-up of AT&T generated pervasive judicial participation in the telecommunications industry. For example, between 1984 and 1995, the court ruled on over 250 waiver requests pursuant to the consent decree. Most of these were necessary to allow the companies spun off from AT&T to respond to market developments that had not been anticipated when the decree was entered. Although 96 % of the requests were eventually approved, the average delay prior to approval was four years. It is not surprising, then, that Congress put the court out of the telecommunications business when it passed the Telecommunications Act of 1996.

This kind of intrusive, time-consuming regulation is particularly ill-suited to a rapidly- changing industry such as IT. For example, many settlement opponents have made proposals resting on a distinction between middleware and the operating system. But this distinction is dubious even now, and is rapidly being eroded. The federal courts are not equipped to draw lines in the shifting sands of information technology.

Notwithstanding this reality, some settlement opponents have proposed ongoing regulation of Microsoft's conduct, or detailed enforcement provisions envisioning ongoing judicial involvement in Microsoft's management. Some have even proposed egregious private attorney general provisions that would simply foment litigation and enrich plaintiff's lawyers. All of these proposals would create the kinds of problems that arose in abundance in the wake of the AT&T consent decree.

Other cases demonstrate the dire consequences that can arise when courts attempt to regulate an industry under the guise of an antitrust decree. For example, in United States v. United Shoe Machinery Corp., 110 F. Supp. 295 (D. Mass. 1953), aff'd, 347 U.S. 521 (1954), the district court imposed extensive regulation on the shoe machinery industry over a ten-year period. The remedies were meant to end United's practice of distributing shoe machinery through long-term leases and to make shoe machinery available from a variety of sellers. To this end, the court restricted lease terms, required United to offer its machines for sale in addition to leasing them, and required United to charge separately for services such as repairs. Id. at 352–53. However, a 1993 study concluded that the court order destroyed many efficiencies arising out of the technical realities of the shoe manufacturing industry, impaired the quality of United's performance, and likely contributed to the dramatic decline of the domestic shoe industry in the 1960s and beyond. Scott E. Masten & Edward A. Snyder, United States v. United Shoe Machinery Corp.: On the Merits, 36 J.L. & Econ. 33 (1993); see also Lino A. Graglia, Is Antitrust Obsolete?, 23 Harv. J.L. & Pub. Pol'y 11, 17 (1999). For all these reasons, judicial regulation of the IT industry, or any portion of that industry, is to be avoided at all costs.

Indeed, that appears to be the main message of the DC Circuit's earlier decision

rejecting the preliminary injunction that the Government sought. Microsoft, 147 F.3d at 948 (Antitrust scholars have long recognized the undesirability of having courts oversee product design, and any dampening of technological innovation would be at cross-purposes with antitrust law.). And the Court of Appeals' most recent decision is entirely consistent with that message. Microsoft, 253 F.3d at 101–07. Indeed, even Judge Jackson has acknowledged that in this case, as in others: The less supervision by this court, the better.' John R. Wilke, For Antitrust Judge, Trust, or Lack of It, Really Was the Issue, Wall St. J., June 8, 2000, at A1.

II. THE RPFJ IS CONSISTENT WITH ALL OF THESE PRINCIPLES, WHEREAS THE PROPOSALS BY THE LITIGATING STATES AND OTHER CRITICS WOULD VIOLATE EVERY ONE OF THEM.

On balance, the RPFJ complies with these four principles and is therefore in the public interest. Like most settlements, it is less than perfect. However, the purpose of this proceeding is not to produce a perfect order. The court must review the settlement that the parties have agreed to, and enter it so long as the proposal falls within the reaches of the public interest.' Microsoft, 56 F.3d at 1458 (DC Cir. 1995) (emphasis in original; citations omitted); see 15 U.S.C. u 16(e) (Before entering any consent judgment proposed by the United States under this section, the court shall determine that the entry of such judgment is in the public interest.).

It is clear that entry of the RPFJ is in the public interest. The federal government has explained at length in its Competitive Impact Statement that the RPFJ will provide a prompt, certain and effective remedy for consumers by enjoining the conduct that the Court of Appeals found to be illegal, and by restoring competitive market conditions. Competitive Impact Statement at 2, United States v. Microsoft, No. 98–1232 (D.DC Nov. 15, 2001) (CIS). Each of the Court of Appeals' findings of anticompetitive conduct is addressed by at least one provision of the proposed final judgment. See Exh. B (table showing which provisions address each finding of illegality). Indeed, the RPFJ's provisions regarding server protocols, and its enforcement provisions, extend beyond the anticompetitive conduct found by the Court of Appeals. Accordingly, any notion that the RPFJ only tells Microsoft to go forth and sin no more, United States v. Microsoft Corp., 159 F.R.D. 318, 334 (D.DC 1995), rev'd, 56 F.3d 1448 (DC Cir. 1995), is ludicrous.

In contrast, the Litigating States and other critics of the RPFJ have proposed a variety of radical remedies that they claim would be more effective than the RPFJ in restoring competition. However, these proposals violate the four principles described above, and are in fact designed to benefit Microsoft's competitors. Indeed, these proposals would advantage Microsoft's competitors in areas other than PC operating systems, which is the only market at issue in this case. Moreover, rather than seeking to restore competition, these proposals and others like them seek to impose a court-designed, court-regulated regime that is especially inappropriate for a rapidly changing area such as IT. A principle-by-principle analysis highlights the flaws in these proposals.

A. The RPFJ Is Designed To Benefit Consumers, Whereas The Litigating States' Proposals Are Designed To Benefit Microsoft's Competitors.

As noted above, the most vital principle in designing an antitrust remedy is that it must be designed to benefit consumers rather than competitors. Unlike the Litigating States' proposals, the RPFJ easily complies. Consumers will benefit from the guaranteed flexibility and choice provisions in the RPFJ. All new Microsoft operating systems, including Windows XP, will have to allow end users to readily remove or re-enable Microsoft's middleware products such as its Internet browser, instant messaging tools, media player, and email utilities. While end users can already remove Microsoft middleware from Windows XP, the RPFJ will make it easier for users to switch and compare among competing middleware products, including those installed by computer manufacturers and those readily accessible over the Internet. Most importantly, the RPFJ preserves the integrity of the Windows standard while making it easier for other platforms to compete with Windows. As discussed above, the network effects that characterize the operating system market mean that consumers and the IT industry both benefit when they know that the platform they rely on is widely used, and will continue to be widely used in the future. Findings of Fact at 19–23; see also Affidavit NN 9–14. By and large, the RPFJ avoids requirements that would encourage the emergence and sale of multiple, incompatible operating systems under the Windows brand name. At the same time, the RPFJ protects Microsoft's competitors in several ways. Most importantly, it forbids retaliation against OEMs, u III.A, requires uniform license terms for the twenty largest OEMs, u III.B, and prevents Microsoft from including various restrictive provisions in OEM licenses, u III.C. Thus the RPFJ opens up the valuable OEM distribution channel to competitors, addressing the Court of Appeals' most substantial concerns. By increasing competitors' access to OEMs and by preventing Microsoft from negotiating quotas with IAPs, the RPFJ reasonably ensures that consumers will have access to whatever products they want.

By contrast, a central thrust of the Litigating States' proposals is to break Microsoft's control over the Windows brand. Forcing Microsoft to break up Windows into what a court conceives of as its component parts both destroys the utility of the standard Windows platform and entangles judges in a maze of technical regulation that they are poorly equipped to solve. If implemented, the LSPFJ would result in the creation of as many as 4,000 different versions of Windows, each requiring support not only by Microsoft but also by OEMs, software developers, and other IT professionals. This outcome would worsen, not improve, the lot of consumers. It would only serve to weaken Microsoft's product offerings, confuse users, drive up prices, and limit software choices.

Such remedies would also create concerns about privacy and security. Consumers are concerned and rightly so about on-line privacy and the security of their electronic information. E.g. David Ho, Identity Theft Tops Fraud Complaints, Wash. Post, Jan. 24, 2002 at E4. Because Microsoft would have almost no control over access to its code and to its technical information under the states' plan, hackers and other unsavory characters would find it much easier to penetrate the most common privacy and security protections. It would also be harder for Microsoft to control computer piracy, which in the end drives up prices to consumers. By making the fruits of Microsoft's innovations readily available to competitors, the Litigating States' proposals would also harm consumers by reducing Microsoft's incentive to innovate in the future. Indeed, it is likely that Microsoft's research and development budget, which has historically been the largest in the industry, would be substantially reduced to the 22 detriment of consumers. Property ownership is the cornerstone of a free market system; as property rights are eroded, so is the incentive to put that property to its most valuable use. Beyond these problems, the Litigating States' proposals are patently designed to provide specific benefits to Microsoft's principal competitors, and to reinforce their dominant positions in markets that are irrelevant to this litigation. This approach to remedies is contrary to the interests of consumers and the rest of the IT industry, and contrary to antitrust law. Benefits to AOL Time Warner. Some of the Litigating States' proposals will directly benefit AOL Time Warner. For example, the Litigating States' proposal to break Microsoft's control over the Windows brand, and the proposed prohibition on making Microsoft middleware the default for any functionality, LSPFJ u 10, unless the OEM or other licensee can override the setting and designate a different default or give the end-user a neutrally presented choice means that consumers who think they are buying a coherent, integrated operating system designed by Microsoft will get something quite different.

To see how this benefits AOL, consider the following scenario: AOL's Magic Carpet service will compete with Microsoft's .Net services. If Microsoft designates .Net as a default service in Windows, AOL can ask computer sellers to re-direct the default to Magic Carpet. Indeed, AOL's strategy is to do just that. Alec Klein, AOL to Offer Bounty for Space on New PCs, Wash. Post, July 26, 2001, at A1 (In internal AOL documents, the media giant lays out a strategy that calls on manufacturers to build into their new personal computers icons, pop-up notices and other consumer messages aimed at pushing aside Microsoft by giving AOL's own products prominent placement on PCs. It's the latest foray in an intensifying feud between the two technology titans over consumers and supremacy on the Internet.) Yet this hybrid product will still be marketed as a Windows system, making Microsoft responsible in consumers' eyes for programs it has no control over, and giving AOL a free ride on Microsoft's reputation and marketing.

Other users will be provided with a bewildering array of choices, all presented in a neutral manner, i.e. without guidance as to what product best suits their needs. Yet sophisticated users who have information

about middleware alternatives do not need neutrally presented choices to help them make their decisions. Less sophisticated consumers are entitled to get the brand they paid for, or at least to be told how to get that brand. The RPFJ's Section III, by contrast, puts Microsoft and its competitors on a level playing field, with minimal judicial intervention.

Benefits to Sun Microsystems. Another Microsoft rival, Sun, would also benefit directly from the Litigating States' proposals. Sun would benefit most obviously from the proposal that Microsoft include Sun's Java with every copy of Windows. LSPFJ u 13. Apparently Sun sees no conflict between that proposal and the proposal that Microsoft make available middleware- free versions of Windows at reduced prices. It is hard to argue that this requirement would benefit consumers, who can already get Sun's Java free from those web sites that use it. The federal government's settlement with Microsoft will make Sun's Java even easier for consumers to obtain by allowing OEMs, IAPs, and ISVs to provide it to their customers without fear of retaliation. But under the Litigating States' proposal, all consumers would have Sun's Java forced on them.

Benefits to IBM and Apple. The Litigating States' proposals also benefit IBM and Apple, giving them each an Office suite. IBM wants Office for Linux, and under the Litigating States' proposal it will get its wish by snatching Microsoft Office source code at the auction price. Under that proposal, Microsoft must maintain and support Office for the Macintosh even if it is a money-losing proposition. And if Apple is unhappy with the Office support Microsoft has to provide, it can snatch the source code at auction, and have an Office all its own. LSPFJ u 14. These porting proposals go far beyond the scope of this case, which is the Windows operating system market.

Conversely, the federal government's settlement with Microsoft addresses the Court of Appeals' only holding of anticompetitive behavior involving Apple, namely the agreement that Apple would distribute Internet Explorer exclusively. Under the RPFJ, Apple, like all ISVs, is free to distribute and promote non-Microsoft platform software without fear of retaliation. The states' proposal would give a free ride to a handful of companies and would impose an unnecessary burden on Microsoft but would not benefit consumers.

The states' proposals also provide free source code for Microsoft's Internet Explorer, LSPFJ u 12, giving IBM a good browser for the entire line of IBM computers and Apple a leg up on its software design. But once again, the problem with all this generosity is that its sole purpose is to benefit competitors and harm Microsoft, not to benefit consumers.

B. The RPFJ Is Narrowly Tailored To The Court Of Appeals' Ruling, Whereas The Litigating States' Proposals Go Well Beyond It.

Another key flaw in the Litigating States' proposals is that they go well beyond the Court of Appeals' ruling. Indeed, the sweeping scope of the Litigating States' proposals suggests that they mistakenly read the Court of Appeals' decision on liability as a broad affirmance, rather than as it was in fact a reversal in part containing very precise, narrow holdings on liability. Indeed, the DC Circuit reversed the District Court's findings that Microsoft had committed attempted monopolization and illegal tying.

As to the remaining findings, the Court of Appeals affirmed only some of the District Court's findings that Microsoft had illegally maintained its monopoly. Microsoft, 253 F.3d 34.

The Court of Appeals held that some exclusionary contracts and negotiating tactics were unlawful; that Microsoft had acted illegally in deceiving developers about its own Java language; and that Microsoft had illegally excluded Internet Explorer from its Add/ Remove facility and intermingled its Internet Explorer and operating system code. The Court also emphasized that, on remand, the District Court must base its relief on some clear indication of a significant causal connection between the conduct enjoined or mandated and the violation found directed toward the remedial goal intended.' Id. at 105 (quoting 3 Philip E. Areeda & Herbert Hovenkamp, Antitrust Law N 653(b), at 91–92 (1996)).

Section III of the RPFJ addresses each of these holdings. As to exclusionary contracts and high-pressure negotiations, the RPFJ forbids Microsoft to retaliate against OEMs, u III.A; requires Microsoft to sell Windows to the twenty largest OEMs under uniform license terms, u III.B; and forbids retaliation against, or exclusionary agreements with, ISVs or IHVs, u III.G, u III.F. As to Java, the RPFJ requires disclosure of information needed to design other software to be fully compatible with Windows, u III.D, and requires Microsoft to license its intellectual property to rivals, u III.I. As to Internet Explorer, the RFPJ forbids Microsoft to restrict any OEM from modifying their computer interfaces in various ways, such as removing the Internet Explorer icon, u III.C, and requires Microsoft to allow end-users to remove access to Microsoft Middleware or to designate a non-Microsoft middleware product as the default instead of the Microsoft product, u III.H.

The Court of Appeals was also quick to note that much of the conduct that Microsoft was accused of and even conduct that was found to be anticompetitive in particular settings is common in business, and is usually not anticompetitive. But the states' proposed categorical bans sweep in a host of pro-competitive conduct, in disregard of the Court of Appeals' instruction that any remedy be narrowly tailored to specific holdings of illegality. For example, the states would ban exclusive dealing across the board. Yet the Court of Appeals explained that: ''exclusive contracts are commonplace especially in the field of distribution in our competitive, market economy, and imposing upon a firm with market power the risk of an antitrust suit every time it enters into such a contract, no matter how small the effect, would create an unacceptable and unjustified burden upon any such firm.'' Microsoft, 253 F.3d at 70.

Similarly, the proposed judgment reflects an implacable hostility to integrating an internet browser or any additional functionality with the basic Windows operating system. Yet, as the Court of Appeals observed, [a]s a general rule, courts are properly very skeptical about claims that competition has been harmed by a dominant firm's product design changes. Id. at 65.

In perhaps the Litigating States' most egregious proposal, Sun CEO Scott McNealy got a special gift he has always wanted, see Peter Burrows, Face-Off, Bus. Wk., Nov. 19, 2001, at 104, — the ability to stop Microsoft from buying anything that could help it compete with Sun. If Microsoft wants to make an acquisition, an investment, or an exclusive license, it must notify the plaintiff states' attorneys two months in advance. LSPFJ u 20. The states make this proposal despite the total absence of any takeover-related findings anywhere in this case. It was precisely this type of overreaching that the Court of Appeals soundly rejected in 1995, when it reversed Judge Sporkin's refusal to approve the federal government's settlement with Microsoft and reassigned the case to a different district judge. Microsoft, 56 F.3d 1448. Judge Sporkin had gone beyond the complaint to try to force the parties to address his own concerns about vaporware. The Court of Appeals found that effort inappropriate. And it is no more appropriate for the Litigating States, at this late date, to try to drag in new issues and punish Microsoft for conduct that it never had a chance to defend. If a claim is not made, a remedy directed to that claim is hardly appropriate. Id. at 1460.

Another example of overreaching is buried in the Litigating States' proposals regarding orders and sanctions, and which singles out for punishment any groundless claim Microsoft makes of intellectual property infringement. Again, Microsoft's conduct in intellectual property litigation is no part of this case.

Finally, the Litigating States' proposed ban on retaliation against those who participated in the litigation is not grounded in any finding of illegality, even though Microsoft has been enmeshed in antitrust cases for years and has presumably had ample opportunity to retaliate unhindered. The RPFJ retaliation ban, in contrast, is clearly aimed at the possibility that Microsoft might try to punish companies that do not cooperate with Microsoft's business goals. The Court of Appeals envisioned that Microsoft would continue its normal business relations, albeit with injunctions in place against specific conduct found to be anticompetitive. The RPFJ provision implements that vision, while the states' proposal would open the door to unfounded claims of retaliation by any disgruntled participant in the litigation.

Of course, the RPFJ itself is overbroad in some respects.

Yet despite these problems with its scope, it is clear that as a whole, the RPFJ falls within the reaches of the public

For example, the Proposed Final Judgment defines Microsoft middleware as including Outlook Express, photo and video editing software, and other products that cannot serve as competitive threats to Microsoft. RPFJ u VI.K.1. This definition clearly

overreaches. This case is about Microsoft's response to the emergence of middleware as a competitive threat a possible alternative platform for software developers that could run on a variety of operating systems and thus would make software independent of Windows. Only middleware that can interest. It addresses the Court of Appeals' findings of illegality, remedies them all, and ensures competitive conditions in the market for Intel-compatible PC operating systems. C.The RPFJ Will Benefit The IT Industry, Whereas The Litigating States' Proposals Would Impose Substantial Harm On Other IT Companies. The RPFJ also offers significant advantages to the IT industry. Most importantly, of course, it preserves the integrity of Windows. But it also serves the IT industry by achieving a relatively quick resolution of this dispute. Litigation over remedies, possibly followed by appeal and remand or further appeal, could take years. The Supreme Court has recognized that a government antitrust consent decree is a contract between the parties to settle their disputes and differences, United States v. ITT Continental Baking Co., 420 U.S. 223, 235–38 (1975); United States v. Armour & Co., 402 U.S. 673, 681–82 (1971), and normally embodies a compromise; in exchange for the saving of cost and elimination of risk, the parties each give up something they might have won had they proceeded with the litigation. Armour, 402 U.S. at 681. The RPFJ has the virtue of bringing the IT industry certain benefits and protections without the uncertainty and expense of protracted litigation, Armour, 402 U.S. at 681; Microsoft, 56 F.3d at 1459; it will provide prompt, certain and effective remedies, CIS at 3.

The RPFJ also directly helps OEMs and other IT firms. Many of the options that will benefit consumers will also benefit the companies they buy from. As discussed above, OEMs serve as an independent basis for software development across different operating systems poses a competitive threat to Windows. Microsoft, 253 F.3d at 53. Similarly, the RPFJ overreaches when it requires that Microsoft disclose communications protocols used to interoperate with Windows 2000 servers and their successors. The Court of Appeals' definition of the relevant market made it clear that servers are not a part of that market and therefore, that they are not a part of this case. Microsoft, 253 F.3d at 52–53. As explained above, the only connection between servers and this case is that Microsoft's competitors in the server market have been highly influential with the Attorneys General who continue to litigate this case. The server protocols themselves are irrelevant and thus compelling disclosure is both overbroad and designed to benefit competitors rather than consumers.

29 that equip their products with any Microsoft operating system will benefit from guaranteed flexibility under the RPFJ. The twenty largest OEMs will also be entitled to uniform licensing terms, with some flexibility for volume discounts and marketing allowances. OEMs will have the ability to lease desktop space as well as space in the boot sequence on their computers by installing or promoting non-Microsoft products and services; IT companies will thus have the option to negotiate with the OEM(s) of their choice for that space. By contrast, the states' proposal to give the OEMs the choice of which parts of Windows to include on their computers and forcing Microsoft to accommodate those choices would fragment the Windows standard. As explained above and in Mr. Zuck's affidavit, such fragmentation would have disastrous effects. Creating multiple versions of Windows would slow the release of new versions of Windows and would make it impossible for software developers to program with confidence. Either they would write only to the leanest version available, depriving consumers of the benefits of most of Windows' functionality, or they would have to write multiple versions of each program, substantially increasing development costs and customer confusion. A stagnant, fragmented Windows would hurt the entire industry.

On another front, the RPFJ benefits all IT providers, including Microsoft's competitors, by guaranteeing access to technical specifications. Microsoft would have to promptly disclose technical information that enables any Windows operating system to communicate with Microsoft servers and with all Microsoft middleware products. uu III.D, III.E. To encourage more non-Microsoft middleware, the settlement forces Microsoft to license any intellectual property rights that others might need to compete with Microsoft. u III.I. And as with OEMs, Microsoft could not penalize any software developer, service provider, or hardware vendor that develops or sells products that compete with Windows and Microsoft middleware. uu III.A, III.F.

By contrast, as discussed above, the Litigating States' proposals would stifle innovation further by weakening or entirely eliminating Microsoft's intellectual property rights, thereby reducing its incentive to innovate. E.g. LSPFJ uu 1 (stripping down Windows), 2(a) (mandatory licenses), 3 (mandatory licensing of predecessor versions), 4 (disclosure of APIs and technical information), 12 (giving away browser), 14 (mandatory porting), 15 (intellectual property licenses), 19(f) (intellectual property claims). These provisions would not only hurt Windows, but also would instill in any sensible IT executive the fear that success will lead to confiscation. Even if these proposals did not end Microsoft's improvements to Windows, another provision would likely do so. That is the Litigating States' proposal to require Microsoft to notify any ISV of non-Microsoft middleware of any planned action, sixty days in advance, if the action will interfere with the middleware's performance or compatibility with Windows, unless the action is taken for good cause. LSPFJ u 5. After the notification, the ISV could complain to Microsoft's court-installed regulators to try to block the change.

The states' broad prohibitions on exclusive dealing and on agreements limiting competition also would prohibit Microsoft from entering into joint ventures with any other members of the IT industry. Because IT products are so interdependent, both consumers and companies would suffer if the only option is to design around Microsoft products, and the option of collaborating with Microsoft on entirely new projects is excluded.

D. The RPFJ Attempts to Structure a Workable Compromise, Whereas the Litigating States Propose to Establish a Court-Run Ministry of Microsoft. Finally, the approach of the RPFJ is not unduly regulatory. To be sure, the enforcement mechanism is too intrusive and could be substantially improved. However, the substantive provisions of the RPFJ focus on improving competition rather than micromanaging markets or product design. Thus, most of the injunctions tell Microsoft what not to do, rather than imagining what a perfect competitor might do and then attempting to enforce that vision. Not so the proposal by the Litigating States. They have proposed ongoing regulation of Microsoft's conduct, including ongoing judicial involvement in Microsoft's management, by a special master who would serve as an investigator, prosecutor, judge, and potentially even witness against Microsoft. LSPFJ u 18. The special master would be free to receive and act on even anonymous complaints, again a procedure that the Court of Appeals harshly criticized when Judge Sporkin used it. Microsoft, 56 F.3d at 1464. These proposals are most likely unlawful, if not unconstitutional. Id.; Microsoft, 147 F.3d. at 954 (granting mandamus to vacate non-consensual reference to a special master where [t]he issue here is interpretation, not compliance; the parties' rights must be determined, not merely enforced). And in all events, they would allow Microsoft's rivals to thwart competition at every turn.

The Litigating States also err in proposing an unduly long duration period. Any remedy in this case must be sensitive to the rapid pace of technological change in the operating system market. An injunction that is appropriate today may be completely unsuited to tomorrow's market. If, as The Economist has written, operating systems are no longer central, then there is little point in regulating that market. Microsoft: Extending its Tentacles, The Economist, Oct. 20–26, 2001, at 59. The RPFJ recognizes this reality by limiting its term to five years, with the possibility of a two-year extension. u V. Not so the Litigating States, who in their rush to ask for the most punitive remedies available seek a ten-year term for the judgment. In an effort to cover unforeseeable eventualities, the States also define key terms such as middleware, browser, and technical information so broadly that the proposed judgment is in some ways absurd. For example, it appears that the middleware definition would include parts of Windows 3.0, which was developed before anyone thought of Java or Internet Explorer. Because they are unworkable, many of the Litigating States' proposals invite additional judicial involvement through complaints by competitors or others; indeed, the provisions for anonymous complaints invite not only involvement, but abuse.

In short, the Litigating States' proposals pose an enormous risk of ongoing judicial regulation. Not only would they require

substantial modification of Microsoft's internal management structure, but they would require the District Court to set up its own regulatory agency, headed by the special master and potentially including a substantial staff, all paid by Microsoft. Courts are simply not designed for this sort of ongoing regulatory role, particularly in a field as far removed from their expertise as IT. At best, the Litigating States' proposals would create a contentious, judicially-regulated regime in place of a market. At worst, they would seriously impair IT innovation, at everyone's expense.

CONCLUSION

For all these reasons, the RPFJ should be adopted, and the Litigating States' proposals should be rejected.

IN THE UNITED STATES DISTRICT COURT

FOR THE DISTRICT OF COLUMBIA

UNITED STATES OF AMERICA, Plaintiff, v. Civil Action No. 98–1232 (CKK) MICROSOFT CORPORATION, Defendant

STATE OF NEW YORK ex rel.) Attorney General ELIOT SPITZER, et al.,) Plaintiffs, v. Civil Action No. 98–1233 (CKK) MICROSOFT CORPORATION, Defendant.

DECLARATION OF JONATHAN ZUCK

January 25, 2002

Qualifications and Scope of Testimony

1. My name is Jonathan Zuck. I am over 18 years of age. I reside at 3701 Upton Street NW, in Washington, DC. I am President and Executive Director of the Association for Competitive Technology (ACT). I make this declaration in my capacity as President of ACT, which declaration is based on my personal knowledge of the facts set forth herein. To my knowledge, the factual assertions presented in this affidavit are true and correct.

2. ACT is a nonprofit association representing over 9,000 companies and individuals in the information technology (IT) industry. ACT members include independent software developers, hardware developers, systems integrators and on-line companies, many of whom are small and medium-sized businesses who depend on Microsoft technology for their success. Protecting the freedom to achieve, compete and innovate, ACT is dedicated to preserving the role of technology companies in shaping the future of the IT industry. Although their businesses vary, ACT members share a preference for market-driven solutions over regulated ones. Through education, advocacy and collaboration, ACT gives the IT industry a powerful voice in shaping its future. Although Microsoft is also an ACT member, ACT's interest in the remedies phase of this case stems primarily from the serious adverse impact the remedies proposed by the Litigating States will have on ACT's other members, and especially on independent software vendors (ISVs) in the business of developing applications software for use by business and consumers.

3. I became President of ACT in 1998. Since assuming leadership of ACT, I have been responsible for providing analysis, commentary and background information on behalf of the IT industry on a broad range of technology issues being debated in the public policy arena. I have appeared on a wide variety of television and radio programs, and do a large amount of writing for trade publications such as PC Magazine, PC Week, DBMS, the Visual Basic Programmer's Journal, and Windows Tech Journal. I have coauthored several books on the subject of Windows application development, including Visual Basic How-To. I also regularly speak at trade conferences in the United States and around the world on matters important to ACT's membership.

4. Prior to becoming President of ACT, I spent more than 15 years as a professional software developer. Most recently, I served as Director of Technical Services at the Spectrum Technology Group in Washington, DC, a consulting firm specializing in client/server, Internet and data warehouse solutions. Prior to that, in 1988, I founded and served as President of User Friendly, Inc., of Washington, DC, a company providing consulting and software development services to local businesses. The company expanded into commercial software development with Crescent Software in 1992. I also set up U.S. operations for Matesys, a French software firm that produced client/server development tools including ObjectView. At Matesys, I was responsible for product management, marketing and sales, and helped build the company into an $11 million business before it was sold to Knowledgeware.

5. The purpose of ACT's Tunney Act comments, and of my Declaration, is to provide the Court with the IT industry's perspective on the Revised Proposed Final Judgment (RPFJ) as well as the industry's perspective on more radical proposals that have been advanced by various groups, including the Litigating States. Specifically, this Declaration seeks to explain the importance of the standard, constantly evolving Windows platform and the heavy costs that would be imposed by the Litigating States' proposals or any other proposals that impair Windows' integrity. For the reasons explained below, ACT believes that the Litigating States' proposed remedies could well be devastating to the IT industry, with no corresponding benefit. In contrast, the RPFJ will likely preserve and even strengthen the IT industry.

Value of Windows

6. In various ways, the Litigating States' proposals will threaten the three features of the Windows operating system that make it so valuable to the IT industry: (1) the fact that Microsoft constantly improves it by adding new features and functionalities; (2) its uniformity and widespread acceptance; and (3) its low cost to consumers.

7. Constant Improvement and Addition of New Features and Functionalities. One reason Windows is so valuable to the IT industry is that Microsoft has constantly improved it. For example, each new release of Windows contains software drivers for the major new printers and other peripheral devices that have been released since the prior version of Windows. This means that developers of applications such as money management software, graphics programs, etc., do not need to create their own drivers for these devices or, worse, choose from among several competing drivers.

8. Virtually everyone in the IT industry, moreover, has a strong interest in seeing this trend continue in the future. The addition to Windows of such new functionalities as voice recognition, for example, will allow software developers to add such features to their products at minimal cost. Those costs will increase dramatically and consumer benefits will be reduced if software developers are forced to develop their own voice recognition features or, worse, to port their programs to several competing voice-recognition programs.

9. Windows' Uniformity and Widespread Acceptance. Uniform standards are crucial to an efficient, rapidly evolving IT sector. Communications and Internet standards provide the language necessary for many different computers to talk or network with one another, enabling, for example, users of the World Wide Web to locate and retrieve the information they seek. Operating systems perform a similar function, allowing hardware devices and software applications to communicate with a computer. Indeed, it is Windows' consistency that makes it so valuable.

10. As the District Court recognized in its Findings of Fact, with Windows the operation of both the computer and the software is the same from computer to computer. This means that the same software will run on all Windows-based PCs and, by and large, all hardware devices can be used as well. Hence, the consumer avoids the need for time-consuming, often expensive retraining, and thus has a greater incentive to learn how to use the existing system. Also, the widespread acceptance that Windows enjoys also makes it easier to ensure that computer products (both hardware and software) work the way they are supposed to, and work well with each other. Operating system consistency usually means that software will operate normally even if the type of computer changes. For example, WordPerfect will function as advertised on a Windows-based Dell computer or a Windows-based Compaq computer.

11. In its consistency from one computer and software program to another, Windows is markedly different from the UNIX operating system. That system is in reality a collection of similar operating systems, including Sun's Solaris, Digital's UNIX, HP's HP-UX, IBM's AIX and SCO's UnixWare. See http://www.techweb.com/encyclopedia/defineterm?term=unix. Although different versions may be desirable with respect to many products, for most computer users such a proliferation promises nothing but confusion, lost time, fewer applications, and higher prices.

12. For example, a consumer who shifts from one UNIX-based computer to another

UNIX- based computer may find that the two computers use different UNIX versions with different features, functions, and idiosyncrasies. Consequently, the consumer may have to devote considerable time and expense learning how to perform the same tasks on the second UNIX- based computer that she already knew how to perform on the first platform. Worse still, the software applications or hardware equipment she purchased for and used on the first computer may be incompatible with the version of UNIX installed on the second computer. And a UNIX user obviously has less incentive to develop skills tailored to her particular system if it is likely that she will use a different UNIX operating system in the future.

13. For these reasons, the cost per potential customer of developing a piece of software for the Windows operating system is significantly lower than the cost for the UNIX operating system, which translates into more software and lower prices for consumers.

14. In addition, more than any other operating system, Windows has remained compatible with software written for older Windows versions. As a result, consumers have much greater confidence that the software they purchase will work when they upgrade to a new Windows release. Hardware manufacturers and developers similarly face much less risk that their R&D expenditures will be stranded if Microsoft releases a new version.

15. Windows' Low Cost to Consumers. The Windows operating system also allows the developer, or other providers of support services, to support end-users at minimal cost. Each operating system not only has signature application interfaces and user commands, it also presents its own set of bugs and system errors. Thus, to provide software or hardware support, a developer must train personnel to identify and understand the idiosyncrasies of each operating system under which it markets its product. These increased support costs increase prices and decrease consumer demand for products and services.

16. Consumers, moreover, obtain all of these benefits inexpensively. Compared to the cost of a typical PC, and to the cost of the software typically installed on that PC, the cost of Windows (at about 5%) is relatively small. A low price, coupled with all the benefits stemming from Windows' widespread use, drives up demand by making computer products more affordable and attractive to consumers.

17. The widespread use of an inexpensive, constantly evolving operating system is particularly important in an industry as dynamic as the information technology industry, which constantly generates both new products and new uses for those products, and for which new developments such as the Internet can redraw the competitive landscape overnight. A popular operating system like Windows allows consumers and developers to act quickly and with confidence that software and hardware will work on most PCs today and in the future. And the fact that many consumers choose Windows adds a measure of stability to a highly dynamic industry. This Court should avoid any remedies that would threaten or undermine these benefits. Potential Adverse Effects of the Litigating States' Proposals on Consumers and the IT Industry

18. The RPFJ will increase consumer choice while maintaining the integrity of the Windows platform. OEMs and consumers will be free to add whatever products they choose, even to the startup sequence, or to disable access to Microsoft middleware, but consumers will still be able to choose Microsoft products and programmers will still be able to invoke Windows' full functionality. RFPJ u III.

19. In contrast, the Litigating States' proposals will impose tremendous costs on the IT industry, its consumers, and the public at large.

20. Balkanizing Windows. A central problem with the Litigating States' proposals is that they would allow OEMs to create what would amount to separate versions or flavors of the Windows platform. As a result, the proposal would set in motion a process that could well result in the balkanization of Windows, to the detriment of IT companies and consumers alike.

21. The Litigating States' proposals would require Microsoft to offer stripped-down versions of Windows, with the middleware elements removed, at reduced prices. OEMs could then either leave those elements out altogether or replace them with competitors' products. As a result, a software developer can no longer assume that particular Windows components will be readily available to consumers. The developer must then purchase the needed feature from Microsoft and include it with its own program, or it must force the customer to purchase it from Microsoft. Either way, both the developer and the consumer would ultimately suffer from the need for a second, unnecessary transaction.

22. As an example, suppose that a company had an application that relied upon a Windows innovation to automatically support the display and navigation of its HTML-based on-line help system. The proposed remedy lets OEMs sell Windows without that support middleware, so the developer would have to incur the costs to create, distribute, and support its own middleware for on-line help display without delivering any greater value to customers.

23. The Litigating States' proposed remedy, moreover, actually gives OEMs an incentive to strip down Windows before offering it to consumers. That is because Microsoft shall offer each version of the Windows Operating System Product that omits such Microsoft Middleware Product(s) at a reduced price (compared to the version that contains them). Litigating States' Proposed Final Judgment u 1. Under the Litigating States' mistaken notion of Middleware, Windows itself would have been called Middleware, since it originated as an application running on top of DOS. There can be no doubt that the implementation of this concept would effectively balkanize what is now a uniform, coherent software platform. This balkanization would of course destroy one of the characteristics of Windows that makes it so valuable to developers of software and hence consumers its consistency from one Windows-based PC to the next.

24. Uncertainty in the IT Industry. Yet another major cost of the States' proposal is the tremendous uncertainty it would create and, indeed, already has created in the industry and the associated financial markets. The uncertainty surrounding the long-term implications of the proposed remedies is already causing software and hardware developers, as well as their current and prospective clients, significant harm. I do not believe that the vast majority of the conduct remedies proposed by the Litigating States will do anything but create an unwieldy regulatory regime for software and hardware designers.

25. A major source of uncertainty has to do with the future of the Windows platform. We do not know whether, assuming that the Litigating States' proposals or similar proposals are adopted, Windows will continue to be the standard operating system, or whether it will be viable at all.

26. For all these reasons, the mere fact that the Litigating States have proposed such extreme remedies is already creating a certain amount of paralysis among those in the IT industry who are working to improve existing products and to create the products of the future. Conclusion

27. While the RPFJ is superior to the Litigating States' proposals in many ways, a crucial difference is that the RPFJ would preserve the integrity of the Windows standard. By doing so, it will preserve the integrity of the IT and particularly the software development industry.

28. I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge:

Subject: Stop MS, for the comsuner sake!!

HI

This is not a legal argument, it is a personal experiance in dealing with MS. The settlement is bad. It does not deal the the problem of MS rape of the consumer and developer.

MS Modis Operandi(sp) is to control the access to computers and make money! This is at the expense of consumers and developers. When Word98 first came out it could not write Word95 format. This prevented the two programs sending file back and forth. This forced the Word95 user to upgrade(spend money).

MS does NOT follow standards!!! Even when thay help define the standards they break the same standards they help define. This forces developers to write new work arounds for the ''intentianl bugs/features''. This make MS products incompatiable with all other software, because these bugs are unpublished.

There is a difference between API (Application Programming Interface) and (protocols/file formats). An API requires a library that know the (protocol/file format).

To be interoperable the lowlevel protocols and file formats need to be known. This includes security protocols. MS does not intovate!! they take existing ideas and comercialize the one method of doing that idea. The only reason they can do that is that they are an monopoly. If low level formats and protocols are published then the ''secret'' is in the quality in programming the application. This is where the compitition come in. If they can do something better than someone else in an open playing field, that is the way to compete. An monoculture of computers is very instable. the security of MS products is terrible!! When you allow the mix of data and program to be exchanged between systems then there is a lack of security. MS allows the transfer of data AND code in its data documents. VERY BAD! A way to force MS to improve service/products to the consumer is to allow compitition. To allow compitition ALL (that means ALL) low level protocols, file formats, and algorithms needs to be in the public domain. MS will try to sneak out of doing any change in its MO, and put paper work and beurcrat stuff, and legal stuff between change. Just look at the lies and ''tricks'' they pulled during the trial phase. Any settlement needs to have teeth. Really BIG teeth!!!

I, as an consumer, can't take legal action against MS, I don't have the money, time,. . .

I may have a justice case the MS harmed me, but I can never seek or have justice on my own.

''The goverment is here to protect me from things I can't protect myself from''

Please protect me from Microsoft!

Subject: Microsoft Settlement

If you are not able to process html format for proper printing, or you lost the html version I sent, please accept this email (excepting this sentence) as my comment on the proposed settlement, otherwise please accept the html version which preceded this.

MS Settlement Reflects Deep Failure To Understand Implications of ''Patching'' Technology

The positions of the DOJ, the States, and even Lawrence Lessig are based on a failure to understand that something unique to the software industry, which programmers call ''patching'' technology, makes software products infinitely separable if an essential facility called ''source code'' is provided. No disclosure of APIs, and no structuring of APIs, can accomodate all potential products in the manner that disclosure of source code plus use of patching does. Every line of source code is a possible location for insertion of new code that forms a new product. This new code can be distributed separately from the original source code, and post-sale added by the consumer, via what programmers call a ''patch''. Patching technology fundamentally changes product separability, making separation dependent on the essential facility called ''source code''. Non-programmers seem to not yet understand this. Persons who work in the Linux industry know this from experience, and I will try to convey this experience as someone who has built a business from the sale of patches (for the ReiserFS filesystem) in the only market where I had access to kernel source code.

Software is unique in that ''Compiler'' technology allows consumers to effectively reassemble software themselves.

A compiler is a computer program that takes a set of instructions about how to build a program (called ''source code''), and builds the software. Almost all software is actually assembled by compilers not humans, and the work of humans is almost entirely in creating the source code.

You have probably never used a compiler to assemble software yourself as a consumer because:

*you are not a Fortune 500 company with a staff of trained system administrators

*you probably use Windows not Linux, and Windows does not give you access to the essential facility known as ''source code'' that your ''compiler'' needs to reassemble your software

*the new crusade by Linux to make the compilation process user friendly has only just started Because you have never done it yourself, your intuition may tell you that it is not feasible, or that it is not feasible for a large market. Beware this intuition, it is simply wrong. The Fortune 500 are a significant market for antitrust purposes, and Linux is rapidly moving towards making asking compilers to perform reassembly a friendly experience for average persons.

It is frequently efficient to post-sale integrate software for a large part of the market, and it is getting more so with time. This is deeply different from physical products such as cars, in that most persons do not find it as effective to buy a collection of parts and self-assemble because they would have to do the work of assembly. With software, the computer does the work of post-sale assembly, and the consumer simply tells the computer to do it, goes to make some tea, comes back, and the job is done.

For instance, the business that I own (Namesys, see www.namesys.com) made its money entirely from sales of a filesystem (ReiserFS) that was sold separately from the operating system (Linux) for the first few years of our business. The revenues from this were enough to support us. Paying consumers such as MP3.com would take our source code, add it to the Linux kernel source code, use a compiler, let their computer do a few minutes of work to reassemble the kernel, and get a better filesystem as a result of it. This allowed MP3.com to save $20 million dollars according to their estimate. Others in my industry also sell filesystems separately from operating systems (www.veritas.com got its start that way, and still makes simply enormous amounts of money from doing so, there are others....).

Notice that I say filesystem. Your intuitive notion of what is an operating system probably tells you that the filesystem is part of the operating system. You may be tempted to think that what is part of the operating system is not viable as a product sold separately from the operating system. Lessig thought so, and this is because he lacks experience selling operating system components in the Linux/Unix programming industry.

Think of Jefferson Parish, and understand that software takes the fine distinctions of Jefferson Parish to their extreme:

*Software can be integrated in its functioning, and yet separate in its sale, and this means separate as a product for purposes of anti-trust law. (Most software products are functionally integrated with a separately sold operating system.)

*Software can be integrated in its physical distribution, yet separate in its sale. (Purchase of a CDROM holding the software is often separated from purchase of a license to use, and it is often considered efficient by publishers to bundle physical distribution without bundling licensing.)

*Software can be sold and transmitted over the Internet with no physical product created at all.

There is only one characteristic that necessarily defines the separation of a software product, and that is the license. A license is a contract, and contractual tying is illegal under the Clayton and Sherman acts.

Yet wait, if software products are so easily separable, why aren't there far more OS components out there being sold? Control over an essential facility is the answer.

Secret source code can be an essential facility the equal of putting a combination lock on every bolt in a car, and then declaring the combination to be a trade secret.

You wouldn't allow this for a car, yet traditional industry practice is that source code is kept a trade secret. The crisis our industry is facing, in which monopoly control is the norm in all parts of it not in infancy, is directly caused by this industry practice of secret source code. It is not necessary that the text be kept secret for copyright protection on books to be maintained, and it is also not necessary for software that the source be kept secret to protect ownership of it. Far from it, the underlying historical motivation of copyright and patent laws is to bring more information out of trade secret status.

We have a widespread well-entrenched industry practice that keeps an essential facility (source code) under the control of monopolists (of which Microsoft is merely the largest), and we have almost complete monopolization of the software industry in each of its mature niches. These are cause and effect.

I pray to you to not allow their continuance. Open up the operating system source code, and go even further. Declare that software is per se separable where source code is available. Declare source code to be an essential facility. Return copyright and patent practices to their historical roots, and require that information created be made public if it is to be protected.

Please do not hesitate to ask me to comment in greater detail or respond to your questions in this matter. I am available for in person testimony if desired.

I have great respect for Reilly and Lawrence Lessig generally, and for their

arguments in most other matters, and I hope it is understood that I merely have an advantage in possessing ''patches'' sales experience.

As for my needs, please create the legal conditions which will allow me to port ReiserFS to Windows and sell it separately from the operating system, by giving me the access to source code that I need to do the port, and to sell the patch separately from the OS.

Essential Facilites Related Citations

[U.S. vs. Trans-Missouri Freight Ass'n, 166 U.S. 290 (1897)] is the original precedent.

[MCI Communications v. AT&T Corp. 708 F.2d 1081 (7th Cir.), cert. denied, 464 U.S. 891 (1983)] describes a case more recent (it is a persuasive rather than controlling authority). Note that the 4 part test lacks any component referencing the need for a market to have been active at some point prior to the refusal to deal, and is the better for that lack.

Profit To The Monopolist From Tying

The Chicago School, to which the current DOJ administration adheres, holds that there is no incentive to monopolists to engage in tying because it believes they cannot extract more profit from forced sales of the tied product than they would from raising the price of the tying product, unless business efficiencies exist. For this reason, they feel that there is no need for the Clayton prohibition against tying, and feel there are civil liberty reasons to avoid government intervention into markets. Their analysis assumes the tied product is part of a fully competitive market, and for this reason it is deeply flawed.

The profit to the monopolist from engaging in tying is the difference between the market price and the marginal cost. For less than fully competitive markets, which is to say most markets, this is a non-zero amount. For software, especially software sold and distributed over the Internet, the marginal cost is close to zero, and the motivation for engaging in tying is extremely high. Senators Sherman and Clayton were much more knowledgable about economics than the Chicago School is paid to think (various monopolists have given large funding sums to pro-trust law schools). Some might like to think that, but for government, free choice expressed in the market would free us, but in sad reality the government is not the only means by which people organize to control and plunder the public. Cartels and monopolies take away our freedoms as well. The only thing worse than a government controlled economy is a monopoly controlled economy.

The Settlement As A Whole

I am opposed to the settlement as a whole. President Bush owns stock in Microsoft, and he appointed to head the antitrust division at the DOJ someone who is widely known to be opposed to laws against tying. When someone is opposed to a law that they are supposed to prosecute, they should not be allowed to settle a case their predecessor started. The proposed settlement is designed to be toothless, and to do nothing. Do not allow President Bush to settle this case, and thereby cripple the ability of the next administration to enforce the law. The failure of Microsoft and the DOJ to adhere to the contact disclosure provisions of the Tunney Act is one more reason to reject the settlement.

Conclusion

If you have the courage to firmly reject this settlement, if you declare software to be per se separable, and if you move aggressively to enforce the claim of the States while we wait for a new administration, you will have earned the admiration of the American people. Some of them will even know this.

More importantly, you will.

Danville, CA 94506
January 27, 2002
≤Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I write today to document my support of the recent settlement proposed by the DOJ in its antitrust lawsuit against Microsoft. I support this settlement because its formalization will mean that Microsoft's attention will no longer be diverted and they can get back to the business of creating excellent products. The formalized settlement will also mean that the IT industry will get the boost it has lacked since the beginning of this case. This boost will undoubtedly affect our failing economy positively.

I am pleased with the terms of the settlement as it stands, and I feel that Microsoft has made substantial strides to honor these terms. The compliance with these terms will ensure that competitiveness in the IT industry will be highly increased thereby giving consumers greater choices. Microsoft has already agreed to give their competitors license to their intellectual property and have also granted access to internal codes and protocols. These moves are all pro-competition and should more than quell the concerns of Microsoft's opponents.

It is my hope that you will see how crucial formalize this settlement is to the consumer, the IT industry and the economy and bring this matter to an expeditious close.

Sincerely,

MTC–00027810

Renata B. Hesse
Antitrust Division
U.S. Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001
January 28, 2002

Dear Ms. Hesse:

The United States v. Microsoft Corporation litigation, which was brought nearly four years ago, should be ended with the consent decree by your Court.

Products which formed the basis for the Microsoft case in 1998 have since disappeared, becoming obsolete antiquities to be viewed with a smile and a ?remember when? usually reserved for hula-hoops and RC Cola. Other issues at the core of the case have also changed almost unidentifiably or have been sold or merged with others.

The failed Microsoft Network is one of the best examples. It was part of the case in the beginning, but has since faded from the landscape as another of Microsoft's unsuccessful ventures. What's lost in the haze in the anti-trust argument is that Microsoft has probably experienced as many failures as successes, but instead of employing more attorneys to even the playing field by litigation, they employed more developers and more R&D folks.

It's clear that Microsoft's innovations over the past 25 years were not anti-competitive, witnessed simply by the robust software marketplace we have today. In fact, the products and platforms Microsoft offers continue to make other products possible, like educational and learning programs.

New products and consistently decreasing prices cannot be symptoms of a closed or anti-competitive marketplace. The cries of ?monopolist!? against Microsoft, it turns out were an overreach.

More regulation will only damage one of the most promising industries in America. I hope you will sign off on the settlement agreement between Microsoft and the Justice Department and nine state attorneys general.

Sincerely,

Onnie Shekerjian

Subject: Microsoft Settlement
Attorney General John Ashcroft

Dear Mr. Ashcroft:

I believe that the demands to break up Microsoft in the beginning of the antitrust suit against it would have had an adverse effect not only on my business but the IT industry as a whole. Fortunately, the settlement reached between Microsoft and Justice Department is reasonable. To settle this case is in the best interests of the consumer and the economy. While I do believe that sanctions against Microsoft are appropriate, we need to react rationally and not do anything that would result in damage to the economy.

Thank you.

To: ''microsoft.atr(a)usdoj.gov''
Date: 1/28/02 11:10am
Subject: Microsoft Settlement

The purpose of this email is to add my voice to those opposed to the proposed settlement of the Microsoft Antitrust case. Much stronger penalties and remedies are necessary if Microsoft's behavior is to change.

The company has been convicted of committing crimes. It needs a punishment that matches the crime.

I am the CEO and Chairman of a private, employee owned company with about $20 million revenue and 200 employees. We provide employee relocation services to corporations when they transfer their employees. I am a card carrying capitalist. I have a degree from Stanford Graduate School of Business and have served as a part time professor there. Our capitalist system is the most productive economic engine ever invented. BUT it needs to be protected and guided by government (all branches) in order to continue to serve us and to be a model for the rest of the world.

Unfortunately, Microsoft represents capitalism at its worst. Here's how Microsoft's anti-competitive and anti-capitalistic behavior affects my company.

First, our company is now almost entirely dependent on Microsoft technology to provide our services. Frankly, when our computers go down we cannot do productive work. We are dependent on internal and web based systems to communicate with our clients, to manage our vendors and to perform basic business functions. All of our systems are Microsoft. And according to our IT staff ''we have no choice''.

Second, Microsoft limits the software we can purchase. At one point we had a database system called Foxpro. Foxpro was purchased by Microsoft. We purchased an accounting system called Great Plains. Great Plains was also purchased by Microsoft. We used to use word processor, spreadsheet, e-mail and presentation software produced by other companies that worked on the Microsoft operating system. I am now told by our IT staff that we can no longer purchase these products because they are not ''compatible'' with our other software. What happened to the companies that produced these excellent products? ''We have no choice''.

Third, we are paying more to Microsoft software than we should. How else could they accumulate $35 billion in cash in the face of the current recession? When I ask our staff what would happen if Microsoft increased tripled their licensing fees, they say, ''we have no choice''. We would have to pay whatever price they ask. There is no other product or service that we purchase as a company, other than public utilities, for which we have absolutely no choice.

The long term success of capitalism depends on free markets, fair competition and freedom of choice in selecting products and services. We don't have any of these in this very important sector of our economy, due to the illegal practices of one company: Microsoft.

I believe the Courts have two choices. The first is to allow Microsoft to maintain it's monopoly. If so it should be declared a public utility and regulated as such. Alternatively, the company should be broken up into enough parts that will encourage competition. This kind of remedy has proven to be successful in both the oil and telephone industries.

The proposed settlement is neither of these, and should be rejected. One last point, the fact that Microsoft is actively lobbying for the proposed settlement is cause for very great concern. We need to remember that Microsoft committed crimes and the remedies should be painful to the criminal. The current solution will send the worst message possible to current and future capitalists.

Sincerely,
Frank M. Patitucci

Subject: Microsoft Settlement
January 16, 2002
Attorney General John Ashcroft
The Justice Department
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am writing in support of the recent settlement between the Department of Justice and Microsoft. I am not as acquainted with all the details of this that I would prefer, but this entire lawsuit seems to have come about simply because some of Microsoft's competitors grew weary of trying to compete with Microsoft's Free Internet Explorer. I personally use IE and have done so for a while. I appreciate the fact of having free software with the operating system that I got with my computer. I understand that Netscape does not appreciate not being able to get my $40 or so dollars which I would have had to pay to them to get an Internet Explorer, because Microsoft provided it for free. This, in my opinion, is not a proper utilization of our legal system.

I use Microsoft products in my business and have found that their software is simply better and more reliable than anyone else's. I have used Netscape which I had received from my ISP, but I found Microsoft's product more user friendly and les problematic when it came to updates. Microsoft exerted no amount of influence for me to reach that conclusion. Simple experience has done that.

I believe that this lawsuit was simply an effort to force Microsoft to ''dumb down'' its efforts and allow other, software developers a chance at catching up. I also think that when a customer buys an operating system that has some added features such as a stable Internet explorer, the only one that benefits is the consumer. They don't need to go out and purchase additional software to get on the web which is what most customer are now getting computer for. This settlement has thankfully nullified the effort to separate IE form Windows. It is fair and offers pragmatic answers to complex problems, such as competitors'' worries about interoperability of Windows and OEMs irritation with Microsoft for shipping additional software along with Windows. Though the settlement extends a bit beyond the scope of the original lawsuit, it does end the litigation and should, in my opinion, be accepted.

Sincerely,
Carlos Andrade

Dear Mr. Ashcroft:

I am extremely pleased to hear that the Justice Department has finally decided to end its persecution of Microsoft, and agree to a settlement. Microsoft was never a monopoly; it simply provided the best product that people enjoy.

I hope that people will appreciate what Microsoft has sacrificed in order to bring an end to this settlement. Among the many terms they have agreed to, Microsoft has promised to allow computer manufacturers to pick and choose not only what Windows programs they will feature, but they can also include numerous Microsoft competitive programs in the computers they ship.

There are, of course many other terms in the settlement that are also damaging to Microsoft, but I just wanted to make a brief point, as I'm sure there will be numerous emails coming in on the side of Microsoft. Thank you for taking the time to hear me out on this matter.

Sincerely,
Carlos Kennedy

THE ECONOMICS OF THIS COUNTRY HAVE BEEN DAMAGED BY THE US GOVERNMENT BRINGING AN ANTITRUST SUIT AGAINST MICROSOFT, WHICH COMPANY HAS DONE MORE TO ADVANCE COMMUNICATIONS AND THE COMPUTER INDUSTRY IN THIS COUNTRY THAN ANY ONE ELSE.

FOR LORD'S SAKE, PLEASE ACCEPT THE SETTLEMENT NOW BEFORE THE COURTS AND LET'S GET ON WITH THE REAL BUSINESS OF THE COUNTRY. TOUGH COMPETITION BETWEEN COMPANIES IS WHAT HAS MADE THIS COUNTRY GREAT.

THOSE STATES THAT DON'T WANT TO ACCEPT THIS AGREEMENT SHOULD BE THROWN OUT OF THE UNION. THE PEOPLE OF THEIR STATES HAVE BENEFITED FROM MICROSOFT AND ITS CREATIVE OPERATING SYSTEMS FAR MORE THAN ANY ALLEGED UNPROVEN DAMAGE.

THE DEPARTMENT OF JUSTICE ALMOST RUINED IBM WITH THE EXPENSES OF ITS ANTITRUST ACTI ON AGAINST THEM AND THEY HAVE GONE A LONG WAY IN DAMAGING THE ABILITY OF MICROSOFT TO COMPETE IN THE MARKET PLACE WITH THE EXPENSE OF DEFENDING THEMSELVES AGAINST SOME AN UNWARRATED ANTITRUST ACTION..

Subject: Microsoft Antitrust Remedy Proposal

I am writing to express my disapproval of certain terms of the remedies set forth in the antitrust case against Microsoft. My concerns stem from examining the document located at the following URL: http://www.usdoj.gov/atr/cases/f9400/9495.htm

The proposed remedy is a bad idea. As currently outlined, it allow Microsoft to gain an even larger market share rather than force it to compete more fairly.

Documentation/Disclosure/Licensing of Security-Related Interfaces III J: No provision of this Final Judgment shall:

1.Require Microsoft to document, disclose or license to third parties: (a) portions of APIs or Documentation or portions or layers of Communications Protocols the disclosure of which would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems, including without limitation, keys, authorization tokens or enforcement criteria; or (b) any API, interface or other information related to any Microsoft product if lawfully directed not to do so by a governmental agency of competent jurisdiction.

There is a saying in the computer security industry: ''Security by obscurity is no security at all.'' The phrasing in the above passage gives Microsoft leeway to obscure from public scrutiny the protocols and APIs that are of greatest importance to computer security. Encryption and authentication are complicated concepts. Encryption systems must be subjected to extensive attacks by the security community at large before they can be trusted. Furthermore, the interfaces to the encryption system must also be examined by security experts before they can be trusted. According to III J 1, Microsoft will not be required to document, disclose, or license this information to the vendors of security-related products whose security would be compromised by flaws in the API or protocol. Microsoft will be the only company in possession of the information needed to make security-related software secure.

Although I am no fan of digital rights management systems, I must express my concern for copyright holders, as well. Copyright holders will be subject to the greatest losses if any level of the digital rights management system is compromised. If the decision of to whom to document, disclose, and license the details of the digital rights management system in Windows is left solely to Microsoft, then Microsoft could enter into exclusive agreements with some copyright holders and not others. This would result in an imbalance in the ability of content providers and copyright holders to protect their properties to the abilities of the best experts royalty money can buy.

Worse, Microsoft could elect to not document, disclose, or license these details to any non-Microsoft entity. Then Microsoft would be poised to become the only copyright holder with access to the information required to make working digital rights management systems for their properties.

Conclusion

Microsoft is an extremely slippery company. They have reached their current position of market dominance through questionable business practices and not quality product. I sincerely hope that the final version of the remedies forces Microsoft to either produce good software or get out of the way so others can. We've been tolerating insufficiently useful computers for too many years already.

Respectfully,
Scott D. Ventura

Washington, DC 20530–0001

Dear Ms. Hesse: I am writing to give my comments on the Microsoft antitrust settlement. I believe this settlement is counter to the interests of the American public, deleterious to the American economy, and inadequate given the findings of fact in the trial. Microsoft's anti-competitive practices are counter to the law and spirit of our free-enterprise system. These practices inhibit competition, reduce innovation, and thereby decrease employment and productivity in our nation. Microsoft's monopolistic practices cause the public to bear increased costs and deny them the products of the innovation which would otherwise be stimulated through competition. The finding of fact which confirmed that Microsoft is a monopoly requires strict measures which address not only the practices they have engaged in in the past, but which also prevent them from engaging in other monopolistic practices in the future.

It is my belief that a very strong set of strictures must be placed on convicted monopolists to insure that they are unable to continue their illegal activities. I do not think that the proposed settlement is strong enough to serve this function.

Sincerely,
s/Brian L. Gollum

Subject: Microsoft Settlement

As a software developer for over 11 years, I am very dissappointed in the Microsoft settlement. It basically validates the Microsoft monopoly without any acknoledgment of guilt or meaningful reparations to the industry they have damaged.

I believe that Microsoft has illegally obtained their monopoly and are using it to further their reach while keeping innovative technology such as Java from reaching consumers.

Please consider forcing Microsoft to ship a standards compliant version of Java with their operating system. This will allow developers and consumers to benefit from the latests technology for writing and delivering applications.

Also, I believe that Microsoft should be forced to ship Netscape along with Internet Explorer so that consumers will have a choice of browers.

Thank you for your time and consideration.

From: chip@the-altmans.net@inetgw
To: Microsoft ATR
Date: 1/28/02 11:07am
Subject: Microsoft Settlement

I think the remedy is fair and should end the case completely. I do not feel that Microsoft has hurt the public in any matter. Ten to fifteen years ago the computer industry was in a mess. There was no standard operating system. If you went to purchase a computer at Radio Shack you would get a computer running Deskmate. If you went to an Apple distributor you got the Apple operating system. If you went to IBM you got their OS operating system. And then of course you had Windows. Kids in school learned Apple but could not go into businesses and run their computers. The average person had to have an apple computer so their kids could do homework and an IBM computer so they could work at home.

Since then and thanks to Microsoft the industry has been standardized, kids in school can go out in the world and run computers. Employees can go home and work on a computer with the same system they use at work. By becoming standardized, how does this hurt consumers? Microsoft has saved the average consumer thousands of dollars. By their continued innovation and development of the operating system they have added tools and recourses that would have cost the average consumer a lot of money. If Microsoft charged for each addition to its product, or forced the consumer to purchase such things as Internet explorer, word, notepad, a calculator, Paint, the basic TCP/IP protocols, the average person could not afford these add ons and would be shut out of the internet.

As for Internet Explorer, that was the best thing that Microsoft ever did. It made surfing the web enjoyable. Question, did you ever try to use Netscape Navigator before Internet Explorer came along, I have and it sucked. You had to pay around $50.00 for it, it took several hours to down load and would crash so often that trying to look up one item would take hours. Microsoft came and gave you Internet Explorer, which at first had its problems, but when they finally integrated into the operating system, it was fantastic, you could surf the net and really enjoy the experience. System hangs and lockups that occurred often before integrating disappeared. And by integrating the software it saved me money, how DID this hurt me? I know the argument it hurt competition, my argument is it did not hurt competition, it caused competition. It caused Netscape to wake up and make a better product. At a more reasonable price, this let the consumer save money by being able to buy a! better product at a lower cost. Microsoft did nothing wrong. Those consumers that wanted Netscape still continue to use it, if Netscape wanted to keep customers, and gain customers, they should have developed a product that knocked the socks out of Internet Explorer, but did they no, they cried and sued.

They gave up, because they would not take the time and resources to develop a better product. I, know, the argument how could they when they did not have the money because Microsoft was giving the product away, simple, build it and they will come. The consumer wants better products and if the consumer found an item better those that can afford will buy it.

Is it wrong, to build your business, and to protect your business. NO, it is not wrong! Microsoft played hard ball, yes, but how is that different from any other company that wants to grow, expand, and make a difference. Netscape, AOL, Sun Microsystems and others are playing hard ball now, buy suing Microsoft, because of their jealousy over the dominance Microsoft has. If the companies really cared about the consumer, they would build better products that would blow Microsoft way. But do they no, the run and scream and sue Microsoft, because Microsoft does not play fair. If these companies would build better products on the same caliber as Microsoft, consumers will go there; they will buy what they want. But stripping down Windows will only hurt the consumer, because the costs associated with buying each piece of software will be more than the average consumer can afford. But those that can afford the software will buy the better software. How is this any different ! from the auto industry? Yes, I know that there are several companies competing equally, If I went to ford to buy car should they be required to give me a stripped down car. So that I can go to Chrysler to purchase the motor, to Bose for the stereo, to Goodyear for the tires, to Monroe Muffler for the Shocks, and Muffler. NO, they provide the basic systems and then you buy the additional or custom items that you want. Microsoft does that they provide the consumer with the basics and let the consumer buy what they want. The problem is the other companies are not making products that are better and more desirable.

End the lawsuit now and let Microsoft go back and build and innovate so that the envelope of information and knowledge becomes more reliable and available to the average consumer, and so that these other companies will be forced to push the envelope even further buy building better software. If these companies would just worry about building better software that pushes the limits, they would not have to worry about Microsoft.

Dear DOJ,

May I beg of you either to stop this Microsoft settlement nonsense, or just retire and get out of the way?

This is all making our government look like something we can all be thoroughly ashamed of. To spend this much time on Microsoft's ''unfairness'', a company so productive and worthwhile to America's economy - and by a government so monopolistic and unproductive of any real benefit to the public, and towards which we are becoming more and more cynical in re the grandstanding for self-aggrandizement that is about all we see government officials doing anymore.... we hear or see another thing on this suit and we just cry out ''oh,no!''. While we are all thinking about an economic stimulus and instead this goes on and on and on and..... the ultimate non-sequitur. Please, get it over with and move on to Marc Rich, or the dishonest Fish and Game people trying to shut down so much of our economy with lynx hairs, or the mess DOI has made of Indian Trust Funds, or .. you can name it, we know you can.

Please reassure us again that the federal government sees and understands itself as the chief impediment to justice in society today and will not tolerate this core human indecency in Washington any longer. And believe me, we'll be pulling for you again with loud hurrahs soon's we see the first inkling of it!!!

We DO wish you all the very best,

Subject: Microsoft Settlement

To whom it may concern:

The proposed settlement against Microsoft has many flaws, but my problem with it is more philosophical in nature than most that I have heard. My understanding is that this judgment is supposed to be a punitive measure to correct monopolistic behavior in what should have been an open market place. With that in mind, should not the mere threat of such judgment modify Microsoft's behavior?

I have followed the proceedings against Microsoft fairly closly, as I am an IT Professional. During the trial through today, Microsoft continues to forge ahead mightyly developing partnerships and products that forcably squeeze competitors out of any market they decide to pursue. It is my humble opinion that the proposed settlement should take greater care to protect the consumer by evening up the playing field on which Microsoft competes. I see this proposed settlement as nothing more than a slight public slap on the wrist. Although it is a step towards the right direction in limiting some of Microsoft's anti-competitive practices, it does not prevent Microsoft from finding new ways to exploit the gains they have made in the market place as a monopolist.

This is much akin to closing the barn door after the cow has already gotten out. More must be done.

Thank you for your time and the opportunity to comment. —

January 25, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am writing to voice my opinion of the Microsoft antitrust case.

I think the U.S. Department of Justice should accept the terms of the settlement, which represents the best possible outcome.

Microsoft has agreed to several points, including the licensing of Windows operating system products to the 20 largest computer companies. For the sake of concluding this suit, Microsoft even agreed to several terms that extend to products not at issue in the lawsuit.

Furthermore, I am a proud shareholder (since 1995) and a user of Microsoft products. I believe that I and many other customers worldwide have benefited from Microsoft's products and pricing and have never been harmed by any of their actions in the very competitive global marketplace for information technology, particularly PC software.

This is a respectable agreement. The economy and the American consumer should benefit from the terms in this settlement. I hope you will support it.

Sincerely,

Daniel Jack

<<Letter to John Ashcroft for Microsoft- 01–28–2001 .dot>>
CC: ''fin(a)mobilizationoffice.com''
January 28, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

In the hopes to be heard, regarding the Microsoft lawsuit, I am writing this letter to express my opinion.

As a small business owner, we always strive to provide our customers the highest level of service and products they are purchasing from us. In order to differentiate us from our competitors, from time to time, we include free services and add-ons to our products to build on our promise to the customer.

I have always disagreed with the lawsuit against Microsoft and I believe that Microsoft is entitled to dictate the terms under which

it will sell its software, even to its OEM customers. The uniform pricing mechanism will give the 20 OEMs all the benefits of a union with none of the hassles vis-a-vis Microsoft. The very idea that a few of Microsoft's most ardent competitors wanted government sanction to pillage Microsoft's success is disturbing.

I am somewhat pleased that this settlement has been accepted. It has the advantage of ending this sad chapter in our histor3,. However, the terms of the settlement seem to give the government one last poke at Microsoft by requiring it to release some of its venerated source code to its competitors. As a Microsoft partner, Microsoft has always provided to us an insight to its source code to allow us to build better software products without releasing its right to the ownership of such code. It should be to the discretion of Microsoft to determine which companies, if any, need to be provided access to this valuable asset. This, however, is a topic for a future letter.

For now, let's just leave the settlement stand as is and move on.

Sincerely,
Aldo Mancini
CEO
Mancini Enterprises, Inc.

Date: January 28, 2002

Bill Gates wants to insure innovation by Microsoft. To further this objective, Microsoft has impaired the ability of others to innovate. A marketing genius, Gates wants to convince everyone that empowering innovation by Microsoft is in everyone's interest. Microsoft has damaged the software industry by restraining trade as means of maintaining competitive advantage. I cannot quote you specific dollar values of the impact of this restraint, but I will relate to you one anecdotal instance which may be an illustration.

During the late 1980's and early 1990's two colleagues and I were developing software for IBM and subsequent electrical utility companies. The software implemented on a PC the functionality of Geo Facilities Information System (GFIS) software, which required a more expensive mainframe computer. GFIS was used by electrical utilities to help them manage their electrical grids. The new software ran on IBMs OS2 operating system. Over the course of several years IBM, Florida Power and Light and Duke Power probably invested on the order of one million dollars in the development.

As a result of the competition between IBM and Microsoft (Windows v OS2), what I refer to as the Microsoft Wars, viability of OS2 as a ubiquitous operating system was destroyed. The consequence of this was that the cadre of developers creating applications software was reduced. For a while in the early 1990s I developed software for the AIX unix operating system. The size of that market and the cost of unix development drove me out of software development by 1995. I have finally, starting in 2002, reentered the software development arena. I am reluctantly developing software for use under Windows 2000. Primarily because that is the largest market.

I am not privy to the facts with regard to the abrogation of the contract between IBM and Microsoft for the development of the graphical user interface for OS2. I have seen only from afar, via the news media, the machinations of Microsoft in dealings with companies such as Sun MicroSystems over JAVA and Netscape and AOL over browsers. Microsoft business practices sicken me and damage the ability of the software industry to innovate. I had hoped that the federal government would seek a remedy which would restore some balance to the industry by separating the operating system unit from the application development unit. Microsoft is like a black hole in our solar system. It suppresses competition to such an extent that the light of some new products will never be seen.

Microsoft's practices will continue unless steps are taken to protect the small cap companies which would try to innovate. A case in point is the small Rachis Corporation of Marlboro, MA. This startup company develops software for the emerging interactive TV market. They provide system integration test and evaluation and software for hardware manufacturers, application vendors, middleware, and network operators. Scientific Atlantic, a set-top box manufacturer, partners with RACHIS despite efforts by Microsoft to provide software to Scientific Atlantic. Microsoft appears to be eyeing the media industry as an arena in which to throw it's weight around. Microsoft has created Microsoft TV and with it's holding in ComCast has some influence over the deployment of the cable network acquired by ComCast from AT&T.

Please keep an eye open for the Microsoft guerrilla vis a vis Rachis.

Respectfully submitted.
Gray Curtis

From: Tennison, James
To: ''microsoft.atr(a)usdoj.gov''
Date: 1/28/02 11:24am
Subject: Microsoft Settlement

To whom it may concern,

I would like to comment on the proposed settlement in the Microsoft Antitrust Case.

The first thing I would like to say is that from day one I have been appalled that such a thing as the Microsoft Anti-trust Case even exists. It is immoral.

My family and various relatives have been using Microsoft products including MS-DOS, Windows 95, 98, NT, 2000 and Internet Explorer for years. Had I been unhappy with Microsoft products I could have purchased other brands such as Apple with their Apple OS, Sun with their Solaris or Red hat with Linux to name a few. I have never been under the ignorant opinion that there are no other choices for my computing needs. Microsoft products have worked well enough and I've been quite happy with all I could do with them.

Microsoft is extremely successful for good reason. Microsoft products provide a full range of capabilities, have great prices and wonderful availability. It is my reasoned opinion that Microsoft products have been a boon to the citizens of the United States and the world. Microsoft's products have only offered positives to the lives of countless people.

Before you think that I am a total Microsoft zealot I will inform you that I have also happily owned and used Sun products (Sun Solaris workstations), Silicon Graphics and Apple products (Macintosh I, II, Quadra 410). I also happily employ the Netscape browser on all three of my PC's.

I strongly hold that Microsoft has the absolute right to freely pursue it's interests in the capitalist market of the United States. This includes their right to bundle their various products any way they see fit. No one, and certainly not our government, has the right to dictate what products Microsoft can produce and must not initiate force against this outstanding company. Microsoft

has always providing products and services in the absence of any compulsion. Moreover, Microsoft, unlike the US Government, cannot use force to make people buy it's products. And, since the only legitimate purpose of government is to deter and punish those who use force, the attack on Microsoft because it is successful completely inverts the role of government. The Microsoft Anti-trust case has once again made our government, justly a protector of rights, instead a powerful violator of rights. It is extremely disheartening to see such rampant totalitarianism! In addition, the antitrust laws being used in an attempt to lynch Microsoft have been called into effect not by citizen's complaints against Microsoft's products, but by Microsoft's unsuccessful competitors. These companies seek to ''win'' in the marketplace by resulting to force and not by offering superior products with superior marketing. Moreover, instead of using guns themselves to force consumers to buy their products, these companies seek to use force by proxy, with the US Government acting as their agent. This is truly a despicable attempt to influence the market through the pure use of force. They are employing the very corrupt anti-trust laws, applied by a government on a mistaken crusade to eliminate the infidel (a hugely successful Microsoft), to ''win'' in the marketplace. This is an unconscionable injustice! This should be the illegal activity which is attacked by a just government. Shame! The Anti-trust laws used by their willing governmental accomplices were unjust at their inception and remain so today. They represent non-objective law. Laws that should not and must not exits.

Individual rights, which also apply to the American businessmen of Microsoft, are not granted by our government. Just government serves only to protect the rights of it's citizens. Microsoft has an inalienable right to it's products (bundled as they desire) and profits.

Many smart people in the United States Justice Department have created a case against Microsoft based on the subjective egalitarian premise that big is bad. They punish success for being success. They have erred in that they never sought to fully understand the legal premises they employ. To find out whether they are just. They relied instead on a history of precedence generated by a wholly mistaken initial premise. That premise is that force can and should be used to do good. That force should be used to elicit an egalitarian ideal. As if the alleged good of society trumps the rights of innocent individuals. Actually, our government is employing a Marxist socialist concept. The group has rights superior to those of the individual.

Let us place reason firmly in it's seat. Leave Microsoft alone to create even better and more successful products for the free American capitalist consumer. Drop this unjust case immediately! No punishment is due Microsoft. With a great flourish of marketing skill, Microsoft has brought the computer to the world and changed history. All of you persecutors should feel the guilt of your brutish and totally unjust quest to destroy the good because it is good.

Thank you for letting me defend the rights of American businessmen.

James G. Tennison Jr.

Dear Honorable Justices,

Microsoft has twice been found guilty of serious violations of the Sherman Antitrust Act, by a federal District Court and by the United States Court of Appeals. While the Court of Appeals reversed the breakup order issued by the District Court, it upheld the trial court's Findings of Fact and affirmed that Microsoft is guilty of unlawfully maintaining its monopoly. As I understand it, the court must hold public proceedings under the Tunney Act, and these proceedings must give citizens and consumer groups an equal opportunity to participate, along with Microsoft's competitors and customers.

Please allow consumers participation.

Regards,
Eric

DEADLINE:In times of a struggling economy, I find it confusing that we're still arguing against Microsoft. It's time for this settlement to be accepted and let's move on. Or maybe it's about states trying to increase their revenues and attorneys building a retirement. Sheez. At one time no on thought the Japanese could compete in the domestic automobile market. Who's going to be the Japanese when it comes to software in 10 to 20 years?

If we continue, we will prove where businesses should not be in the future.

Attorney General John Ashcroft
US Dept of Justice
950 Pennsylvania Ave, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am writing to give my support to the agreement reached between Microsoft and the Dept of Justice. I did not support the original lawsuit against Microsoft.

I do not think the case was warranted. The lawsuit was more political than any outrage over unethical business dealings. Bill Gates has carried the technological revolution on his shoulders. He has enabled the average person to become part of the technological ago. Does anyone remember what it was like before Microsoft? Bill Gates standardized computer software to enable its compatibility with other software. And people bought the product, because it was the best and it still is.

Bill Gates has agreed to any number of terms demanded from the Dept of Justice. Microsoft has agreed to share its source codes and books pertaining to Windows, that Windows use to communicate with other programs; Microsoft has agreed to a three person technical committee to monitor future compliance; Microsoft has agreed to contractual restrictions and intellectual property right.

This is more than fair.

Give your approval to this agreement. Allow us to get back to work. Honestly, I do not agree government intervention on technology and its innovation. it only serves as a hindrance. Microsoft's dominance on computer and technology is due to superiority of its products and its marketing skills.

Sincerely,
Marc Hui

Subject: Microsoft Settlement

Dear Ms. Hesse,

I am writing in regard to the proposed settlement in the Microsoft Antitrust case. I feel that there are tremendous problems with the proposal and support the open letter written by Dan Kegel. There you will find my signature along with many many other people who are also concerned by this proposal.

I also support Dan Kegel's essay regarding the problems and difficulties that the proposed settlement will create. I hope that the Department of Justice will seriously reconsider the problems with the plan and work to revise it so that it will be of benefit to computer users.

If Microsoft is not reined in and given more stringent guidelines to follow, they will continue to create products which don't work and there won't be any alternatives available. I am glad that there are alternative operating systems available currently, but they deserve

just as much access to the market as Microsoft has.

Thank you for your time and consideration of this matter.

Sincerely,

John D. Brosan

Subject: MS v DOJ

I am against the proposed settlement with Microsoft. It does not do enough to punish the software company or ensure changes in behavior in the future. Netscape was replaced as the dominant web browser by Internet Explorer(IE) because IE was free. Microsoft has already been found liable for misusing it's operating system monopoly to make this happen. IE is now used by most Internet users because it is free and supplied with Windows and Macintosh by default. No other browser has a chance to gain market share because of this.

Now that IE has become the leader, it has stopped using Netscape's ''plug-in'' technology for enabling helper applications to open alternate Internet content. Active X is the new proprietary solution and give Microsoft an advantage in writing helper applications for IE. Even if they are required to release the API(Application Programmer's Interface) for Active X, it still gives them the advantage. They have the code first and they have the ''real code.'' I would not be surprised, nor should anyone, if they release to other vendors an inferior subset of the API. This will give Windows Media Player, Word, Outlook, and Messenger a lead on other current market leaders like Real Player, Adobe Acrobat, Eudora, and AOL Instant Messenger.

Microsoft has also dropped support for Java in it's latest operating system, XP. This is hardly in the consumers best interest, as a large quantity of useful programs are written in this platform independent language. This can only be Microsoft's attempt at punishing Sun Microsystems and no one can stop them from doing this. They should work with Sun to make a good version of Java for Windows. The solution proposed by the Justice Department seems like a giveaway. It is notable that it comes right after the executive branch has become Republican. I would like to see a more objective resolution to the illegal behavior by Microsoft. Thank you...

I think the current proposed settlement with Micrsoft is a bad idea and should be abandonded.

It has many faults, but to pick one: my business is dependent on using Samba to allow our Unix machines to inter-operate with our Windows machines on our network. The proposed settlement does nothing to protect the rights of non-commercial projects like Samba, and the millions of users of such projects, against Microsoft's actions.

Thank you.

It's time for the government to back off of private lawsuits against businesses and to stop legislating private commerce as much as it is.

The role of government should be to provide NECCESSARY regulation of private commerce.

We have gone WAY BEYOND that role in trying to legislate equality and/or fairness into private industry.

The government bureaucracy is in no way qualified to judge the effects of legislation on the citizens and their economy and has already caused a great deal of damage to the private sector with its extensive meddling.

Lawsuits and legislation targetted against legitimate enterprises like tobacco companies (as disgusting as cigarettes are), gun manufacturers, Microsoft, and many others are not the role of our government.

Continued abuse of legislative and executive power is only going to continue to erode the faith of the citizens in our government and cause more divisiveness and discontent that is already out there. Unneccessary governmental interference and gross fiscal irresponsibility have damaged this country greatly. In the latter half of the twentieth century our culture has gone a long ways toward becoming a ''third-world'' country due, in large part, to out-of-control actions by our legislature and the government bureaucracy. We have a long way to go still, but I shudder to think about the future my children may have to deal with. Please re-think your position on the role of government and let's get back to the basics of running the government, not running the people and industry in it.

Sincerely;

Bob Petolillo

I don't feel particularly verbose today, but I've written and read much on the reasons Microsoft must be broken into a minimum of two companies.

Microsoft owns the OS which is fine. Microsoft also makes applications for their OS which is not fine. Why? Microsoft does not fairly publish the specification of the interface to their OS. When Microsoft builds an application and another company builds a competing application, Microsoft is guaranteed to build the better application because they have intimate knowledge of the OS. Microsoft knows how the optimize their applications in ways their competitor cannot know.

Any settlement which stops short of breaking Microsoft into an OS company and an applications company is in my view and the view of many others a lost settlement.

Sheldon

Dear Sirs and Madams:

It is time to put to rest the Microsoft Case. This ill-advised litigation was likely the cause of the present recession our country is enduring, and its continuation is only going to prolong the economic troubles.

While the Tunney Act fails to satisfy Microsoft's most vocal critics— the competitors and their greedy lawyers—it provides a fair solution to the alleged monopolistic practices of Microsoft, and it benefits the country as a whole to get this behind us and move on. Dragging on this battle will only pad the pockets of the lawyers, and a few special interest parties.

Many consumers, including myself, do not agree that Microsoft did anything wrong. Without the Windows technology and the innovations that that company continues to develop, the personal computer industry wouldn't be half as strong as it is today. Any continuation of the litigation against Microsoft only smears the entire industry and keeps the economy from recovering.

Please bring this farce to an end.

Subject: Microsoft Settlement

Dear Sir or Madame,

I am a consultant working in the Intelligent Transportation Systems area of Transportation Planning. As such, I frequently make recommendations to clients of all types, public and private, about software acquisition and use.

This experience has given me a great deal of exposure to software vendors (particularly Microsoft) and to the various methods they employ in marketing their products and competing with other producers. I also have a background in economics (B.A. University of Minnesota) and am a certified planner (AICP).

My concerns stem from the continuing trend of Microsoft's alterations to licensing policies and the fact that often times no additional value is offered to the consumer, even though a greater revenue stream is generated for Microsoft. This, coupled with a practice of intentionally making newer versions of products incompatible with previous versions, causes a situation of ''forced'' upgrades for consumers. This is particularly troubling for small public entities, such as para-transit providers, whose mission is to provide mobility to handicapped persons, often on very limited budgets.

This is relevant to the settlement at hand for two reasons:

(1) The Settlement does not address the separation of applications from operating systems in any meaningful way. Thus Microsoft is able to build in version incompatibilities and tie them to the operating system itself. In the transportation community, we have a joke: ''If Microsoft made cars, every time you changed your tires you'd have to build all new roads.'' Although exaggerated, this illustrates the point of a monopolist manipulating product to ''force'' secondary purchases.

(2) The Settlement does not address past harm. Under the current proposal, a three-person oversight team would be established to assure that Microsoft does not further abuse monopolist power. Although debate can be had on whether this mechanism would even be effective in that role, my concern is more that there is no provision for punative action against Microsoft or compensation to those harmed by the abuse. An analogy would be a person convicted of bank robbery and simply assigning them a parole officer to assure that they didn't rob the same bank again.

For these reasons, I belive that the proposed Settlement is not in the best interests of the public and should not be agreed to.

Thank you for your consideration in this matter,

Mark R. Gallagher, AICP

Sirs and Madams:

I oppose the Proposed Final Judgment (PFJ) in United States vs. Microsoft because it (1) does not adequately address the issues raised in Judge Jackson's findings of fact and conclusions of law, (2) will not remedy the past illegal monopolistic behavior of Microsoft, (3) will not prevent Microsoft from committing future monopolistic abuses, (4) will ratify many of Microsoft's practices that have been adjudicated as unlawful, and (5) will allow Microsoft to continue such practices under the cloak of final judgment.

Microsoft has been adjudicated to be a monopoly and to have acted illegally in many particulars, which rulings have been upheld on appeal. It has become evident that to this day, Microsoft does not believe it has done anything wrong and is using all means at its disposal to avoid any real consequences for its illegal actions. The Justice Department and the Court have a duty to promote a remedy that is effective and consistent with previous findings in this case.

I believe that Microsoft has shown that it will not negotiate in good faith to promote an effective and just settlement of this case. It therefore behooves the Justice department and the Federal Court not to insist on a negotiated settlement, to fashion a truly effective remedy, and to seek to impose such a remedy on Microsoft within the proper powers of the judicial system. There is no good reason to continue to negotiate with this intransigent and adjudicated wrongdoer.

Rather than restate all the well reasoned arguments against the PFJ, I have added my name to the ''open letter'' submitted this day by Dan Kegel as set forth on his web site at: http://www.kegel.com/remedy/remedy2.html.

Dear Mr. Ashcroft:

The last three years of litigation against Microsoft has been unjustified. The original intent of the lawsuit was to protect consumer by breaking up a monopoly and stop infringement on consumer rights. Microsoft has consistently delivered high quality goods at normal prices, which goes against standards definition of a monopoly and has never infringed on my rights.

In fact I think their innovation has standardized the technology industry making it easier for users around the world to operate. That is why I disagree with some of the terms of the settlement because they give Microsoft's interfaces and protocols away. This is a violation of Microsoft's intellectual property rights.

I request that your office finalize the settlement as soon as possible and ignore the nine states that are holding this thing up. They are obviously not concerned with the public's bets interests. Thank you.

Sincerely,

Joel O'Connell

Washington, DC 20530

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Michael R. Martin

Dear Sirs/Madams,

I'm writing to express my opposition to the settlement being proposed between some of the States and MicroSoft.

Microsoft has been convicted, and that conviction upheld on appeal, of violating several parts of the Sherman Anti-trust Act. The settlement in its current form does nothing to repair the damage that has already been done to the software industry. It also does nothing to prevent them from continuing to abuse their monopoly position. Furthermore it does nothing to place monetary damages on their past abuses, nor does it establish any framework to punish the abuses that they will most assuredly commit in the future. There is no reason that Microsoft should be allowed to keep all of their ill gotten gains or continue to abuse their monopoly with anti-competitive practices. Please consider some of the many suggestions already sent in by industry luminaries that would restore competition and innovation to the software industry. Thank you.

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

It is high time for this antitrust suit between Microsoft and the Department of Justice to come to an end.

For three years now, people in both the IT industry and many average people who depend on Microsoft products, have waited for this case to be settled.

Unfortunately seeing this case put to rest could mean a severe change in the way Microsoft does business.

Opening up its code to the competition and allowing computer manufacturers broader freedoms in how they configure Windows will mean a serious loss of control over its product for Microsoft, and they will have to carefully rethink their business strategy.

But they obviously feel capable of doing so if they have agreed to the settlement, so I can see no reason not to move forward on this issue. Let's put an end to this case at the federal level and move on once and for all.

Sincerely,

Anthony De Cicco CPA / ABV

The Settlement Proposed By The Justice Department Overlooks Reality

Consumers within the Information Systems industry have expressed their skepticism about the settlement proposed by the Justice Department. In a poll of readers, for example, ZDNet asked: ''Did Microsoft get off easy in the DOJ settlement?'' Seventy four percent of the respondents said ''Yes''. To quote columnist David Coursey, ''Nobody is precisely sure what it means, but the total effect seems little more than a hand slap .... Prohibitions that exist in one section seem to be rendered meaningless by another'']

Consumer and industry respondents to the Tunney review process will probably contend that the proposed remedy does not effectively end the anticompetitive practices, will not materially deprive the wrongdoer of the fruits of the wrongdoing, and will do virtually nothing to ensure that the illegality does not recur. The terms of the settlement are much too vague to be of much use. They can be manipulated and rendered ineffective through the legal process. The enforcement mechanism is inadequate. And finally, there is no clear cut way to prohibit monopolistic behavior.

There is a more fundamental issue, however, that has not been adequately addressed by the process of law. It can be expressed as a simple question: How much unconstrained power do we want one single company to have? As the Enron debacle has demonstrated, this is not an idle question. Unrestrained corporate behavior can severely damage consumer rights. Microsoft has demonstrated that it can dominate the thinking of the PC Culture that it so zealously nourishes. It has an overwhelming influence over the press—and therefore—the opinions of an uncritical public. Within the information systems industry, Microsoft is acknowledged to have indisputable economic, political and cultural power. Comments by members of congress suggest this company also has a growing influence over the legislative process.

Given its announced strategic plans, it should be obvious this company wants more. Much more. Microsoft wants to wield the same kind of influence over the entertainment and communication industries that it does over the computer industry. It currently has aggressive initiatives to dominate the services and content of the Internet and is pressing forward with plans that will Quotation from: ''MS settlement

reads like a fairy tale''. David Coursey, ZDNet, November 5, 2001.

effectively manage the access, distribution and use of networked consumer entertainment. Mobile and location technologies will be used to penetrate additional consumer services..Net will drive the consumer to Microsoft approved content and services. If these initiatives are successful, this single company will be in a position to dictate how we create, store, edit, access, distribute and use all kinds of electronic information. Worldwide. Across three industries.

The reality of this situation raises a number of questions. Given its growing political and economic power, why do we believe that Microsoft will feel compelled to abide by the proposed settlement terms? Will they modify Microsoft's business strategy? Product plan? Will they prevent Microsoft from using integration, bundling and tying as weapons to lock out competitors in three industries?

Will the proposed behavior monitoring process guarantee the delivery of reliable products? Improve consumer security? Prevent the abuse of corporate power? Ensure open markets? Encourage competitive innovation?

It would appear that the answer to all of these questions is a resounding ''NO''. If that is true, then how can any reasonable person claim that the proposed settlement serves the public interest?

Who Is The Consumer?

Consumers have the right to expect that our federal institutions will deliver a settlement that has an immediate, substantial and permanent impact on the restoration of competition within the information systems industry.

But, who is the consumer?

Media and political personalities frequently project the image that all ''consumers'' are deficient, clueless and vulnerable. It is an image favored by self proclaimed consumer protection groups. Consumers are easily victimized and thus considered in need of protection. Hence in the Microsoft anti-trust case, both the Justice Department and the presiding Judge were concerned that the ''consumer'' had been victimized by excessive software prices and a lack of choice. This somewhat ill-defined person had been forced to purchase Microsoft software through a captive retail channel and may have been overcharged.

In reality, this image of the ''consumer'' is misleading. If we want to reach a settlement that protects both personal and institutional rights, we must first agree on a definition for the word ''consumer'' that incorporates all classes of buyers. For the purposes of this settlement agreement, therefore, we must consider two broad classifications of the concept ''consumer''. There are personal consumers and there are Enterprise consumers.

Personal consumers engage in personal consumption. This happens when people make purchases for themselves, their families, their friends or anyone (or thing) else that commands their interest. They use their own money. Typical purchases include food, clothing, housing, vehicles and so on. Personal consumption accounts for roughly two thirds of America's GDP. Enterprise consumers spend money that belongs to the Enterprise. They buy products, property or services for their employer or their business. Broadly defined, Enterprise consumers include any entity defined by the standard industrial classification codes: i.e. insurers, manufacturers, retailers, hospitals, educational institutions, government agencies, personal service businesses and so on. Enterprise consumption accounts for approximately one third of America's GDP. Both segments of America's consumer population must be protected from Microsoft's assertive marketing power. We must not leave either group of technology buyers in the position that they will be forced to chose key products and services from one vendor, good or not, on terms and prices they can not evade.

One of the more glaring problems with the proposed Microsoft settlement is that while Federal and State authorities have properly reacted to personal consumer complaints, they have failed to deal in a meaningful way with the problems of the Enterprise consumer. Industry wide issues include:

Enterprise networks have become incredibly expensive and difficult to maintain.

Existing PC operating systems are hard to manage and very costly to own.

Internet and Intranet security problems have become so bad that they threaten electronic commerce and the viability of Enterprise operations.

There are multiple industry reports that address these issues in great detail. It is worthy to note that excessive information system costs have been calculated in the $ billions per year and that industry publications continue to report on the related management and operating problems. It is also clear that these impediments will continue to plague the Enterprise consumer because there is no effective competition for the architectural concepts promoted by the dominant vendor.

In this legal action however, Microsoft's alleged disregard of consumer needs was never pursued. There appear to be several reasons: some political, some practical, and some due to the inherent obsolescence of the Sherman Antitrust Law. But the issues remain:

If PC operating system development has been paralyzed by the domination of a single vendor, has the consumer been harmed? And if the products are defective, what is the burden of liability?

If network systems design has been primarily driven by the product plan and business model of a single vendor, has the consumer been harmed? And if the underlying system design was dysfunctional, what is the burden of liability?

If a vendor, in order to deflect competition, announces products that do not exist, or products that never make it to market, has the consumer been harmed? And if the consumer was mislead, at what point does this constitute consumer fraud? What is the associated liability?2

If consumer security and safety have been jeopardized by deficient systems architecture and defective products, what is the vendor's liability?3

The complaints against Microsoft are far more numerous than those covered by this narrowly defined legal action. If the court wishes to impose a meaningful settlement on Microsoft, it will have to consider both the concerns of this specific case and the underlying intent of the Sherman Act. There is case law and there is the reality of dealing with an overwhelming marketing machine that is essentially able to set its own agenda.

This reality puts the court in a quandary. If the court is to be forthright in its desire to protect the consumer, it must provide substantial relief for both personal and Enterprise consumption. It will have to deal with both the specific and the ambiguous. It must certainly expand the interpretation of the Sherman Act. And finally, the court will have to make its findings with the knowledge that this settlement will have a bearing on future actions against AOL/Time Warner.

2 The announcement of non-existent products was an issue in the Justice Department's case against IBM. It puzzles me why Justice chose not to pursue this issue in its development of a case against Microsoft.

3 The National Academy of Sciences has recommended the creation of laws that would establish vendor liability for security breaches that are the result of vulnerable software products.

Microsoft The Company

Microsoft's corporate culture is driven by the mantra of revenue growth, institutional power and market control. Software is developed to gain market share or to demolish competition. Software defects and chronic insecurity have been institutionalized as components of the product plan. Microsoft does not have to be driven by consumer wants and needs. Microsoft is free to be driven by whatever strategy protects its revenues and extends its power into additional markets. Microsoft has been able to adopt competitive software concepts within its Windows architecture, thereby rendering the competitive software irrelevant. Examples include the incorporation of the Internet Explorer browser into the Windows user interface in order to destroy Netscape's Navigator and the inclusion of ''Java like'' features in the company's .Net strategy, a ploy that will eventually render Java redundant within the Windows environment.

When faced with standards based competition, Microsoft has frequently been accused of using an ''embrace, extend, extinguish'' strategy to render the standard useless. Microsoft's version may even flaunt the concept of ''open standard'' by restricting Windows clients from working with any platform other than a Windows server.

Microsoft has convinced a wide range of technologists, journalists, legislators and consumers that it has the exclusive wisdom to provide software innovation.

This—of course—is absolute nonsense. Microsoft is not the only company that understands the fundamentals of software technology. Were it not for the company's monopoly control over the market, consumers would be able to purchase a far superior PC operating system. Other vendors have developed, and are marketing, embedded operating systems with better

technology and excellent reliability. Enterprise users have embraced a variety of alternative server operating systems because they have superior reliability and a lower cost of ownership. There are certainly alternative ways to build consumer friendly Internet, e-mail, word processing, spreadsheet, graphics and data base applications. And there are many companies that develop software for the cell phone, PDA, set top box, in-home server and game markets. Unfortunately, few alternatives can effectively compete against Microsoft's marketing power. This company continues to use integration as a predatory weapon. Competing products, services and content will be hobbled—and thus less desirable.

Management has a vision. Microsoft plans to dominate the computer game, cell phone and PDA/HPC (Personal Digital Assistant/ Handheld PC) markets, will force its way into the cable business and fully intends to be a leading provider of Internet services. These are key revenue growth strategies. The company's XP operating system is important because it drives Microsoft's largest revenue stream and the future of the company's .Net strategy. The Stinger cell phone and Pocket PC HPC OS launches open up new recurring mobile network revenue opportunities. The XBox game platform opens a strategic path to the convergence of entertainment and computing in the home. The company is actively tying its computer and communication software product strategy to its Internet services and content strategy. The Internet gives Microsoft a virtually unlimited marketplace that can be molded to the company's operating philosophy. Hailstorm and Passport fit perfectly into this scenario. Network clients using Microsoft software will be tightly integrated with Microsoft application and content servers.

This is, after all, what convergence is all about.

Unfortunately for the consumer, management's vision has a potential downside. Microsoft will be able to demand access to all of the software we use, modify it with or without our knowledge, and make copies of our files. This company will be in a position to monitor our use of the Internet, our political philosophy, our purchase behavior, and our friendships.

Will Microsoft actually do this? Will a hacker be able to do the same thing? Does the consumer really want to be this vulnerable?

We can understand that Microsoft's business model is driven by the visceral desire to absolutely dominate all high volume software applications. We can also understand that the company's prospects for revenue and profit growth are interdependent with the accumulation of power over the consumer's use of computing technology within the computer, communication and entertainment industries.

It is time, however, to ask one simple question: Does this ubiquity serve the public interest? On the one hand we acknowledge Microsoft's accomplishments, the intensity of its vigorous pursuit of new markets and its right to function as an independent business. But on the other hand, the court must fashion a remedy that incorporates genuine protection for the consumer. The PC era was lots of fun. The Internet era was a wild ride. But going forward, Enterprise and personal consumers must have cost effective software that is reliable, predictable, useful, secure, easy to manage and open.

Will a court imposed settlement provide the key?

Alternative Remedies

Nine States'', along with the District of Columbia, have presented an alternative proposal of remedy that would, if implemented, partially correct these deficiencies. This proposal has credibility because it directly addresses the findings of this specific case and establishes remedies that are consistent with prior court tests that judged the validity of relief from infractions of the Sherman Antitrust Law.

1. Microsoft would have to offer a stripped version of Windows.

Although much thought must go into the implementation methodology of this recommendation, it could have the effect of reducing consumer costs by encouraging the development of alternative personal computing appliances with competitive applications software. It would also have the effect of making it more difficult for Microsoft to exclude competition by tying its operating systems to its applications, content and services.

2. Microsoft must support Java.

Enterprise consumers have espoused Java as a highly useful programming language. Because it is an interpreted, object oriented, platform independent language, Java can be used to reduce the cost of developing, deploying and supporting networked applications. Despite the obvious benefits to the consumer, Microsoft wants to kill Java by making it irrelevant within a Microsoft controlled programming environment. Forcing Microsoft to give its full support to Java would give the Enterprise consumer and applications software developer incremental choice in the selection of development environments.

3. Microsoft would be compelled to make Office available for all popular operating systems. Consumers have been forced to accept either Apple or Microsoft PC operating systems as a defacto prerequisite for using the company's Office suite. If Office were made available for all popular non-Microsoft operating systems, consumers would have a wider choice of operating system environments. In addition, this recommendation would encourage the development of competitive PC operating systems, presumably based on architectures that could deliver superior reliability, function and security.

Given a carefully constructed court approved implementation and supervision methodology, these recommendations would be most helpful to the restoration of competition within the PC and network appliance software industries. However, if we want to preserve an open and competitive market, and if we want to be vigilant in our support of acceptable corporate behavior, then we should consider three additional recommendations.

4. Restrict Microsoft from the Embedded Systems market.

There are a number of reasons to restrict Microsoft's participation in the embedded systems market5. For the purposes of this specific settlement, however, we must focus our attention on the restoration of competition and innovation within the PC market. Going forward, we also need to ensure consumer choice in the markets for set top boxes, entertainment devices and communication appliances, as well as network based content and services. As discussed above, Microsoft's announced strategy is to tie its software products to its services and content businesses. If Microsoft is successful with these initiatives, this company will have greatly extended its marketing power and will be in a position to monopolize segments of the entertainment and communications industries.

For a period of seven years, therefore, Microsoft should be prohibited from selling any embedded systems software products, including CE, its derivatives and any comparable products. If there is to be any credible competition for Microsoft's existing monopoly over PC operating system architectures, it is most likely to come from the manufacturers of network attached appliances. Over time, the embedded software within products will increase in sophistication. There is no reason why these system architectures can not be used to provide the consumer with the whole range of PC applications.

Microsoft would be compelled to establish a separate company for its CE, Stinger, XBox, PocketPC, set top box and all other currently active embedded systems product efforts within 8 months of signing a settlement agreement. Microsoft would not be allowed to own any part of the company or its stock for a period of 7 years. Any funding for the newly spun-off company must come from sources in which Microsoft has no financial interest. Five years after the spin-off, Microsoft would be allowed to start a new embedded software development effort that could be offered for sale no sooner than seven years after signing the settlement agreement.

Placing restrictions on Microsoft's embedded systems efforts will reduce the company's ability to dominate the related communication and entertainment markets. Microsoft would be encouraged to establish partnerships with the existing content and service companies as well as the manufacturers of embedded hardware and software products. These markets can then evolve in ways that are not tied to a single company's business strategy and revenue plan.

5. Place Microsoft under Court Supervision

It is difficult to imagine how the proposed settlement terms will prevent Microsoft from engaging in anti-competitive behavior. One would have to assume that Microsoft is immune from the temptations of corporate power. It would be helpful, therefore, if Microsoft were placed under the supervision of the court. A methodology must be developed that permits complaints of wrongdoing to be reviewed in a prompt and fair manner. Fines and restrictions, where necessary and justifiable, should be imposed by the court after a hearing process.

5 A more detailed discussion of the basis for the recommendations and comments

presented in this document may be found in my book: ''CyberCarnage: Everything We Own Is Obsolete''

Court supervision should reduce the need for further Justice Department action and could be used to establish the parameters for pending civil actions. The intention is that Microsoft could engage in any permitted business practice, strategy and tactic it wished, so long as the court agrees that its actions are lawful. The period of supervision should be continued until the court, by its own determination, believes that supervision is no longer justified.

6. Insist on a Code of Conduct

If we assume that we do not want our larger corporations to be driven solely by the mantra of revenue and profit growth, then any company that achieves a dominate position within any single industry has an obligation to adjust its behavior to operate in the public interest. The usual mechanism is through the imposition of government regulation. Absent this solution, the alternative is to insist that the dominant company have a set of enforceable standards against which it is possible to judge individual employee conduct.

Under court supervision, Microsoft should be compelled to adopt a Code of Conduct. Specific sections should address this company's relationship with competitors, suppliers, consumers, and partners. A methodology must be developed that permits complaints of wrongdoing to be reviewed in a prompt and fair manner. Fines and restrictions, where necessary and justifiable, should be imposed against individual employees.

It would appear that these recommendations can be implemented in a fair and equitable manner. The objective is not to unduly punish Microsoft. The Third and Fourth Waves of computing are history. We must look forward, not backward. Punishment is less desirable than the creation of a competitive, needs driven, marketing environment for the consumer. It would appear that all six recommendations, if implemented as a whole, would have a minimal impact on Microsoft's existing revenues and profits. There would be little interference with the company's PC and server software business. Over the next 5 to 7 years, the net effect is that Microsoft would not grow as fast and it would have to look to industry partners for some products compliment its .Net strategy.

For the consumer, however, the restoration of competition within the PC industry will be enormously beneficial. New innovation can take the form of products that are easier to manage, more reliable, more secure, and less costly to own.

The Sherman Antitrust Law

As a piece of legislation, the Sherman Antitrust Law appears to be obsolete. The Sherman Antitrust Act of 1890 was designed to deal with the political and monopoly power of (frequently interlocking) trusts. Specific companies had pricing, availability, distribution and product power over the consumer. Relief came in the form specific restrictions to business practices and monetary punishment.

The Sherman Antitrust Law does not address the defacto standards issue. Over the last 75 years, the telephone, teletype, electric, water, radio, entertainment, and television industries have been characterized by the evolution of increased concentration based on a company dominated list of defacto standards. Within the public services industries, regulation has been used to ensure that these standards are beneficial to the public interest. There are additional examples of industrial standards that have been promoted for the benefit of all potential players. When RCA set the defacto standards for color television, for example, multiple industry participants were able to adopt them for their individual benefit.

Dominant players set the rules of competition and corporate existence. All industries are vulnerable. Airlines, banking, insurance, manufacturing, retailing—it does not matter. The potential for domination—whether by marketing power, financial strength, or technology—exists.

And if 21st century industries tend to gravitate toward single standards established by one dominant player, then we need to ask multiple questions:

?What is an open and competitive market?

?What is the basis for determining economic concentration?

?What is market domination?

?Should a company be allowed to use it's domination of one market to leverage its customer base into the domination of other markets?

? If the consumer is forced to purchase defective and/or dysfunctional products because there is no viable alternative, what is the dominant company's implied liability?

?What are consumer rights? (How can they be measured?)

?At what point does the power of the dominant player jeopardize consumer rights?

?What is a fair penalty for jeopardizing consumer rights?

If a market is dominated by a single company, at what point does this imply that it must assume a fiduciary responsibility to act in the public interest? And what are the guidelines for corporate behavior? How will they be enforced?

?How much political and economic power do we want a single company to accumulate within a specific market?

?And finally; What is the mechanism for restructuring competition?

Obviously, there are many more questions that need to be addressed if the Sherman Act is to be rendered relevant to the realities of 21st Century Corporations. The purpose of this more limited discussion, however, is to demonstrate the deficiencies of the Sherman Act when considering the specific parameters of this settlement. Neither the Sherman Act, nor the proposed settlement, address the realities of existing market structures, emerging technologies, defacto standards, the issues of convergence or the use of 21st century corporate power. Since the Sherman Act currently provides inadequate guidelines for establishing what will be— essentially—public policy, then the court has two choices:

? Interpret the law within the narrow confines of this case using legal precedent (which essentially will let Microsoft off the hook); or

Broaden the interpretation of the Sherman Act in order to protect the consumer from further harm that may occur in the future (which will require the Court to consider issues and questions not necessarily documented within the scope of this case).

Either way, the court's determination will be sent to the Supreme Court for resolution.

Conclusion

Since the proposed Justice Department settlement provides only limited relief for a very narrowly defined case, it will fail to provide the public policy guidelines that are so desperately needed to protect the consumer from the abuse of corporate authority. It does nothing to relieve the increasing concentration of political, economic and marketing power that is now occurring within the computer, communication and entertainment industries.

We are thus faced with two realities. On the one hand there is the reality of the specifics of this case and the proposed settlement remedies. On the other hand, there is the reality of the need to maintain open and competitive markets for the products, services and content. A really good settlement will bridge these two realities.

As for the Sherman Act? Corporate governance is out of control. Unfortunately, we all know that Congress will not act until it is politically expedient to do so. Failure to act implies acceptance of the status quo. Competition will fade. Corporate power and influence will be concentrated. More Enron's will happen. By the time congress acts, if at all, it may be too late to impose meaningful reform.

So it is up to our court system, and perhaps the Commissions of the European Union, to both make and execute the guidelines we need to protect the consumer. We want our corporations, including Microsoft, to be successful. We expect them to grow their revenues and profits. We want them to pursue new business opportunities. But we also want them to operate within open and competitive markets so that consumers have an opportunity to purchase the products, services and content they want, at a price they can afford, and on terms that make them practical. That means that our legal system must guard against the potential abuse of corporate power and the inherent problems of market domination. In this settlement, we are asking the court to define those guidelines in a way that protects consumers from the potential of future abuse.

Is that too large a task? Too sweeping a challenge? Too far from the specifics of this case? I think not. It is the reality of 21st century technology and market structures. Convergence, after all, implies consolidation. And consolidation breeds domination.

I believe that the proposed DOJ settlement with Microsoft is wrong and will further eliminate lawful competition with this criminal corporation. Do please consider changing the settlement to help struggling Operating Systems developers as well a browzer developers.

Washington, DC 20530

Dear Mr. Ashcroft:

I am sending this email to show my support for the settlement reached in the Microsoft antitrust case. The settlement should make it easier for other companies to work with Microsoft and its products. I find it weird that the suit was brought in the first place, since companies that wanted more business in this industry could get it by making their products better. I think innovation, by the whole technology industry including Microsoft, should be encouraged, not stifled.

I work in the computer printer segment of the computer technology. Compatibility of our printers with popular software is important to our business. It could be of some considerable benefit to our partners, the computer industry, and us in general, that the settlement will allow us to have the open access to Microsoft's copyright software code for the internal interfaces of the widely used Windows programs.

Industry standards are the lifeblood of peripheral products, such as our printers. Microsoft has greatly helped the industry by setting an affordable, easy to use standard that a wide range of people around the world have chosen to adopt out of the multitude of systems available.

Other terms in the settlement, such as changes to Microsoft's ability to exercise its contract rights will help the industry, including Microsoft's rivals, such as AOL Time Warner. AOL will be able to work with computer manufacturers to remove Microsoft's Internet Explorer and Windows Messenger and replace them with AOL's own Netscape Navigator and AOL Internet Messenger, AIM. So, in terms of the American computer industry as a whole, the settlement's requirements of increased openness, flexibility and disclosure from Microsoft should lead to greater experimentation and innovation. Microsoft should benefit too, from the end of the distractions to its business focus and costs of litigation.

The settlement is, in my opinion, in the public interest.

Sincerely,
Jack Kolb

Dear Mr. Ashcroft

I am writing today to voice my opinion on the Microsoft Antitrust case. As an owner of a business that is part of the IT industry I feel this case has been dragging on for too long and it has hurt not only Microsoft, the entire IT industry and indeed the entire economy. The government has no rights meddling in the affairs of independent business unless it is truly hurting consumers through unfair practices. This is certainly not the case with Microsoft who has facilitated computing technology to benefit the majority of the world's population. Productivity and creativity has been stifled and it is now showing in the marketplace. Our economy has grown so much in the past two decades, due mainly to Microsoft and other key companies providing innovative products to the general consumer.

I have firsthand experience dealing with Microsoft, as I work as a Systems Integrator, creating and installing networks. Their products have made our business and the majority of our clients run smoothly and more efficient. As Microsoft experienced problems due to these lawsuits, so have we and it has affected the entire economy. I feel part of the recession that we are now experiencing is due to these lawsuits. I ask that you please take the public's concern into consideration and help put an end to the lawsuits. Additionally, I hope that remaining nine states can come to quick settlements, without further scrutiny from the government.

Sincerely,
Guthrie Chamberlain

Subject: Microsoft Settlement

The settlement is a bad idea. It allows Microsoft to just go about is business of squashing everyone else. Look at the areas they now control! They want more and they are now being rewarded with a slap on the hand. America needs Microsoft stopped from ruining competition in the computing landscape. Microsoft has proven duplicitous and has displayed their outright blatant lying nature over and over again.

Save the taxpayer some money and do the job right this time, otherwise we will just revisit this in a few years. Microsoft has shown a propensity to skirt the rules or follow them long enough to make it pretty window dressing. Fix the problem, make they do the time for the crime.

Subject: The way I see the Microsoft settlement

Sir:

How does one go about expressing their opinion, about something that there government said is in their best interest of there citizens of our wonderful USA.

Here are my thoughts on this settlement concerning Microsoft Company , which I believe is the first true all American USA company..

First allow me to say up front here, I started reading the court documents about the terms of the settlement and was very troubled by the findings and ground rules laid down for Microsoft. It reads like more money out of the public pockets and nothing to protect our best interest. in the software or computer world.

I feel that the agreement isn't really in the consumers best interest nor is it in Microsoft's best interest, this is my opinion. The decree reads like a very confusing judgment. which. in the end I believe will put software & computers out of reach for the average everyday American citizen,

Now mind you. I said average citizen, not those who are already at the bottom or top, of the food chain. [no disrespect meant there] Why do I say this. Because you have took a

company in the name of some folks greed and put a price tag on everything which has to do with technology , which, technology has no price tag, nor is mankind a third of the way ready for this wonderful new world of technology. I hope and pray you understand this statement. this could destroy generations of children now, and those to be born.

I wonder in today's world, does any one really care about the citizens of our nation or humanity. Maybe the green god rules in total. Heaven help us. There will never be a standard set for software. that is the way I see it at this time from the decree being handed down..

I have shelf's full of useless software which doesn't work on my computers. I purchase software & hardware from those who only seek profit, and no perfection in there software to work with any OS system. let the buyer be truly aware of what this will eventually lead to with software for the consumer.

Or even Companies at there total own risk we will take your cash and bed... you the consumer. The internet will all but be destroyed by those who would benefit from it, in the name of greed and jealousy by a few. Who only have there interest at hand, so sorry but this is how I see it from the beginning of this to continued law suits against Microsoft. Allow me to state that I have no axe to grind with anyone nor do I work for Microsoft.

I choose on my own to use Microsoft's products because their software was the only software that actually works for me being a lay person, and I didn't need a PhD to use Microsoft's software, they supported there software, with out charging outrageous fees to fix there product if something went wrong with there software, which was a rare thing for such a large software company. to take responsibly for there products... Nor did they tease me with there browser like Netscape did [my very first browser] offer me the bare bones files, in order for there browser to work I had to spend hard earn funds at that time to get it to work for me [very complicated] to enjoy using what my and a lot of other folks tax dollars have already paid for, the Internet.

I hope you understand what I am trying my best to get across to you here. I think this issue should be rethought and support Microsoft more then what it isn't doing now in my opinion, my sixty three years could be wrong , but I don't think so.

This isn't a phone company or a light company, etc.. we cannot continue to destroy companies because someone thinks that they are to wealthy or that they want part of the action, the phone company is a good example.....this company Microsoft is part of the very back bone of our nation the new frontier of the twenty-first century. they are a American Global Company with major assets here in the mother land, supply jobs to the best and brightest of our youth to move forward in the 21st century...who sets good standards on how a company should treat those who work for them fairly.....this is Wonderful.....this is something we can not destroy in the name of greed.....you know like when we first started out as a raw nation, an new frontier the west ..... in the earlier years. We can never revert back, even thought some of us think that is what it will take to get our house in order . it Takes honesty & compassion for mankind to put our house in order, if we are lucky as a nation.

I would also like to suggest that we change some of those outdated Sherman act laws, they are a great guide to follow , but horrible to use against companies in today's world, those standards where for that time period in our history, we also need to remove a lot of business tax shelters and start making them pay there fair share, restore checks and balances, not when someone thinks a company are person is to large are to big. also, we need to allow those who build there own companies from there pockets not the tax payers pockets. a little more legal lead way. Sometimes we will need to allow a company to be a monopoly [this is one of those instances] with guidance's. By those whom we tax payers, pay as our watch dogs to protect us an our country from being devoured. Does that make sense. No two babies are birth the same way, I had to throw that in, It must be said. No I do not own any stock in Microsoft.

Thank you for allowing me to voice my opinions. God bless you and our Nation.

Dear Mr. Ashcroft:

I appreciate the opportunity to comment on the settlement agreement reached between Microsoft and the Justice Department in the antitrust litigation. Please do not forego the opportunity to settle this case now. The settlement provides benefits for the economy which can be taken advantage of now rather than taking the risk of litigation. The remedies awarded by a Court may not be as advantageous to the public.

Microsoft has agreed to eliminate a number of alleged barriers to competition by adjusting its pricing policies, eliminating restrictions in its distribution contracts with third parties, and allowing competition from non-Microsoft software within Windows systems. These changes will help the computer industry as well as provide greater choice of products for consumers.

Sincerely,
David Pindel

From: Steven White
To: Microsoft ATR
Date: 1/28/02 11:42am
Subject: Microsoft Settlement

Since today is the deadline for public comments, I thought I would add one parting shot to the email I sent some weeks ago and the hand-written note I sent yesterday by fax. I assume that a lot of people more knowledgeable than I have explained the details of why the settlement is too weak to stop Microsoft from stifling innovation (unless it's their own) and driving other companies out of business. I have seen pages of it in mainstream newspapers and computer publications, and I have gotten a clear explanation from my own state attorney general. You must have seen those also. Let me just make one non-technical point.

Don't be swayed by the marketing-type arguments I hear. Some people say that this whole affair is just Microsoft competitors jealous of Microsoft's success and unable to compete with them, and looking to the government to help them. That is not correct. As the findings of fact told, the issue is that Microsoft will not LET other companies compete. Their way of ''competing'' is not to make a better product, it is to drive competitors out of business. That's why they have things like the contracts with computer makers that prohibit computer makers from even talking about competing products, let alone selling them. You might make a settlement that says to Microsoft, ''No, no no, you mustn't do that any more,'' but they will find a way around that. They might not make the contracts any more, but they will use subtle strong-arm tactics, or will find something that follows the letter of the law but not the intent of the settlement. There must be someting structural that forces them to behave, not just what amounts to a scolding.

And also don't be fooled by the ''freedom to innovate'' arguments where Microsoft says that a settlement prevents them from ''innovating'' and puts the government into the software design business. That is not the point. The point is that Microsoft stops others from innovating and that is what prevents the computer industry from being all it can be. Microsoft's tactics starve other companies from the money they could use to offer better products. The BE-OS is a perfect example. Microsoft's contracts prevented BE-OS from being sold by computer makers. This deprived BE of money it could have used to improve its product so more people would want to buy it. BE went bankrupt.

And finally don't be swayed by arguments that what is good for Microsoft is good for America. Bringing Microsoft to heel will not cripple the economy or have some catastrophic consequences.

I have four computers at home and none of them run any Microsoft software. I have to struggle a bit with them, but I get by just fine. With more money going to other companies, it will get only better.

Thank you.

To whom it may concern,

I have watched the case against Microsoft and believe the actions to date to be an atrocity of justice. The actions taken against Microsoft have been of questionable substance and lacking a justified agenda. The negative affects on the technology sector and the de-valuation of one of America's greatest assets ''Microsoft'' has been hard to justify.

Microsoft has influenced the growth of the computer and compute environments more than any company in history. Many companies and manufacturers have benefited from the open development and utility of the Windows operating system and Microsoft certifications. The continued attack on Microsoft is un-productive and a challenge to the innovative spirit and freedom to grow that is typified by American business.

The marketplace has demanded close integration of OS and functionality. Integration of form and function is not a wrong doing and Microsoft should be commended for all they have accomplished and brought to America's technical dominance. UNIX manufacturers have been imbedding programs in the OS for years; MacOS contains many imbedded functions. Microsoft has done nothing wrong and has acted responsibly to meet the needs of the market and the installed base of PC users/manufacturers. Microsoft is strong because they develop superior products in response to demand. They must be allowed to continue pushing the envelop and to have the freedom to innovate.

The States which have failed to support the DOJ decision are wrong. It is wrong for AOL/Time Warner and Netscape to pursue or be permitted to pursue continued challenges against Microsoft. There is not value in the pursuit, only further devaluation of a great company and the harm to many investors and the technology industry as a whole.

AOL and MSN both offer messaging. AOL, Compuserve, ATT and other services are offered as part of the Online services load of Windows 98, ME, 2000 and XP systems. The users have complete freedom to select ISP, Browser, and email client. The fact that Explorer, Outlook express, and MSN are options to the OS load is perfectly acceptable. These are also superior applications.

Please take action to prevent further legal challenge and wasted energy to defend Microsoft's freedom to innovate. The DOJ has decided; lets get on with re-building the US economy and re-vitalizing the technology sector of this great country.

A Cornerstone Technology for the Twenty-First Century

''Home users who buy new PCs don't have much choice in operating systems. Once Windows XP ships, nearly all computers will be sold with it installed.'' ''When your six-month-old version of MusicMatch Jukebox doesn't work, you may decide just to live with WMP [Windows Media Player].'' The New Windows, PC Magazine 30 October 2001

http://www.pcmag.com/article/0,2997,s%253D1590%2526a%253D15591,00.asp

This phase of the antitrust trial concerning Microsoft products is occurring at one of the most trying times in the history of the United States. The due deliberation given it (going on as does all business) says much about the resolve of the nation and its allies. Personal Computers are vital to the world economy which means even in this dire time the United States needs to ensure the vitality of the whole Personal Computer industry which is a mainstay for the engine of the world economy in this new century. Security is best served by having a strong economy that has the means to lift up the world into a new prosperity as was done after World War II.

At question in this case is the unfettered access to the next generation of the common infrastructure. Microsoft Operating Systems have become the cornerstone for running a myriad of Personal Computers world-wide! These Operating Systems take a place beside raods and highways, electricity, and the telephone system, as infrastructure services that are fundamental to everyday life in modern society. Care must thus be observed with the newest Microsoft system, Windows, to see that it remains a platform any company or individual may build on and garner the full benefits of any innovation.

1. The Revised Proposed Final Judgement gives Microsoft too much influence over how other developers can implement their programs. Section III.H allows OEM installs of non-Microsoft products. That clause is made too narrow by Section III.H.3.2, which states Windows may invoke a Microsoft product (Section III.H paragraph 2) if another product does not meet a ''reasonable technical requirement'' (ActiveX) consistent with Windows. Once it is in writing, ActiveX support will be a minimum for all programs to meet. That will be anti-competitive by requiring programs to be a proprietary Microsoft ActiveX control as a ''reasonable technical requirement'' to allow OEM installs when some software firms would prefer to use only Java. Studying constitutions and court decisions is part of my background and I have seen innocuous clauses gain unexpected importance.

Section III.H.3.2 could be such a clause causing OEMs to leave Microsoft programs in place. That Microsoft has broad latitude to override OEM software choices makes this Judgement contrary to the public interest. Section III.C of the Judgment, indeed, seeks to leave open such options. Generally, as Microsoft does not give tech support to 0EM built systems, there is not a strong business reason for Microsoft to so closely govern the initial boot. Buyer recourse is to an OEM, which bears the costs of more technical support phone calls if it deploys a confusing initial boot or a confusing configuration. Microsoft costs do not raise due to some inept OEM ideas so OEMs can certainly be left to their own ideas on finalizing systems. OEMs carry the financial burden of manufacturing and selling what they build so OEMs need the freedom to install programs that make those systems most attractive to buyers. If an OEM markets PCs that misbehave, a Web or other review will quickly make that news and the market will react leading that OEM to fix its error without reflecting on Windows itself. Microsoft paternalism is unnecessary. Not to say that it can not protect the reputation of its product, only that in ensuring Windows works as expected Microsoft does not also stifle non-Microsoft programs because those developers choose to use their own vision on the Windows Operating System.

1a. The revised settlement gives Microsoft far too much competitive advantage because Section III.H.3.1 and its preamble let the Windows Operating System select Microsoft programs to connect to a Microsoft server. That leaves the door wide open to Microsoft specifying, for example, only Internet Explorer may be used to update Windows so people wishing to use other browsers still need be familiar with Internet Explorer. People using the Lynx browser perhaps because of reduced vision or Opera's browser due to physical disability would have no way to visit Microsoft Web sites or to update Windows. This settlement may allow discrimination and or infringe upon the Americans with Disabilities Act (ADA) and perhaps other codes if a secondary route is only left to people with disabilities. (Plus their Personal Computers are painstaking configured to allow independent operation which a central authority is unlikely to be able to clone no matter how strong its motivation!) From a wider perspective, this clause gives Microsoft too much latitude to disregard individual choice.

Other vendors will be reluctant to write similar programs knowing reasonable earnings from the work is unlikely as possible customers will not use a program since Windows may by-pass it at critical

times when customers need be most familiar with their programs to ensure successful outcomes. Moreover, the Court of Appeals Ruling on page 30 (using the Adobe PDF rendering) notes having two browsers on systems is unpalatable to OEMs as some customers will phone the support line asking which browser to run. OEMs seek to limit such costly calls so OEMs will not configure systems with two similar programs to avoid customer confusion. Because OEMs carry the burden of product support they need to be able to configure systems to best suit the individual buying a system. Windows is a most adaptable Operating System allowing buyers to run Personal Computers in a personalized fashion, giving OEMs an option to begin the personalization process would be one way to make using a new Personal Computer easier. Conversely, if via Section III.H.3.1 Windows ignores buyer chosen software to increase ease of use by using only one browser buyers will of necessity run Internet Explorer to be able to update Windows. Some violations the Court of Appeals upheld deal with promoting exclusive use of Internet Explorer, no part of any settlement should allow for any similar eventuality. Microsoft must be encouraged to quickly implement open standards so any browser can interact the same way with any server. The guiding goal should be the example of the telephone system which at one time only allowed equipment built by the phone company to be connected to the system. By the early 1980s, equipment built by any manufacturer was allowed to connect to the telephone system something that helped the greatly expanded types of telephone services available now. Plus at that time telephone companies stopped requiring that handsets be wired into the system by their employees as telephone sockets were fitted with jacks that allow easy connection of handsets. Having seen other technologies become much easier for customers to handle alone it would be most unfortunate to go backwards against that trend by letting Personal Computers appear to be devices that only a central authority can setup.

Car dealers offer customers many options, although the supply chain for assembly is long with an involved manufacturing process. Since car dealers let customers pick items such as seat color likewise 0EMs can have options for Web players, browsers, and other preferred software components. (Dell Computer buyers custom configure hardware for new systems http://www.zdnet.com/anchordesk/stories/story/0,10738,2834200,00.html fifth paragraph, doing the same with some Web ''plug-in'' software merely extends an existing concept.) Yes the finishing stages of Personal Computer assemble will change to yield widespread benefit as new systems have the newest versions of programs installed.

Customers satisfaction should go up given less need to update new systems with the most recent versions of programs helping lower or hold steady OEMs costs by reducing phone calls to support on what to do when an update causes a malfunction. Microsoft benefits by having some updates done before customers receive systems. A 3 Dec 2001 article at http://www.wired.com/news/print/0,1294,48756,00.html shows a patch which closes many security holes in Microsoft Outlook is very seldom downloaded as a percentage of estimated Outlook users. And that a tiny test group had little success installing the patch. (Having run desktop systems for 23 years, I'm fully familiar with instructions for software I found those for the patch process involved. Not complex, just a process needing diligence to complete.) All software firms try to make updates easy, yet customers, especially the majority not interested in the technology itself, are fatigued by frequent updates. By having the Operating System supply fewer components (where they become outdated with unfortunate speed) OEMs will be able to relieve buyers of some extra setup chores, making them more immediately productive! For retail sales OEMs could provide CDs (which stores could also update) with new versions of programs.

Returning to the comparison with the phone system where interoperability (meaning seamless operation between components from diverse manufactures) reigns supreme the idea that only Microsoft programs (besides when self-updating) be allowed to access Microsoft servers is as inefficient as calling the phone company for customer service merely to be told to call back on handset it built. Possible problems with other browsers using Microsoft servers probably stem from Microsoft placing proprietary functions in its own Internet Explorer browser (please see http://www.pcmag.com/article/0,2997,s%253D1470%2526a%253D4804,00.asp) and then using those function on Microsoft servers. The public interest is only served by universal Web access as exemplified in continental telephone systems where those responsible for the system do not limit customer choice. lb. My 23 years of experience with desktop class computers (then called ''micros'') stems from my being a person who is physically disabled (having Cerebral Palsy entails lack of fine motor control, unsteady and shaky movements, and difficulty in moving). That familiarity with keyboards began in about 1961 with I began using a headwand to type on a typewriter. My first ''micro'' computer in 1978 enabled me to complete a Bachelor of Arts in History by 1982. Even a computer did not speed up my typing though (a photo at http://www.opera.com/press/guides/operapower suggests how I work) so the whole Degree took seven years to finish, letting me to all the reading (and much more) related to the History, Political Economy, and Economics courses for the Degree. A background enabling me to place this case in a broader perspective than is often done, with the skill to look at all factors and sides before writing an analysis.

Vital to note also is the wide power of software to do amazing things! It is software which transforms the diverse components within desktop computers into cohesive wholes able to a universe of tasks. If you do not want to, or cannot hold down two keys at once solutions abound! A two key command can be programmed on to one key or software 'holds'' modifier keys like Shift on till another key is typed. Personal Computers adapt to the person. For browsing the first thing I did on purchasing Web access in 1995 was Search for a suitable browser and found NCSA Mosaic 2.1 highly usable.

Please see http://archive.ncsa.uiuc.edu/SDG/Software/mosaic-w/releaseinfo/2.1/WBook—60. html for its one key commands which were enough for keyboard Web navigation, at that time. By mid-1996 the Web was more complex and Opera Software http://www.opera.com had a browser that has since filled the bill. Being able to find and run commercial software is huge a cost saving, too. On the Web site for the White House, ''Fulfilling America's Promise to Americans with Disabilities'' http://www.whitehouse.gov/news/freedominitiative/freedominitiative.html says adaptive technology to make Personal Computers usable by people with a disability costs $2000 to $20,000 a system. In comparison Opera and this macro program (to program commands or often used phrases to run by typing one or two keys) http://www.macros.com together cost $65, showing that great software can reduce some expense of making computers usable by people with a disability. Such a large saving is rare, yet it illuminates the power of software.

The malleable nature of software is the vital point as that versatility lower costs. Every program does not have to use the exact same approach to accomplish any task. Most programs even have a few ways to do any one task. Some macro programs carefully guide you through macro building, the one I run also does direct building which is less work for me. Neither approach is more correct, the best solution is the one most suited to the interest and skill level of the person performing the task. With Microsoft moving to place more full programs in the Operating System the best feature of software, its malleable nature, will be lost.

We risk reaching a point where people only know how run a few programs by rote as they service the computer instead of computers serving the individual. In an enlightened age of reduced regulation it is very strange to see Microsoft regulating the Personal Computer industry. Because many clauses in the Proposed Judgement give Microsoft ways around prohibitions, especially Section III.H.3 using the word 'notwithstanding'' (meaning despite stated limits Microsoft may have its way), it is no over statement to say Microsoft may now regulate its industry. With it being able to still influence many aspects of OEM systems customers will largely see Windows in the form Microsoft wants, placing it at the center of the Personal Computer letting Microsoft regulate industry affairs. When a monopoly impedes the free flow of products that is at odds with the nominal workings of a capitalist economy and its open markets.

1c. Technology plays its best role in economic growth when it is deployed in a manner that does not favor or give special status to any party (which is separate from financial returns due product creators). Applying that concept to Operating Systems for Personal Computers is illuminating. DOS began in 1981 as a system with the bare essentials to run a computer, some might say so bare that it was like selling an engine with no spark plugs.

Other vendors began selling software to perform such essential tasks. In 1991 Microsoft released DOS 5 which later with DOS 6 were the first more complete versions, (http://www.nukesoft.co.uk/msdos/dosversions.htm) less requiring third party software to enable computer features of that day.

Notable these implementations left room for improvement and customer choice. Although by 1993 the engine definitely included spark plugs demanding customers seeking their view of complete computing were free to buy software offering a full of range options in areas like memory-management from a number of vendors. What Microsoft added to DOS are functions virtually fundamental to the workings of an Operating System, yet there was no wide attempt to exclude other vendors from those markets. Windows 95 had improved memory-management so third party software for it all but vanished, which is natural because the Operating System should be able to handle a basic computer resource like memory itself.

To understand the impact of combinations a careful review of whether another product brings a finishing touch to an Operating System does help. Optional utility software to check Operating System integrity and better memory-management refine the Operating System, increasing its ability to perform without incident. Those items represent more intensive development of what the Operating System is meant to do, make Personal Computers ready and able to run programs the owner needs. A built-in browser, media player or the like expands the Operating System without increasing the integrity of that software. Expansion adds to the Operating System without polishing it. When such tying occurs the Operating System can become more difficult to maintain, unlike the customer benefits derived from intensive development.

Problems with an expanding Operating System are illustrated by the security holes Internet Explorer lends Windows. Two articles on http://www.extremetech.com/article/0,,s%3D25124&a%3D21033,00.asp explain matters. ''Microsoft Releases IE 'Mega-Patch''' notes that a combined patch now closes various Internet Explorer holes (one even lets someone take over your computer, details on http://www.infoworld.com/articles/hn/xml/01/12/13/011213hnbackdoor.xml). Yet it is not always clear the browser must be updated to version 5.5 before the patch will install, thus after download some people gave up. Brett Glass writes further in the article that stopping is bad, the patch is essential since Microsoft nearly always has Internet Explorer run, (to view email sent in the style Web pages) ''unbidden,'' even if computer ''owners'' act ''to make another browser the default''. That means owners using another browser must still maintain Internet Explorer because Microsoft expanded the Operating System to include its own product. That means just not using Internet Explorer does not avoid security problems in Windows. Extra software in the Operating System brings extra problems. This is a particular bad time for compromised security so it is unwise to make people work hard for security.

Despite such hard work the second article, ''Internet Explorer Violates Basic Security Principles,'' on the above link says that how Javascript runs in Internet Explorer makes it vulnerable. Malevolent Web sites can ''hijack browsing sessions,'' steal items like credit card numbers from browser cookies or read sensitive information from files on computers. No patch existed when the article went to the Web on 10 Jan 2002. Disabling Javascript is the only way to seal the gap for now. And that makes the Web very difficult to use since many sites employ Javascript to exchange information with browsers and to have Web page pieces properly placed. An expanded Operating System makes it difficult for people to decide what browser best serves their interests because Internet Explorer asserts itself in Windows.

And it seems silly, at first glance, to seek other programs when the Operating System maker provides software in a persistent manner to do things. That persistent hampers competitors from fulfilling the browser or other functions. Brett Glass notes that Internet Explorer at time runs despite efforts of computer owners to have Windows launch a non-Microsoft browser when a third program requests browser functions. Such behavior is anticompetitive because it will cause some users to surrender and use Microsoft products to get their jobs done instead of toiling to have Windows always use the browser they want. Usually Microsoft says bundling will not inhibit customer choice of software that does not seem to reflect real world experience. Worse than being anticompetitive is that people are led to using software which is not secure. Bringing the discipline of the market is the best way to let customers choose great and secure software uninfluenced by the first blush of tying.

2. How Microsoft dominance and now monopoly in desktop class computer Operating Systems functions demonstrates surprising durability. A product primarily sold on new computers each edition of the Operating System has a fresh plateau to maintain its dominance. Not depending on static plants or structures to provide goods or services in a certain locality means this monopoly is unlikely to weaken due to age, obsolescence, or outside encroachment. Not having to finance and maintain fixed assets to manufacture tangible products means Microsoft is able to quickly apply resources to new challenges without the lag and expense of having to retool manufacturing plants to build new kinds of products. Which is not to say software development is instantaneous or that Microsoft has no costs only that the expenses are not structural, not binding it to one course for any time span. With little to hinder it Microsoft can quickly respond to meet emerging market trends making the monopoly durable.

What sustains the Operating Systems monopoly is fascinating. Increasing yearly sales of systems licensed to run Microsoft Operating Systems created a huge installed base of systems with the hardware specification derived from the first IBM Personal Computer in 1981. About 100 million Windows client licenses (including corporate updates) now ship yearly, with declining computer prices making it more ''enticing'' to buy new systems than to try upgrading old ones http://www5.zdnet.com/zdnn/stories/news/0,4586,5100875,00.html. With Windows put on many new systems the monopoly is self-renewing as the equipment it runs on is continually updated. For entities running Windows there is not one large unit or factory to age and be replace by equipment from competitors at one moment in time. Interesting too, is that buyers of the Operating System pay for the equipment its runs on, relieving Microsoft of paying for equipment to maintain the monopoly. Low costs to Microsoft, with no decisive point in the product cycle to switch vendors due to continual buying means the Operating System monopoly is durable and long lasting.

Development of this point stems from the Court of Appeals note that Joseph Schumpeter saw only temporary monopolies in technology. The ruling (page 12) cites Schumpeter's idea of product improvement causing many firms to dominant a market in sequence. A dynamic technology market would appear difficult to dominant for long, as another firm will improve the given item such that buyers flock to for a few years till a third firm replaces it and so on. That works when a given item has no dependances on it. If changing the one item, however, demands that other things must be changed too product improvement has difficulty unseating the first monopoly.

Schumpeter's theory does not apply to Personal Computers Operating Systems because Schumpeter could not be expected to foresee the huge network effect in this arena. Producing a better Operating System in isolation will not enable buyers to adopt it. When Microsoft began with MS-DOS and early Windows it did not face a dominant rival ''with a massive an installed base and as vast an existing array of applications'' (Court of Appeals ruling page 23). Instead of being temporary deep support makes the Windows monopoly most resilient.

2a. Remedies to antitrust activities need to reflect the strength of the Microsoft monopoly. It is very durable so the company is much, much more likely to be able to damage other firms than anything in a judgment disrupting it. Windows is as much a cornerstone of personal computing as are plumbing and electricity to a building. Buyers require Windows to be able to run the programs that form their daily activities and will purchase the Operating System in a basic or its present expanded form. Any discomfort experienced by Microsoft is a necessary of result of allowing the free market to again operate. Bumps in the new open market road are just the expected opposite reaction to benefits from antitrust activities. In specifying what Microsoft must not do its ability to employ its own interpretations of matters needs to be considered to achieve the desired result. The firm managed to sidestep the 1994 Consent Decree http://www.usdoj.gov/atr/cases/f000/0047.htm (page nine, paragraph three) item that Microsoft not require notification of any New System line sold with no Microsoft Operating System. In a most innovative

fashion, Microsoft had a contest in early 2001 to have system builders inform Microsoft of systems shipped without Windows. Builder employees gained more valuable prizes for telling Microsoft of higher numbers of non-Windows system sales. Microsoft wanted to see that Enterprise licenses are not misunderstood as covering new systems, a necessary thing noted in, ''Microsoft offers PC builders prizes to be finks'' http://www.infoworld.com/articles/hn/xml/01/05/02/010502hnsitelicense.xml

Letters to Enterprise license holders could of accomplished the same result without garnering builder sales information which is private between seller and buyer! Instead, what Microsoft did went against the idea of the 1994 Decree with a method to gain details on builder sales by using a voluntary entry to contest which seems to get around the point Microsoft not require such information, except perhaps to dissuade clients running non-Microsoft server Operating Systems (''Be a Microsoft Stoolie, Win a Chair'' http://news.cnet.com/news/0–1278–210–5816847–1.html). Though it is unknown if Microsoft used information from the contest to influence software usage it is seen that Microsoft cuts close to prohibited actions in pursuing its goals, for this case all requirements must be exacting to prevent sidesteps. Nor can the anticompetitive ingredient of the contest be ignored as it clearly made known Microsoft's concern over systems selling without Windows. Because builders must be able to put Windows on desktop computers to retain buyers, system builders (particularly less known firms) could take pause and decide not to risk relations with Microsoft by selling relatively few (if more expensive) server systems without Windows. All system software and hardware suppliers can be replaced except for Microsoft because only it licenses Windows which brings together all the products from other suppliers into a cohesive unit that can be sold.

Such complete dependence on a single supplier for the only product with no substitute would make builders wary of offending Microsoft since it is the only firm in the Personal Computer industry that can put other firms out of business by halting access to merely one product. The Court of Appeals ruling on page 16 says customers will not change Operating Systems due to the cost of new programs and training for them which is a burden while other Operating Systems offer fewer programs.

Also, each hardware component requires a piece of software referred to as a ''driver'' to mediate communications between a component and the Operating System the ''driver'' is written for. Component makers write Windows ''drivers'' almost exclusively so system builders lack options for any simple substitution. Thus relations with Microsoft are a prime concern leading builders to stay attuned to what Microsoft wishes. Yes, another Operating System can be used, yet it demands a seldom seen deep commitment. Lack of ''drivers'' deters buyers from trying another Operating System on new computers, adding to why buyers stick to Windows despite frequently new purchases. Linux distributors do provide ''drivers'' with their Operating System, but these seldom drive all features on components making these ''drivers'' unattractive substitutes. Components makers over time have sold many items in their product category making it difficult for distributors of other Operating Systems to timely develop ''drivers'' to suit specific components. A tiny part of the remedy should prohibit Microsoft from in any way deterring or interfering with components makers possible writing ''drivers'' for other Operating Systems.

3. Pricing is the one area where, at a glance, the Operating System monopoly is not readily discerned. The price is usually not high compared to other Personal Computer components so previously cost was not an issue. Point 2 of this submission notes Windows sales are now about 100 million unit a year. Over an approximate three year mainstream life of an Operating System total sales do perhaps yield a monopoly like profit. Especially as Microsoft has low fixed costs. A humble suggestion to the Court is to investigate the cost of producing software in a very high volume to discover how price per unit relates to production cost. Another item to account for is Microsoft having no direct enduser support costs when builders put Windows on systems. Not facing that cost could let a lower price yield unexpected returns.

Annoyance, too, is a reason Microsoft has unremarkable prices. In software development ''the-state-of-the-art'' produces good programs which seldom run as well as common, everyday devices. The science, or art, of software is young so somewhat less reliability is reasonable. That means to sell many units a year prices cannot be maximized to the same extent, for example, as can prices for ad space in the sole newspaper for given area. Annoyances is even the name of a popular Web site http://www.annoyances.org for dealing with Windows so what have been moderate prices were a trade-off to keep buyers. Of Windows 98 a prominent writer said one reason to spend the $90 is that 98 crashed less than Windows 95 http://content.techweb.com/winmag/library/1998/0701/ana0001.htm

4. Bundling is a pivotal matter here making understanding it important. Bundling is common to enhance the value of new kinds of products, movie rentals included with VCR purchases when that product was new to spur customer interest, a process now happening with DVD players, are fine examples of the more frequent kind of bundling. When Personal Computers first became fast enough to display usable graphics on monitors writers of programs to do charts and graphs arranged to have makers of the new, fast graphic boards for systems bundle those programs with new boards to increase sales of both products! All temporary arrangements to boast new product recognition.

Similar to this Operating System and browser packaging, ''AWeb-II 3.4 Packaged with Amiga OS3.9'' http://browserwatch.internet.com/news/story/news-20001229–1.html Amiga is a neat, niche computer and Operating System with some loyal supporters. Bundled with Amiga OS3.9 is the AWeb browser for buyers to try out as v3.4SE Special Edition has some features disabled so if folks wish to keep using it they need to buy a full version. Limited versions let prospective buyers try a product without damaging potential sales. Notable these test versions can be removed from systems if customers so wish. Probably the instances of Operating System and browser bundling presented at the original District Court hearing allowed the browser to be removed from the Operating System, as well. What Microsoft did in binding Internet Explorer to Windows was atypical since other programs can always be removed. Apple Computer could not create and tie the two products together, for instance, being under contract to Microsoft for its MacOS Internet Explorer to be the default browser on Apple systems.

That the Internet Explorer experience can be duplicated on Apple's MacOS without placing that Microsoft browser in the Apple Operating System shows the browser is a product category, not Operating System plumbing like memory-management that wholly depends CPU and Operating System interaction. That the product category exists is illustrated by its functions. Unlike most computer programs a browser is meant to show on a local system information that is formatted into Web pages on remote computers. A browser would quickly become boring without a connection to the Web to provide fresh and new information. A browser is part newspaper, radio, and TV for computers that only really shines because of its outside connection while other programs deal what they create. Separating the browser from other software is that it does not create what it displays. Even most computer games create files to allow games to be resumed at a later time.

Demonstrating a possible market for browser is difficult because once a firm with market power uses its builder distribution network to distribute its browser with no regard to cost by not charging for it buying a second browser seems odd. NetMechanic http://www.netmechanic.com though, is a firm in business to make Web sites work in a variety of browsers, and different types of computers, demonstrating not everyone prefers the Web as presented by Windows through Internet Explorer. Tastes do change. One noted computer commentator recently wrote (20 Dec 2001) he now uses Opera's style of having a number of Web pages open within the browser's one window (called MDI), instead of one program for each Web pages as Internet Explorer does producing a ''blizzard'' of separate programs http://www.scotfinnie.com/newsletter/18.htm.

If the playing field was more level, with no firm having market power using its very special access to computer distribution, there is reason to think buyers would seek browsers that suited their individual preference instead of just happening to use what ships with the computer. Equally important is that other types of computers do access the Web so a proprietary specification of how to interact with browsers is anticompetitive since it favors one type of computer. Microsoft's main focus is the Personal Computer, making it less interested

in the advancement of other computers to protect its principal area of business. That is natural for Microsoft to do, yet it is bad for customers as possible choice for computers will not have the options as the kind Microsoft caters to. An example is on http://www5.zdnet.com/zdnn/stories/comment/0,5859,5101802,00.html noting that Microsoft's PDA named the Pocket PC does not support Apple's Mac computers. Not a big item, yet it is another way to make Windows look better. Microsoft is so fiercely competitive it should not be left to handle a cross-platform standard better formulated by an industrial association.

(I must now apologize to the Court as time is now very short to finish the filing and I still type slowly so I need to work in point form, I hope you will excuse me.)

These 4 columns note that open standards greatly reduce costs for buyer and much improve the number and quality of available choices. ''Standards can put you in control''

''Why we should hail IBM's ode to open source—the Purple Book''

http://zdnet.com.com/2100–1107–503981.html and ''Group builds onto wall of Web standards'' http://news.com.com/2100–1023–802022.html. The W3C stands for Web open standards with interoperability between all software, Microsoft should be urged its lead.

5. The most effective remedy to administer with most ease is that Microsoft only sell Windows with the basic plumbing to run computers for the 1st 30 months of a judgment. That will be called disruptive, yet it is the best way to remind everyone Windows is the means to let many companies run programs on Personal Computers, not just Microsoft, and not as 2nd class players. If that is not done Microsoft will have decreasing reason to accommodate other firms on Windows as those firms will not much add to Windows'' popularity. Plus that will encourage Microsoft to have enough Windows'' APIs so any browser runs all browser functions in Windows instead of the APIs being limited to Internet Explorer.

During that 30 months programs now in Windows will sell at prices as determined from sources like the Web. After 30 months such programs and basic Windows most stay available for 10 years. And Microsoft may then sell 2 other Windows versions with prices reflecting having some extra programs in 1 version, and all extra programs in the 2nd version; as well as direct Microsoft support being of 1 contact for setup (only good if used in 1st 35 days after buying) that may go on for a time after the contact began, and a 2nd 6 months starting from a later contact within 15 months of system purchase. Simple reason for Microsoft support is that it be responsible for any full programs put in with Windows, that is only creating a consequence for Microsoft's action which is fundamental to a well running market economy.

5a. Judgment needs to last a long time so market can develop products and just get use to being fully open (so participants in markets related to Personal Computers have no reason to act in anticipation of its end).

Allowing time for those notions to be entrenched so OEMs will react strongly to unusual demands instead of merely accepting them so Microsoft regains its position.

That is a big concern given Microsoft's habit is to disparage what other firms make, ''Novell sues Microsoft over ad campaign'' http://news.com.com/2100–1001–273775.html while a later review found the Novell progressing quite well, 17 Dec 2001 ''Not Just Another NOS—NetWare 6 includes impressive Web tools, file and print services''

http://www.eweek.com/article/0,3658,s%253D708%2526a%253D20078,00.asp.

Unfortunately such ads and the blocking of 3rd party browsers from some Microsoft Web sites occurred while Microsoft negotiated this Proposed judgment suggesting Microsoft may not be serious about this process. It was soon seen that the browsers dealt well with the Microsoft sites, ''MSN.com shuts out non-Microsoft browsers''

http://news.com.com/2100–1023–274944.html, ''Parts of MSN Still Off-Limits to Amaya, Opera Users''

http://browserwatch.internet.com/news/stories2001/news-20011101–1.html,

''Microsoft backpedals on MSN browser block''

http://news.com.com/2100–1023–274980.html. Perhaps 1 remedy could have Microsoft mostly deal in the benefits of its own products in ads and not supposed flaws in what other firms produce, generally leaving buyers to decide what suits them best.

5b. To give independent developers the opportunity to write a browser based on its code, Netscape Communications made its source code available through http://www.Mozilla.org. As a result the specification for Netscape style ''plug-ins,'' which add functions as helpers to browsers, is now commonly known. This specification allows any company developing a browser to run ''plug-ins'' in its browser application.

Because Microsoft now has such a wide lead in browser usage, its support of ''plug-ins'' in all its browsers is critical to such helpers being created both in ActiveX and ''plug-in'' style. To give market forces the chance to establish a market for browsers, Microsoft shall include ''plug-in'' support in all its browser for 12 years. That period will begin on the first day of the first month after Microsoft demonstrates restored internal ''plug-in'' support in all current (or future) browsers from by Microsoft, its subsidiaries or successors. Menu and other means that exist to modify program options in Windows could turn off ''plug-in'' support. If it becomes apparent ''plug-ins'' fall out of common usage Microsoft may be allowed to end its support early.

A 12-year time period is necessary since many Web sites are built to mainly support Internet Explorer and many Web designers will require time to become accustomed to using an open standard (likely from http://www.w3.org). Customers will also need to adapt and choose a Web browser that best meets their usage requirements, the usual way of choosing products. And the 12-year period approximately doubles the time Microsoft hindered usual market forces through special distribution requirements. Thus, 12 years is reasonable recompense to that market.

Restored Microsoft ''plug-in'' support (dropped in August 2001 http://news.cnet.com/news/0–1005–200–6881773.html) is a fine part of a remedy as it reinvigorates the browser market without steering it in any direction. Requiring Microsoft to publish its source code for Internet Explorer would merely develop copies with strengths and weaknesses similar to the original. Leaving them dependent on Microsoft for core code development, not creating an open market. Browsers do not relate to the booting of computers so showing source code is currently unneeded. So long as a browser is not commingled in the Operating System it is just another program making for easy substitution. Both ActiveX and ''plug-ins'' have strengths and drawbacks with no clear winner. ActiveX deeply ties into Windows, which is troubling if security breaks down. Meanwhile, Microsoft has doubts about ''plug-ins.'' Such issues are exactly the type best left to customer choice.

More importantly, ensured ''plug-in'' support only produces a level playing field since all browsers have good access to helper programs leaving it to market forces to determine what browsers succeed. This point is forward looking as it leaves the market open with minimal or no market distortion making it very much in the public interest.

6. Varied point2: Using ActiveX on the Windows Update site does not exclude people from general access to the Web as the Court of Appeals ruled. The anticompetitive element is that only Microsoft knows how to have browsers run ActiveX meaning that users must maintain Internet Explorer to be-able to reach the Update site which is a crucial, must reach site for anyone running a Windows Operating System! Above this filing shows it is a long and somewhat difficult process to keep Internet Explorer current and secure. Also the Court of Appeals ruling (page 30–1) says Microsoft twice acknowledged two browser icons can be confusing. Running two browsers would be confusing as well, the easiest course for most people is to only run Internet Explorer. It thus has a very distinct advantage over other browsers. Yet Microsoft must ensure the integrity of its products so of course it may have Windows invoke a single purpose client that would check and service only Microsoft software. Such a client would have limited, specialized usage likely only for connecting to Microsoft servers, it will not be anti-competitive because it will not effect perceptions of programs from other vendors. That differs from the present wording of Section III.H.3.1 and its preamble which gives Microsoft programs special rights users could see as making it better than similar products from other vendors.

6a. Relating to Microsoft Passport: If Microsoft wants customers to create a basic account (using an existing e-mail address)

before providing product assistance that account should only be for dealing with Microsoft, and not for dealing with other firms over the Web. Privacy and security concerns of individuals deem that each person be able to make their own decision on whether to create an account to deal with Microsoft alone or a process for giving out information to third parties. Having 2 kinds of accounts means Microsoft will not be able to unduly leverage the Operating System monopoly into the de facto identification and information dispersal process for the Web. That will also much decrease the possibility that newcomers to PCs would erroneously think only Microsoft provides software for this class of computers. A central repository for all personal information will be probably a target for thieves trying to steal credit card number to commit fraud and perhaps where malevolent forces will go for personal information in efforts to build false identities. Signing in to a creation like Microsoft Passport is not something to be done while people are trying to setup another product. It must be considered on its own drawbacks or merits, and then perhaps entered into.

Thank you for this opportunity.

Sincerely,

Bryan Campbell

Subject: Microsoft Settlement

To whom it may concern,

I strongly encourage a fair and appropriate settlement concerning Microsoft and their anti-trust violations. The company in question has abused it's position and created an unfair market place to which they are the dominate player. In order to right this situation the government must truly punish Microsoft for their unethical behavior. This means creating opportunities for other companies that have suffered at the expense of Microsoft's business practices. Proposals such as the education solution only increases Microsoft's market share and shows that the current presidential administration is oblivious to the current problem. Microsoft is a monopoly and that is definitely not beneficial to the economy. In order to increase competition steps must be taken to thoroughly punish Microsoft and give businesses such as Apple Computer, Java, and a host of others a fair chance.

Thank you,

garrett williams

Microsoft Settlement U.S. Department of Justice ,

Dear Microsoft Settlement U.S. Department of Justice:

The Microsoft trial squandered taxpayers? dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is time for this trial, and the wasteful spending accompanying it, to be over so that companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Thank you for this opportunity to share my views.

Sincerely,

US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

As an elected member of the Antelope Valley Health Care District representing 450,000 people, I am writing this letter as in support of the settlement in the case against Microsoft. I believe that this whole suit was a waste of time and money. Only in America do we focus on tearing down success, and destroying a product line the works. There are choices out there, but none of them work as well as the Microsoft products.

There are more pressing issues that are of concern to me in this country such as the energy crisis here in California. The state has lost $22 billion dollars resulting in consumers getting gauged. In addition, the price of gas has risen 20 cents per gallon, just in the last week. The Department of Justice should have taken a strong NO to the rash of oil company mergers this past decade; we can live without a home computer, but must have gasoline (real public transit has not arrived yet)

Microsoft did not get off as easy, as its opponents would have people think. They agreed to terms beyond what was required in the suit. They also agreed to design future versions of Windows, starting with an interim release of XP, to provide a mechanism to make it easy for computer companies, consumers and software developers to promote non-Microsoft software within Windows. Microsoft seemed to be generous when settling the case. Let's end litigation now so that Microsoft can go back to work. We, the American people, need a company like Microsoft to stay strong, so they can continue to create innovative products, well paying jobs, and help strengthen the tech sector of the economy.

From: Don Campbell
To: Microsoft ATR
Date: 1/28/02 11:47am
Subject: Microsoft Settlement

The current settlement of the Microsoft case is a travesty. Since becoming a monopoly, Microsoft has almost continuously ignored antitrust law against anticompetitive behavior. When caught and tried, they deny the obvious. After agreeing to cease the anticompetitive behavior they carry on as before.

They have shown negligible effort at compliance and continue to operate against consumer interest and consumer choice. If anything, they have extended this approach beyond their traditional software market into other markets of Internet and media commerce.

I do not think that a remedy which falls short of structurally modifying the company will work. Microsoft will go on as usual and destroy more companies. In so doing they will continue to chant the false mantra that they are ''innovating'' and being punished for that. They should be broken up, Windows code should be opened up to the competition and they should not be allowed to leverage their current monopoly into new ones.

Washington, DC 20530
Dear Mr. Ashcroft:

The antitrust suit against Microsoft has been settled. This agreement was arrived at after extensive negotiations with a court-appointed mediator. The whole process took three years, which I believe is long enough, if not too long. This settlement has profound implications for all software publishers, the rest of the IT industry, and consumers.

New government regulations will be imposed on the IT sector. The proposed agreement requires major changes in how Microsoft develops and markets its products, while allowing competitors the possibility of suing the company if it does not comply with these new rules. The settlement is in the best interests of the state, the economy and our nation as a whole.

The recession has had a devastating effect on budgets at both the state and federal levels. It is important to allow the IT industry the ability to concentrate solely on its business at hand. The original agreement reached by the Justice Department is beneficial to the industry and the economy at this point. The settlement needs to be agreed upon by all members of the federal government, permitting us to continue being a leader in the technological market at home and around the world.

Sincerely,
Tom Skinner

Dear Ms. Hesse:

I was pleased to hear that the Department of Justice had settled its ridiculous suit against Microsoft.

Clearly, this lawsuit was politically driven and using our government and our laws in this fashion was unfortunate from the beginning. I am relieved to see this dispute resolved, although believe it should never have been brought in the first place.

Although Microsoft has agreed to the restrictions in this settlement, I believe it is unfortunate that our government has chosen to do anything less than completely dropping the case. Microsoft has done more to improve our efficient and effective communications than has any other company in history.

They should be left alone to continue their fine work without further interference from our government. Sincerely,

US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

I believe that the antitrust suit against Microsoft has been detrimental both to the economy and to the IT community. This suit was an attempt by Microsoft competitors to use the legal system to manipulate a market for their own gain. It is time to let us in the technology industries get back to the work; to do our part in moving our economy forward.

The antitrust suit has had a negative, trickle-down consequence, that if not stopped, will lead to spiraling business downturns both of companies that partner with Microsoft as well businesses that use Microsoft products. The settlement guidelines are tough and rigorous. It is time to finalize the settlement and let us get back to the work of revitalizing the economy and the IT industry.

I urge that all action taking place at the federal level be stopped. Microsoft must be allowed to return to innovation.

Sincerely,
Susan Caghan
President

U.S. Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

I have been following this case, and don't believe litigation was necessary at all. The computer industry is very competitive. I believe the competition pursued litigation in order to distract Microsoft and level the ''playing field''. Now that several more states and companies want to pursue further litigation, what are they trying to accomplish?

Microsoft has been more than fair in settling this case. They agreed to license its operating system to the twenty largest computer companies for identical conditions and prices. They also agreed to design all

future versions of Windows, to provide a mechanism to make it easier for computer companies, consumers and software developers to promote non-Microsoft software within Windows.

Let's end the distraction and go back to business. Microsoft can go back to reviving its company and the technical sector. Government can work on bringing us out of this recession.

Sincerely,
Robert Marmelstein

This whole jihad against Microsoft by varied government officials at the behest of Microsoft's competitors has been ill advised, corrupt and unproductive. It has harmed the company, harmed our international leadership in technology, harmed how young people view a career in technology, harmed the consumer with legal fees added to product cost, and introduced the attempt to have technical elegance determined by states'' attorney generals.

Do not let the zealots and the cynics determine the fate of Microsoft's ability to delivery complex solutions. Look at the strides being made in China with wireless and you will see what can happen quickly if we weaken our own ability to provide large scale solutions. I am old enough to have learned to drive in a beautiful 1960 Buick convertible. Within a few years I watched the automobile industry's abilty to product a decent car greatly decline relative to our competitors and saw the takeover of our main industrial hallmark by foriegn companies. We have had to wait for Microsoft to create an American world competitive flagship company to again provide the ability to command domestic and world markets.

Because this case is about the fragility of intellectual property, the old rules do not always apply and should not be allowed to push an American success story into mediocrity.

Dear Mr. Ashcroft:

I understand that the Department of Justice is presently accepting public comment on its agreement with Microsoft to settle the antitrust litigation. I wholeheartedly support the agreement. Microsoft was just being punished by the last administration for its success, and that's not fair. Microsoft's competitors complained that they were frozen out of competition by Microsoft's licensing and pricing practices as well as by their inability to offer competing software within the Windows system.

Microsoft has agreed to uniform pricing guidelines as well as less restrictive licensing agreements with distributors. Microsoft has also agreed to open its operating systems to competing software applications.

I believe that Microsoft's actions more than adequately answer the complaints, and Microsoft should be allowed to get back to business. Please implement the settlement as soon as the law allows. Thank you for your consideration and attention.

Subject: Microsoft Settlement

With respect to the proposed Microsoft settlement, I would like to offer these brief comments:

To the great disadvantage of its customers, as well as users and manufacturers of competing systems, I believe that it would effectively leave the monopoly intact; well-funded, highly-paid, highly-motivated Microsoft lawyers will easily avoid the vague settlement rules and the giant will continue largely unchecked. Public meetings are essential to a democratic process and there should be public hearings nationwide to afford citizens the opportunity to speak out on this important matter.

Subject: Microsoft Settlement

I wish to register my strenuous objections to the proposed settlement to the Microsoft Antitrust case.

Of all the provisions which I find most objectionable are those related to so-called ''middleware.'' The proposed settlement provides Microsoft with more control over software to be included with Windows then they have today. If the settlement is approved, they will be permitted to discriminate in ways which before the settlement would almost certainly generate antitrust scrutiny. This proposed settlement does not open the door to middleware development, it slams it shut.

This settlement does not promote competition; it institutionalizes the Microsoft monopoly. To approve it would not be in the public interest.

To: Microsoft ATR
Date: 1/28/02 11:55am
Subject: Microsoft Settlement

Dear Sir/Madam:

I just wanted to comment on the Microsoft matter with respect to ''pending'' matters in the courts. I feel as a consumer that Microsoft has been a strong American company and has helped to ''standardize'' the disparate software in the PC industry over the last 10 years. Competitors such as AOL (who BTW appear one again to be against ''standardization'') are not happy with a ''large systems integrator'' concept, which by default in the software industry goes to the Most Aggressive Company ..in this case Microsoft. Most Microsoft products I purchase are ''fairly priced''. In fact SUN's compilers and tools were once ''way more expensive'' than Microsoft products, but thanks to the ''Microsoft Trial'' their SUN product line ''price'' has improved ''considerably'' for consumers. Microsofts'' has always been in the $100–500 range...I was mystified as to why ''consumers were

hurt'' as SUN claimed. (they were probably jealous of volume)

However aggressive Microsoft has been, it HAS helped to achieve standardization, which the PC industry needed to ''get off the ground'' and bring ''mass market'' consumer awareness to many things, PC desktop, Common Operating Environment, Office tools, etc all of which operate ''together'' with a forward vision that DOES include many growth opportunities for smaller competitors. I know of many small vendors who ''need'' standardization that Microsoft provides as a ''defacto large systems integrator'' for consumers. AOL, who makes only a Browser (purchased for $10B from Netscape) and its AOL instant messenger are only TWO products. This is not enough to ''standardize an industry'' and consumers like myself (who are also software developers) are aware of this and keep Microsoft in the ''lead role'' by spending our consumer dollars for ''better integration''...what in fact comsumers vote for with their $$$.

When AOL makes products that ''hit all bases'' as far as ''developers need'' I'll buy more AOL products...right now they have a limited product line...who's fault is that????? If $10Billion were spent in the right place it may not have happen as it did.

If they (AOL) want to be a ''large systems integrator'' in ''consumers minds'' they they should compete by trying to ''bring together'' lots of smaller companies as Microsoft has done well as a platform and help consumers ''see this'' instead of just complaining and trying to do this ''via other means''...thinking the browser is the ''only thing'' that consumers ''see'' ...in fact alot more goes on in terms of data, binaries and libraries that make an ''integrated product'' which microsoft has been far ''better at doing'' than AOL and their ''vision''. end of comments.

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing in full support of the recent settlement between Microsoft and the US Department of Justice. It is time that this foolishness comes to a prompt end. More than enough time has been used to cover all of the bases and I feel that it is just a political standoff at this point.

The terms of the settlement make apparent to me the intense lobbying efforts of Microsoft's competition as they will be granted new rights to configure Windows so that non-Microsoft products can be promoted more easily and also be given interfaces that are internal to Windows'' operating system products.

Even though these concessions do not actually protect consumers and just help Microsoft's competitors that were unable to be innovative on their own, I urge your office to finalize the settlement. It is in the best interests of our economy, IT sector, and public for the case to end and our country to move on. Thank you.

Sincerely,

John Odonnell

Subject: MicroSoft Settlement
Date: Mon, 28 Jan 2002, 09:55

Sirs:

Regarding the MicroSoft Settlement ''Proposed Final Judgment'', I am in extreme opposition.

I am in complete agreement with the amendments proposed by Dan Kegel (ref: www.kegel.com/remedy) in his essay to be submitted to the DOJ, entitled ''On the Proposed Final Judgement in the United States vs Microsoft''.

It has been my professional observation over the last 20 years that Microsoft provided useful innovative products SOLELY when there was string and significant competition.

It is my strong belief that should the PFJ be approved, the result will be an extraordinary loss of innovation in commercially available software within the United States; a significant erosion of respect for the US laws and regulations thus established, mainly among commercial and independent software developers in other nations less tolerant of large corporate monopolies; and a significant increase in litigation in the Federal courts to challenge the consequences of the PFJ.

NB: this note represents ONLY my PERSONAL OPINION, and should not be construed as representing any official position of Storage Technology Corporation.

Ms. Renata B. Hesse, Antitrust Division
601 D Street NW, Suite 1200
Washington, DC 20530–0001

Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough. Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user.

This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

Sincerely,

Curtis Stauffer

Subject: Microsoft Settlement

Dear Ms. Hesse:

I am wriing in support of the proposed settlement agreement with Microsoft that would provide technology funds, computers and software to schools in low-income communities.

Wisconsin schools would benefit from the technology funds. Our state falls below the national average in the percentage of fourth through eighth grade students in schools that have computers available in all classrooms. As a future teacher, I am learning about teh benefits of technology in the classroom.

However, many schools do not have the funds or equipment to give the students these experiences. I think teachers and students should be given the opportunities technolgy can give.

Computers are important educational tools in schools. No student or teacher should be denied this opportunity. THe proposed Settlement is very positive and would benefit students, teachers, schools, and communities that need the technology funding most.

Thank you.

Sincerely,

Kelly Anthony

Subject: The proposed settlement in the Microsoft antitrust case does not go far enough

Dear Sirs,

The only way to level the playing field after the years of abuse by Microsoft is to let the competition have access to the source code.

Microsoft should be compelled to make available a license to any interested party for the source code for all versions of Windows(R) for a reasonable fee, perhaps $1,000,000.

Thank you.

Washington, DC 20530

Dear Mr. Ashcroft:

I am writing you today to express my opinion in regards to the Microsoft settlement. I feel this debate has gone on long enough, and I feel after three years of litigation enough resources and time have been wasted on this issue. It is time to focus our attention on more pressing concerns facing us today.

I am a believer in free enterprise, and I do not think Microsoft should be penalized for doing its job well. That is the goal of every American worker. This settlement finally ends three years of litigation and will allow Microsoft to continue designing and marketing their innovative software, while no longer focusing on litigation. This settlement was reached after extensive negotiations, and Microsoft has agreed to terms that extend well beyond the original terms of the lawsuit, just for the sake of ending it. For example, Microsoft will now be required to share information regarding the nature of the internal workings of its Windows operating system, allowing them to place their programs on it. Personally I consider this akin to charging the consumer for e-mails because the post office is losing money...paying a competitor because they aren't smart enough to compete.

During these difficult times, one of our highest priorities should be to stimulate our businesses so as to strengthen our lagging economy. Please support this settlement.

Sincerely,
Victoria Barkan

From: Alonzo Gariepy
To: Microsoft ATR
Date: 1/28/02 12:00pm
Subject: Microsoft Settlement

To Whom it May Concern:

Pursuant to the Tunney Act, I am writing to comment on the proposed settlement of the United States vs. Microsoft antitrust case. An important point to be made regarding the large amount of comment that you have received regarding this case is that the many points made must be taken very seriously, although some are not as well presented in these emails as they might be with more time or by other people. I doubt that any quick resolution to this case will do justice to the many issues raised; the answers are not obvious and the exact solutions are not necessarily ones that have been considered by the DOJ up to this point.

Microsoft continues to roll over software companies by incorporating into Windows features that have been developed by other companies as their main product. One continually comes back to this issue of what Microsoft should be allowed to make part of its Windows product. What is needed is some philosophical (and eventually legal) foundation for the consideration of this issue. Despite work on such products as Wine (a linux Windows emulator) Microsoft has a defacto monopoly. Ironically, the hardware involved is one of the most diversely manufactured devices in history. One of the reasons this continues to be so is that Microsoft puts a huge amount of work into making sure that Windows will run on all the different PCs that are manufactured with their huge diversity of devices, and Microsoft includes a great number of drivers for all these devices.

Regardless of whether one can ever forsee an alternative to Windows, the problem is that every time Microsoft adds a feature to Windows, that feature becomes part of its monopoly. The marginal cost for the consumer is perceived as zero, and the originator of the feature in some other company can no longer compete. A perhaps too simple example is that the latest Windows OS supports ZIP files as virtual folders, saving users from having to acquire another piece of software to open ZIP files.

Many such pieces of software are free or shareware, but shareware is a valid marketing model and its developers deserving of protection as anyone else. The greatest example of this would probably be Netscape.

Perhaps what is needed is some kind of patent protection. Once someone else has made an add-on for Windows to perform a certain task, Microsoft (and perhaps others) cannot add that feature to Windows without paying some kind of royalty. Nothing else strikes me as a reasonable long term solution to this problem. As an experienced software developer, I don't generally believe in the concept of patenting software, but in this particular case, it appears an ideal solution.

Sincerely,
Alonzo Gariepy

Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing to support the recent settlement between the US Department of Justice and Microsoft. I think the lawsuit has gone on for way too long now and is becoming a waste of taxpayer dollars. The government interferes with free enterprise too much and should start facilitating business instead of hindering it.

I care about what is fair for the public and I think that although very harsh, the settlement is in the best interests of the public. Microsoft will make some concessions that include disclosing interfaces internal to Windows'' operating system products, granting computer makers broad new rights to configure Windows, and forming three-person team to monitor settlement compliance.

I hope that your office does what is best for the American public, not what is best for politicians, lawmakers, or big business that can't win in the market. Please make the right choice and finalize this settlement. Thank you.

Sincerely,

MTC–00027906

From: Thomas Winzig
To: Microsoft ATR
Date: 1/28/02 12:02pm
Subject: Microsoft Settlement

The problem with the Microsoft settlement is that it leaves them intact. If you want to really open up the computer industry to newcomers, and punish Microsoft for their illegal activities, you should break them up into five or more groups. An operating

system company; an applications company; an internet services company; a hardware company; a gaming/entertainment company. If you are not willing or able to do that, then consider the following:

FAIR OEM CONTRACTS

Force Microsoft's OEM licensing deals to be fair. They killed Be, Inc. and many other companies that offer choices to consumers with these OEM deals. Specifically, Be was unable to deliver it's well-regarded OS via new PC's, because the OEM's would not (could not) bundle it on their new PC's, due to Microsoft's contracts. Be even offered to give their OS to OEM's for FREE to try and break into the market. Only Hitachi risked the wrath of Microsoft, and even then, they were not able to show the installation of BeOS to the end-user (due to Microsoft's license restrictions).

Microsoft should be forced to come up with a fair contract for an OEM which does not provide a BARRIER TO ENTRY for other OS companies, and which is the same for all OEM's.

DISTRIBUTE (BUT NOT NECESSARILY ''OPEN'') WINDOWS SOURCE CODE

Force Microsoft to sell their operating systems with the source code. I'm not talking about Open Sourcing their OS—just provide the source code with the copy of Windows that was purchased. The source code license would restrict distributing the source code, but would NOT restrict developers and consumers from being able to create applications that integrate with Windows just as well as Microsoft's applications. It would also allow developers and consumers to do things like: create patches to remove MSIE entirely; find and fix bugs in security before Microsoft can, etc. But the primary purpose is to allow third parties to be able to develop competing applications that integrate well with Windows.

COMPLETELY DETAIL ALL MS OFFICE DOCUMENT FORMATS

Force Microsoft to release the full documentation and all related source code for their Office document formats. Microsoft has used the full force of its monopoly to get people hooked on Office products. Now that Office has a monopoly on the production suite market, the barrier to entry is maintained because new office suites cannot adequately read/write the MS Office documents. If the full documentation and source code for those document formats was released (and required to be updated for each new version of these formats), then third parties could provide read/write abilities in their competing office suites, and consumers would have a choice. As it is now, most people HAVE to use Office, because their friends and co-workers do, and they must be able to share documents with them.

Dear Mr. Ashcroft:

I am writing you today to express my opinion in regards to the Microsoft settlement issue. I support Microsoft and I support the settlement that was reached in November. I believe it will serve in the best public interest to end this costly litigation battle.

This settlement is fair and reasonable. Microsoft has agreed to all terms and conditions, including: disclosing information about certain internal interfaces included in Windows and designing future versions of Windows to make it easier to install non-Microsoft software. A technical oversight committee has been created to monitor Microsoft compliance.

During these difficult times, one of our highest priorities should be to boost our lagging economy. Restricting Microsoft will not accomplish this end. Please support this settlement so this company can get back to the business of creating innovative software, which will benefit all of us. Thank you for your time.

Sincerely,
Stephanie Mathisen

Dear Mr. Ashcroft:

In this era of bad economic times, the news of a proposed settlement between the federal government and Microsoft was most welcome. I just hope that the settlement is not unfairly torpedoed during the public comment period.

This settlement was not proposed by Microsoft merely as a way of extracting itself from this litigation. The settlement contains a number of substantial changes in Microsoft's business practices and the proposal has met the preliminary approval of a court- appointed settlement mediator. The most significant concession in my opinion is Microsoft's agreement to grant broad new rights to computer makers to configure Windows operating systems so as to promote competition from non- Microsoft software programs. Both competitors and consumers should applaud these moves.

Please don't allow all of the hard work put in reaching this settlement to have been a waste of time. Thank you for your consideration.

Sincerely,
Charles Faulkner

From: Decker F Wong-Godfrey
To: Microsoft ATR
Date: 1/28/02 12:01pm
Subject: Microsoft Settlement

Dear Sir or Madame,

I am writing as a concerned citizen about the proposed settlement with Microsoft. As a professional in the industry, and as a general computer user, I do not believe that the proposed settlement is in the public interest for a number of reasons. These are a few:

* The PFJ doesn't take into account Windows-compatible competing operating systems

* Microsoft increases the Applications Barrier to Entry by using restrictive license terms and intentional incompatibilities. Yet the PFJ fails to prohibit this, and even contributes to this part of the Applications Barrier to Entry.

* The PFJ Contains Misleading and Overly Narrow Definitions and Provisions

* The PFJ supposedly makes Microsoft publish its secret APIs, but it defines ''API'' so narrowly that many important APIs are not covered.

* Microsoft currently uses restrictive licensing terms to keep Windows apps from running on competing operating systems.

* Microsoft has in the past inserted intentional incompatibilities in its applications to keep them from running on competing operating systems.

* The PFJ allows Microsoft to retaliate against any OEM that ships Personal Computers containing a competing Operating System but no Microsoft operating system.

* The PFJ allows Microsoft to discriminate against small OEMs— including regional ''white box'' OEMs which are historically the most willing to install competing operating systems—who ship competing software.

* The PFJ as currently written appears to lack an effective enforcement mechanism.

Thank you,
Decker F. Wong-Godfrey

From: Simon Lewis
To: Microsoft ATR

Date: 1/28/02 12:05pm
Subject: Settlement Comment

I do not agree to the terms of the pending settlement. I believe in the market place and competition, by requiring Microsoft to release all of its API's. That way, companies can innovate new products because they will know how to make them work on the monopoly platform, rather than having to ask Microsoft's permission. No-one owns the English language, and no company should be allowed by *unlawful* conduct) to build a monopoly on what is essentially a computer language.

MTC–00027913

From: William Trueman
To: Microsoft ATR
Date: 1/28/02 12:07pm
Subject: Microsoft Settlement

I wanted to comment on the microsoft settlement that has been reached. Microsoft needs to be punished more that this settlement proposes for its anticompetitive, anti-innovative practices. Due to its monopoly there has been a squash on Operating Systems competition due to the inability for other superior OSes to compete with Microsoft Windows. These operating systems such as Macintosh OS, need to be given a chance. This settlement does not provide enough to resolve the problem of the Microsoft monopoly and its ranging effects on competition.

Will Trueman
Macintosh and Windows user and owner

Renata B. Hesse
Antitrust Division
United States Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001

Ms. Hesse,

As an educator and working professional in the Computer Industry I thank you for the opportunity to express my concerns regarding the Microsoft Settlement. While unqualified to speak on the legal merits, my opinion on the affects on the computer industry may be of some value.

Microsoft has always been an aggressive marketer of their technology and vision of the computer in business and home. While I respect their right to do so, I disapprove of some of their tactics and the long term consequences of their clear and pervasive market monopoly. Netscape was only one of their most visible victims. Do not forget WordPerfect or Lotus 1–2–3, both overcome, in part, by their inability to operate as effectively on Microsoft operating systems as their Microsoft analogs, Word and Excel.

Because Microsoft has developed this strategy of supporting their internal developers, the marketplace is less able to provide innovative new alternatives. The most recent example is the decision by Microsoft to not support the developing standards for JAVA programming, thus ensuring another round of incompatibility issues with applications developed using non-Microsoft tools. In other words, Microsoft is saying ''Buy our development tools if you want your applications to run as well as possible on our operating systems''.

The critical distinction is between the Operating System and the Application domains. A forward looking option is to enforce transparency on the operating system; that they publish all the specifications, functions, and procedure calls available to any application. This will ensure as level a playing field as possible, so that any application developer will be able to utilize any feature of the system as effectively as a Microsoft application developer.

With regard to counter arguments that this will compromise intellectual property or corporate secrets, their copyright will still be protected under U.S Law. They will have the remedy of the courts for any perceived violation of their rights, and they will be treated as any other author with regard to the fruits of their labor.

While some remedy is necessary, in my opinion, to balance this market influence, I disagree that the firm should be broken up. It is a complex and possibly intractible problem with which you are faced. The advantages Microsoft has provided to all of us in developing, standardizing ,and popularizing personal computer technology cannot be discounted. But some enforcement of checks and balances must be found a reasonable course. The current proposal may be unenforcable and may provide opportunities for Microsoft to avoid compliance or exempt itself from the provisions.

I encourage you to hold open hearings and permit input from any interested party, not only the competitors and the plaintiffs in the case. Provide a forum for robust discussion of opportunities for cooperative change.

Microsoft isn't going anywhere; decisions of this magnitude deserve open dialog, consideration of many differing perspectives, and careful deliberation.

Thank you for taking the time to consider these comments. If you have any questions please contact me at your convenience.

To Whom it May Concern:

After reading about the Microsoft antitrust settlement, I must comment that I do not feel it is in the best interest of the US or the US school systems to give Microsoft yet another opportunity to practice their bombastic, destructive practices. Giving Microsoft the opportunity to further their power via their so-called giving of technology to schools just serves to erode in their favor one of the few remaining fields where they do not currently have a monopolistic grip. Additionally, the amorphous nature of this part of the agreement leaves schools vulnerable to onerous license agreements in a few years.

Thank you for consideration of these comments.

Dear Ms. Hesse,

I am writing in regard to the proposed settlement in the Microsoft Antitrust case. I feel that there are tremendous problems with the proposal and support the open letter written by Dan Kegel. There you will find my signature along with many many other people who are also concerned by this proposal.

I also support Dan Kegel's essay regarding the problems and difficulties that the proposed settlement will create. I hope that the Department of Justice will seriously reconsider the problems with the plan and work to revise it so that it will be of benefit to computer users.

If Microsoft is not reined in and given more stringent guidelines to follow, they will continue to create products which don't work and there won't be any alternatives available. I am glad that there are alternative operating systems available currently, but they deserve just as much access to the market as Microsoft has.

Thank you for your time and consideration of this matter.

Sincerely,
Kimberly A. Brosan

Subject: Microsoft Settlement

Honorable Judge Kollar-Kotally,

I am writing to express concern regarding the proposed Microsoft anti-trust settlement. The settlement does not adequately resolve the damage caused by Microsoft's monopolistic practices and does not provide adequate guarantees that Microsoft will not continue to engage in monopolistic practices.

Even though the courts have determined that Microsoft violated the U.S. anti-trust laws, the proposed settlement would allow Microsoft to retain the profits from its illegal practices and does nothing to provide remedies for the many companies that were negatively impacted or put out of business by Microsoft's illegal activities.

Furthermore, Microsoft is essentially being asked to police itself, so there is no assurance that Microsoft will not continue to engage in illegal practices. Microsoft can largely carry on as it had before, and the government is therefore implicitly endorsing Microsoft's monopoly.

I ask you to reconsider the proposed settlement and find another solution that

addresses the issues that are mentioned above. Thank you very much.

Date: 1/28/02 11:56am
Subject: Microsoft Settlement
Dear Mr. Ashcroft,
That Microsoft has maintained a very strong position in the IT marketplace is a given. That Microsoft has done so unfairly is not. Microsoft has always maintained its position of strength through business strategies that simply make good sense. I am not so sure that these strategies warrant this federal lawsuit.
That the lawsuit suddenly collapsed into a settlement rather makes my point. Even though the terms of the settlement are certainly not favorable to Microsoft, it has the advantage of ending the suit. That Microsoft will be forced into a position of greater cooperation with its OEMs and third party software developers is good. However, that they will be forced to give up some more of its source code is not. Since both sides have agreed to these terms suggests that the settlement will be more constructive than the suit would have been.
I am writing to add my own support to the settlement. I am hopeful that any additional court action on this matter will be unnecessary.
Sincerely,
Ray Collins

MTC–00027919

From: Tim Spink
To: Microsoft ATR
Date: 1/28/02 12:08pm
Subject: Microsoft Settlement
Honorable Judge Kollar-Kotelly, As a management student at Boston University, the settlement between that US Justice Department and Microsoft (PFJ) disturbs me.
To begin with, the PFJ still allows Microsoft to operate as a monopoly through its Windows operating system. In addition to giving permission to Microsoft to continue breaking anti-trust laws, PFJ does nothing to punish the company of its monopolistic practices from years past.
Microsoft has routinely used monopolistic strategies to gain a larger market share with little regard to competitive practices defended in the American legal system. Not only has superior software been either absorbed or destroyed by the company, but the chance of other companies moving competition further in the industry has been effectively terminated by Microsoft and this settlement. In fact, the PFJ does little to enforce the weak restrictions demanded of Microsoft.
To sum up, I'm deeply concerned the recent settlement does not regulate Microsoft's monopolistic tactics, nor does it punish the company's disregard for established law. I request that you do your best to overturn this settlement.
Respectfully,

From: T Bird
To: Microsoft ATR
Date: 1/28/02 12:09pm
Subject: Microsoft Settlement
Dear Judge Kollar-Kotally,
I am objecting to the proposed final settlement that the DOJ and MS have agreed upon behind closed doors. Not only does this go against the findings by the U.S. Court of Appeals but, in facts allows MS to go unpunished for past wrong doings.
In addition the Proposed Final Judgment permits Microsoft to continue its predatory practices at the expense of other companies. Thus, my main argument encompasses the preservation of healthy competition and the promotion of diversity with in the business sector. For a single entity, such as MS, to control 80 to 90 percent of the market for PC operating systems, e-mail readers, and office productivity software (which undoubtedly can spread viruses) is clearly a significant risk to security. To then allow that monopoly to actively attempt to drive out its remaining competition would hardly be in the public interest.
Therefore, I submit to you in all fairness that the Proposed Final Judgment will not solve the Microsoft issue.
ALL THE BEST,
DR. JIMENEZ

Dear Mr. Ashcroft,
Today I write to encourage the Department of Justice to accept the Microsoft antitrust settlement. This issue has been festering in the courts for over three years now and it is time to put an end to it. A settlement is available and the terms are fair, and I for one would like to see the government accept it.
In order to put this issue behind them Microsoft has agreed to many terms. They have agreed to design future versions of Windows to be more compatible to non-Microsoft software. They have also agreed to change several aspects of the way that they do business with computer makers. Microsoft has even agreed to terms that extend well beyond the products and procedures that were actually at issue in the suit. Microsoft has given a lot to be able to put this issue behind them, I would like to see the government accept it.
Microsoft and the technology industry need to move forward. The only way to move forward is to put this issue in the past. Please accept the Microsoft antitrust settlement.
Sincerely,
Justin Jones

Dear Judge,
I would like to express my concern about the case against Microsoft. Microsoft has become a monopoly on the operating system on computers. Microsoft needs competition so that we the American people can receive the best products. In the case, the PFJ will allow Microsoft to continue as a monopoly which is not right! Thank you for your consideration.
Respectfully,

Subject: Microsoft Settlement
The proposed settlement will not end abusive, anti competitive acts by Microsoft. Any suitable remedy should include as a minimal subset: Public disclosure of all file, disk, network protocol and other data interchange formats used by Microsoft operating systems and programs. This information to be sufficient to allow seamless translation to and from Microsoft file formats, and seamless interoperation with Microsoft software.
Full disclosure of all Application Programming Interfaces. Microsoft applications forbidden to use interfaces unavailable to independant software developers.
No software discounts other than quantity purchased. Uniform, publiclly available price schedules. Microsoft product licences to be made transferrable and vendable, the same way physical products are treated [e.g. textbooks, novels and other common publications].
No penalties may be asesed by Microsoft against computer manufacturers, software developers or end users for using non-

Microsoft software or supplying it as an option.

Computer manufacturers to have free reign to sell the hardware and software that they deem approriate, including systems without an installed operating system, or systems operable with multiple operating systems.

Microsoft software installations are not permitted to disable currently functional software. Microsoft to be forbidden to announce products prior to 90 days before shipment to customers.

Any group monitoring terms of the settlement to have the right and duty to provide public disclosure.

To: Microsoft ATR
Date: 1/28/02 12:13pm
Subject: Microsoft settlement citizen/ competitor input

I understand that there is still time to submit public comment/ recommendations on the Microsoft antitrust settlement.
Summary:

* The software industry is so complex, and Microsoft so dominant, that administrative and procedural remedies will be a complete waste of time for the government and Microsoft itself. There are too many loopholes and back- doors to ever regulate the company as structured.

* Splitting the company up would work to an extent, but over the long run would simply create two or more monopolies, rather than one big one.

* Perversely, the industry actually prospers when there is a near-monopoly to drive de facto standardization. The software industry does *not* thrive on the chaos of small players. So the industry would be best if there were a quasi monopolist that didn't do economic harm.

* The only way to actually neutralize a monopoly in the software industry is to fundamentally alter the economics of the monopolist. With the incentive gone, the behavior and damage to the industry would fade away.

* The operating systems market for Intel-based PCs is brain-dead: it exists, but it does not function in any meaningful sense. So there is an opportunity to neutralize the bad effects of the Microsoft monopoly.

* The government can use the argument of eminent domain to declare the PC OS ''marketplace'' as property that will be taken over in the public interest. The government then grants this ''marketplace'' as a dead-zone in which only Microsoft can be a commercial supplier. The government pays Microsoft one dollar a year, and the fees paid by PC vendors for their operating systems goes to the US treasury. (An alternate form of this recommendation is just to put Windows into pure open source, where many vendors can work to make the system more secure and reliable while no vendor can charge for the product.)

* Microsoft thus has an incentive to keep their OS innovations going (to make their applications business prosper, but they get no monopoly profits from the OS. They also have little power over the PC vendors or application vendors.

Now that I've written the ''summary,'' I'll spare you the details.

Regards, and good luck.

Subject: Microsoft Settlement

Judge Kollar-Kotally,

I wish to express my personal perspective on Microsoft vs. U.S

As an 8th grader in Rantoul, Illinois I have concluded and noticed many disturbing views of Microsoft's control of the software industry or as we would say monopoly. I really don't think its fair Microsoft is a monopoly because of the prices it sets on software. $200 on software program which I know it would be about $50 if there was competition.

I have learned in school about the Sherman Anti-Trust Act was too weak or very ineffective because of big companies bribing high officials which I think that Microsoft is doing. I might not have any proof but I know that Microsoft is at least violating some part of the Sherman Anti-Trust Act which I think is really wrong. If we let one company do this then slowly more and more companies will start doing this in other industries.

Although I like the stuff Microsoft makes the thing is that they set the prices to high.We all know that there are many more companies competent enough to make such software if given a chance. That way people will have more variety. Microsoft is just taking it easy with coming out with not so late and just adding a few adjustments to their software at their own price and pace they would like to set it at. If there are more companies the quality of the product will become better and that way many companies will join in to make the best quickly. The prices will be low and the people will be content.

Thank you
Sincerely Yours,
Yashua Bhatti

January 26, 2002

Dear Mr. Ashcroft:

As a member of the IT industry, I welcome an end to the Microsoft anti-trust case. This case has had a debilitating effect on the IT industry and the economy in general. If fair competition is the desired end to the government's actions, competition is not encouraged by draining the energy of one competitor. You do not get a better race by hobbling the favorite. Howsoever, a means to end this case exists in the proposed settlement agreement before you now for consideration. It should be adopted and this case resolved. The settlement fairly deals

with the positions of all the parties. Microsoft, by its terms, will remain one sole corporation, but will take certain actions to dilute its monopolistic influences in its industry. Microsoft will now configure its Windows platforms to invite the use of non-Microsoft software. It will no longer contractually constrain computer manufacturers to the nearly exclusive use of Microsoft products in licensing agreements. It will submit itself to ongoing review by a new federal oversight committee. It has committed itself to a completely new method of doing business entailing an active effort to foster competition. Microsoft deserves to continue to thrive. It is an elemental force in perhaps our nation's most important industry. Please support this settlement.

Sincerely,
Robert Petolillo

Attorney General John Ashcroft
U.S. Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I suspect the Justice Department offered to settle its antitrust lawsuit against Microsoft due to your taking over as head of the agency. As a reasonable man you probably recognize the Clinton Administration's antitrust suit against Microsoft, and their intended break-up of the company, jeopardized software innovation and standardization. This scenario would seriously hinder the United States'' competitive edge and is why the settlement should be finalized without further ado.

If one accepts the premise that Microsoft is a monopoly, which I do not, the settlement will cure the problem. The settlement speaks for itself: 1) Microsoft has agreed not to retaliate against computer makers who ship software that competes with anything in its Windows operating system; 2) Microsoft has agreed not to retaliate against the software developers who make or promote the software that competes with Microsoft. While these are only two tenets of the 22 pages of the settlement, they alone should make Microsoft's competitors happy because they will inhibit anti-competitive behavior. I find it curious that certain opponent's of Microsoft reject the settlement and refuse to sign on to it. It is unfortunate; they should not be allowed to derail the process.

I am a small business owner in South Mississippi who specializes in computer networking and software support. It is my steadfast belief that the free market should be allowed to determine which products are bought and sold by professionals in the industry. Microsoft offers superior products and this is why they possess the market share they do. This lawsuit has not only affected my business but also my investments in the market. It is my hope that the government will accept the settlement in as timely a manner as possible so our industry can begin to heal from this unnecessary intrusion into the free market.

Sincerely,
Kevin McDaniel

From: Neal Lindsay
To: Microsoft ATR
Date: 1/28/02 12:15pm
Subject: Microsoft Settlement

To Whom it might concern:

I am a network administrator for a small engineering company, and I have been working with computers for half of my life—usually on Microsoft operating systems. I have had the chance to use other operating systems (such as various Unices and Linux) and many have signifigant advanced features that Windows (even XP) has not come close to. Microsoft has the money to implement such advanced features, but it does not have to because its customers are locked into its operating system. This is probably the single largest problem plaguing the computer world right now, and this case has the opportunity to force Microsoft to open up and let in any companies brave enough to challenge it. That being said, I do not believe that the proposed Microsoft settlement goes far enough. The idea of making Microsoft open up its APIs is a good one, but it is weakened by the restrictions placed upon it. For example, any scrutiny of Microsoft's code is bound to reveal security holes (Microsoft software is traditionally full of them). Microsoft would almost certainly use this as an excuse to not open up more than a token amount of what would be needed for a company to compete with them.

This case is complicated from both a legal standpoint and a computer technology standpoint—to the point that almost noone can understand the proposed settlement. You are not likely to find an impartial voice in all of these public comments—everyone has a stake in the outcome. But please, don't let Microsoft off with just a slap on the wrist. They have continued to violate anti-trust laws even as they were in trial for breaking those same laws. They need some sort of serious penalty AND need to take steps to reverse their ill-gained market shares in many different markets.

Thank you.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I am filing my objection to the Proposed Final Judgment in the Microsoft case. In the last several weeks, close friends and relatives have brought this proposed settlement to my attention and in all honestly I dont like what I see. I cant possibly imagine the Department of Justice throwing out court findings that indicts Microsoft for all illegal activities both past and present. First and foremost the Proposed Final Judgment grants MS a government mandated monopoly that threatens to destroy any and all serious Microsoft competitors. Im all for free enterprise and what it symbolizes. To strike a huge blow against the spirit of free enterprise, one need not look any further than to allow MS to monopolize every sector, whether it is the gaming industry or the software industry, by eradicating most if not all competitors. By all means diversity is one essential ingredient in maintaining a healthy industry and more importantly a thriving economy.

I submit to the Court that the Proposed Final Judgment does not solve the Microsoft issue.

From: George J. Papanicolaou

To: Microsoft ATR
Date: 1/28/02 12:15pm
Subject: Microsoft Settlement

To Whom it May Concern:

Pursuant to the Tunney Act, I am writing to comment on the proposed settlement of the United States vs. Microsoft antitrust case. The proposed penalty for Microsoft's violations is entirely prospective and the predictability of the penalty to effect a sufficient diminishment of Microsoft's anticompetitive behavior is completely inadequate, including being overly complex and to vague, especially in light of published comments by Microsoft CEO Steve Balmer after Microsoft's conviction that he does not even know what a monopoly is. Furthermore, Microsoft has failed to live up to previous agreements. In addition, Microsoft did not report its extensive lobbying of Congress or a White House meeting last summer between its chief executive, Steve Ballmer, and Vice President Dick Cheney. This is a violation of the Tunney Act itself.

What would make the settlement fair? Divide the company into Applications and System Software entities with a firewall between them. Had politics not interfered, this approach was the only logical choice. Failing this reasonable approach, other remedies, although half-measures are required.

1) Open up all Windows APIs to all interested parties with thorough documentation and standardization. Exorbitant penalties would be made if either the APIs are not fully documented or if non-open APIs are used by Microsoft.

2) Open up all Microsoft Document Standards and publish them immediately because market dominance has created a defacto standard for such files. In addition, the use of a non-Microsoft standards board, modeled on the W3 organization for web site documents, could insure that office as well as other documents generated by Microsoft applications would be fully usable, readable, and alterable by other programs. This would allow some competition in the office suite industry and hopefully prevent the use of ''Microsoft only'' codes in browser or office apps that prevent others from having a choice in selecting an office suite. Also, features that allow a user to assign the opening of programs with other apps through a central registry would be useful, allowing an individual to easily bypass Microsoft Products and Services.

3) Microsoft should be required to produce Office Software for the Macintosh system as long as Apple remains in business. It should not be able to again threaten Apple with canceling further Mac Office development. In addition, Microsoft must be required to make the Mac Office Suite with the same features and document transparency as the Windows version. They must also not hobble the software in any way to make the Windows version appear faster. As Mac Office is a profitable venture for Microsoft, failing to manufacture it would be indicative of a monopoly threatening a small rival.

In addition, software which can interact with Microsoft server products, such as Outlook, should be made available for the Mac, including subsequent operating systems, and have all features available in the Windows client.

4) In order to give more choices to consumers, either Microsoft should create a Linux version of their Office and Browser software or should license their software and/or ''look and feel'' to anyone wishing to produce software for the Linux system. This would keep Microsoft from keeping offices and homeowners away from alternative operating systems. Microsoft used to offer Word for Unix systems with far fewer users than Linux. It cannot argue that as a company with monopoly powers and rich coffers that it isn't feasible.

As someone who has been using computers and programming them for seventeen years, I have seen little innovation from Microsoft. The advances in the field have been due to smaller players that have been crushed by Microsoft. Currently, Microsoft has monopoly powers and is seems less concerned with innovation, reliability, and security, than with market domination and extension. Our national security and economic competitiveness requires a stronger action than has been proposed by the Justice Department.

George J. Papanicolaou, PhD.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

Your honor, I am stating my objection to the Final Settlement agreed upon between the Department of Justice and Microsoft. I wanted to point out several underlying flaws attributed to the Proposed Final Judgment.

One noticeable flaw encompasses an inept enforcement device implementing restrictions. The settlement in other words closely monitors and screens all of Microsofts business activities. This close scrutiny insures MS complies with all restrictions entailed in the agreement.

A three man compliance team will oversee and insure that Microsoft comply with the stated rules and regulations. Yet, this three-man oversight committee will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team.

Also, in the likelihood of any enforcement proceeding, all findings by the oversight committee will not be allowed into court. The sole purpose of the committee is to inform the Justice Department of all infractions by Microsoft. Subsequently the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions. When all is said and done, the oversight committee is just window dressing, who will not strictly oversee Microsofts business moves?

In my opinion, the Proposed Final Judgment does not provide appropriate restrictions against Microsoft. What reassurance do we have against Microsofts illegal and illicit activities? I can assure you that the Proposed Final Judgment does not effectively nor sufficiently address the question. In conclusion, I submit your honor my objection to the final settlement in the Microsoft case.

Subject: Judgement

If I understand the Judgement correctly, Microsoft is to receive no ''punishment'' at all for it's illegal activities. They are only instructed to stop performing them. This is a problem. Perhaps the Government or the Court feels that Microsoft has already suffered some penalties because of the interruption of business and other interference because of this litigation. However, in other cases where, for instance, a criminal's punishment is limited to something already done (i.e. ''time served''), sentence is still passed for the record and that stipulation that the sentence is to be considered ''fulfilled'' is still entered into record. And considering the amount of money that the various governments have had to spend in legal proceedings simply to force Microsoft to stop behaviors that were illegal to begin with, the governments should at least apply penalties to recoup these monies in the interests of their constituents.

Dear Mr. Ashcroft,

I support the recently proposed antitrust settlement between Microsoft and the Department of Justice. I would like to see an end to this lawsuit and I believe this is one of the more favorable resolutions. Microsoft has given up access to several of its Windows products, and given up much of the code that helps Windows run efficiently.

Historically, Windows has been a large part of its competitive advantage. This is a very generous concession on the part of Microsoft. I hope that you will support Microsoft. It has stood out as a great example of a company that can be charitably generous and still make lots of profit. We should allow it to continue these efforts.

Sincerely,
Deborah Rose

Subject: Microsoft PFJ Comments.

To whom it may concern,
<mailto:microsoft.atr@usdoj.gov>

As a consumer of Microsoft products as well as a business professional in the software industry I would like to add a few important comments concerning the proposed final judgment between the US DOJ and Microsoft. Simply put the proposed settlement does very little to address the three items listed by the US Court of Appeals. Hence, my recommendation is that the PFJ proposal in its current form is not acceptable. I ask that the DOJ needs to address the three key components listed unanimously by the U.S. Court of Appeals ruling. Specifically, to

*terminate Microsoft's legal monopoly

*deny Microsoft the fruits of its past violations

*prevent future anticompetitive activity.

As an observer and professional in the software world I define Microsoft's mantra to be one of domination. Over the past few decades Microsoft has uses both legal and illegal practices to attain their goal of domination. If the current PFJ is accepted, I'm left with two questions.

First, does the DOJ's definition of effective anti-trust work include the supporting of monopolies? Second, is the precedent for dealing with companies with a track record of violating anti-trust laws to condone their track record of violations? I hope the answer to both questions are no. As such I ask that the current PFJ be updated to include the three items unanimously decreed by the US Court of Appeals.

It is great to be an American where each individual has a voice. Thank you for your consideration of this issue.

From: Michael Horowitz
To: Microsoft ATR
Date: 1/28/02 12:24pm
Subject: Microsoft Settlement

Hello,

One complication in this case is defining what a computer Operating System(OS) is. Microsoft keeps adding features to Windows and every time it does, it stretches the meaning of the term ''Operating System''. What Microsoft sells now is not so much an OS, but a combination of an OS and assorted applications. No doubt you are aware that what Microsoft does in expanding the scope of the OS is tantamount to what, in other contexts, is called ''dumping''. It is as if Toyota started selling its cars for $3,000 instead of $19,000 to drive Ford Motor out of business. This is exactly what Microsoft does and has done many many times. They can do it because they are rich enough and because the incremental cost of software is almost zero, brutally different from an automobile. This case may have been about web browsers, but people in the computer field have seen Microsoft use the same tactic (give away software to kill the competition) many times.

MY SUGGESTION:

I suggest that development of Windows be assigned to a separate company that is restricted to developing an Operating System in the strictest sense of the term. This will require monitoring by an independent entity as to just what features and applications belong in the base OS and which are considered external applications (more on this below). I'm not sure if this separate Windows OS only company should be for profit or not.

This would let Microsoft add whatever features and applications they want to the core OS and sell a product called Microsoft's Windows. However, Dell and Compaq and Gateway and IBM would also be free to add whatever features and applications they wanted to the core OS and sell it as their version of Windows. Any software company should be free to license the core Windows OS and add whatever features and applications they want and sell it on the open market. Each company selling a version of Windows would compete based on price, their reputation for quality software and support, and the features and applications they chose to include. This, by the way, is how Linux is sold with the exception that the core Linux OS is free. I am not suggesting that the core Windows OS be free.

Drawing the line between the core Windows OS and extra-add-on applications could be a full-time job. In the case of word processing for example, it seems obvious that Notepad and WordPad are not full-blown word processors and therefor could be included in the core OS. In contrast, Word and WordPerfert are full featured word processors and therefore falls into the category of a seprate application. In other areas the distinction will not be so easy to make. If a program to play sound files can have 100 features, which of those features qualify for a bare-bones version that can be in the core OS and how many features does a program need before it qualifies as a full-blown application that can not be included in the core OS? Someone will need to decide.

That's my 2 cents. Thanks.

Michael Horowitz

It is my opinion the settlement represents the best opportunity for Microsoft and the

industry to move forward. The rulings are fair to all parties involved.

It is also my opinion that Microsoft is one of a few American corporations that truly has the ''consumers'' best interest at heart. I can't say that for many other corporations.

Dear Judge Kollar-Kotally:

I am writing to comment on the Proposed Final Judgement with Microsoft. As one involved in the software industry, I appreciate the contributions of Microsoft. However, their dominance of operating systems has given them extraordinary market power, which they have used ruthlessly to crush competitors and forestall innovation in the interests of consumers. The PFJ needs to be materially strengthened to level the playing field. The sanctions must be strong and the disincentives to further monopolistic behavior clear. Do not allow Microsoft to play on complexity, market uncertainty or promises of different behavior in the future. The company's culture is one of ruthless competition at a time when they should be providing support rather than destruction. They now operate a utility, are enjoying monopolistic returns on capital and are utilizing their financial strength to maintain a monopoly position.

The consumer is served by the standardization that Microsoft's success has brought. But the consumer is also vulnerable to the abuse of monopoly power. The public interest requires that the Federal government either sanction and restrain the monopolist or eliminate the monopoly position.

It's that simple.

Sincerely yours,
David Bock

To Whom It May Concern:

I am writing to comment on the Proposed Final Judgment (PFJ) of the United States v. Microsoft antitrust case. I believe that the PFJ does very little to discourage Microsoft from continuing its anticompetitive practices, and fails to restore balance to the markets which have been seriously damaged by those practices in the past.

Specific Failures of the Proposed Final Judgment:

1. Section III.J.2

Section III.D requires Microsoft to licence ''the APIs and related Documentation that are used by Microsoft Middleware to interoperate with a Windows Operating System Product'' to ''ISVs, IHVs, IAPs, ICPs, and OEMs''. However, section III.J.2 essentially gives Microsoft the freedom to choose which ISVs, IHVs, etc. may receive this information by allowing Microsoft to require that any licensee ''(a) has no history of software counterfeiting or piracy or willful violation of intellectual property rights, (b) has a reasonable business need for the API, Documentation or Communications Protocol for a planned or shipping product, (c) meets reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business, (d) agrees to submit, at its own expense, any computer program using such APIs, Documentation or Communication Protocols to third-party verification, approved by Microsoft?''

This gives Microsoft the ability to keep the ''applications barrier to entry'' artificially high. There are no restrictions on what Microsoft may consider ''authenticity and viability of [the licensee's] business'' or even a ''reasonable business need''. It could be used to keep start-up or open source software projects from gaining access to APIs crucial to their success; in fact, it could allow Microsoft to restrict such projects from information to which they had prior access via the MSDN. (See, for example, Jeremy White's analysis of the impact of section III.J.2 on the open source Wine project at http://www.codeweavers.com/jwhite/tunneywine.html.)

2. Section III.D.1

Section III.D.1. exempts Microsoft from the requirement to ''document, disclose or license to third parties: (a) portions of APIs or Documentation or portions or layers of Communications Protocols the disclosure of which would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems?''

It has been reported by a variety of news agencies that Microsoft has plans to include digital rights management, authentication, and other related security features in future versions of Windows. See for example,

The Register, Mar 23 2001,

''MS plans ''Secure PC'' that won't copy pirated audio files''

http://www.theregister.co.uk/content/4/17851.html

Wired News, Feb 13 2001,

''Windows XP Can Secure Music''

http://www.wired.com/news/technology/0,1282,41614,00.html

Microsoft has already included encryption services in Windows 2000 Service Pack 2

(see http://www.microsoft.com/windows2000/downloads/servicepacks/sp2/def ault.asp).

Given Microsoft's past actions, including integration of Internet Explorer with the Windows OS, and more recently integration of Windows Media Player with WindowsXP (see http://news.com.com/2100–1040–256387.html?legacy=cnet), there is every reason to assume that Microsoft will integrate current and future installations of ''anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems'' into the Operating System. Thus many key APIs, such those dealing with basic network communication, file/disk access, and even simple multimedia capabilities could be claimed as exceptions under section III.D.1. Again, this would serve to keep the ''applications barrier to entry'' artificially high.

3. General Remedies and Penalties

Microsoft has been found guilty of maintaining their monopoly status through illegal means. They should not be allowed to maintain the profits earned by doing so. The PFJ basically codifies the current status quo into law, and neither punishes Microsoft for their past infractions nor prevents them from similar actions in the future. Strong structural and financial remedies and/or penalties are necessary to restore balance to a horribly damaged marketplace.

The Proposed Final Judgment is completely unacceptable as a resolution to the U.S. v. Microsoft case. Please consider stronger, more effective remedies.

Thank you,

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

With all due respect, I object to the (PFJ) Proposed Final Judgment in the Microsoft case. There are numerous flaws in the final proposal, which undoubtedly gives Microsoft absolute, power to continually abuse their existing monopoly position. Based on my review, the proposed settlement overlooks one thing. This one defect contains a faulty mechanism to implement appropriate restrictions. As stated in the settlement, Microsoft will be closely monitored to comply with all restrictions encompassed with in the stated agreement.

A three man compliance team will oversee and insure that Microsoft comply with the stated rules and regulations. Taking a closer look however, this three-man oversight team will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team. Also, in the likelihood

of any enforcement proceeding, all findings by the oversight committee will not be allowed into court. The sole purpose of the committee is to inform the Justice Department of all infractions by Microsoft.

Subsequently the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions. When all is said and done, the oversight committee is just window dressing, who will not strictly oversee Microsofts business moves? In my opinion, the Proposed Final Judgment does not provide sufficient and appropriate restrictions or penalties against Microsoft. What reassurance do we have against Microsofts illegal and illicit activities? I can assure you that the Proposed Final Judgment does not effectively nor sufficiently address the question. Therefore I submit to the court my objection to the Proposed Final Judgment.

Subject: Microsoft Settlement

Dear Ms. Hesse:

I am the owner of a small interior design firm and would like to comment on the settlement with Microsoft.

I believe that there is undue haste in reaching a settlement for what has been a carefully executed pattern of illegal behavior by Microsoft. Microsoft controlled the application market so tightly in the Macintosh operationg system that it not only drove out competitors like WordPerfect but used its applications as hostage to obtain concesions from Apple Computer, Inc.

The pattern of illegal behavior forced Apple to offer the Microsoft, Internet Explorer to be the supported application by Apple. If this would not have happened, there would have been no Office, Word or Excel. Futhermore, those us who used Netscape still found that the presence of Microsoft codes in the office applications to crash the Netscape browser. The choice for us was the applications or the Netscape browser. The same type of illegal tactics got its media player dominance after finding that they copied code from QuickTime. This issue was closed when Microsoft gave money to Apple to drop the suit. The patter of illegal tactics by Microsoft is quite large and pervasive and I find the current proposed settlement to be insufficiently punitive to punish or to encourage Microsoft to change its ways.

I strongly suggest that the monetary settlement be cash and that the sum be increased to 5 Billion dollars, a sum that will teach a lesson and one that Microsoft can afford.

Sincerely,
Louis R. de Alvare

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to express my opinion of the recent settlement between the US department of Justice and Microsoft. I think the lawsuits have dragged on for far too long now and have been a waste of taxpayer dollars. I am a proponent of free enterprise and the government's interference with Microsoft is ridiculous.

The only criticism of Microsoft could be that their marketing tactics are a bit heavy-handed, but that is hardly an antitrust violation. The terms of the settlement are harsh against Microsoft and should appease all competition. Microsoft will be disclosing interfaces that are internal to Windows operating system products. They will also be granting computer makers broad new rights to configure Windows so that competitors can more easily promote their own products. These concessions and more should appease all parties involved in dispute.

I urge your office to do what is right for the public and our economy and finalize the settlement.

Thank you.

Subject: Microsoft Settlement

As a Macintosh user I feel that Microsoft did nothing wrong. I believe what we have here is envy of Microsoft's competition in that they did develop the idea first. Bill Gates had the foresight and ambition to move ahead when he did. After all is this not the land of opportunity and free enterprise. The competition was asleep at the switch and Gates seized the moment.

Bill Gates and Microsoft should be praised for advancing the technical knowledge of computers that we are all benefiting from.

So, my feeling is that the Federal Government should get off the back of all businesses both big and small so that we can make progress. It is about time that all entrepreneurs are recognized as the people that make this country as great as it is and make the economy strong.

Subject: Microsoft Settlement.
C/O Renata B. Hesse, Antitrust Division,
U.S. Department of Justice,
601 D. Street NW. Suite 1200,
Washington, DC 20530–0001

To: Judge Colleen Kollar-Kotelly

My name is Mark Montgomery. My background includes being an entrepreneur and management consultant who was also an early booster to Microsoft dating back to 1981. Since that time, my consulting assignments have numbered in the hundreds, including dozens of small businesses in networked industries and recently specifically within the IT industry cluster.

I converted our business consulting firm in 1995 into an independent tech incubator and lab. My only business partner joined our firm in 1997 after working for Microsoft for 17 years. I myself trained with Microsoft products to become an NT network administrator, programmer, and analyst who has tested every major public technology Microsoft produced during the period of this case, watching in amazement and sometimes horror at the pace of justice when compared to the environment in question.

I am writing today primarily because circumstances in this case may allow me to see more potential areas of damage than others. As any of us who have worked in predatory environments know all too well, it is rarely what we see that threatens our system, but rather what we cannot. In this case, I do not believe that any human is capable of identifying even a small portion of the damage being done to consumers, much less society, including of course eventually Microsoft and their investors.

I would like to explain some of our attempts to work with Microsoft at every level, and the extreme financial stress, disappointment and embarrassment a few of their executive actions have caused us and others, but the topic today is on the proposed settlement pursuant to the Tunney Act. I have carefully studied the proposed settlement as well as every document filed in this case since the beginning of the trial. In the early stages of the case, I provided analysis for the members of our global digital network.

In addition, I may have been the first to publicly label Microsoft a threat to the global economy, one of the most difficult declarations of my career that may also partially account for our failure in attracting external funding to our ventures.

For me, this case represents a test of the very credibility of the U.S. justice system. Although the case history has been difficult, and I have not always agreed with the rulings or conduct of the court, the system credibility was from my view in a recovery phase until the USDOJ agreed to settle as proposed. The agreement of the USDOJ to settle on the proposed grounds is where the system broke down entirely. I'll leave it to others to speculate and/or determine why.

The proposed settlement is a disgrace and an insult to those of us who risked everything we had, and often lost, to speak out against what I believe ranks among the most dangerous threats to the future of the world in our time; the ability of innovative technology to be conceived, hatched, and reach maturity. I fear that if the proposed settlement is adopted, and the EU and Congress also fail to restore liberty within global IT markets, that our creative scientific genius will fail to meet the significant challenges lying directly in our collective path.

Therefore, from my perspective, the world simply cannot afford to allow the proposed settlement to stand. It would be more favorable to risk having an appeal overturned on technical grounds, and allow the political process to work (or not), than to suffer the stamp of approval from the very entity charged to defend and protect us against illegal predatory practices. A portion of the still untold story of modern predatory strategy, generally speaking, is just how successful preventative efforts have become with respect to the invisible potential competition, and that topic is certainly not limited to Microsoft. Indeed Microsoft is a nascent latecomer in that regard when compared to the more historically entrenched vertical industry leaders, revealing another glimpse of why justice must be served in this case.

I submit to you that a just conclusion to this case is entirely possible, but a negotiated settlement that provides justice may not be.

Thank you for your consideration of my views, and God's speed in your work.

Mark A. Montgomery

January 28, 2002
Attorney General John Ashcroft, US Justice Department
950 Pennsylvania Avenue, Washington, DC 20530–0001

Dear Mr. Ashcroft,

I'm glad that a settlement was reached in the antitrust case between Microsoft, the government and nine states. However, I don't feel there should have been any litigation in the first place. Free enterprise should manage itself.

Not only has Microsoft agreed to make sweeping changes so that to computer manufacturers can configure Windows in order to promote competitor software programs that compete with programs included in Windows. They've also agreed to not enter into any agreements forcing other companies to distribute or promote any Windows technology exclusively or in a fixed percentage, except for a few exceptions where there isn't any competition anyway.

It is obvious to me that Microsoft is cooperating so they can go back to business and help revive the technology sector of the economy. No more action should be taken at the federal level at all.

Sincerely,
Raymond Fairbanks

January 27, 2002
Attorney General John Ashcroft
United States Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Attorney General Ashcroft:

I am writing in regards to the settlement reached in the antitrust case between the U.S Government and Microsoft in November of 2001. I am asking you to support the agreement. I do not believe any further measures are necessary.

As you know, the settlement requires Microsoft to promote competition from other computer makers. For example, Microsoft must license its Windows operating system to other computer makers and to grant them rights to configure Windows to meet other system specifications. Furthermore, Microsoft has been required to design further versions of Windows in a manner that would make it easier for competitors to promote non-Microsoft software within Windows. It is my opinion that this legislation is sufficient. Microsoft was not dealt with lightly, and I believe that further litigation would be less of a productive and more of a vindictive nature.

I am satisfied that Microsoft has been justly dealt with in the antitrust case. Further litigation would no doubt lead to restrictions and obligations on products and technologies that did not fall within the scope of the case. Microsoft has paid its dues to society; now I ask you to let them get back to business. I appreciate your taking time to consider my views on the issue.

Sincerely,
Donald W. Monk

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I am opposed to such a preposterous solution in regards to the Proposed Final Judgment in the Microsoft case. Based on past findings the Court of Appeals has found Microsoft guilty of violating all rules of the anti trust laws.

Yet the PFJ (Proposed Final Judgment), the Department of Justice throws out these findings, indicting Microsoft on all charges of business wrongdoing. More importantly, the PFJ allows Microsoft to continue with its monopolistic practices. I strongly believe you will receive similar appeals entailing the numerous errors apparent in the final settlement. To make a long story short, the PFJ does not effectively break up Microsoft. But in fact, permits Microsoft to leverage its current monopoly position and expand its business into several other technologies markets. In the past most monopolies were either broken up or carefully regulated. Why not Microsoft?

Severe reprimands by the DoJ do not drastically alter Microsofts existing operation methodologies. Time and time again as history will show, Microsoft will abuse its monopoly position. Breaking up Microsofts business into several parts just might be the best antidote to prevent MS from even doing more damage to the industry. Therefore I submit to you that the Proposed Final Judgment does not solve the Microsoft issue.

Microsoft Settlement U.S. Department of Justice

Dear Microsoft Settlement U.S. Department of Justice:

The Microsoft trial squandered taxpayers? dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

From: Robert Sartin
To: Microsoft ATR
Date: 1/28/02 12:33pm
Subject: Microsoft Settlement

I am against the current proposed settlement of the United States vs. Microsoft case.

I have been programming professionally for 20 years. In reviewing the terms of the settlement, I am unable to see how the terms will in any meaningful way improve the competitiveness of the current environment. The disclosures required by Microsoft are too weak and the exemptions too great. It will be trivial for Microsoft to continue to keep secret important information and use it for unfair competitive advantage. The proposed settlement will perpetuate an environment in which Microsoft can, and based on past experience will, withold critical information from developers who are perceived to be competing with Microsoft. Lack of access to such information, generally available for other platforms and specifically available to Microsoft and partner teams working on similar applications, will prevent a developer from producing competitive products. Continued tight bundling and coupling of Microsoft's chosen solutions will prevent new entries into the market of better technology at lower prices.

Consumers will continue to be forced to purchase and use the solutions provided by Microsoft. The price we pay will be higher due to the lack of credible competitive alternatives. Technical innovation will be decreased because it will not be necessary for competitiveness. Any settlement in this case must include provisions that will create a truly competitive environment, including competitors in the commercial and free software marketplace, and offer a variety of choices to consumers.

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I have followed the case against Microsoft for the past three years, watched media coverage from both sides, and I have concluded that Microsoft, in whatever strong-arm tactics they used, should never have been punished like this. This is a slap in the face to one of the most, if not the most, successful companies in history.

In my opinion, the Department of Justice has no right to seek further legal injunctions against Microsoft. The settlement Microsoft has proposed, benefits the competition far more than it should. The best thing for this company, the economy, and the general public is to settle this case, so that Microsoft can get back doing what it does best, fulfilling the computing needs of users. Windows is incredible; there may never be a product quite like it. I can see how the have-nots want to have a big piece of the haves. The settlement certainly gives the have-nots what they want without handing over Microsoft.

I believe that Microsoft is entitled to this settlement in every way. It appears to be reasonable to Microsoft and more than fair to the competition. Approving this settlement can do so much good for the economy, which has been weakened by stresses on our country. I passionately urge you to agree to settle this case.

Dear Judge Kollar-Kotally,

I wanted to state my objection and the error existent in the Proposed Final Judgment. There are several apparent flaws with in the final proposal favoring Microsoft. Based on my assessment the proposed settlement does not dish out any due justice or punishment on the side of Microsoft. At the same time no devices are in place to ensure MS compliance to the stated rules enclosed in the settlement.

Although being closely monitored, Microsoft will not have any direct supervision to reassure the company complies with the stated agreement. A three-man compliance team overseeing Microsoft remain in alignment to the stated rules and regulations. This three-man oversight team will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team. All findings by this committee will not be allowed into court. The sole purpose for such a committee is to inform the Justice Department of all infractions committed by Microsoft. Subsequently the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions. When all is said and done, the oversight committee is just window dressing. In turn, who will not strictly oversee Microsofts business moves? In my opinion, the Proposed Final Judgment does not provide sufficient and appropriate restrictions or penalties against Microsoft. What reassurance do we have against Microsofts illegal and illicit activities? I can assure you that the Proposed Final Judgment does not effectively address the question. I object to the Proposed Final Judgment.

Respectfully,
Janice Ortiz

Dear Renata B. Hesse Antitrust Division U.S. Department of Justice and appointed Judge;

I'll get right to the point, microsoft is about as unamerican and anti-competitive and consumer as ever there was a corporation. They've lied under oath, they've lied to their customers and they've lied to corporate investors. Their total motivation for any and everything they do or will ever do is about GREED, cash flow and bill gates, at whatever the cost to the consumer and customer. They've proven that microsoft suppressed technology by using their power and influence to intimidate. USB technology developed by intel corporation for one. If Apple hadn't built USB into the iMac when it was first introduced and now has become a standard for add-ons, I believe it would still be suppressed today. microsoft has never been honest with those who've purchased their OS! window's has never run or operated as they've claimed. It's not nor has it ever been or ever will be secure or stable! xp their latest release has been heralded to be the most ''Stable and Secure OS they've ever produced! It's better then previous, and that much is somewhat true. But it's far from stable or secure. It has failed to live up to it's claims. The in-store sales say it all to well, It's selling far below previous releases, this is a good sign that the consumer is finally seeing microsoft with ''Eyes wide open instead of Eyes wide shut! But even so it's to late for those who've bought into the lies and are now victims of false marketing and advertising hype. The countless virus attacks and hacks to their online service and severs, prove their statements of ''Stable and Secure are rendered mute.

I'm not nor have I, nor will I ever be an owner of anything with windows as an OS. I don't support anything wintel! (that's a PC running an intel processor with window's OS by microsoft) 95% of the computer market worldwide uses microsoft window's. 51% or above in my estimations would be considered a MONOPOLY! microsoft's .Net, licensing of software (taking away ownership and replacing with leasing) and Passport initiatives is a clear attempt at Corporate slavery and an invasion of our personal privacy! These initiatives are DRONE driven! USE microsoft TECHNOLOGY, AND ONLY microsoft! Where's the consumer's FREEDOM of CHOICE here? It's already been proven what bill gates said when he saw Apples Mac OS with GUI (Graphic User Interface). His words go something like this: bill, I want it! paul, That's stealing bill! bill, I don't care! I want it, this is what I WANT! window's is about 98% similar to the Mac OS. If you're familiar with the Mac OS and you saw window's or use it, you know all to well that the truth behind window's is Apple's Mac OS. To quote a friend of mine's son when he first saw window's 95, ''It looks just like the Mac's we use at school! He turned said Huh! And walked away. If it's that clear to a child, what's wrong with the adults in public, political and corporate America?!

I never have nor will I ever like microsoft! I believe there is at the heart of this company, something very WRONG and DARK and definitely not GODLY! I believe their motives are based and rooted in pure corrupt business practices. The only shining light of Good within the Black on Black existence that is microsoft, is the Macintosh Design Department! There is a saying, ''Sometimes you have to go through hell to get to Heaven.'' The only thing you'll find on the other side of microsoft is pure darkness. microsoft should be hit hard and deep, hit where it will hurt the most and that being in REAL CASH outlays in the amount of 33 billion dollars. This amount would be for all the States involved in the lawsuit, the consumers hurt by microsoft's Monopolistic practices, Corporate businesses, some should go to ''Homeland Security Initiative and finally 7 billion dollars set aside through a Private Organization and distributed for use in Private and Public Schools who need it for use where they feel it is best used and on whatever OS or Computer (Apple) they deem appropriate for the benefit of their Teachers and Students! If microsoft isn't reprimanded severely for their illegal activities through REAL CASH outlays that are made payable within one year of settlement, and hits them where it hurts! They will never stop doing what they do! BREAK the LAW! NOBODY IS ABOVE THE LAW! (The Enron disaster is evidence enough for that!) microsoft will just keep pushing the envelope of illegal activity, simply because they think they can! This time they can't be ALLOWED to get off with a slap on the hand, even if those in power say ''It could be damaging to the economy!'' That argument doesn't hold any water anymore! Not after the events of September 11th and the resulting effects on the economy thus far. In closing; I don't hold any respect for bill gates or steve balmer, nor should anyone! They haven't earned it as individuals or a company, nor do they deserve it! They're not nor is microsoft a Good example of Good Business or Corporate ethics for the youth to look up to and learn from! microsoft has done everything wrong from a moral and ethical perspective. Thank you.

Take Care;
Bradley R Johnson

Washington, DC 20530

Dear Mr. Ashcroft:

I am writing you today to inform you of my opinion in regards to the Microsoft settlement issue. I support the settlement that was reached in November, and I oppose any further action against Microsoft at the federal level.

This settlement is fair and will be sufficient to deal with the original issues of this lawsuit. Microsoft has agreed to all terms and conditions of this agreement. Under this agreement, Microsoft must share more information with other companies regarding certain internal interfaces included within Windows and any protocols implemented in Windows operating system products. Microsoft has also agreed to be monitored by a technical oversight committee for compliance.

Microsoft has done so much to contribute to our daily lives, in the office and at home. To stifle or restrict this company would be a huge injustice to consumers and will do nothing to stimulate our lagging economy. I urge you to support this settlement so Microsoft's resources and talent can be fully devoted to designing their innovative software, rather than litigation. Thank you for your time.

Sincerely,

James Jaremka (Microsoft shareholder and registered Republican)

January 27,2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

Three years ago, Microsoft was brought to trial for antitrust violations. I have been of the opinion from the start that this has been a false case. Federal antitrust laws are stifling in a global market. Microsoft has never presented a threat to the consumer by using its market dominance to raise prices or to offer a shoddy product. Microsoft would never have been so successful if the consumer had not been satisfied with its actions. Now Microsoft's competitors are upset because they are unable to pry consumers away from Microsoft. They instigated the case in the first place, and now they are seeking to overturn the settlement and bring additional litigation against Microsoft.

I do not believe it is necessary to bring additional litigation against Microsoft. By doing so, these states are essentially crippling America. Foreign competitors are not subject to the same laws that American businesses are, and all this infighting is making the American market vulnerable to foreign interests.

Putting reins on Microsoft's behavior is the same as encouraging foreign competitors to step in. The settlement should be finalized as soon as possible, for the good of the economy, the industry, and the consumer. The settlement allows Microsoft to remain intact, which is, I believe, wise. It also gives Microsoft's competitors a chance to work with Microsoft as well as compete directly. For example, Microsoft has agreed to provide its competitors with source code integral to the Windows operating system so that they will be able to operate within the Microsoft framework. Microsoft also plans to reformat upcoming versions of Windows so that the operating system will support non-Microsoft software.

Microsoft's competitors are not going to gain any greater advantage by continuing litigation. In fact, it is quite possible that they will end up doing America more harm than good. I ask you to support the finalization of the settlement.

Sincerely,

Robert Blake Jr

Date: 1/28/02 12:34pm
Subject: Microsoft Settlement

The following is the personal opinion of Peter B Kloss and is not the opinion in any shape or form of his employers, the BBSRC (Biotechnology and Bioscience IT Services)

Dear Sir

I do not know whether non US nationals are allowed to comment on this case. however, what happens in this case will have an enormous influence on what happens elsewhere, so I hope I am permitted to comment.

I am concerned that the settlement will not do what it is intended to do, that is, restrict the predatory behaviour of Microsoft. The nature of the exception clauses in the current agreement makes it possible for MS to continue to do whatever they want without hindrance. I think this is a bad thing to do and a bad message to give.

It is important that while Microsoft have this overarching dominant postion that the interests of the public and consumer are properly protected. This is particularly in the area of choice—Microsoft have continually complained that restrictions on them will inhibit ''innovation'' and choice. however, history teaches us that Microsoft have hardly ever innovated and have acted in a way to restrict choice for OEMs, business customers and consumers like to their advantage.

Let us take innovation: It is true that most OS and application ''innovations'' have been either bought in or copied from third parties:

DOS—bought from a third party

Windows (the concept)—from Xerox and Apple

Excel—bought in from a third party

Windows 95 GUI details—copied from Apple in many places (eg the keyboard short cuts)

Explorer, Web Browsing—copied the concept from NCSA, Netscape etc

Additional features in windows XP such as CD burning, camera connection and video editing—a straight copy of advanced features in Apple's MacOS

As for choice: In most respects Microsoft's leveraging of their position has restricted choice by squeezing out competitors and competing products.

A loss strongly felt personally was that Aldus once made an excellent presentation package called Persuasion. It is now a discontinued product because Aldus could not justify continuing marketing and developing the product in the face of PowerPoint being given away free by Microsoft with MS Office. This is classic predatory pricing killing off a product which was superior in every respect.

A more recent case is the free bundling of Internet Explorer and Internet Information Server with desktop and Server OS to the detriment of competitors such as Netscape and many other smaller but genuinely innovative companies. a recent scandal was the attempt by Microsoft to block access to their Web sites by non—MS browsers on the grounds that they were not ''standards'' compliant. This was strongly contested by suppliers such as Opera Software and Microsoft had to grudgingly relent. but this attempt is only the tip of an iceberg in which MS try to persuade us that their browser is the standard by brute force. This must also be seen in the context that both browser and server are notorious security risks, in part due to the insecure architecture inherent in operating systems and applications supplied by Microsoft.

Furthermore it is also true that Microsoft devote more attention to adding features to their products in an attempt to crush competing products than they do to fixing long existing problems, for example, Excel still has a number of arithmetic bugs which have existed from before version 4 which have never been fixed.

Even now, Microsoft are attempting to extend their grip in other areas to the detriment of consumer and business choice: In the area of network validation of personal credentials with the proprietry ''Passport'' authentication system In the area of video streaming delivery with bundling of ''Windows Media Player'' to the detriment of Real Inc's Real Player and Apple computer's Quicktime (a genuine standard)

In the area of on-line music delivery by attempting to corner the market with windows specific server and delivery technologies In the area of home automation and device control with embedded OS products I have not even touched on Microsoft's attitude towards OEMS, competing OS suppliers etc ..

This kind of behaviour is structural in a provenly monopolistic company. Remedies must be strong to correct this behaviour and I urge the DOJ to rethink its compromises to ensure that restrictions and punishments are appropriate to yield better behaviour. To be truthful, with the current huge market penetration of MS products, restrictions will not hurt the company for a long time to come. When they do, it will becuase genuinely innovative and superior products have taken a hold.

The fact is that in many areas where Microsoft have obtained an almost complete grip of the market they exhibit genuine monopolistic behaviour— such as many price increases forced on business users through less favourable bulk licensing schemes recently introduced. It is only a matter of time before this is attempted in other areas.

Microsoft has been legally proved to be a monopoly and to have abused its position—please treat it as such with remedies that bite.

Thank you for listening to me

with kind regards, Peter Kloss

2002–01–28

Dear Renata B. Hesse:

I do not believe that the proposed Microsoft settlement is appropriate. I believe there are numerous problems, however, I will only comment on a couple of items here.

Without any requirement that Microsoft provide detailed data file documentation on its application files (for example, the internal format of a .DOC file) there is no hope for inter operability between Microsoft and other potential software suppliers.

The same applies to Microsoft's operating system interface. Without proper documentation of the interface, all the interface, and a constraint that Microsoft may not use undocumented interfaces, other software developers will never be able to produce software that is competitive and will not be independent of changes made, perhaps deliberately, to the os interface that are detrimental to the proper functioning of applications.

May thanks for your time.

January 28, 2002
Attorney General John Ashcroft
US Department of Justice
Washington, DC 20530

Dear Mr. Ashcroft,

This lawsuit against Microsoft has proven to be more contentious than most would have anticipated. Its effects have been felt in a slowing down of consumer purchases of computer products due in part to an increased sense of anxiety on the part of the buying public.

It is for this reason that the settlement recently negotiated between Microsoft and the government is good. While I am not too familiar with the specific terms of the settlement, other than that it mandates changes in the way Microsoft licenses its software to OEMs, among other things, since both sides have agreed, then the public litigation is at long last at an end.

I am writing to express my support of this settlement, along with my hope that any further federal action will be unnecessary.

Sincerely,

Joseph Brady

Subject: Microsoft Settlement

I wish to comment on the Proposed Microsoft Antitrust Settlement via the Tunney Act. I'm a professional software developer with Xerox Corporation. I have been developing software for over 20 years. I have seen the industry change over 20 years—while the hardware has improved by orders of magnitude, software is a mixed bag—some chores are harder to accomplish (and sometimes take longer) than 20 years ago. One thing that has changed is the growth of the computer industry and the PC on every desk. Almost every PC runs microsoft software. I've been following the Microsoft-DOJ debacle with interest for years. I develop free software. I try to use products which work and which I can customize—it turns out I try not to use microsoft products. I do not want to live in a world where I have to use microsoft products to interact with other people. I have no problem if microsoft defines file formats and networking standards, as long as they are public and correct. The proposed settlement does not appear to address this. As a free software developer software developer, am I entitled to rights as a third party? Software is a new and unique creation. I think its important to have a resolution of this case which actually encourages competiting products (both free and commercial). Dan Kegel's critque is well thought out. I endorse it and urge you to read it: http://www.kegel.com/remedy/remedy2.html

I also endorse Ralph Nader and James Love's views as: http://www.cptech.org/at/ms/rnjl2kollarkotellynov501.html

Dear Mr. Ashcroft,

This letter is in support of the settlement with Microsoft. We must stop wasting money on unnecessary litigation and concentrate our resources on matters that actually need more action. Let's move forward, not backward.

This settlement allows us to go forward and end the waste. Microsoft has agreed not to retaliate against computer makers who ship software that competes with anything in Windows. Plus, Microsoft has agreed to design future versions of Windows so that computer makers and consumers can easily promote non-Microsoft software within Windows. Finally, Microsoft has agreed not to enter into agreements with other companies to promote any Windows technology exclusively. All these will be enforced by a new federal government commission.

The most impressive aspect of the settlement is that it even applies to Microsoft products that were not at issue in the lawsuit. This agreement is fair and reasonable, and it will clearly prevent future anticompetitive behavior. We must accept this settlement and allow the IT industry to concentrate on business as soon as possible.

Sincerely,

Karl Heimberger

To Whom It May Concern:

I believe that the proposed settlement is problematic for two reasons:

1. The settlement furthers Microsoft's strangle hold on the desktop platform by seeding into thousands of locations where impressionable youngsters will have access to only the Windows environment and thereby influence their future purchases.

2. The settlement only benefits a small number of the individuals who would have been harmed by Microsoft's blatant disregard of the results caused by its business strategy. America's school children of today were not the consumers affected by Microsoft's practices.

Thank you for your time and interest in my comments.

As a United States citizen, I urge you to withdraw your consent to the revised proposed Final Judgment settlement in the United States v. Microsoft Corp. antitrust case. The limitations and punishments imposed upon Microsoft do not sufficiently restore the competitive conditions previailing prior to Microsoft's unlawful conduct. The Settlement only prevents Microsoft from future monopolistic practices; it does not punish Microsoft for previous unlawful behavior. The advantages of immediacy and certainty of the proposed Final Judgment are not sufficient cause for abandonment of pursuit of further litigation.

I urge you to pursue litigation of the issue of remedy, whether as set forth in the Final Judgement entered by the District Court on June 7, 2000, or as one of the other remedy proposals described in the Competitive Impact Statement, section (V) Alternatives to the Proposed Final Judgement.

Dear Mr. Ashcroft,

I am sending you this brief letter in hopes of adding my sentiments to those millions who would like to see an end to the Microsoft case. This litigation has stymied an entire industry and contributed to our general economic malaise. There is no further reason to prolong the resolution of this case. I hope you will use your office and influence to see it settled soon. By the terms of the proposed settlement plan, Microsoft will endeavor to actively undermine its own predominance in the IT industry. It has agreed to surrender its past practice of demanding exclusive domain over software in its Windows platforms. It has even agreed to render its Windows platforms in configurations that invite the use of non-Microsoft software. It has agreed to open its technology to exploitation by its competitors. It has, in fact, agreed to facilitate competition.

These and other concessions validate Microsoft's claim to desire an open and fair playing field in the industry. Microsoft deserves this settlement and so does the country.

Sincerely,
Thomas Allbee

Dear Judge Kollar-Kotally,

I oppose the Proposed Final Judgment in relations to the Microsoft case. As one can plainly see, Microsoft continues to violate business practices. The Proposed Final Judgment does not punish Microsoft for its past violations to the anti-trust laws.

With out a doubt, Microsoft is guilty of breaking several anti-trust laws. Under the final settlement, Microsoft is permitted to retain most if not all profits gained through their illicit activities. Subsequently, the PFJ will not compensate parties injured or harmed through Microsofts egregious misdeeds.

In addition, the PFJ will not take into account all Microsoft gains made through its illegal maneuverings. With all due respect, the final settlement is basically acknowledging the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? I can assure you that the message is clear and simple.

The PFJ encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. With all due respect your honor, I am outraged at such a preposterous proposal that only helps Microsoft to remain intact and continue with its unethical practices. In conclusion I submit to you my objection to this Proposed Final Judgment.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I'm writing to you as a Supporter the Free Market. Recently it was brought to my attention that over the past 3 years every federal court that has reviewed the Microsoft antitrust case has found that Microsoft repeatedly and aggressively violated U.S. antitrust laws and was liable for its illegal conduct. It was also surprising to know that the Justice Department had announced that it had cut a back-room deal (the Proposed Final Judgement) with Microsoft that granted Microsoft a government mandated monopoly that threatened to destroy any and all serious Microsoft competitors. How can this be allowed to happen? Why here, in a free capitalist country, is it permitted to allow a company like Microsoft infringe the rights of consumers and competitors everywhere. Men have gone before us, seen the issue, and have made a way so that the rights of consumers and other competitors were protected. So why now is there an exception to the rule to let Microsoft be allowed to abuse antitrust laws?

Sure the name Microsoft has prestige, and people trust in the company's quality, however no good can ever come of a monopoly. That is why the Tunney Act passed by Congress is so vital because it ensures that all antitrust settlements proposed by the Justice Department are not ''contrary to the public interest.''

Believe me, the public interest wants to see the Microsoft Industry put to a stop before it completely wipes out all of its competitors—other defenders and leaders of the free world.

Sincerely,
Jeanette Gonzales

Subject: Microsoft comments

My inputs on the Microsoft matter.

I am a patent attorney, and I take my responsibilities very seriously, of course. I have seen several cases of hackers penetrating Microsoft systems, such as at a law firm I was associated with until recently. While most attacks seemed to be intent on corrupting files, there were some attacks that I am convinced could have and may have resulted in data being taken.

I am unwilling to expose my clients to such risks, especially since I believe the Microsoft XP OS has the capability of allowing ?someone?, such as at Microsoft, to copy data off your system with no indication to the owner. I am changing to Linux, and I find that most companies that offer software packages that run on Microsoft OS systems are discontinuing support for other than Microsoft systems (the exception is Apple, which depends on Microsoft investment and

help for their existence). In fact, since Apple has a Linux-type system and IS supported, it appears that the decision by these companies not to support other Linux-type systems has no legitimate purpose. The companies I refer to that are moving to Microsoft-Apple support only are Adobe, the Acrobat product, and the various companies that make .TIFF readers. I need both .PDF (Adobe Acrobat) and .TIFF for my patent work, and I find that to have them I must use an OS from Microsoft. Even Mapquest, where I have been getting map data, gives very unsatisfactory results on other than Internet Explorer. By unsatisfactory, I mean the results on other than Internet Explorer are such as to indicate sabotage of the Microsoft competitors.

I feel I must not expose my clients to the hazards of a Microsoft system, but I find that Microsoft, directly or through companies that depend on Microsoft, is poisoning all competing systems. I hear even WordPerfect, a clearly superior word processor, is ?on the ropes? due to Microsoft's tactics.

I would like to sue Microsoft. Can you provide any help?

Dear Mr. Ashcroft: I did not agree with the federal government's decision to sue Microsoft, and I am glad to see the two sides have reached a settlement. Microsoft is a strong and successful company because it develops the best products for the industry, and k is time to start spending the government's money on more important issues than trying to hinder this company's success. Microsoft has agreed to change its business operations so that competition will increase in the technology industry. The company will design future versions of its Windows operating system so that computer makers can promote non-Microsoft software within Windows. Microsoft has also agreed not to retaliate against computer makers that ship software that competes with anything in Windows. This settlement was reached after many long and costly hours of litigation, and extensive negotiations. It is fair and reasonable, and k should be finalized as soon as possible.

Settling now will benefit consumers and the industry, and this was what the government sought from the beginning. The American economy needs a boost right now, and stopping this litigation is a great step in the right direction.

Sincerely,
Dolly Waters

Dear Judge Kollar-Kotally-

I am stating my objection to the Proposed Final Judgment. Most honorable one, I implore you to see the true facts in the matter and judge accordingly. In the past week it has been brought to my attention an interesting development in the case involving the Department of Justice and Microsoft. A Final Settlement has been reached between the two parties, which will supposedly end the never-ending fiasco. Yet astoundingly enough based on my understanding and the information provided to me, the Proposed Final Judgment would overturn findings by the U.S. Court of Appeals indicts Microsoft on violating antitrust laws. After further review of the proposed settlement I find it hard to believe the Justice Department would withdraw their charges against Microsoft. In fact, based on the assessments made on the proposal, Microsoft will go scotch free from any charges of wrong doing in the matter. How can this be? There are several glaring flaws in the PFJ. However, non-so more apparent than allowing an absentee landlord to govern Microsoft. With all due respect, the final settlement provides no security to restrict MS from breaking any laws in the future. In my humble yet accurate opinion, the future governing body, implementing certain rules or regulations and forcing MS to adhere by them, will not be stringent nor forceful enough to make any dramatic changes. Similarly, I am not convinced that these stiff penalties applied to MS will ensure the security and future growth of other companies, A stiffer penalty and a whole new framework of laws must be established to justly punish MS. The Proposed Final Judgment abstains from such justification and order. Therefore I object to the stated Proposed Final Judgment.

Sincerely,
Dr. Romeo Ortiz

From: C. Scott Ananian
To: Microsoft ATR
Date: 1/28/02 12:50pm
Subject: Microsoft Settlement.

I am a graduate student at MIT, and author and maintainer of many commonly-used ''open source'' applications[*]. I have also contributed code to the Linux kernel that is used by millions of people every day. I wish to express my dissatisfaction with the terms of the DOJ/Microsoft settlement. It does not, in my opinion, serve the public interest and provide remedy for the anti-competitive actions of the monopolist. In particular, I urge a closer examination of how the terms of the proposed settlement impact *non-profit* competitive entities; as a case study you might want to examine the Apache foundation (www.apache.org), which produces the *only* web server which is a real competitive threat to Microsoft at this time. The terms of the agreement, by letting Microsoft decide what constitutes a ''real business'', threaten to exclude independent developers and non-profits like the Apache foundation from the disclosures (API and otherwise) which the settlement hopes will place a check on Microsoft. In this way, Microsoft may actually be able to edge out its last remaining competition from the marketplace —- certainly not the result the DOJ intends, and certainly not in the public interest. As an independent developer who has written (for example) a competitive reimplementation of Microsoft's PPTP protocol *without benefit of any information from Microsoft* and who would almost certainly *not* qualify for API disclosure however Microsoft decides to define ''viable business'', I have a personal interest in seeing this settlement loophole closed. And on behalf of the many people who have used my software, I can state definitively that there is a public interest in allowing developers like myself to compete with Microsoft.

Thank you.
C. Scott Ananian

Subject: Microsoft Relief

To whom it may concern:

It appears to me that a great deal of Microsoft's market power comes from its policy of leasing its software and then using the copyright laws to enforce anticompetitive requirements. May I suggest that Microsoft be required to sell its software and thereby relinquish relevent copyright rights, much as a book seller relinquishes such rights upon sale of a book. Customers, such as PC

manufacturers, would then be free to alter Micorosoft products to provide additional value to the end using consumer.

Microsoft will argue that any such alterations to the software will then make the product not maintainable and thereby void its warranty. While in the limit this is indeed possible, it practice most alterations would have little impact upon maintainability. Microsoft should therefore be also required to maintain any altered product unless and until it can show beyond reasonable doubt that such maintenance is an unreasonable commericial endeavor.

I have participated in the computer industry since 1968 and have at various companies been involved in the selling of hardware and software to PC manufacturers and PC end users. I testified for the people in US vs. IBM on software interface manipulation as an anti-competitive tactic.

The opinions expressed above are mine alone, and not necessarily those of any service provider enabling the transmission of this email.

I urge you to reject the Proposed Final Judgement (PFJ) and replace it with one that is simpler to test Microsoft's adherence to, allows for the full range of competitors to Microsoft's practices including explicitly addressing open source alternatives, and better protects consumers from being the continuing victims of Microsoft's monopolistic practices.

The PFJ does not, as stated in the Competitive Impact Statement provide ''prompt, certain and effective remedies for consumers.'' Nor will the PFJ ''eliminate Microsoft's illegal practices, prevent recurrence of the same or similar practices, and restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings'' as also stipulated in that statement.

Microsoft has shown by past and current monopolist behavior, by its tactics of embracing and extending technology in ways that force consumers to use and upgrade only its products (e.g., their extensions to the Kerberos security protocols), by selectively incorporating technology that in some cases it has appropriated from competitors into its operating system (e.g., Stac Electronics disk compression and Mosaic browser-based technology), and by adding code into their operating systems and middleware that unfairly targets competitors products (e.g, the DR/DOS code added to Windows 3.1 and the way in which consumers were steered away from Kodak applications for digital photography in the just released Windows XP) that they actively work against consumer choice.

The PFJ does not ensure ''computer manufacturers have contractual and economic freedom to make decisions about distributing and supporting non-Microsoft middleware products without fear of coercion or retaliation by Microsoft'' because it specifically allows Microsoft to enforce ''any provision of any license with any OEM or any intellectual property right that is not inconsistent with'' the PFJ. One can already find examples of a variety of Microsoft End User Licensing Agreements (EULA) in which Microsoft has forced consumers and OEMs to accept agreements that effectively tie use of Microsoft products to its middleware and operating systems and restrict the consumers right to substitute competitive technology.

The PFJ does not ensure ''that computer manufacturers have the freedom to configure the personal computers they sell to feature and promote non-Microsoft middleware, and ensuring that developers of these alternatives to Microsoft products are able to feature those products on personal computers, by prohibiting Microsoft from restricting computer manufacturers'' ability to install and feature non-Microsoft middleware and competing operating systems in a variety of ways on the desktop and elsewhere.'' Microsoft has already demonstrated they have no intent to adhere to this restriction by insisting, prior to the release of Windows XP, that their own products be given equal display on the desktop to competitive alternatives.

Finally, Microsoft has shown by its behavior of rushing products to market to further extend its monopolies, while continually delaying and extending the trials that might restrict that behavior, that it has no intention of modifying the past behaviors with which it has so successfully eliminated competition and restricted consumer choice. The PFJ is riddled with loopholes, more even than the 1994 consent decree that Microsoft flaunted the intent of, while at the same time providing cover for Microsoft to browbeat competitors with the very language that is supposed to protect those competitors. For example, the PFJ's wording explicitly excludes Microsoft from having to deal with the one consumer alternative that Microsoft has recently shown the most fear of, the open source movement, by explicitly allowing Microsoft to condition the release of documentation of its APIs and communications protocols based on Microsoft's own judgement that the third party ''meets reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business.''

The PFJ states ''Microsoft shall begin complying with the revised proposed Final Judgment as it was in full force and effect starting on December 16, 2001.'' I believe a court interested in ensuring consumers'' choice would agree that Microsoft's actions since the release of the PFJ on November 6, 2001 with respect to their .NET initiative, their attempts through orchestrated ''grass roots'' campaigns to influence the outcome of the court and legislative inquiries into their activities, the security of their existing products in maintaining consumers privacy and Microsoft's lack of ability to protect that trust, and their attempts to advance their monopolies into other markets (e.g., gaming devices and multimedia) demonstrate that Microsoft's is already flaunting the intent of the PFJ just as it has in the past flaunted the intent of other consent decrees.

Please accept the following comments regarding the Revised Proposed Final Judgement published by the DOJ at http://www.usdoj.gov/atr/cases/f9400/9495.htm .

I agree with the obvious implied spirit of the Final Judgement. However, I believe it fails to truly attain that spirit in practice in several ways, the most important of which I discuss below.

Sections III.D and III.E regarding scheduling the publication of APIs and protocols:

These two sections fail to meet the spirit of the Final Judgement in two important ways.

First, the schedules based on delays of 9 and 12 months respectively would place publication of those APIs and protocols about halfway Microsoft's own development and deployment cycle. Vendors who could benefit from using those APIs and protocols

would thus only be able to deploy products with them as Microsoft has new products looming on the horizon.

Second, the publication mechanisms specified in those two sections remain far too closed to foster competition outside of Microsoft controlled circles.

Publication of APIs as specified in III.D would be only to a select audience and only by the purchase of the MSDN (currently at a cost of between $1000 and $3000). That publication should be entirely public, possibly through a recognized standards body like ISO, ANSI or the IEEE.

Otherwise Microsoft will continue to wield essential absolute control over those APIs and their use.

Similar arguments apply to the publication of protocols.

With regard to protocols and ''interoperating with a Windows Operating System Product'' it should be recognized that all file formats used by Windows Operating System Products fall under the umbrella of ''protocol''. Interoperability must be explicitly recognized to cover any data produced by any program on any medium that might be used by any other program for a specific purpose. The current phrasing is far too weak and vague to allow interoperable alternatives to the likes of Word, Project, Visio, etc., all important Windows Operating System Products.

Section III.J further weakens sections III.D and III.E.

Section III.J has several flaws.

First, in it the Department of Justice and the nine plaintiff states sanction a policy of /security through obscurity/, an mechanism known to be flawed. It is far more secure to allow public scrutiny of security mechanisms to reveal the most egregious holes before commitment, implementation and use. Consider the work regarding DES, AES, Kerberos, etc.; even the theory behind RSA was published and widely discussed long before practical implementations were made. The possibilities and implications of vulnerabilities in the field under such policies are far worse that under published security mechanisms. Among other things, fixes become nearly impossible: (1) backward compatibility is necessary, difficult and counter-productive leading to a false of security and (2) deployments of such fixes can never be expected to be complete.

Second, by not publishing secure aspects of application protocols (authentication and authorization), third party software can never reach the point where it /can/ use the functional application protocols intended by section III.E.

All in all, sections III.D, III.E and III.J create at best a documentary opening of Microsoft products with (1) consequences for Microsoft and (2) no improved opportunities for the rest of the software industry.

Thank you for taking my comments under consideration.

Subject: Microsoft Settlement

Introduction

As a software engineer with 25 years experience developing software, mostly for personal computers, I would like to comment on the Proposed Final Judgement in United Stated vs. Microsoft.

I believe that The Federal Government is attempting to achieve a remedy that infringes as little as possible on the market, while trying to stop illegal conduct. I applaud that attempt and think that was just what you should have been trying to do. I think, however, that the Proposed Final Judgement fails to stop the illegal conduct and should be rejected in its present form.

I am not looking for the federal government to pick winners and losers in the marketplace. I want my federal government only to ensure that fair competition will let the marketplace decide the winners. At the very least, any part of this agreement should be neutral in its effect on further entrenching Microsoft's monopoly. And since this agreement is supposed to be a remedy for illegal conduct, it should lean slightly to the effect of opening the market in order to remedy past wrongs. Then, and only then, the free and fair market can benefit the consumer.

As your own Competitive Impact statement says ''The District Court held that Microsoft engaged in a series of illegal anticompetitive acts to protect and maintain its personal computer operating system monopoly, in violation of Section 2 of the Sherman Act and analogous state laws.''

Failures of the Proposed Final Judgement

1) Section III.D states Microsoft shall disclose to ISVs, IHVs, IAPs, ICPs, and OEMs, for the sole purpose of interoperating with a Windows Operating System Product, via the Microsoft Developer Network (''MSDN'') or similar mechanisms...''

The problem here is that Microsoft, as a monopolist, is setting standards for the industry. For a competitor to arise, interoperability must be possible. Restricting this API information for the sole purpose of interoperating with a Windows Operating System Product only entrenches the monopoly. There is no legitimate purpose served by restricting this interoperability to only Windows Operating Systems. For example, a competing middleware product may ask for these APIs so they can make their product compatible with both Microsoft Operating System Product and its competitors. Microsoft could refuse and thus their product tying would have succeeded in stifling competition. If Section III.D is to have the effect of fairly documenting these interfaces to stop the tying, the section quoted above should read:

''Microsoft shall disclose to ISVs, IHVs, IAPs, ICPs, and OEMs, via the Microsoft Developer Network (''MSDN'') or similar mechanisms...''

2) Section III.E states ''Microsoft shall make available for use by third parties, for the sole purpose of interoperating with a Windows Operating System Product, on reasonable and non-discriminatory terms (consistent with Section III.I), any Communications Protocol''

This is a similar failure to number 1, but more serious. These communications protocols need to be documented so that any competing operating system may use them. Microsoft's monopoly does not currently extend to the server market. If Microsoft were to gain a server monopoly by the quality of their product offering, that is fine. If they gain it by tying the server market to their current monopoly, that is the same kind of improper behavior that brought about this case. This judgement should not encourage that improper behavior and so this section I quote should be changed to read:

''Microsoft shall make available for use by third parties, on reasonable and non-discriminatory terms (consistent with Section III.I), any Communications Protocol''

3) Section III.G.2 states ''on the condition that the IAP or ICP refrain from distributing, promoting or using any software that competes with Microsoft Middleware.''

This is too narrowly drawn and to use a metaphor, confuses the cart with the horse. The illegal conduct was the attempt to preserve the monopoly on operating systems. Middleware was the tool used to preserve the monopoly. Microsoft should not discriminate against businesses that encourage the use of other Middleware, but they should not discriminate against businesses that encourage other operating systems, either. If the phrase ''Microsoft Middleware'' were replaced with ''Microsoft Platform Software'', this would have meaning. With the phrase ''Microsoft Middleware'' in place, an IAP encouraging the use of Linux, BSD or other competitive operating systems could be discriminated against.

4) Section III.H.2(second 2) states ''(e.g., a requirement to be able to host a particular ActiveX control)'' This is a terrible example and significantly lessens the likely intent of this paragraph. Hosting ActiveX controls is not a technical requirement. It is an implementation using a proprietary method. A reasonable technical requirement should not necessitate the use of Microsoft development tools. The only slightly reasonable point here is that ActiveX has been around long enough that there are a few alternative tools. I am not sure whether it is possible to build ActiveX controls withoutout the use of Microsoft development tools. If it is not, ActiveX should definitely go as an example.

5) Section IV.B.9 states ''prohibiting disclosure of any information obtained in the course of performing his or her duties as a member of the TC or as a person assisting the TC to anyone other than Microsoft, the Plaintiffs, or the Court.''

As worded, the TCs will not even be able to communicate important information to their staff or other TCs. There is also no reason to protect information about improper business practices by Microsoft. This should be amended to read ''prohibiting disclosure of any proprietary information obtained in the course of performing his or her duties as a member of the TC or as a person assisting the TC to anyone other than other TC, the TC staff, Microsoft, the Plaintiffs, or the Court.''

6) Section IV.B.10 states ''No member of the TC shall make any public statements relating to the TC's activities.''

This sentence should go. The purpose of the TC is to apply pressure to Microsoft to stay within the law. Secrecy does not serve that purpose. A better clause would read

''The TC shall make quarterly public reports. These shall be available on a web pages provided by Microsoft. Microsoft may fufill this requirement by hosting the web pages or paying for their hosting elsewhere, as long as the web pages are generally available.''

7) Section IV.C.3.h states ''maintaining a record of all complaints received and action taken by Microsoft with respect to each such complaint.''

The purpose of this judgement is to end the illegal practices of the past. Light must be shed on questionable practices and credit should be given to improvements in behavior. These records should be easily accessible to all and the best way to do this is the change this sentence to read ''maintaining and publishing on a public website at the expense of Microsoft a record of all complaints received and action taken by Microsoft with respect to each such complaint.''

8) Section IV.D.3.c states ''Microsoft shall have 30 days after receiving a complaint to attempt to resolve it or reject it, then promptly advise the TC of the nature of the complaint and its disposition.'' and will There is no feedback mechanism here to ensure that complaints are actually resolved. The complaintant should also be notified by Microsoft. If the resolution is unsatisfactory, then the complaintant would be prepared to take appropriate action. This should read ''Microsoft shall have 30 days after receiving a complaint to attempt to resolve it or reject it, and will then promptly advise the TC and the complaintant of the nature of the complaint and its disposition.

9) Section IV.D.4.d states ''No work product, findings or recommendations by the TC may be admitted in any enforcement proceeding before the Court for any purpose, and no member of the TC shall testify by deposition, in court or before any other tribunal regarding any matter related to this Final Judgment.''

This is completely unreasonable if the issue is a further proceeding involving this matter. If the TC finds out about illegal behavior, they should have a duty to report it and stand behind their claims.

Conclusions

The final judgement as it now stands will only make things worse for the following reasons.

1. After this suit is ended, there will be tremendous pressure to leave Microsoft alone and see if the judgement leads to a free market. If the judgement is a reasonable one, I would join in protesting actions against Microsoft.

2. The failures of this judgement mean that the illegal and unsportmanlike conduct of Microsoft will likely continue. Because the people who may see the evidence, i.e. the TCs, must keep silent, we will have to wait until great harm is done before we will realize it.

3. That means real competition is less likely to get its foot in the door and offer real chice to the public. This is what really drives me. I think that if Microsoft wins a fair fight in the marketplace, then we are all better off. When they use their monopoly position to keep entrants out of the market, I think everyone but Microsoft loses. I wish Microsoft was prepared to fight a fair fight, but their history tells me they won't.

I really do think kudos are in order on this attempt at a Final Judgement. It is better than I expected in many ways. The breaking up of the company, as proposed at one time was too great a punishment and I am glad to see that solution is gone. In spite of my optimism at what I first heard about this agreement, a careful reading leads me to say that this proposed judgement is not good enough. Because of the significant failures I addressed above, this agreement will not serve to undo any past wrongs and I strongly believe it will only make things worse. With a few changes, it could serve the public interest and not unnecessarily impinge on the rights of a great American corporation. If the only choices are to take the Proposed Final Judgement as is, or reject it, I say you must reject it.

Respectfully submitted on January 28, 2002

Ralph Green, Jr.

Subject: Microsoft Settlement

Which of Microsoft's competitors has even expressed an interest in undertaking the gargantuan task that is writing a desktop operating system that could compete with Windows XP? I think we must discount the tiny startups like Be, Inc. since they are no more positioned to compete with Microsoft anymore than Tucker or Rosen Motors was positioned to compete with GM. Both had superior, innovative products but were just not realistically positioned to compete with GM. Face it, there is just as much barrier to entry into any major market as there is into desktop operating systems if you are not already a megacorp.

I think the whole scope of the ''market'' that Microsoft has been found to be monopolizing has been carefully crafted to make them the the only player. That scope makes Intel a monopolist in that market too and by the same token Apple a monopolist in the Motorola-based PC market. Look at some of the dirty tricks Intel has pulled vs. AMD and how Apple displayed undeniable market control in the Motorola-based PC market— it allowed Mac clone vendors to exist and then immediately when Jobs came on board, it canceled all their licenses and put them all out of business.

To me, the market is for ''personal computing devices'' not just Intel-based PCs. It should have included Apple and Palm as well. For this reason I think the case has been fundamentally flawed from the start and I think it's whole reason for being is too. I don't think there would be a case if it weren't for competitors in other markets (Oracle, AOL, SUN) where Microsoft cannot remotely be considered a monopoly (more like a struggling underdog!) playing protectionist politics. Not one of those companies has ever made even the slightest indication of intent to create a full-featured desktop operating system for Intel-based personal computers.

Their only intent in their friend of the court activity is to get back at Microsoft for competing with THEM in their near-monopoly franchises.

If you look at it from that perspective then they are even more anti-competitive than Microsoft and certainly more opportunistic.

The bottom line: Settle this. It was never in the public interest. You've already spent too much of my tax dollars playing marionette for billion dollar Microsoft competitors.

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing in full support of the recent settlement between the US Department of Justice and Microsoft in the antitrust case. Firstly, I do not agree with a lawsuit being brought against Microsoft in the first place. Microsoft is not a monopoly, as they have never tried to deliver poor quality goods at inflated prices. They have at times employed tough marketing tactics, but that is by no means a crime in our capitalist society. In fact, I would say it is often the only way to be successful, let alone survive, in our free enterprise system. Microsoft spent huge amounts of time and money to develop excellent products and services. But rather than being allowed to enjoy the fruits of their labor, Microsoft is now forced in one term of the settlement to disclose interfaces that are internal to Windows'' operating system products. This seems to violate their intellectual property rights. I hope the settlement goes through anyway because I think our IT sector and economy cannot afford further litigation. We need our strongest assets innovating and trying to grow. I know many others echo my opinion that I work and live with. I hope your office takes a firm stance against those who want to drag the suit on still longer, and instead strongly supports the implementation of the settlement.

Sincerely,

Paul Staudenmeier

Subject: Microsoft Settlement

I hope you can settle this suit ASAP. It has gone on to long and continued litigation is harmful to our economy, due to the disruptions in the software industry. Microsoft is guilty of only trying to put the best product on the market. I've been a software user for over 20 years now and have never felt I was forced to use only a Microsoft version of a program. I have tried several others over the years and have always returned to Microsoft versions, because they are better. Would you want to be forced to buy a KIA vs: a Toyota?. Netscape was a big thing. I tried it for two years and the switched back to MSN. I use earthlink as my browser and not MSN's browser. This was a conscious decision and executed in a free market. I did not fell forced to use MSN's browser. Did breaking up AT&T really help us? We don't know where we are getting our long distance service most of the time. And rates for LD phone service?? You could write another book about that. Why don't you devote your efforts to clarifying the up and down fluctuations of the oil and gas market? That would be something the consumer would really be interested in. These state attorney generals are just looking for political headlines so they can be considered for state governors jobs. What is the average consumer really going to get out of a settlement penalizing Microsoft? Look at the Ag'S track records. How many governors were previously AG's?

Please give us a break and end this Microsoft ''witch hunt'' now.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally, I oppose the proposed resolution in the MS case, better know as the Proposed Final Judgment. Over and above the usual economic risks presented by an unchecked monopolist—rising prices and monochromatic innovation the nations computer infrastructure will be increasingly vulnerable to attack if a single software system predominates.

Obviously I am referring to Microsoft.

Suppose that 80 or 90percent of the world's grain supply came from a single variety of corns. We would be faced with the unacceptable risk that some single disease, might wipe out an enormous portion of our food supply. Having only one kind of operating system or one kind of browser would make it terribly easier for saboteurs to bring the entire Internet to its knees.

For one entity, such as Microsoft, to control 80 to 90 percent of the market for PC operating systems, Internet browsers, e-mail readers, and office productivity software is clearly a significant security risk. To then allow that monopoly to actively attempt to drive out its remaining competition would hardly be in the public interest. Diversity is the key in producing economic prosperity and improving the society as a whole.

It's now up to you, Judge Kollar-Kotally, to decide whether the proposed settlement between Microsoft and the DoJ is a correct and just solution. However from where I sit, it contains too many loopholes to drastically effect Microsoft's behavior, much less bring about a certain kind of diversity which would enhance our security.

Kind Regards,
Eddie Ortiz

RE: U.S. DOJ /Microsoft Settlement

Your Honor:

The remedy proposed by the Department of Justice (DOJ) brings to mind the Oct. 22nd statement of the SEC chairman Harvey Pitt, ''the SEC would henceforth be a kindler and gentler place for accountants. We all know what a disaster this attitude has resulted in, the Enron scandal. That DOJ would accept the settlement it has, shows that either they don't understand the impact software has in a modern economy or they don't understand the way that Microsoft exerts a negative influence as a monopolist. This settlement is definitely not in the public interest. I use software everyday on my job, as a controls engineer, in factory automation. Over the past two decades I have seen the software get more complex by an order of magnitude, requiring faster and faster computers just break even, with little increase in accomplishment. Increasingly you spend more time getting your operating systems and interfaces to work than you do actually writing the ladder logic that controls the motions and cycles of the factory equipment.

Personally, I feel the disclosure requirements required by Microsoft so that third parties can interface with Windows should be identical to that required by U.S. patent office. In the case of patents, if you don't publicly disclose enough information so that anyone skilled in the art can replicate your invention (interface with it in this case), your patent is invalidated.

Because it is a monopoly, a Microsoft copyright has the same effect as a patent, in preventing other people from entering the market. Forcing Microsoft to come up with a version of Office that would run on Linix as nine states who refused the DOJ settlement are requesting, still doesn't solve the problem. The real dollars are spent buying the Office product not in buying the Windows operating system. So you save $200-$300 by using Linix instead of Windows XP, you still have to fork over $500-$1000 to get Microso ft's Office for Linix.

In addition, there should be an anti-churning provision in the remedy. We are all familiar with churning in the stock market where your broker buys and sells stocks solely for the purpose of gaining commissions. This is exactly what Microsoft does when it brings out a new version of Windows and forces everyone to upgrade. To prevent this, the court should allow only two versions of Windows to be copywrighted at any one time, a business version and a consumer version. When a new version is brought out, all previous versions would revert to the public domain.

One of the benefits of allowing a monopoly is the standardization that it can bring. With Microsoft having so many different versions of Windows the standardization is gone. This is true both from an operator standpoint and from a software standpoint as many programs will only run on one version of Windows.

Finally let me detail two instances of fraud on Microsoft's part. The first envolves the removing of spelling check from the Internet Explorer 5 browser with Outlook Express.

When I downloaded I.E. 5 for free circa 4/28/99 it came with Outlook Express 5 version 5.00.2314.1300 for Windows 95. Under the tools menu the spelling check was a very useful feature for catching errors in you email. Recently I purchased a Dell Inspiron 3800 laptop that came with Windows 2000 and Outlook Express 5.00.2919.6700 which has the spelling check feature disabled.

In any other business this would be called bait and switch. Just to call up and ask the software support people at Dell about a Microsoft problem like this they want $29 for each question asked. Microsoft refers you to the OEM you bought the computer from. Now that they have browser dominance Microsoft wants you to fork over $500 for Office to get the spell checker you used to get for free. And with a Justice Department that ''hears no evil'', ''sees no evil'' and ''speaks no evil'' they get away with it.

The second instance of fraud involves the removal of QBasic from Windows 200 0. If a person goes to a car showroom and sees an engine listed on the sticker, buys the car and then subsequently finds out it has no engine, he would have little trouble in sending that dealer to jail. Yet when Microsoft does the same thing the DOJ just looks the other way.

The contents of the help file is the sofware equivalent to an automobile window sticker.

The help file for Windows 2000 clearly shows that QBasic is included as part of the product.

When you inquire the Microsoft knowldge base as to why QBasic isn't on your CD rom it suggests copying it from an NT CD rom. In as much as not all people with Windows 2000 have legally purchased Windows NT, Microsoft is clearly guilty of conspiracy to get people to violate the copyright act by making these suggestions.

In as much as DOJ's knowledge of computers seems limited, let me elaborate on the significance of leaving out QBasic. A computer operating system such as Windows 2000 can do nothing towards solving problems, which is the reason most computers are purchased. Without QBasic or some other additional software your computer is a $3000 piece of junk. Deleting QBasic is another example of Microsoft's bait and switch. QBasic was part of Windows NT, and it says right on the Windows 2000 boot up screen ''based on Windows NT'' Yet QBasic is gone. What Microsoft is doing here is described in the Wall Street Journal article ''Technology Grows Up'' by Walter S. Mossberg 10/25/01 pg B1 ''On the software side a similar consolidation and drying up of innovation and competition has taken place ....There are two main reasons for the demise of boxed software. First, Microsoft has become a brutal monopolist in the key software categories squeezaing out competitors.'' (pardon the spelling mistakes, Microsoft took my spell checker away) So now you have to purchase Microsoft's Visual C boxed software if you want to write some code to solve even the simplest of problems, like you can on a programable calculator.

Let me close by saying that it took extraordinary effort to locate the address to send these comments to even though I have been looking for months. I contacted Sun, several attorney generals offices, and my local newspaper's office. I find it significant that neither www.pcmag.com now www.pcworld.com felt comfortable posting the address on their web sites.

This kind of fear only a monopolist commands. Something needs to be done.

Sincerely,
Richard M. Griest

Dear Judge Kollar-Kotally,

I object to the so-called Proposed Final Judgment in the Microsoft case.

As every one knows, Microsoft continues to violate anti-trust laws set in place many years ago. The Proposed Final Judgment goes against all logic. Previously the US Court, has found Microsoft guilty of breaking the anti-trust laws. However, under the proposed final settlement, MS is permitted to retain most of its profits gained through their illegal activities. Subsequently, the PFJ will not compensate parties injured by the Microsoft debacle.

Moving forward, the PFJ does not take into account all Microsoft gains made through its illegal maneuverings. The final settlement basically acknowledges the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? Do you think the public will be in favor of such a move?

I can assure you that the message is clear and simple. The Proposed Final Judgment encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. With all due respect your honor, I am outraged at such a preposterous proposal that only helps Microsoft to remain intact and continue with its unethical practices. I submit to you my objection to this Proposed Final Judgment.

Respectfully,

Subject: Microsoft settlement

I am an electrical engineer working at a telecom research division in Boulder, CO. I am in favor of ruling as strongly as possible —against— Microsoft in the current case. The only step I'd not advocate is breaking the company up. I find Microsoft's behavior in the matters being investigated if not illegal—which I'm not qualified to judge—reprehensible, immoral and absolutely un-American. They're every bit as manipulative and predatory while hiding behind a panoply of legalisms as the worst stories of turn-of-the-century rail barons ever boasted. Microsoft is clearly an abusive company and near-monopoly. If Microsoft is not reined in, it could continue to foster and force upon an unsuspecting public, mediocre products that have not been properly subjected to the scrutiny and competition of open markets. The result will be a country ill prepared to cope with the 21st-century information age; prone to computer virus infection and poor software reliability.

Punish Microsoft! Share with them some of our pain, please.

Sincerely,
Brian Gregory

Dear Judge Kollar-Kotally,

I am object to the final settlement in the MS court case. Not only does this go against the findings by the U.S. Court of Appeals but, in facts allows MS to go unpunished for past wrong doings.

The Proposed Final Judgment allows MS to continue its predatory practices. My main argument entails the preservation of healthy competition. The way to accomplish such a task is by promoting diversity with in the business sector. For a single entity, such as MS, to control 80 to 90 percent of the market for PC operating systems, e-mail readers, and office productivity software (which undoubtedly can spread viruses) is clearly a significant risk to security. To then allow that monopoly to actively attempt to drive out its remaining competition would hardly be in the public interest.

Therefore, I submit to you that the Proposed Final Judgment will not solve the Microsoft issue.

From: Rhodes, Vaughn
To: Microsoft ATR
Date: 1/28/02 1:04pm
Subject: Microsoft Settlement

Dear DOJ,

I am the former product manager at Compaq Computer Corporation who was responsible for the Compaq/AOL deal in 1995. I worked for Rod Schrock at the time, who worked for John Rose. You used several of my email messages in your case against Microsoft. Name: Vaughn Rhodes.

I HIGHLY object to the proposed settlement with Microsoft. I'll go a step further: I have a hard time believing that it is even being proposed. It is a gross miscarriage of justice. I know because I was at the heart of the project at Compaq that resulted in Microsoft sending a letter of termination to Compaq.

Let me provide some background for you.

In 1995, I was placed in charge of defining Compaq's consumer online strategy. I proposed a relationship with America Online, one which was great for America Online, and even better for Compaq. It was worth HUNDREDS OF MILLIONS OF DOLLARS IN INCREMENTAL PROFIT to our business unit. The deal, in a nutshell, involved Compaq heavily promoting the AOL service, in exchance for AOL giving Compaq a large revenue share.

Microsoft heard about this forming relationship. They contacted us and asked that we work with them instead of AOL, to promote their new online service code-named Marvel (now known as MSN, the Microsoft Network). We responded the we would be happy to work with them, but we would expect them to pay us in a similar fashion to how AOL was to pay us.

Their response? I'll paraphrase: We are Microsoft. We own the customer, not you, Compaq. You Compaq have three choices:

1) Do the deal with Microsoft. We will pay you NOTHING, but we'll have a closer relationship, with various intangible benefits (wink wink lower price on the OS, etc.)

2) Cancel the deal and do it with nobody. We Microsoft are OK with that.

3) Do the deal with AOL. WARNING: IF YOU PURSUE THIS OPTION, WE WILL PUT YOU OUT OF BUSINESS.

Our team at Compaq reviewed the situation, and concluded that Microsoft must be bluffing. They couldn't do it, because it would be such a blatant violation of anti-trust laws.

We decided to proceed with the deal.

Shortly afterward, Microsoft sent us a letter telling us that we were in violation of their Windows Licence agreement, and we could no longer sell PCs with Windows installed. THEY WERE PUTTING US OUT OF BUSINESS!!!

Needless to say, we ended up having to redo the deal with AOL, dramatically watering it down and making it effectively into a nothing deal: no real benefit to AOL, no real benefit to Compaq.

If this kind of behavior is not a flagrant abuse of monopoly power, I don't know what is.

I would be glad to discuss this further with anyone from the DOJ.

Please contact me at your earliest convenience.

Thank you,

Subject: Microsoft Settlement

The comments on the Microsoft Settlement by Dan Kegel [1] highlight many reasons for handing down a swift and harsh punishment for Microsoft. There should be no negociating this settlement. They are at the mercy of the court and should suffer the conseqences of their actions. The following suggestion on the nature of the punishment has not been

proposed in any discussions I have seen to date.

I am concerned that the settlement talks with Microsoft have ignored the assignment of a financial penalty. Antitrust law allows for treble damages so the court has ample power to punish violators. An effective settlement must include a stiff financial penalty that is proportionate to the profits that Microsoft gained through their violations of the law. The abuse of monopoly power has resulted in many billions of dollars in windfall profits to the company. A fine of $20–30 billion would send a message that Microsoft will understand. It isn't excessive (it would be less than a year's profits) and wouldn't do excessive harm to the company's financial health (they have the cash to pay the fine immediately). Anything less will be a simple slap on the hands which they will ignore.

Awarding this money directly to those who where damaged by the abuses of Microsoft is not practical. Not everyone registers the purchase of the products involved and even if the fine were distributed the resulting award would only be a few dollars per person. A straight distribution of the fine would have no lasting outcome.

The judgement could leverage the fine against Microsoft to strengthen the punishment and benefit those who were harmed. This can be done by using the money to set up a foundation to fund open source software projects. This would result in a just solution that helps those who were damaged directly by Microsoft. Open source software is freely available to everyone, so everyone benefits equally. Open source software is also the one potential ''competitor'' that Microsoft still fears. A $20B trust fund that assigns matching grants to those who are willing to work for the public good would benefit everyone equally and potentially help restore competition to the software world. There are many open source organizations set up to help fund open source developers. Organizations such as the Free Software Foundation [2] and the Python Software Foundations [3] would be able to make significant progress in projects that otherwise only make progress through the voluntary efforts of motivated and highly skilled software developers. Imagine the good that would be had by funding 20 such organizations with a $1B trust fund. This remedy will do much to help restore the market balance, but it will not be sufficient if Microsoft continues to control the definition of standards.

The punishment must also require Microsoft to participate in the development and use of open and well documented standards. The Kerberose abuse is evidence of their intentions to subvert competition. The punishment must prevent them from further harming the market though the abuse of standards and secret interface definitions.

Subject: Microsoft Settlement

A Better Settlement Proposal

Microsoft was found guilty of violating antitrust law. Microsoft has never abided by any previous findings or judgements beyond the narrowest definition of the letter. During the various legal proceedings, Microsoft continuously demonstrated its contempt for the law and its process. The proposed settlement is, more than anything else, a license for Microsoft to continue and extend its abusive behavior at the expense of the consumer and the industry. Accepting the settlement as is would be an outrage. There must be punishment for previous crimes. There must be compensation for the vast quantity of parties injured by these crimes. There must be consequence for continued, renewed, and new anti-competitive behaviors. And, there must be a mechanism to deter Microsoft from dragging out process, as has been their habit and intent, to outlast competitors, judges, and public attention.

It is with these points in mind that I suggest the following:

1) Require that Microsoft make public all file formats and APIs, past, present, and future, without charge, to anyone who asks. There can be no squirm room here, no hiding behind a supposed need for Microsoft to safeguard internal secrets. Microsoft has always used file formats and APIs as weapons to injure customers and competitors, and any loss of business advantage from this requirement would be a minimal and fair compensation to the world at large.

2) Implement a penalty schedule to force compliance of Item 1. For each file format or API not already published, a clock would start at the first request for it, and a fine imposed for every week said item it not made publicly available. This fine would increase geometrically: a weekly fine would start at $100,000 and be doubled and collected each week. The total cost of delay for four weeks would thus be $1,500,000, and for eight weeks it would be $25,500,000. The fines and penalty schedules for information requests would be independent—by dragging its feet, Microsoft could wind up paying several fines at varying penalty levels at the same time.

This geometric increase is essential, as it addresses the important issue of time, which Microsoft has always used as an ally. Any notion of these fines being ruinous is easily dispelled by two points:

1) all fines can be avoided by immediately complying with information requests, and

2) this is punishment, after all—Microsoft has no business asking for mercy, having always acted with brutality and bad faith in their dealings.

Information may not be witheld for reasons of presentability. Or, rather, if Microsoft cares to polish its presentation, or disentangle it from, say, strategic business information, there would be a known cost for delaying its publication. Again, there can be no excuse for non-compliance. Penalties must be exacted with the extreme prejudice justified by judicial findings and Microsoft's historical refusal to comply with the law.

It is important that fines be collected as they are incurred. There should be no incentive for Microsoft to delay compliance, or hope that by running up a huge total fine they might gain public sympathy and again escape punishment. On the contrary, delay of payment should be met by freezing of their assets and forced collection. There can be no fear of enforcing the law—after all, there is nothing that Microsoft makes that is essential to the economy. To the contrary, the economy has suffered long enough at the hands of Microsoft, and Microsoft needs to learn how to become a proper citizen. The hard way, if necessary.

I have to take objection to this:

''59. The primary channel through which Microsoft distributes its operating systems is preinstallation on new PCs by OEMs. Because a PC can perform virtually no useful tasks without an operating system, OEMs consider it a commercial necessity to preinstall an operating system on nearly all of the PCs they sell. And because there is no viable competitive alternative to the Windows operating system for Intel-based computers, OEMs consider it a commercial

necessity to preinstall Windows on nearly all of their PCs. Both OEMs and Microsoft recognize that OEMs have no commercially viable substitute for Windows, and that they cannot preinstall Windows on their PCs without a license from Microsoft. For example:''

Look at today's PCs and try to buy a PC from Dell, HP with both Windows and Linux factory installed. You can't. You can get Linux in some places, mostly WinMe, but not both. The reason is MS plays a clever game. To use a boot loader, if you're a Windows licensee, you must use the MS loader. Then, if you read the MS Boot Manager license, you can only use it to load MS OSs, DOS, WindowsXX, Windows 2000. Otherwise you lose your Windows license. This explains why you cannot buy a dual boot Windows and a competing OS loaded at the factory. If and when the DOJ wins their case for good and winning means Dell or Compaq can install competing OS at the factory, MS will have to compete on merits. Today, they abuse their monopoly. See http://www.befaqs.com/mirror/classic-be/developers/bmessage/issue01.html for the full article:

Manufacturing Consent

by Jean-Louis Gass,e

Perhaps I should call this column ''Manufacturing Public Opinion,'' rather than ''Manufacturing Consent.'' The idea for it occurred to me as I read the opinion ''polls'' taken right after last Friday's announcement of the DOJ's proposed remedies in the MS anti-trust trial. The pollsters found that the majority (more than 60%) of the American public is opposed to the remedies proposed by Joel Klein's team at the DOJ, working with the attorneys general of 19 states. With more than 20% undecided, that leaves relatively few people supporting the DOJ's position. Vox populi, vox dei? Is the DOJ, which is supposed to fight for the people, out of touch with the public good? That's what the pollster-geist behind the probe would like us to believe. Far from me to suggest that this poll is unscientific. Au contraire. It represents the real science of manufacturing opinion, preferably by creating an avalanche effect. If most people are against breaking up Microsoft, it must be bad; therefore, I must join them, and the next poll might show even stronger disagreement with the DOJ. What's bad for Microsoft is bad for America.

Let's go back to December 1982. You poll consumers for what they want in a personal computers. What do you hear? I want a better, faster, cheaper Apple II, or ///, or PC, or CPM system (yes, these were still around at that time). A month later, you give public demonstrations of the Lisa. The same people now tell you that's what they want. B-b-b-b-but, you stutter, that's not what you said last month. Yes, no, I didn't know this existed.

In other words, the consumer had no words, no concept, to deal with what was unthinkable at the time but which suddenly became describable-and attractive- once seen and touched: a mouse, overlapping windows, a bitmapped screen, pull -down menus. I can only think and discuss what I have reference points for and, in general, I tend to describe the future in today's vocabulary. In this case, most PC users have only been exposed to Microsoft's lineage of operating systems. As a result, there are few reference points for thinking of life with more than one breed of operating system and applications.

Microsoft made sure that an alternative OS such as Be's, Linux, or FreeBSD couldn't be loaded next to Windows by PC OEMs. As a result, people have no data other than the Microsoft experience. They're told that some of the remedies would make the Windows system riskier and that applications might not work as well. We have something that works, the jack-booted thugs at the Justice Department want to make it less than what it is today, so why should I be in favor of breaking up Microsoft? Setting aside the caricature, the point remains: Microsoft's monopoly practices are the very reason why we haven't experienced what a truly competitive situation might be like. This is why the poll is so revealing of a certain kind of science in manipulating the political situation around the suit.

A Crack in the Wall

By Jean-Louis Gass,e

You're the CEO of a PC OEM, delivering some great news to Wall Street: ''In an effort to offer greater variety and performance to the customer, our factory now installs three operating systems on the hard disk—Windows, Linux, and the BeOS. The reaction has been spectacular. Customers love having a choice of OS, and the press—from John Dvorak in PC Magazine to John Markoff in the New York Times to Walt Mossberg in the Wall Street Journal—has heralded us for our bold move. This is a great step forward for the consumer and for the industry. Oh, and by the way, we lost $50 million since we no longer qualify for Windows rebates. But it's a sacrifice for the common good.''

You're now the ex-CEO of a PC OEM.

We know that the Windows rebate scheme exists—but what *is* it, exactly? And why are so many OEMs afraid of losing it? Windows pricing practices are closely guarded secrets, so we don't know exactly how the rebate is structured, but we can assume that it works something like this: The total cost of a Windows license consists of a base price offset by a rebate. The base price is set; the rebate is flexible, and contingent on the ''dedication'' of the licensee. That is, the more you ''advertise'' the product—through prominent positioning, expanded shelf space, and so on—the greater your rebate. This quid pro quo rebate looks innocent enough, and can be a useful tool in a competitive market.

But when you're running a monopoly—and when it comes to out-of-the-box, consumer-grade PC clones, Microsoft *is* a monopoly—''prominent positioning'' and ''expanded shelf space'' have little meaning. Microsoft has no interest in getting ''more'' footage on the OS shelf, because they've already got it all. What interests them—the only useful advantage they can ''buy'' (to be kind) with their rebate—is to ensure that no one else will get any. So how is ''dedication'' measured? A real-life example: We've been working with a PC OEM that graciously—and bravely—decided to load the BeOS on certain configurations in its product line. However, there's a twist in their definition of ''loading.'' When the customer takes the machine home and starts it up for the first time, the Microsoft boot manager appears—but the BeOS is nowhere in sight. It seems the OEM interpreted Microsoft's licensing provisions to mean that the boot manager could not be modified to display non -Microsoft systems. Furthermore, the icon for the BeOS launcher—a program that lets the user shut down Windows and launch the BeOS—doesn't appear on the Windows desktop; again, the license agreement prohibits the display of ''unapproved'' icons. To boot the ''loaded'' BeOS, the customer must read the documentation, fish a floppy from the box and finish the installation. Clever.

One suspects that Linux suffers from the same fealty to Microsoft's licensing strictures. Linux is the culmination of 30 years of development by the Unix community. Surely an OEM can't complain about Linux's quality or its price: It's good, and it's free. If Microsoft licensees are as free to choose as Microsoft claims they are, why isn't Linux factory installed on *any* PC? If you randomly purchase 1,000 PC clones, how many have any OS other than Windows loaded at the factory? Zero. But what about all these announcements from companies such as IBM, Dell, and others? A few URLs are supplied here for your convenience:

<http://www.dell.com/products/workstat/ISV/linux.htm>

<http://www.compaq.com/isp/news—events/index.html>

<http://www.compaq.com/newsroom/pr/1998/wall1298a.html>

<http://www.hp.com/pressrel/jan99/27jan99.htm>

<http://www.hp.com/pressrel/jan99/27jan99b.htm>

<http://www.software.ibm.com/data/db2/linux/>

If you parse the statements, Linux is offered and supported on servers, not on PCs. Another IBM story is that installation is to be performed by the reseller on some PCs or laptops, not by IBM at the factory. As an industry insider gently explained to me, Microsoft abides by a very simple principle: No cracks in the wall. Otherwise, water will seep in and sooner or later the masonry will crumble.

Guarding against even the smallest crack is important to Microsoft, because it prevents a competitor from taking advantage of a phenomenon that economists call the ''network effect.'' The ''network effect'' manifests itself as an exponential increase in the value of a product or service when more people use it. Applied to a computer operating system, the effect works like this: As more people install and use an OS, the demand for applications increases. Developers respond to the demand, which attracts the attention of OEMs and resellers, who promote the OS in order to sell the apps, which attracts more customers... The key to all this is distribution and visibility — in other words, ''shelf space.''

Bill Gates understands the network effect well—he once quoted it to me, chapter and verse. In the Fall of 1983, when I was still running Apple France, I met with Bill in Paris and we got into a conversation regarding the market share limitations of DOS. No problem, he said, with the wide

distribution we enjoy, we'll get the attention of third parties, and the marketplace will fix these shortcomings.

This puts statements by senior Microsoft executive Paul Maritz in perspective. In reaction to my claim that Be wants to co-exist with Microsoft, Mr. Maritz said (as quoted by Joseph Nocera in Fortune Magazine): ''[Gassee is] articulating his strategy for entry into the operating system marketplace. But on the other hand, I know that Be has built a full-featured operating system, so what I believe he's doing here is outlining his strategy about how he will initially co-exist with Windows and, over time, attract more applications to his platform.''

Mr. Nocera interpreted Mr. Maritz's interpretation thus: ''In other words, Gassee's spiel is little more than a trick intended to lull Microsoft. But Microsoft isn't so easily fooled! Microsoft will never ignore a potential threat to its Windows fortress, no matter how slight. The software giant may be in the middle of an antitrust trial, but—as Andy Grove says—only the paranoid survive...''

[The entire article, part of a court house diary, can be found at <http://www.pathfinder.com/fortune/1999/O3/O1/mic3.html>.]

Industry sages such as T.J. Rodgers, the CEO of Cypress Semiconductors, as well as venture capitalists aligned with Microsoft, criticize the Department of Justice's intervention in the new Pax Romana we're supposed to enjoy under Microsoft's tutelage. Don't compete in court, compete in the marketplace, they say. I'm a free marketer myself; I left a statist environment for the level playing field created by the rule of law in this, my adopted country. A free market is *exactly* what we want. One where a PC OEM isn't threatened by financial death for daring to offer operating systems that compete with the Windows monopoly.

We started with a thought experiment. We end with a real-life offer for any PC OEM that's willing to challenge the monopoly: Load the BeOS on the hard disk so the user can see it when the computer is first booted, and the license is free. Help us put a crack in the wall.

Is the Customer King?

By Jean-Louis Gass,e

One would hope to answer this question in the affirmative, but before I elaborate, some follow-up to last week's column, ''A Crack In The Wall,'' along with our thanks.

Our offer of free copies of the BeOS to OEMs willing to load our OS ''at the factory,'' on the hard disk of PCs they sell, got a tremendous response. We appreciate the interest in our product and we intend to do our best to honor the hospitality extended to us. Watch this space or, more generally, www.be.com, for more details. For a number of contractual reasons, this offer applies only in the US and Canada, not to other countries in the Americas or in Asia. For Europe, please contact our VP Europe, Jean Calmon, jcalmon@beeurope.com, for country-by-country details.

As we collect data from the flow of responses, an interesting but not unexpected picture emerges. The OEMs expressing interest are the ones who cannot realistically be ''fined'' by Microsoft—that is, lose their Windows rebate. If you pay the maximum OEM price for Windows, or close to it, you won't be afraid to load Linux or the BeOS on your customers'' hard drives, especially if you don't have to account to Wall Street for your actions. If, on the other hand, your exposure is measured in millions of dollars per quarter, and you are the CEO of a publicly traded company, you'll load Windows and nothing but Windows on the PCs you sell. More precisely, you might load Linux as the OS engine on hardware other than PC servers. In any event, this represents only a preliminary look at the returns—it's too early to draw definite conclusions.

Now, let's turn to the customer in the title of this column. We hear that the Windows monopoly is good for customers—it's a standard, there's no confusion, users can rely on a trusted foundation for their work, and so on. But how can this be if there are so many obstacles placed in the way of a customer's even seeing that (s)he has some (limited) choices? I'll take one example of what I mean by choices. One overseas OEM announced with great fanfare that it would offer some configurations in its PC line with a dual-boot arrangement: Windows 98 for mainstream applications and the BeOS for its natural media uses. Great—exactly what we wanted—the specialized media OS peacefully coexisting with the mainstream platform. Well, not exactly. If you take the machine out of the box and boot it, the BeOS is nowhere to be seen—the computer boots only Windows 98. If you read the documentation carefully, you'll find out how to ''unhide'' the BeOS. Then, through a complicated sequence, you'll finally get to the dual-boot situation. Should the OEM be criticized for this state of affairs? Again, not MTC.00028027—0005 exactly. It appears that the fear of losing Windows rebates intervened to prevent the customer from being offered a genuine dual-boot system. In fact, as we verified for ourselves, the steps the customer must perform are so complicated that it's much easier just to do the simple partition and BeOS installation possible with our retail product, complete with a BeOS Launcher icon on the Windows desktop.

Wouldn't one think that Microsoft behaves, in effect, as if the PC belonged to it, rather than to the OEM or to the customer? It's is hard to see how the customer and, more generally, the industry, benefit if one company decides what's good for all, and what the customer should see or not see.

A Crack in the Wall: Part II

By Jean-Louis Gass,e

Some time ago, I wrote a semi-fictional column regarding the plight of the CEO of a PC clone company (''A Crack in the Wall'' <http://www.be.com/aboutbe/thebenewsletter/volume—III/Issue8.html>). At a quarterly business review for Wall Street analysts, the CEO extolled his vision: Giving buyers more OS choices was A Good Thing. Everything went well—customers loved having Linux and the BeOS installed on their system at the factory, next to the classic Windows. The out-of-the-box experience was great, the options at boot time were easily understood and, since customers could delete the system(s) they didn't want to keep, this was the real thing, freedom of choice—without waste. The PC magazines loved the move, we reaped all the Best Of... awards and generated good will and oodles of free publicity.

Ah, another thing, the CEO continued. The company lost $50 million dollars this quarter because Microsoft fined us for offering other operating systems. Their contract with us gives them the right to increase the price we effectively pay for Windows if we offer other operating systems. Microsoft even invoked an obscure—and confidential—clause in their licensing agreement and grumbled that we had no right to use their boot manager, or any DOS code, to load other operating systems. It's OK for the customer to install a boot manager him/herself, but you, the PC OEM shouldn't. As a result, they claim we shouldn't offer the of out-of-the-box experience I mentioned earlier. Some customer assembly is required. At this stage, the CEO has lost his audience—and his job.

As I said at the beginning, this is a concoction. But testimony is sometimes tastier than what amateur columnists can dream up. What we have before us is a deposition by Garry Norris, an IBM executive and a government witness in the antitrust suit against Microsoft. In his testimony, Garry Norris describes how Microsoft quintupled the Windows royalties it demanded from IBM, to $220 million. There is some dispute about the exact numbers, but you get the idea.

How the media treated this is noteworthy. One title read ''IBM breaks ranks...'' This appears to reflect a commonly held belief: PC OEMs didn't want to break a code of silence for fear of some kind of retaliation. In private, PC OEMs ''share their thoughts'' quite freely. They appear to resent being treated as vassals by Microsoft in its use or abuse of its desktop OS monopoly. In public, they have to take care of business. Who can blame them? Business is competitive enough as it is. Why risk a falling out with Microsoft that will result in a competitive disadvantage? As far as we know, there is no Antitrust Witness Protection Program, so the tension between self -interest and the calculus of common good is understandable. This leads to another thought: Why IBM? Is this an example of the altruism of an enlightened corporation, or have they decided they no longer have anything to lose in the PC business, as various rumors have intimated in the past few months? There has been speculation—and denials—that IBM wanted out of the PC business, because it has become too commoditized and it's been impossible for them to make a profit. Some have even read something of that nature in their multi-year, multibillion dollar agreement with Dell. Whatever IBM's reason for breaking the code of silence, their testimony could make this phase of the trial as surprise-filled as the first Three things you need to remember about me:

1. Alright, alright... I'm a DJ,

2. I changed my mind, OK? (see http://www.djmaytag.com/name/),

3. In any case, I'm STILL not a washer and dryer repairman, either.

Subject: Microsoft Settlement
VIA E-MAIL
The Honorable Colleen Kollar-Kotelly
United States District Court for the District of Washington, DC
c/o United States Department of Justice
Washington, DC

Dear Judge Kollar-Kotelly:

For the following reasons, I feel compelled to add my voice to those arguing AGAINST Your Honor approving of the Proposed Final Judgment (the ''PFJ'') entered into by the United States of America and several of the States as plaintiffs and the Microsoft Corp. as defendant (the ''Defendant'' or ''Microsoft'') in the antitrust case known as U.S. vs. Microsoft Corp. Judge Thomas Penfield Jackson found Microsoft guilty of being a monopoly and of abusing its monopoly powers, among other things, and he ordered that Microsoft be broken up into a number of separate companies, as well as other remedies. On appeal, the U.S. Court of Appeals for the DC Circuit, in a 7–0 decision, overturned several of Judge Jackson's rulings and vacated his proposed remedies, but the Court of Appeals let one of Judge Jackson's core rulings stand: Microsoft possesses monopoly power and unlawfully used that power to protect its monopoly. Both Microsoft's request to the Court of Appeals for a rehearing and its petition to the United States Supreme Court for certiorari have been denied, so nothing changes the fact that Microsoft is a monopoly and used its monopoly power unlawfully. Now the question arises: What are the proper remedies in the case in question? The quick answer is that the proper remedies are NOT those set forth in the PFJ. Notwithstanding The Honorable Attorney General's pre-nomination pledge not to go ''too easy'' on Microsoft, the U.S. (and some of the States) and the Defendant have entered into a ''sweetheart deal'' by entering into the PFJ. Numerous financial analysts and computer industry experts agree that, under the terms of the PFJ, the Defendant would conduct ''business as usual'' should Your Honor approve the PFJ. Too often, we forget the purpose of remedies. Sure, there should be a rehabilitative component— i.e., the remedies to be applied should mandate or at least encourage the wrong-doer to reform its wrongful ways. But that fails to see the forest for the trees. There should also be a punitive component—i.e., the remedies applied should also mete out a punishment for the injurious conduct that the wrong-doer engaged in, if only BECAUSE there was, in fact, wrongful conduct and concomitant harm.

In the situation before Your Honor, there is no doubt that Microsoft, the defendant, is in the wrong (it is a monopoly) and has engaged in wrongful conduct (it used its monopoly powers to harm the public). The PFJ's terms are simply too generous to the Defendant and provide few rehabilitative provisions and little if any punishment.

Right now, being the de facto monopoly in desktop operating systems, Microsoft simply has no competition. The same could be said of Microsoft's network operating system (at least for the Intel platform). Similarly, Microsoft is the de facto monopoly in desktop application software suites (i.e., its Office suite comprised of word processor, spreadsheet, presentations, database, personal information manager, etc., in various combinations and price levels). The situation will only get worse and Microsoft's monopoly become even greater if the powers that be allow Microsoft to implement its .Net and web services strategies. And that is what the PFJ allows: Microsoft will make some minor— mainly cosmetic concessions—to its desktop operating system, but the PFJ leaves Microsoft's monopolistic business practices virtually untouched. With all due respect, Your Honor should also review and take into consideration the Defendant's past conduct when the U.S. entered into a settlement with it and tried to rehabilitate positively its business practices: Microsoft flouted the spirit (if not the actual provisions) of previous formal or informal settlements with the U.S. and never really changed its wrongful business practices. Out of Microsoft's failures to rehabilitate its business practices arose the current antitrust litigation. Looking at the situation from another angle, Microsoft had its opportunity to ''go straight'' and consciously did not. (For some reason, analogies to the criminal side of jurisprudence keep coming unbidden to mind.) The Defendant was on probation, if you will, and then proceeded to openly violate probation. To add insult to injury, the Defendant as probationer is unrepentant about its continued wrongful behavior and violation of probation. Has the Defendant slowed its openly-stated monopolistic strategies? No! Microsoft rushed to market it's newest desktop operating system, Windows XP, and is rushing to market its software that implements its .Net strategy. In so doing, the Defendant apparently hopes that it can ''beat the system'' by relying upon and cynically utilizing the slow pace of our great system of justice.

Now is not the time to go easy on the Defendant, Your Honor. This is NOT a case of a first offender, Your Honor, where some leniency may be in order. Just as I am confident that Your Honor would NOT go easy on an unrepetenant repeat criminal offender, Your Honor should NOT go easy on the Defendant. In truth, however, the only competition Microsoft has is its own internal divisions. The network operating systems division vs. the desktop operating system division vs. the application suite division vs. the network operating system support software, etc., etc. A break-up of Microsoft is a perfect remedy in that regard. A break-up of Microsoft along product lines provides an appropriate remedy with both rehabilitative AND punitive components. I am sure that Your Honor is considering all possible options in fashioning an appropriate remedy. I am also sure that any remedy Your Honor ultimately imposes will be well-considered and carefully crafted. I cannot know what the exact terms of Your Honor's ultimate remedy will be, but I do know one thing: The PFJ comes nowhere near constituting an adequate remedy for Microsoft's sustained and egregious monopolistic conduct in the case at hand.

For the above reasons, as well as those voiced by others, I respectfully implore Your Honor NOT to approve the PFJ in the U.S. vs. Microsoft Corp. case.

Respectfully yours,
Bob Patterson

Subject: Kill Microsoft

Throughout its existence, Microsoft has been stealing and bastardizing the best ideas of true information technology innovators. It repeatedly, and still, uses its size and aggressive nature to suppress competition ans stifle real innovation.

Only an aggressive break-up, heavy fines, and constant future watch-dogging of this monster monopoly will allow the best and brightest of technology innovators to thrive and keep the US at the top of the world's high-tech economy.

Shamefully, the Bush-era Justice Department has lost what little spine the Clinton era Justice Department had and is now offering Microsoft a sugar coated settlement.

It's a shame we will one day all be sorry for.

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Attorney General Ashcroft:

I am writing to voice my support for settling the Microsoft case. Like many people, I feel that the matter has run its course, and should be resolved as quickly as possible at this point. While I understand why people working in the information technology sector want different programs and operating systems to choose from, average consumers like myself are more interested in products that integrate seamlessly. Continued legal action against Microsoft inhibits their ability to develop products that integrate simply enough for consumers to use without hassle.

Please settle the antitrust case against Microsoft as soon as possible. As a consumer, I support their products and would them to be able to focus on developing their business again.

Sincerely,

Tom Laming

Subject: Microsoft Settlement

I was just reviewing a few things for any final comments I could make on the final comment day, and I came across the point that the proposed settlement does not restrict Microsoft's ability to modify, alter, or refuse to support computer industry standards.

I would like to add one thing to that.

You may have heard of the ''Halloween Document'' where a Microsoft staff person outlines ways to squash the open source movement (LINUX). One way suggested was to use standards slightly altered to Microsoft's advantage, which would, because of Microsoft's monopoly position, make them the de-facto standards. (Bill Gates wrote once in a Microsoft annual report that ''the way to make money is to set de-facto standards.'') This would drive the open source software out of existence because, for all practical purposes, competing software must work with Windows based software.

Now whenever the question of competition comes up, Microsoft likes to point to LINUX and say that they have competition. But the proposed settlement makes it legal for them to do just what they have outlined as a method for getting rid of one of their competitors. Does that make sense?

Remember that a lot of people are forced to use Windows. The common reply to this is that ''no one is holding a gun to their heads.'' Of course not, but the effect is the same. Almost everyone buying a computer is going to want or need Windows because of the need to interact with other computers that use Windows. Thus no computer maker can be in business without selling Windows.

If standards are twisted so that Windows and a competing program are mutually exclusive choices, the choice will have to be Windows. That is unfair and anti-competitive.

We must look to the future. The computer industry should be based on an underlying foundation of public standards.

Thank you.

Subject: Microsoft Settlement

To whom it may concern,

I am an independent software developer. I develop software products based on the Microsoft platform. Microsoft's operating systems, web browser, and other products have become defacto standards in the computer industry. This allows us to target our products to one platform and reach a broad customer base, instead of having to develop duplicate solutions for many competing platforms. This reduced software cost and allows us provide additional features which are a great benefit to our customers.

I am outraged at the unjust prosecution of Microsoft. The complaint against Microsoft originated not with individual consumers, or with Microsoft's partners, but with Microsoft's unsuccessful competitors. Failed businesses must not be allowed to set the rules for the markets in which they failed. Microsoft is being punished, not because it did something evil, but because it was too good, too successful, produced too much value for its customers. This is a disgraceful inversion of the principal of justice. A successful business and its products are no threat to anyone.

The government is punishing Microsoft for producing better products at cheaper prices than its competitors. Instead of being persecuted for this, they should be congratulated, thanked, and honored. The only people who do not like this are Microsoft's envious unsuccessful competitors, who are not able to produce products as good and as useful as Microsoft.

This action against Microsoft is impeding progress in the high tech industry. Instead of focusing on producing the best products for the cheapest prices for consumers, Microsoft must use their resources to defend themselves and avoid destruction at the hands of our own government. In addition, software developers must waste effort developing duplicate solutions because of the uncertainty associated with this unjust action against Microsoft. Will the government, at a whim, decide that Microsoft does not have a right to exist? Will the government arbitrarily decide to stop Microsoft from adding features to its products, or discontinue products certain products? Unknown.

It is disgraceful that at a time when terrorists are trying to destroy our country from the outside that our own government is attempting to destroy our country from the inside but attacking and persecuting one of our greatest and most productive companies. Microsoft has a fundamental right to exist and control its own property. Our government's job is to protect these rights, not to take them away!

Dear Mr. Ashcroft:

The IT industry and the economy have been affected enough by the suit brought against Microsoft by the Department of Justice. The litigations have wasted time and tax dollars and it is time this matter is resolved. I am of the opinion that Microsoft has done more than they should have in the first place with regards to the settlement. Microsoft has in part, been responsible for the stabilization of the economy in the 90's and I feel that they should be allowed to continue with their business.

Microsoft has agreed to conditions that will allow for more competition in the IT industry that will in turn benefit the economy and the consumer. In order to do this Microsoft will give competitors the ability to make software that is compatible with Windows, and they will not retaliate against them. Also, they will be monitored by a three person technical committee that will make sure Microsoft adheres to the terms of the settlement and it will also help settle disputes. Clearly Microsoft has done more than what they should have to settle this and so should the Department of Justice.

The country's economy and its citizens will benefit from ending this whole mess. Microsoft should be allowed to return to business as usual. Thank-you.

Sincerely,
Thomas Canfield

Subject: Microsoft Settlement

Your Honor,

I'm writing to voice my objections to the proposed settlement in the United States vs. Microsoft case. Microsoft has profited greatly from its anti-trust violations, and this settlement would allow the company to keep all of those ill-gotten benefits. Furthermore, the settlement doesn't prevent Microsoft from wielding its monopoly power again in the future. The proposed settlement only serves to expand Microsoft's monopoly by allowing them to increase their presence in perhaps the only market segment they don't already dominate—the education market. I ask you to reject the proposed final judgment.

Respectfully,
Connie Deal

I believe Microsoft should be broken up. This will spur a wave of innovation in IT industry and offer consumers choice. It's in the interest of consumers/developers. While, there may be a proposal of settling a case without breaking up Microsoft, I'm highly skeptical that Microsoft which gave such a hard time to DOJ will execute the settlement right. The only way to be assured is to breakup.

Thanks
Tejas

Subject: Microsoft Settlement

To DOJ reviewers;

I believe that the settlement the US government has made with Microsoft is a travesty that will allow MS to continue with its self benefiting, conquer-all strategies and tactics. And, over the near future, uncontrolled, Microsoft will create more injustice that it has in the Internet Browser situation. The data for my argument comes from looking at the emerging area of standards for personal identity on the Internet.

I work in the area of virtual community technologies and services—see bio link below. I believe that collaboration/connections among people, worldwide, is one of the most powerful, forthcoming benefits of computer-communications technologies. I have researched and learned a good deal about the importance of ''identity'' on the net. Microsoft's Passport system, distributed through their pervasive Windows OS, could become a major mal-influence in the emergence of holistic identity services. Here is the data:

Gartner Group has recently completed a study of 2100 users of online/web services; the study focuses on consumer web identity and privacy issues— http://techupdate.zdnet.com/techupdate/stories/main/0,14179,2830912,00.html Summary: ''Despite consumers'' apathy and distrust, identity services will succeed because they will be embedded into Windows XP and the Internet services that consumers will use. Accordingly, Gartner predicts that 40 million online U.S. consumers automatically enrolled in identity services will use them to access an average of three Web sites each month by the end of 2003. ''

This data substantiates that consumers will lose in the future (versus the econometric models likely used in the trial to show how consumers have been harmed in the past) if Microsoft maintains as one business both the operating system and the application software & Services businesses. One of the

conclusions that can be drawn from Gartner's study/data is that Microsoft's monopoly will result in consumers putting up with the weak privacy-control that will result with Passport—whereas the data shows that consumers want strong privacy-control. If Microsoft were to be two companies where the web services were split out from the WindowsOS business more competitive dynamics could prevail in the coming generation of net services i.e., Passport would have to compete with the Java authentication/identity offerings—consumers would have more choice and more privacy-control alternatives would likely be available.

I want to go on record as being strongly against the weak terms of the antitrust settlement with Microsoft. They will cause more injustice and harm in the future than they have in the past if we do not take the current judgment against them to mete out remedies that will protect the Internet industrial and consumer participants from the force of this conquering gorilla.

Judge Kollar-Kotally,

I urge you to reject the proposed final judgment in the U.S. vs. Microsoft case. Every court has found that Microsoft violated antitrust laws, making billions of dollars in the process. This proposed settlement would allow the company to keep virtually all of those illegal profits! There is also no provision that would prevent Microsoft from continuing its anti-competitive behavior. In fact, the monopoly is validated and furthered under the PFJ through the dissemination of Microsoft software to our schools. And Microsoft cannot be allowed to essentially police itself.

Please vote against the PFJ in the interest of the public.

Sincerely,
Donna Rogers

Subject: Microsoft Settlement

A problem just starting to rear its head in regards to Microsoft's desktop monopoly is the company's curent attempt to extend it to all Internet transactions through its .NET initiative and the accompanying C# programming language that is designed to kill Java, JREE, and other non-Microsoft Web interaction tools.

If it is the DoJ's intent to help Microsoft kill off all competitors; to in effect become the sole controller of all Internet standards, then the current proposed settlement should be allowed to stand. If the DoJ wants to foster computer industry competition and innovation, the proposed settlement will be withdrawn, and Microsoft will be penalized harshly enough for its past lawbreaking that its management will not be tempted to break the law in the future. As a U.S. citizen who is employed in the IT industry, I would rather see competition than have one company control our entire computing infrastructure. I think you will find that my opinion is shared by almost all people in this business who do not work directly or indirectly for Microsoft. It is sad that the United States Department of Justice is not protecting citizens'' interests, but has decided to ''lay down'' for a major corporate campaign contributor. Apparently the SEC did pretty much the same thing for Enron, though.

I wish I knew a way to root out this corruption, but it's hard when both the people who make the laws and the people who enforce them are for sale to the highest bidder. Poor America. I fear for our future.

BY E-MAIL

Dear Mr. Ashcroft:

I am writing to give my support to the agreement reached between Microsoft and the Department of Justice. I did not support the initial lawsuit. This suit was brought more out of political and professional enmity than any supposed damage to the consumer, the necessary basis for antitrust action. Bill Gates produced a better product, the standardization of computer software. Granted, Microsoft was aggressive, and at times heavy- handed.

Microsoft has been chastened though. Both parties agreed to a settlement that is, for the most part, fair. Microsoft has agreed to open the company up more to third party innovation, has agreed to a uniform price list, has agreed to a technical oversight committee, and has agreed to interface disclosure. Microsoft is obviously trying to meet the demands of the Department of Justice.

It is time to move forward. We have more important things to worry about. We need to put our economy back on track; allowing one of our major companies to get back to work is one way to do this. I urge you to give your support to this measure.

Sincerely,
Robert L. Butler

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

I am writing because I am in support of ending the antitrust lawsuit against Microsoft. Microsoft's ability to operate under normal conditions remains compromised as long as the litigation continues, and settling the case according to the terms agreed upon in November would be the quickest and fairest way to move on.

The settlement is a reasonable conclusion to the case and will foster market growth for Microsoft's competitors, while still assuring the security of Windows. Easing restrictions on computer makers who license Windows will ultimately enable those companies to offer a broader selection of programs from competing developers. Given that, it seems as though the Department of Justice's goal would be achieved.

I am urging you to settle what has already been too long a case. The public and Microsoft are ready to put the matter behind them, and the government should be as well.

Your Honor,

Microsoft must be forced to play by the same rules as everyone else, and the proposed final judgment before your court fails to accomplish that. I ask you to reject it.

For years, strong-arm tactics on Microsoft's part have cut down promising high tech companies and hurt innovation here in Silicon Valley. The courts have ruled against Microsoft—now let's bring about a solution that actually causes them to cease their anti-competitive activities!

I am also concerned that Microsoft's monopoly would only be broadened by the giving of its software to schools. It costs the company virtually nothing to do so, yet the harm to competitors like Apple is enormous.

Please vote against the PFJ.

Under the Tunney Act, I wish to comment on the proposed Microsoft settlement.

I am a professional software engineer, with 10+ years of experience in industry. During these 10+ years, I have seen Microsoft grow to dominate the computer software market. Microsoft has achieved this dominance through anti-competitive practices, and I have seen many novel and innovative technologies crushed by Microsoft, all in the name of furthering Microsoft's iron grip over the software market. As someone who is both passionate about working in this field, and as someone who tries to innovate in this field as well, Microsoft's actions over the last few years are very distressing.

I have read the Proposed Final Judgement, and I want to say this: the Proposed Final Judgement will allow many exclusionary practices to persist. So, I don't support this judgement. (unfortunately, due to time constraints, I cannont enumerate all of the ways in which this judgement is flawed—if you are looking for more specific complaints, please refer to: http://www.kegel.com/remedy/remedy2.html

I consider the summary of the problems with the Proposed Final Judgement on this web-site to be excellent.)

Please work to fix this judgement. If you leave any loopholes in this judgement, there is much precedent to show that Microsoft *will* exploit these loopholes to maintain its illegal monololy.

Regards,
Kevin D. Clark

Mocrosoft is largely responsible for the greatest technology advance the world has ever seen. MS produces good products at ever-lower prices. Competitions is alive and well in the industry—others need to just make their contribution and let the market buy it or not. The Department of Justice (under President Clinton) and the various states Attorneys General are after money and power—let them show what they can produce. So far I havn t seen what they contribute. They have not protected the public at all rather they inhibit industry advancement. And of course they want millions. (Is there any other thought for these guys?) Let them earn it in an honest way: hard work and imagination. End the suit immediately by taking the least intrusive road out. Microsoft should grow or fail by how it treats the American consumer and not by dictates by government employees. In fact the failed government employees should be forced to relinquish their own pay for all the harm they ve done to innovation and to the American public.

I am writing to urge you to support the proposed Microsoft settlement and end this controversy's tenure in the federal arena. The United States Government has in past administrations provided its citizens with ample evidence of what results when overzealous and uninformed public representatives take regulation of successful private industry to extremes in the mistaken belief that action against private industry will always end in providing a public benefit. Past government actions against AT&T have broken a national treasure Bell Telephone Laboratories and increased prices while decreasing efficiency and customer service in the process. . Microsoft must still contend with several states lawsuits but I believe it s time and best for all parties to get beyond this ridiculous activity and allow everyone to return to the business at hand. The settlement will compel Microsoft to open its systems to competitors software and use. A committee has been provided in the settlement to monitor Microsoft s future business practices to assure compliance with the settlement s terms. I believe that for the sake of our national economy and the continued success of this vital industry this matter should be settled. As a citizen I feel my technological future will be enhanced by innovations which work and that is what Microsoft is all about.

Microsoft has been has helped the US & other countries to emerge into world leading companies. Netscape & CEO James Barksdale was bundling features years ago & was upset with Microsoft turning the tables on them when Mr. Barksdale conceded engaging in in simular practices & stating He didn t recall. Soon after Netscape merged with another company. Who was calling the kettle black? During the 1940 s U.S. Steel went through similar litigation & settled with- out killing the company as Judge T.P. Jackson was trying to do to Microsoft. Who incidentally was not qualified to make this decision. I believe this company has suffered and paid more than their share through unreasonable and excessive charges. The US has encouraged innovation competition & development of technologies. This built our country and made us strong to prevent any Bleeding Hearts to damage and hurt us such as the Ben Laden's. If anyone was wielding a club in these negotations it was Apple not Microsoft. Will AOL be next? What about the merger between AOL and Time Warner? This changed the competition land-scape in one of the most competitive industry in the world. I think it is time to reflect and close the litigation against Microsoft before the Bleeding Hearts close one of our leading companies in our nation.

Dear Judge Kollar-Kotally,

I hereby submit my objection to the Proposed Final Judgement agreed upon between the Department of Justice and Microsoft. I understand that there are several underlying errors attributed to the Proposed Final Judgment.

One noticeable flaw encompasses an inept enforcement device implementing restrictions. The settlement in other words closely monitors and screens all of Microsofts business activities. This close scrutiny insures MS complies with all restrictions entailed in the agreement.

A three man compliance team will oversee and insure that Microsoft comply with the stated rules and regulations. Yet, this three-man oversight committee will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team.

In the likelihood of any enforcement proceedings, all findings by the oversight committee will not be allowed into court. The sole purpose of the committee is to inform the Justice Department of all infractions by Microsoft. In addition the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions. When all is said and done, the oversight committee is just window dressing, who will not strictly oversee Microsofts business moves?

In my opinion, the Proposed Final Judgment does not provide appropriate restrictions against Microsoft. What reassurance do we have against Microsofts illegal and illicit activities? I can assure you that the Proposed Final Judgment does not effectively nor sufficiently address the question. In conclusion, I submit your honor my objection to the Proposed Final Judgment in the Microsoft case.

Sincerely,
Adorabell Bonefacio

I am amazed by the statements that Microsoft (MS) has cost the consumer since I am convinced that I have saved at least 60% over what I would have paid without the their operating system. I remember the days that the people around me made fun of MS due to the fact that the included OS support was so rudimentary. MS has designed better built-in support over the years and now the same people say it is too good and is driving other people out of business. (Browsers have been in all operating systems for decades!!) True competitors are having a hard time coming up with something better to sell. This is hard on them but does not increase the cost to the consumer. If they have a better gidget I have the choice of using the built-in capability or buying theirs. A really good choice. I can go on and on but I will only say one more thing. Given a specific function it is always cheaper to have one designer selling to 10 million vs 10 designers selling to 1 million apiece. Since it takes the same number of people to design the function and each is sold to 1/10th the number of consumers the cost to the consumer is 10x the one designer scenario. We have the battle of lower cost to the consumer vs more jobs for designers!!

Sincerely

Roger Bagwell HW/SW Engineer

It is time to put this case to bed. It is the job of the courts to protect the consumer not competators. From the start this case has been all about vicious compititors fighting with each other and then attempting to get the Federal and State courts to settle the fight for them. The consumer never was harmed by Micorosoft s actions but rather was aided by having interconnected working program with the operating program making the total computer operation more user friendly. If you want to take a shot at a company that has harmed and taken advantage of the consumer go after AOL Just change the payment method. I do not think that Microsoft should be allowed to give equipment and Micorosoft software to the schools because this would give Microsoft an advantage over Apple. If they have done wrong make them buy Apples computers and Apple compatable software. You might also give the schools the right to chose Apple or IBM compatable and make Mirosoft pay for it. If the court has been unable to prove a monopoly that has harmed the consumer than the case should be thrown out and AOL Oracle and the rest of the cry babys should have to pay the court costs. As a taxpayer I do not think that it is my responsiblity to pay it.

Dear Ms. Hesse:

I would like to go on record as saying that the Microsoft settlement should be accepted right away. I feel that delaying it, only makes everything more costly to the public. Court costs increase. The cost to Microsoft increases. It becomes a lose, lose situation rather than a win, win situation.

Thank you for the opportunity to respond.

Sincerely yours,
Sanford Moser

I believe that the Federal Government and all other State governments should now leave Microsoft alone. The court has made it s decision and now we should move on to more important things. Just because the competition is jealous that they did not invent the same things as those working for Microsoft is no reason that they should have any right to capitalize on the hard work of another. I say move on there are more important problems to plague this country. Deal with them.

The ''case'' against Microsoft was, is and shall forever be a sham. The ''problem'' is that Gates and Microsoft got lucky and their competitors didn't. MS was in the right place at the right time and did the right things... the bozo's who are suing them didn't luck out. Let the market decide if Microsoft is a company that the public wants to do business with. Microsoft does not ''own'' the market any more than it owns the souls of it's dustomers. People choose Microsoft products becasue, despite MS's faults, the products are what it's customers want and need and are reasonably priced.

Let the government do what it does best—nothing!!

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I work for Netscape Communications Corportation, on the Netscape browser product. And I am tired of reading uninformed columns in newspapers and answering uninformed questions from friends about 'how Microsoft won the browser war ''fair and square'''. Let's not forget that this is not about the situation —as it is today—, it's about —what Microsoft did that was against the rule of law—. Microsoft has repeatedly flouted the law of the land, and for this, they deserve to be punished.

The settlement fails to terminate the Microsoft monopoly, which they have proven time and again to use aggressively and illegally to expand into other markets. What guarantee do we have that Microsoft will not continue to ''bolt'' new products on to their operating system in the name of ''innovation'', crushing other fledgeling businesses along the way? How will future innovators protect themselves from Microsoft's entry into a market?

Under this settlement, Microsoft will be only marginally penalized for its illegal behavior. Microsoft —broke the law——every court that has reviewed this case has agreed—but yet it will be allowed to retain the profit from its plunder!

I realize that my viewpoint in this matter is far from objective, but I hope that you'll realize that the fate of consumers, entrepreneurs, companies, and even industries rest in your hands right now. Microsoft has proven time and again that they have no regard for the law. They are a threat to innovation in an industry that has powered the economy for the last ten years, and is likely to be a significant economic force for the next fifty years.

Yours,

Chris Waterson

Subject: Microsoft Settlement
Attorney General John Ashcroft
US Dept. of Justice
950 Pennsylvania Boulevard NW
Washington DC 20530
January 28, 2002

Dear Mr. Ashcroft,

I am writing as an investor and as one who helps other people invest in the American capitalistic system. I note the country has had extraordinary difficulties financing the high tech companies who are our hope in improving productivity. This all started about the time that the competitors to Microsoft goaded the government into starting a federal lawsuit. The investing public worried that the leading innovator in computer generated productivity improvements was going to be attacked and wounded by the government, why wouldn't the same happen to others in the industry? This was a major contributor to the failing confidence by the investing public.

I have read about a reasonable settlement that has been negotiated between Microsoft and the government. I understand that it is under public review at this time. Let me add my voice to the millions of shareholders that depend on the American capitalistic system to continue to improve productivity, profits and expand. I believe that the government has had its opportunity to make its point. Microsoft has made good faith adjustments in its operations and has agreed to share ''secrets'' with their competitors, something the competitors had sought from the outset. It is time to lift this cloud of intimidation from the technology community and allow our economy to expand once again. I would hope that the tragedy of Sept. 11th would help all of us including the government refocus on our nation's priorities. It is time to move ahead with improving our people's living conditions and maintaining our economic leadership of the world.

Most Sincerely,
Robert A. Gerhardt

From: Dirk Valcke
To: Microsoft ATR
Date: 1/28/02 1:28pm
Subject: Microsoft Settlement

Dear Sir or Madam:

As a consultant in the computer industry I come in contact with many people in many different organizations.

These organizations range from first class Financial Institutions to small enterprises with only a few employees. For all these organizations and especially for the thousands, even millions of small and mid-sized companies Microsoft* provided an easy to use, cheap, out-of-the-box usable computing environment.

As you probably know and experienced yourself, even a child can install and use the Windows* and Office* platforms. To find a platform that is as easy to use and that keeps the whole computing experience affordable we can only look at Apple*. The giants in the industry, especially SUN, could take some lessons in user-friendliness, ease of use and low-cost from both Apple* and Microsoft*. The initiative of the Linux* group seems to go in the right direction, but the product is not yet at the level we are used to (user interface, ease of use, support).

When I consider the enormous number of companies and people, who earn their living by building on an ever-evaluating platform, persons that study these new versions and implement ever more complex and at the same time ever easier to use software, I am amazed. When I try to imagine the number of people that use these inexpensive, easy obtainable systems, at work, at school and home, I am amazed. When trying to imagine even the very Internet that allowed me to send you this message, without the low-priced, easy to use computers, I wonder if it would have been possible!!

The inexpensive computers and software are a result of volume. The volume is the result of popularity. Popularity is the result of content and happy users! I hope you advice and ruling will allow current and future enterprises to work on even more mind blowing and fantastic applications and systems. That it will allow the customers/users to benefit from ever more features and possibilities.

With kind regards,
Dirk Valcke—Director.

I am not speaking on behalf of Purdue University. However as the IT manager for the Purdue University School of Education I have found Microsoft to be a friend of Education. Microsoft has been a friend to Education for many years even while other companies which have a reputation for being education friendly have taken advantage of Education over-priced their products and given Education little or nothing. Unlike other companies that have been hostile towards education and ignorant of our needs Microsoft has delivered quality products for cheap and in many cases for FREE! This long-term commitment demonstrates to me that Microsoft cares for students and educators. The fact that the vast majority of our students *prefer* Microsoft products to other products and operating systems demonstrates this. I urge you to allow the settlement and resolution of the Microsoft case. Please allow what I consider to be one of our countrys' National Treasures the freedom to continue supporting and inspiring the work of Education.

Thank you and best wishes.

From: will
To: Microsoft ATR
Date: 1/28/02 1:33pm
Subject: in regards to the microsoft anti-trust case

I used to be a consultant on Microsoft products right up until about 4 years ago when I switched from consulting on systems integration and started doing development work on a variety of other platforms. I've known a lot of the folks at Microsoft over the years and been a part of various Microsoft initiatives. As the years have passed, I've become increasingly concerned with the level of quality of Microsoft products and the direct effects they have on our world. Not just consumers, or businesses, or governments, or the Internet, but —everything—. The reason they have this affect on —everything— is because they outsell other operating system providers in a variety of business spaces. This ability they have comes less from radical product superiority, but mostly from their absolutely amazing business and marketing skills. I think these business and marketing moves that Microsoft has made have become increasingly Machiovellian—the ends absolutely justifies the means in the Microsoft juggernaut's mind (sorry for the personification here). Reading through the findings and my experiences in the Microsoft world and my friends'' lives, I believed as the courts did that Microsoft is guilty of abusing their monopoly.

Reading through the settlement recommendation, I'm appalled. I think it does nothing to curb Microsoft's business and marketing juggernaut which clearly lacks moral sense. I think it actually furthers Microsoft's monopoly in the future without instilling any moral and ethical guidelines.

I am absolutely against this settlement and I think it's ridiculous that it's even being considered by anyone. It's not an issues of good vs. evil, it's an issue of fixing the future so that consumers aren't continually hurt by the continual immoral practices of a behemoth company.

Thank you for your time,

/will

MTC–00028112

From: ewspak@yahoo.com@inetgw
To: Microsoft ATR
Date: 1/28/02 1:22pm
Subject: Microsoft Settlement

I strongly support the settlement reached between Microsoft and the Federal Government. The few state attorneys general who have not signed on appear to be more interested in the political benefits of opposing big business than in the public welfare. Government must not penalize businesses merely because they are successful or large. Innovation should not be discouraged by reducing competitiveness. Competition is essential to developing the technology that our country s economy depends on.

The settlement protects the public while ensuring competition and innovation. The key features include an onsite committee to ensure Microsoft s compliance the ability for consumers to delete Microsoft programs from their operating systems the ability for computer manufacturers to add programs to PC s with Windows and forcing Microsoft to disclose the technical information necessary to competitors so their software will run smoothly on Windows.

Sincerely

Eric W. Spak

I believe the settlement as it stands now between the government and Microsoft is fair and just. I believe the government has been exemplary in it s conduct during the Microsoft case. The nine remaining states should end their suits in this case and join the Federal government in ending this long running case.

They are only wasting the tax payers money. For AOL to bring it s suit against Microsoft on behalf of Netscape is pure folly on AOL s part. The case has pretty much been decided on. They are only try to delay it. For what purpose? Who knows. In my personal opinion I don t believe Microsoft ever did anything wrong. But since it has already been ruled against that s OK. We should move on from there.

End this case now before it does more harm than good.

Thank you for listening.

In today's highly competitive environment most of Microsoft's practices should not be judged within a legal framework but rather should be seen as aggressive marketing practices. Such extreme cases confuse people and rather than spending time effort and resources to find ways to become more competitive the rely upon a legal system to get them out of the hook. In my opinion the end result of such extreme legal actions is that the consumer does not enjoy the best possible products at the best possible price that come out of competition in so many other markets.

I think it is time to settle this Microsoft thing and quit wasting Government money on it. I don't think anyone knows how many businesses have been started to carry on and supplement Microsoft. I think it is time they were allowed to continue without the threat of a law suit hanging over them. They have caused no real harm to anyone, but there are those that would like to line there pockets at Microsofts expense.

I believe it is in the best interest of America to accept the settlement and move on. The settlement despite it's prejudice toward Microsoft will help our economy. I don't think the competitors have suffered from Microsoft exclusion.I think they don't have the expertise to compete. If there was a system that was as user friendly as windows it would have been just as successful. At any rate Microsoft is willing to share their technology with competitors so accept it and move forward.

Sincerely
Gwen Fisk

This is a terrible miscarriage of justice. Microsoft should not be held to this ridicule. They are the creature of this soft ware and should be governed by the consumers and not by the government. Microsoft and their operating system are vary big and yes their is a reason for that. It's because they made a produce that was needed. They were is the right place at the right time and created a demand for their produce because people wanted it and it was a good product. Now that they are successful they are being penalized for it. Of course others are going to complain about it that's because others are trying to get a piece of the action and get it any way they can. The actions brought against Microsoft is also an action against the free enterprise of the United States of America.

I think Microsoft is doing a fine job and should be exonerated. The competitors are envious and want the government to control the competition in their favor. They can't win people complain if they give their software away or price it too high. If there wasn't a market for it nobody would buy it. The only ones who seem to have a problem with them is their competitors. Leave them alone and let them keep innovating.

Subject: Microsoft Settlement

I do not believe the settlement offered by the Bush administration and other states is in the public interest. I believe more needs to be done to curb Microsoft's monopoly and invigorate competition and real innovation in the operating system and office product software markets.

I am a technical training course developer in Silicon Valley, and use Microsoft's products not because I believe that they are superior, but because there is no real choice. They have become an inferior defacto standard. One would think that with all Microsoft's resources and the number of years their products have been around, that the products would be robust and elegant. But the fact is, a week doesn't go by that either Word or PowerPoint or even the Windows operating system either freezes up or totally crashes. Over ten years of using their products has added up to countless hours of lost productivity.

I believe that consumers would greatly benefit if Microsoft were forced to spend some of their resources on improving their products (by having to compete) instead of protecting their monopoly.

Dear Antitrust Bureaucrats: First I regard DOJs intrusion into Microsoft's business to be an American Travesty. Now that DOJ has sucked millions of dollars out of the Microsoft pot who will be next? Can't you folks at DOJ understand that you have NOT done consumers a favor in that they [consumers] will ultimately pay for your meddling due to increased costs to produce the Microsoft products? Why can't you government (of by and for the people... yeah right) types understand that simple concept?

Furthermore I DO like many products produced by Microsoft. However if I want a choice of operating systems there are others out there and I DO use them. There are other browser products out there such as Opera which I am using right now.... It is better than the Microsoft browser so I use it. You folks at DOJ DID NOT DO ME ANY FAVORS by getting into Microsoft's business and sucking out millions of dollars THE COST OF WHICH MUST ULTIMATELY BE BORNE BY ME THE CONSUMER. You see... not everyone in America is dumb to what is going on here....

Subject: Microsoft Settlement

Thank you for letting us ordinary citizens comment on this lawsuit. I am confused by many of the charges that have been made in this lawsuit. However, the one issue that seems to get a lot of attention, and affects the people, is the charge that Microsoft has hurt the end-user. As an ordinary citizen, I can categorically state that I have not been hurt one bit by Microsoft. My family uses their software products, along with a bunch of other companies'' software products, and I have not experienced any problems. In fact, I feel that the other companies are benefiting because I am buying their products. That is what is confusing. I don't see the ordinary citizen being hurt. In fact, I see them as benefiting from all this technology.

When I read the allegations, I am deeply bothered at the charges and statements made by the attorney generals of the 18 States. Then I read what Microsoft's competitor have to say, and that makes me outraged, because it clearly shows that these companies are bribing the States to do their dirty work. The way I interpret it, is that they are not very astute business people, and they need some help, so they pay-off their Congressmen to do their dirty work for them. This is what really outrages me.

Furthermore, I read the remaining 9 States are extending this lawsuit. In my opinion it sounds like greed! The companies that are in those 9 States are again bribing their attorney generals. My analysis, as an ordinary citizen, is that these companies are not very astute business people. If they can't make a good product that people will buy, then they don't deserve to be in business. If they are not astute business people, I don't want them representing my country when the go overseas and sell to foreign countries. I don't feel like a proud American when I read that these companies are bribing their Congressmen to do their dirty work. It reminds of the government corruption that I read about in other countries. I certainly hope that our government does not stoop that low that we allow our businessmen to corrupt us through bribery and collusion.

I may only be a common ordinary citizen with not much influence as these large businesses, but I wish to exercise my Constitutional right to freedom of expression and certainly hope that you will consider my comments.

Thank you.

The Microsoft operating systems starting from Windows 98 to the current XP have filters & command lines written within that causes non Microsoft software programs to stall or crash. The error message in the Close Program box is usually Not Responding. No matter how much Ram is being used or what the processor speed is this message appears. My company builds computer systems installs hardware & software and troubleshoots many PC problems. It has been my experience that the bulk of my troubleshooting calls have been non Microsoft software problems. Usually on the new systems that someone has purchased will have Windows 98 NT ME 2000 & XP as the operating system. Common problems are the driver files located in these operating systems. To fix the problem a mass majority of the time I have to uninstall either the hardware or software and then reinstall it with the disk provided by the manufacturer. Ninety-nine percent of the time the first uninstallation/reinstallation works.

There have been times when I had to do this two or three times and keep rebooting the computer to get it to accept the files from the manufacturer instead of the files provided by the Windows operating system. I currently have Windows 98-Second Edition on my home PC and find that system actually helps troubleshoot problems with other Microsoft OSs. Windows 3.1 and 95 didn't carry the same command lines as the newer OSs thus they had less failures. No company should be allowed to dominate a market such as Microsoft. This is America and it should be an equal opportunity for all computer manufacturers. After all computers in this country run a mass majority of business both in the work place and now more so in the private homes of Americans. This should give all companies the opportunity to develop hardware & software that is compatible. For that reason alone companies like Gateway Compaq Packard-Bell & Apple/MacIntosh aren't very successful in the computer

I think this case should end immediately. All citizens have benefitted from Microsoft products. Bill Gates is brilliant and surrounds himself with brilliant people and has done nothing wrong. We only wish we were as smart. To force Microsoft to house a Tech Committee to enforce his compliance with the settlement and then demand he fund it is insane. In America we are suppose to be able to succeed without government punishment for doing well. The government should never have been involved in the first place. CEOs of competitors have thrown money in the right place to bring about this suit in the first place. That is obvious to everyone. To even entertain a forced breakup of Microsoft just simply isn't the American way. Someone somewhere forgot that theory. Maybe the competitors should do better work instead of trying to bring down those that are smarter than them. This is just the opinion of a simple public high school teacher who only wishes to have been so brilliant. Leave Microsoft alone.

I have been a fan of Microsoft and Bill Gates through all of this mess. We as Americans should be grateful for companies and men like Mr. Gates. If Microsoft hadn't developed the technology some other company in another nation would have. All these companies crying and complaining about Microsoft where were they in the early days? Thats right let someone else do the research and development and then cry like a baby that you got screwed. In my opinion Microsoft didn't do anything that someone else could have done if they had been willing to take the Bull By The Horns spend some money and take a risk. I have no ill feelings for Microsoft whatsoever and feel THEY if anyone has been treated unfairly and unjust.

MTC–00028158

From: brians@110.net@inetgw
To: Microsoft ATR
Date: 1/28/02 1:23pm
Subject: Microsoft Settlement

Every section of this settlement which addresses practices which Microsoft has traditionally used to eliminate the possibility of competition seems to be dependent on definitions of terms such as Non-Microsoft Middleware Product and Windows Operating System Product which are still vague enough to be disputable when Microsoft next feels threatened. Enforcement is by a Technical Committee whose paychecks come from Microsoft who are employed in Microsoft arranged offices with Microsoft provided resources on Microsoft's corporate campus in Redmond Washington.

Even if these controls turn out to be sufficient to stop Microsoft's enforcement of it's desktop monopoly we'll be back in this discussion 5 years from now when they expire. This settlement insures that no other company can use the anti-competitive tactics that Microsoft has taught the industry the hard way against Microsoft themselves. To me this seems unfair as these other companies have already been affected by Microsofts past abuses even though most of these other companies have not proven as untrustworthy in this regard as Microsoft. This settlement does not actually have any effect whatsoever on Microsoft's existing monopoly. In my opinion this settlement is an insult to the DOJ and to computer users in general that we could so easily be fooled

again. Microsoft will continue to buy all competition which can be bought and to find creative ways to kill all competition that they can't buy. Thank you for listening. :-)

Subject: Microsoft'settlement

I believe this settlement is not fair. Because I believe this suit should never have been brought in the first place. I have seen firsthand the problems deregulation brought in the telephone industry and I believe it is wrong and rather unAmerican to penalize companys for doing well such as microsoft is being penalized.

The message this sends to the citizens is that if you form a company and do very well the government will step in and force you to give up some of your assets and redistribute your wealth among some of the less wealthy companys. This is the tenents of Carl Marx. We all know what that is called. This has no place in a democracy. This message says Only do moderately well with your company if you make too much money we will step in and redistribute your wealth to others that are less wealthy. Our country needs to take another look at our undemocratic monopoly laws.

Is there a limit to the potential of capitalism? Is there a cap on the American success story? If Microsoft makes a product that is only compatible with other Microsoft products then so be it. Anyone that wishes to compete against Microsoft' should be able to do so without restriction. That is what free enterprise is all about. As long as the products that Microsoft creates is not a health hazard etc. they should be able to do as they please. If the public gets fed up they have the option to choose another brand. Don't get me wrong I don't like the idea of a giant corporation taking advantage of their position in the market to wield their unlimited capital and public appeal to take advantage of the consumer. However lets not put an end to freedom of enterprise and let's not put a cap on the potential of success in America.

The Anti Trust case over Microsoft should have never even started. It is apparent the only reason why it started was because NetScape and AOL paid off people to bring the case because they knew they couldn t bet Microsoft in the marketplace. Who would really want to have to pay for an Internet Browser when they get one for free? This new case AOL has brought is because they are fuming that MSN is getting bigger and bigger pieces of the market. It is called capitalism live with it and stop trying to bring your rival down with cheap tricks or file for chapter 11 and close down. In capitalism whoever is selling the better product for a cheaper price wins and AOL and Netscape needs to realize that and stop complaining to the government. What President Bush is doing by trying to keep out of the private business sector is a smart descision. Business don t need more government control and this how recession we are going through shows what happens when the government does try to control.

Subject: Microsoft Settlement

Although I do not always agree with the way Microsoft does business I also have to admit that they have done more than Sun Netscape AOL and others to advance the wide spread use of PCs. As far as using software from a company other than Microsoft I find it very easy to install the software. I have little or no problems with the installation or use of non-Microsoft software. I know that Netscape AOL and Sun seem to think that Microsoft has harmed their businesses but I have used Netscape in the past and let me say that Netscape hurt themselves. As far as Sun AOL Apple and others are concerned if they were so concerned about the general population I did not sense it in their products or their business practices.

In closing I will restate that I do not always agree with Microsoft but if not for them and the IBM compatable PC I would not be using a PC today. Before we go to far down the road of penalties against Microsoft we need to explore the true intent of the other companies. If their products and services are good then people will buy them if not—why force their products and services on us.

The argument is clear. Was the consumer hurt by Microsoft bundling the browser with the operating system? The answer is no. The Netscape argument is it could not compete because the consumer did not have a choice. Netscapes claim is Microsoft circumvented the consumers decision to choose. Software is ubiquitous in that anyone can design develop and sell it. Microsoft did not prevent Netscape from designing developing and selling its browser. Netscape gave up trying to make a better browser and at that point the consumer did choose they choose to use Microsofts browser. The fact is Netscapes success depended on Microsoft selling more copies of Windows and therefore Netscape could have sold more copies of its browser.

I have been a computer user since the days when every computer had its own operating system. Chaos ruled the field. Microsoft by being in a fortunate position and taking advatage of that position by making a superior product became the standard for personal computers throughout the world. To punish them for being the best in what they do would itself be a crime. Breaking them up would bring chaos out of order at a time when the country s economy needs order. To punish Microfsoft with more than a warning and some survaliance paid for by Microsoft would not be justified. The fact that AOL owns Netscape but uses Microsoft Internet Explorer as its Internet Browser says volumes about the quality of Microsofts products. And it isn t American to punish the succesful nor is it in the interest of the United States to overpunish Microsoft. Sure they did some wrong but they have done far more good.

Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I have taken this opportunity to write and express my opinion of the settlement that has been reached in the Microsoft antitrust case. I believe that we need to concentrate on issues of greater importance . I am pleased that a settlement has finally been reached in this case and that Microsoft will be able to continue doing business as a whole entity. It is apparent to me that the people pursuing this litigation are not looking for a good judgment in this case but rather the perpetuation of their own personal agendas. When government becomes involved in business, socialism becomes the rule of the day. I feel that this case has been fueled by jealousy and that until we reach a conclusion to this litigation free enterprise is stymied. The terms of the settlement are fair: Microsoft has agreed to design all future versions of Windows to be compatible with the products of its competitors, and they will also cease any behavior that may be considered retaliatory. Please support this settlement. I trust that you will do all that is within your power to protect American businesses.

Sincerely,

Vanessa I. Castagliola, Leonard D. Castagliola Jr.

Subject: Microsoft Settlement

The following comments are submitted for the Court's consideration in the Microsoft case before it. Based on my recent experience in the transfer of my Internet service from Qwest to MSN, I am very disturbed about increasing Microsoft's influence and hegemony in the provision of Internet services. The changeover of services has not been managed well—several errors caused frustration, lost information, and took much time to execute. I was led to believe that these difficulties occured because I was not coming from Microsoft software but rather from Netscape. I have spent hours talking to the technical assistance people to straighten this out. Let me add that simply getting to a person (rather than being routed through the branches of call answering systems) is a feat!

While I was not required to switch to MSN, I was given no information on ways I could switch to another server. Nor could I locate such information from Qwest or MSN. In other words, I felt corraled (indeed compelled) to transfer to the Microsoft system, MSN.

Now I'm subjected to advertisements and ''come ons'' whenever I log on. I strongly feel that it is a step backward for the consumer to allow Microsoft more control over Internet services. I am not a sophisticated computer user, but rather a person who struggles with the technology and gets by through simple, direct choices and customer-oriented service rather than glitz and promises.

Please preserve my choice to obtain the best consumer services I can find, not force me into a gargantuan system that is removed, indifferent, and frequently inaccessible.

Thank you for your attention to my concerns.

Comments on Microsoft Settlement

Alex M. Aisen

I am writing these comments as a consumer, professional, and computer user. I am an academic physician, not an attorney, and readily admit I do not know the formal rules for a submission such as this. I believe the comments I am making are accurate, but much of what I write is based on what I have read and remember, but have not verified personally. I am writing as an individual only, and not as a representative of my employer.

My position is that Microsoft is a company that has produced, and continues to produce much excellent software. But they often behave in ways which seriously harm both consumers and competitors, and this behavior is likely to get substantially worse if the proposed settlement is approved without substantial modifications. Like many others, I believe the settlement is far too lenient. The best way to encourage Microsoft to continue to produce top quality software in a way which truly benefits consumers is to ensure that there is competition, and to demonstrate to the company that if they behave in an illegal manner, they will be

punished in a meaningful way. The proposed settlement does neither, and should be substantially strengthened.

Here is my list of many of the harmful behaviors I believe Microsoft to be guilty of. Some of these practices may be illegal; most are likely within the law. But it is clear that the only reason Microsoft has been able to get away with things such as I will mention is that they are a monopoly; their customers, be they corporate or individual, often have no practical choice but to play by their rules, onerous as they often are. Anticompetitive Activities. The activities outlined in the lawsuit several years ago by Caldera Corporation over the computer operating system DR-DOS, wherein Microsoft was alleged to have (and probably did) incorporate well camouflaged code in a version of Windows released to software developers that deliberately ''broke'' a competitor's product (DR-DOS, which at the time competed with Microsoft's MS-DOS) is an excellent example. This lawsuit was settled by Microsoft for a substantial sum.

More recently, Microsoft has released a new version of Internet Explorer, version 6, which, unlike previous versions, is deliberately incompatible with plug-ins (third party accessory software) written in the so-called Netscape style. This deliberate incompatibility may be an attempt designed to further hurt their competitor, Netscape

They have also removed support for up-to-date versions of the Java Programming language from the latest version of Windows, Windows XP. Java is a programming language developed by Sun Microsystems, that has been widely adopted by many software developers; it has the important virtue of being cross-platform. That is, programs written in Java can usually run on computer platforms other than Windows, for example the Macintosh, Unix, and Linux. By removing full support that Microsoft provided in earlier versions of Windows, Microsoft is hurting both developers who choose to use Java, and consumers such as myself who bought Java based software from these developers.

Though I certainly cannot prove it, as a long time users of many Microsoft products, I think is possible or even likely that the company has sometimes introduced or permitted ''glitches'' in their software that interfere with competing products, but not with Microsoft's own. For example, in the past the Novell Corporation has produced a file sharing system that competed with Microsoft servers, allowing desktop PC's to store computer files and share printers via centralized server computers. I have found that there are numerous ''glitches'' when using Novell file servers, that seem not to be present when using Microsoft file servers. As a user, I have no real way of knowing whether these glitches are simply bugs or weaknesses in Novell's software code, or ''deliberate'' incompatibilities hidden in the desktop versions of Windows by Microsoft. And even if there is no overt action by Microsoft, the fact that Windows software is proprietary, and the source code generally secret, can make it hard for competitors to produce products that interoperate with Windows.

More recently, I personally found that I could no longer use a popular third party e-mail client, Eudora, with an enterprise Microsoft Exchange e-mail server. Microsoft had included, as an option, what I've read is a proprietary security feature called ''secure password authentication.'' The enterprise had apparently started requiring that this protocol be supported by the client software. Since Eudora could not use this, I was forced to switch to a Microsoft program, Outlook Express. Now, Outlook Express, like Internet Explorer is presently a free program. And, I have insufficient technical information to determine what caused this particular incompatibility. However, I cannot help but wonder if this is part of a larger strategy to marginalize third party e-mail clients like Eudora, and whether ot not Outlook Express will remain free if and when the competition is gone.

Microsoft's treatment of potential competitors is important as well. An excellent example of the sort of thing they are capable of was recently described in the Wall Street Journal, concerning Eastman Kodak. Film-based photography is now being replaced by digital photography, and Kodak hoped to sell digital cameras and software, which consumers would install on their Windows-based computers. However, this was a market Microsoft wished to enter, either directly or through partners. So Microsoft reportedly designed new versions of Windows to steer consumers away from Kodak's offering, and to those supported by Microsoft. Ultimately, Microsoft backed down in this particular case. But one cannot help but wonder if, given a less powerful adversary than Kodak, or the absence of the ongoing legal activities, if the outcome might have been different.

One additional example: the default home page on standard installations of Internet Explorer (which is part of every copy of Windows and hence part of most PC's sold) is the Microsoft Network. Thus, every time most consumers starts Internet Explorer, the web site they first see is Microsoft's own Microsoft Network. Now, it is possible to change the default home page, but most users either will not know how, or will not bother. So, this simple strategy puts other vendors of web portals at an extraordinary disadvantage.

It has been widely reported that in pre-release versions of Windows XP, Microsoft incorporated a feature called ''smart tags'' which would allow them to direct users of the Internet Explorer web browser visiting just about any third party web sites to be ''directed'' at proprietary sites run by Microsoft or its corporate partners. When word of this feature was reported in the news (the Wall Street Journal), there was an outcry, and Microsoft disabled it. However, there is no reason why they could not activate it in the future, particularly if they feel their dominant position in the market place, and the lack of effective oversight, allows them to do so.

Onerous Licensing Terms: Terms in Microsoft software licenses are often onerous, and it seems self-evident that the only reason Microsoft gets away with including them is that they are a monopoly. These onerous terms affect both consumers and businesses.

Two recently publicized examples from consumer software are as follows. The EULA (end user license agreement) found in the download of Microsoft's very popular Windows Media Player, states ''Digital Rights Management (Security). You agree that in order to protect the integrity of content and software protected by digital rights management (''Secure Content''), Microsoft may provide security related updates to the OS Components that will be automatically downloaded onto your computer. These security related updates may disable your ability to copy and/or play Secure Content and use other software on your computer. If we provide such a security update, we will use reasonable efforts to post notices on a web site explaining the update.''

In other words, Microsoft reserves the right to automatically install software, without the users knowledge or permission, which may disable ''r software'' on the user's computer. Microsoft's newest operating system, Windows XP, incorporates an automatic update feature, which could easily be used in this manner. Though the putative purpose of disabling software is to enforce Microsoft's interpretation of digital copyright enforcement, t it is important to note that the language quoted above is very general; further, even properly intentioned disabling of software could have very adverse unintentional effects on an unsuspecting computer user, as has already been reported in the trade press concerned the automatic updates that occur with XP.

The second example on onerous licensing terms is this language, which speaks for itself, which has been widely reported to be present in the printed EULA included with shrink-wrapped boxes of Microsoft's popular website authoring program, FrontPage: ''You may not use the Software in connection with any site that disparages Microsoft, MSN, MSNBC, Expedia, or their products or services, infringe any intellectual property or other rights of these parties, violate any state, federal or international law, or promote racism, hatred or pornography.''

At the enterprise level, I have heard, and had limited experience with myself, licensing clauses that do such things as forbid companies from sharing performance test results performed on Microsoft software. Thus, companies can, and sometimes are, forbidden from sharing their experiences with Microsoft products with their corporate colleagues. Microsoft is even widely reported to have used such language to prevent the publication of comparative reviews of their products.

Cost is an important factor as well. As Microsoft's monopoly in both operating systems and office productivity software has become entrenched, Microsoft uses its licensing terms to effectively raise prices substantially. For example, years ago, when there were competitors to Microsoft Office, the licensing terms on Office allowed concurrent user licensing. This is no longer allowed. More recently, other changes in its licensing terms require users to pay substantially more, oftentimes several-fold more, for software licenses. The important point is, I think, that Microsoft has substantially increased the cost of its

software to enterprise consumers over the years, and they often do this by changing the licensing terms, rather that ''overtly'' increasing the price. The effect is the same—the price goes up dramatically—but the approach used by Microsoft may allow them to masquerade this fact.

Finally, it is well known that Microsoft often include licensing terms and pricing strategies that pressure companies into making upgrades that they otherwise would not, thereby incurring substantial expenses in training, dealing with incompatibilities with other software, reduced efficiency from complex features that may not be needed, etc. Again, this is a practice that cannot practically be regulated; rather it is essential that there be viable competition to Microsoft to keep their licensing practices reasonable.

Privacy. It is clear that Microsoft often uses its monopoly power in ways that seriously compromise privacy. The major reason Microsoft is able to do this, is that they are an effective monopoly. Several examples of such privacy invasion follow.

Several years ago, it was discovered by a third party that all documents created by the then current version of Microsoft's ubiquitous Office software included a unique identifier that allowed the document to be tied to the system that first created it. Further, it appeared that Microsoft had a database of computer registrations that may have allowed this identifier to be tied to the actual individual who registered or purchased the computer. In other words, any letter created in Word could, with access to MS corporate databases, be tied to the computer, and perhaps even the individual who first wrote it. When this was publicized, Microsoft removed the ''feature.'' But, had this occurred today, with their position even more entrenched, they may not have felt this necessary.

It is worth considering the privacy implications of Microsoft's latest operating system XP. XP incorporates functions that have serious privacy implications. Consider two features a user encounters when first installing or using Windows XP, Product Activation, and Passport. Product Activation is now required of the latest consumer versions of Windows and Office, and requires that users contact Microsoft after purchasing, but before they can use the software (to be precise, they are given a short time of use before product activation is necessary). During this contact, which will usually take place over the Internet, information about the users computer is transferred to Microsoft. The stated purpose of Product Activation is as an antipiracy measure, but the privacy implications are serious. Users have no choice but to send Microsoft information about their computer configuration; the nature of the information they send is not fully known, since the data sent is encrypted, and since Product Activation is a somewhat mysterious and proprietary process.

There are even more serious privacy implications in the MS Passport system. Use of Passport is not theoretically required, as is product activation, but in practical terms most individual users will have to sign on to it. When a newly purchased computer is first turned on, the user is asked multiple times to sign up for Passport. Further, participation in Password is required to obtain technical support from Microsoft; as everyone who has used modem software knows, the need for technical support is inevitable. Passport is designed as a system to electronic commerce, and requires that a user provide significant personal information. One cannot help but be concerned about the collection of such information by a corporation with the ambitions and dominance of Microsoft. Again, viable competition and a robust marketplace would be the best means of ensuring that Product Activation and Passport not be used in ways that violate reasonable user privacy.

Software Reliability: Software reliability, or, rather, the lack thereof, has become a major economic drain in this country. As computers become more ubiquitous, there are important safety concerns as well. It is important to note that the financial motivations for software vendors are not necessarily to produce a reliable product. Companies often charge fees for providing technical support, and indeed, this may be a substantial source of revenue. This revenue stream is enhanced the more complex and ''buggy'' software is. Microsoft's consumer products used to come with free technical support; as the company's dominance has increased, they have discontinued this practice; they now generally charge consumers for technical support after a limited number of incidents that are ''free'' (or, rather, included in the price of the software). Corporations are on the hook for far greater fees, with large annual support contracts and per incident fees. And, because Microsoft's software is proprietary, the company is usually the only feasible source of technical support. The way to ensure that commercially sold software is make as reliable as possible is by competition in the marketplace.

(It is noteworthy that, because software is licensed and not purchased, that the usual remedies in the civil courts for ''buggy'' products do not generally apply to software. This may grow even more true if the software industry, lead by Microsoft, is successful in persuading state legislatures to pass UCITA (Uniform Computer Information Transactions Act), which many feel will effectively eliminate any legal liability for bug ridden software.)

In summary, Microsoft is a great company that has produced many wonderful and useful products. However, there are many ways in which Microsoft's business practices harm consumers, both individual and corporate, as well as competitors. Were Microsoft not a monopoly, the marketplace would be the best policeman. But the company is a monopoly, and has been found by the court to become one through illegal means. It has demonstrated, and continues to demonstrate, a disdain for the legal system that should give us all pause. The solution must be to impose financial penalties, restrictions on conduct, and perhaps even structural changes on the firm that will restore competition and bring things back in to balance. The proposed settlement does not even come close to meeting this end; it is essential for the long-term health of the American economy that the court remedy this unfortunate situation.

Subject: Microsoft Settlement

As a consumer who appreciates the advances in the world of technology, it is difficult to understand the necessity of the Justices Department's suit against Microsoft. I do not even pretend to understand how technology works. I do understand the marketplace and as a consumer it is important to have access to products that can improve communication make it easier to access the abundance of knowledge in the world and to be able to enjoy a different venue of entertainment. Consumers with little doubt indicated they were comfortable with the Microsoft product. It appears the Justice Department may have had too much time and money on hand and needed to make a case against some profitable company. One of the beauties of the US is the ability of the consumer to define the marketplace by what works with ease affordibility and accessibility. It appears the other companies needed to improve their product with more creativity and ingenuity rather than turning to the Justice Department. When the consumer is unhappy then the Justice Department should intervene.

Bellevue, WA 98007
Office # 425–378–8309
Attorney General John Ashcroft
950 Pennsylvania Avenue NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am writing this letter today to voice my support of the settlement reached between the Justice Department and Microsoft. In offering superior, well priced products Microsoft has made my life and my business easier to operate, I have always been extremely happy with their products.

I believe that the enactment of the settlement agreement will spur innovation in the settlement process once more. The settlement agreement contains many stipulations that will benefit the technology industry. Microsoft has agreed under the terms of the settlement to disclose information about the internal interfaces of the Windows system. In addition to this, Microsoft has released contractual restrictions on developers who would wish to enter into multiple contracts.

This lawsuit is old and worn out, and should go away as soon as possible for the

good of America and the economy, and for us, the happy Microsoft consumers.
Sincerely,
Laurel James

Subject: Microsoft settlement
I am against the proposed settlement. I believe the only fair solution is to split MS into 2 companies. One company would be operating systems. The other would be applications. The operating systems company would be required to publish all API's (application programming interfaces) to everyone. This would also eliminate the case of breaking another company's application with an upgrade without breaking Microsoft products.

Sirs
I am in support of Microsoft not only because I am a small shareholder but I believe in capitalism. Microsoft has grown through research and innovative thinking and has fielded some excellent products which has made them the leaders in their markets. To go against them because their competitors cry foul is an incrouchment of the government into the free market system.

I think it is wrong of the United States to do what they are proposing to do to Microsoft. I think Microsoft is a upstanding honest company. They are prosperous because of this and because they have many intelligent people working there. Maybe the government should help fund other companies that aren't as fortunate as Microsoft to give them a chance to compete. I think their decision could hurt them in the future. They may need Microsoft to help them, then what will they do?

It is my opinion that Microsoft is responsible for uplifting America to the Top in Technology. This Anti-Trust Prosecution by the Clinton Adminisration is nothing less than Corruption for monetary gain. Microsoft should receive support from us and not Prosecution. This is a Common Sense company paid for with honest earned money. If our Nations leaders were not corrupt at the conception of this Lawsuit Common Sense says it would have never happened. Microsofts donations to the people of this Nation are another thing. They have given much to the good causes of our good people. If anyone is guilty of anything it is the Clinton Administation being guilty of a conflict of interest and Microsoft being a victim of its unethical outcome. If the truth be known and when it is the people will side with Microsoft. This is an opinion based on fact.

Dear Sirs:
This is to express support for final acceptance of the settlement between Microsoft the Department of Justice, and the nine states. We urge you not to reject this settlement as any delays will not serve the interests of the American people but serve to further the causes of Microsoft's competitors who continue to choose to compete in the courts instead of the marketplace. The American people are insulted by claims that we have been harmed by Microsoft. In truth, we have been harmed by their competitors who have stalled progress in technology and in the economy. These suits must not be allowed to continue. Before said suits our country experienced unparalleled growth and prosperity. Our country regained its dominance in technology due to the innovation and growth of Microsoft and the many companies supporting their operating systems. We respectfully urge you to help return our country towards prosperity by rejecting further lawsuits and further delays in acceptance of the anti-trust settlement.

I can't state it strongly enough. The case against Microsoft was a stupid waste of taxpayer money! The end result was millions of $$$ wasted. Because Microsoft was getting its foot in EVERY door and its products were EVERYWHERE the end result of this total waste of money is to FORCE Microsoft to be in even more places than it is now! By forcing Microsoft to donate software to schools the court is MAKING Microsoft do the very thing it got into trouble for doing! Just DROP the whole thing and go away now before you waste any more of MY money in another pointless chase after Microsoft.
I'll agree that there MIGHT be better things out there than what Microsoft produces. but I have seen NOTHING that forces me to use Microsoft. Did Microsoft FORCE Apple to charge too much for a MAC computer so that most people would choose to buy IBM? No. Did Microsoft FORCE IBM to hold Microchannel close to the vest and not let anyone else make Microchannel products? No. Both of these bone-headed decisions

were made without Microsoft input. Did Microsoft benefit from Apple and IBM making stupid choices? You bet. So did I. The one GOOD thing about the case is that it kept a lot of lawyers busy and thinned out the crowds behind the ambulances.

I am very upset about the Microsoft Settlement. I did not really understand how upset until somebody from Americans for Technology Leadership called my home to harass me about how I needed to show support for the Microsoft Settlement. I have an unlisted number I don't even give it out to the credit card companies. Only my work and very few others (including Microsoft) have my number at all. I am possitive that my privacy has been invaded and I am not sure, but I think my civil liberties may have been violated by the disclosure of my personal information. The proposed settlement is stupid. It will give 3rd parties who did not purchase any software, were not affected by the lack of competition, and not forced to obtain certification from Microsoft, to profit. While on the otherhand, all those affected like customers, competitors, and professionals forced to certify and recertify will go uncompensated. Lastly it does not provide any measures for prevention of future violations. I think that any compensation should go to competitors, customers, and certified professionals who have suffered.

Dear Sir: America has always been the land of the free; to grow, to live, to achieve, to invent and to prosper. On the contrary it seems to me that when someone succeeds in business to the point of making large amounts of money someone or something starts to say this is not right he has to be stopped or he will have a monopoly. Leave Mr. Gates alone. He has been benevolent with his profits, employed thousands and inspired thousands to go into the electronic field. I am not as computer friendly as I would like to be, but at my age, I am doing the best I can with the help of my son. Spend my taxpayer monies and go after the Health Insurance Companies who are dictating who will get the proper care and who won't. I have tried to buy my own health insurance and have been refused because of my age, varicose veins, etc., etc. They didn't care if I could pay; they just didn't want to take the risk. I am sorry I am rambling but my point is there are important issues to take care of. If the product is good, people will buy it. If not, they will buy something else. Frankly I am glad my computer came equipped with Microsoft. It has served me well. I firmly believe in free enterprise. I don't see anyone going after China. They seem to have a Monopoly on every item sold in the USA. When I find something made in the USA, I buy it for a souvenir. Please leave Microsoft and Mr. Gates alone and go catch the bad guys. Thank you.....

Microsofts interests are compelling personal computer users to use their operating system. This operating system which is compelling me to act in ways that I would otherwise not choose exceeds healthy business. competition is neither fair nor just. Specifically I believe the physically and mentally disabled are marginally included in this revolution of communication, information and processing. Developers fear that the predators and reverse engineers await on the margins of one operating system (XP) at the ready to copy product(s) which are too young to defend themselves. In particular, I cannot use Government protection and resources in a capitalistic society to defend myself unless I can reasonably expect my most basic development assumptions are protected. These basic assumptions ought to have Microsoft preserve and create public Safe Haven operating system components that will promote software development which would not have to be redesigned because the Operating System has changed. Open Platform operating system proponents may find this a compromise. My example is my own product. I continue to struggle to design a product that is open platformed, meaning it should work on most operating systmens and within all browsers. My testing has found I must discover software bugs that seem to benefit the interests of the operating systems. I believe that these software bugs are not intentional but they are so numerous that a manager can work slowly on them and still be rewarded. This is unfair to the public. This Business market is NOT functioning normally! This is not a model of competition with room for a better business to succeed! This current business model is dysfunctional! I think this dysfunction works in the following way. Current Law allows the creation of conflict between software applications, hardware, and operating

systems when a competting business begins to spend resource to point out the unfairness and fix the software bugs.

RE: Microsoft Settlement

Dear Ms. Hesse,

I have, as a stockholder of Microsoft, watched the antitrust proceedings with interest. It seems that the Government has worked an agreement that was fair to all parties and now wants to change terms and conditions relating to the settlement. I do not feel it is proper or fair that at this late date this be allowed to happen.

I further feel that Microsoft is not responsible for individuals that create products that cannot compete in the marketplace because of their own shortcomings (e.g.. Netscape). I am further annoyed that my government sponsors what I consider a monopoly in the AOL / Time Warner merger. Now AOL is trying use Netscape as a platform to damage a perceived competitor, MSN. Try to visualize the PC software market before microsoft created and organized it. Our ability to communicate, organize and interface between businesses has been improved on a scale beyond anything we could have ever imagined prior to 1980. Why... Because Microsoft and its founders had a vision. This settlement represents the best opportunity for Microsoft and the industry to move forward, therefore I hope it will end the litigation.

Subject: Microsoft Settlement

Dear Antitrust Department officer,

I have read through the settlement proposal between the Justice Department and Microsoft. It sounds like it is a fair, effective way to resolve the issues within the merit of the case. I do not understand why other non-settled states and critics want to include a lot of different things falling outside of the scope of the law suite and still claim they are acting on behalf of consumers!!! Like judge Postner stated in his recent book, individual states should be excluded from the antitrust suite since they are acting for the interests of their own states only, not for the entire American people. The purpose of the lawsuit is to restore the fair competition environment in the industry, not to punish the successful company, rewarding the failures, or helping the competitors. American is a free market environment. It will go against our principle if we force a company to include the product of a rival company. If a company chooses to do so, it must come from their own decision. The government should not dictate a particular company how it would run its business. It should be free to run itself in its own creative way as long as it follows the general rules set and honored by every one. Freedom is the strength of our economy, our spirit and our lifestyle.

Thank you very much for your time.

Regards.

anh.

ROBERT AND CATHY FRISBY
18523 Hottelet Circle
Point Charlotte, FL 33948

January 21, 2002
Attorney General John Ashcroft
US Department of Justice
Washington, DC

Dear Mr. Ashcroft,

The Department of Justice has finally agreed to terms on a settlement that brings an end to the antitrust suit against Microsoft. We are writing this letter to express support for the settlement, and to ask that it is approved as soon as the public comment period is over.

The faster this settlement is approved, the faster the economy can get back on its feet. We can't stand to sit and watch the market fall over 200 points one day, then rebound to close out the next day with gains over 120. The settlement will encourage competition, which will lead to better technology at a lower price. This hopefully we will give us some of the stability our economy needs, and can kiss goodbye to this recession. Microsoft does have to forfeit a good deal of technology to their competitors, and they will be monitored by an oversight committee who makes sure they are abiding by the terms of that settlement, but this will certainly be worth it in the long run.

Everything is now in place for an exodus from this recession. We support this settlement, and hope it is implemented as soon as possible.

Sincerely,
Robert & Cathy Frisby

From: Chip
To: Microsoft ATR
Date: 1/28/02 1:41pm
Subject: Microsoft Settlement

I feel the remedy is fair and should end the case completely. I do not feel that Microsoft has hurt the public in any matter. Ten to fifteen years ago the computer industry was in a mess. There was no standard operating system. If you went to purchase a computer at Radio Shack you would get a computer running Deskmate. If you went to an Apple distributor you got the Apple operating system. If you went to IBM you got their OS operating system. And then of course you had Windows. Kids in school learned Apple but could not go into businesses and run their computers. The average person had to have an apple computer so their kids could do homework and an IBM computer so they could work at home. Since then and thanks to Microsoft the industry has been standardized, kids in school can go out in the world and run computers. Employees can go home and work on a computer with the same system they use at work. By becoming standardized, how does this hurt consumers? Microsoft has saved the average consumer thousands of dollars. By their continued innovation and development of the operating system they have added tools and recourses that would have cost the average consumer a lot of money. If Microsoft charged for each addition to its product, or forced the consumer to purchase such things as Internet explorer, word, notepad, a calculator, Paint, the basic TCP/IP protocols, the average person could not afford these add ons and would be shut out of the internet.

As for Internet Explorer, that was the best thing that Microsoft ever did. It made surfing the web enjoyable. Question, did you ever try to use Netscape Navigator before Internet Explorer came along, I have and it sucked. You had to pay around $50.00 for it, it took several hours to down load and would crash so often that trying to look up one item would take hours. Microsoft came and gave you Internet Explorer, which at first had its problems, but when they finally integrated into the operating system, it was fantastic, you could surf the net and really enjoy the experience. System hangs and lockups that occurred often before integrating disappeared. And by integrating the software it saved me money, how DID this hurt me? I know the argument it hurt competition, my argument is it did not hurt competition, it caused competition. It caused Netscape to wake up and make a better product. At a more reasonable price, this let the consumer save money by being able to buy a better product at a lower cost. Microsoft did nothing wrong. Those consumers that wanted Netscape still continue to use it, if Netscape wanted to keep customers, and gain customers, they should have developed a product that knocked the socks out of Internet Explorer, but did they no, they cried and sued. They gave up, because they would not take the time and resources to develop a better product. I know the argument, how could they when they did not have the money because Microsoft was giving the product away. Simple, build it and they will come. The consumer wants better products and if the consumer found an item better, those that can afford will buy it.

Is it wrong, to build your business, and to protect your business. NO, it is not wrong! Microsoft played hard ball, yes, but how is that different from any other company that wants to grow, expand, and make a difference. Netscape, AOL, Sun Microsystems and others are playing hard ball now, buy suing Microsoft, because of their jealousy over the dominance Microsoft has. If the companies really cared about the consumer, they would build better products that would blow Microsoft way. But do they no, the run and scream and sue Microsoft, because Microsoft does not play fair. If these companies would build better products on the same caliber as Microsoft, consumers will go there; they will buy what they want. But stripping down Windows will only hurt the consumer, because the costs associated with

buying each piece of software will be more than the average consumer can afford. But those that can afford the software will buy the better software. How is this any different from the auto industry? Yes, I know that there are several companies competing equally, If I went to ford to buy car should they be required to give me a stripped down car. So that I can go to Chrysler to purchase the motor, to Bose for the stereo, to Goodyear for the tires, to Monroe Muffler for the Shocks, and Muffler. NO, they provide the basic systems and then you buy the additional or custom items that you want. Microsoft does that they provide the consumer with the basics and let the consumer buy what they want. The problem is the other companies are not making products that are better and more desirable.

End the lawsuit now and let Microsoft go back and build and innovate so that the envelope of information and knowledge becomes more reliable and available to the average consumer, and so that these other companies will be forced to push the envelope even further buy building better software. If these companies would just worry about building better software that pushes the limits, they would not have to worry about Microsoft.

Thank you
Gary E. Altman II

January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

Regarding the recent Microsoft Antitrust settlement, the PC industry, the economy and the stock market have suffered enough from this misguided lawsuit which was instigated by Microsoft's competitors who elected to compete via lobbying and courtroom tactics rather than in the marketplace. I firmly believe that litigation should come to an end. At this point, it seems ridiculous to prolong this case any further.

Microsoft is much less of a problem than the Cable-Satellite-Broadcast Cartel which has conspired to restrict trade by controlling what consumers will and will not be able to watch by forcing viewing ''packages''. Cable and DBS satellite providers mandate that ''packages'' must be purchased if you want to watch even one of the channels in the package. This lack of a la carte offerings forces consumers to buy a multitude of unwanted channels in order to see a few desired channels.

Business Week (Jan 21, 2002 pg. 71) pointed out that AOL/Time Warner (and other cable and mini-dish satellite providers) are collecting $54 per month from its subscribers while Microsoft is lucky if it sells a home PC user a $90 operating-system upgrade every three or four years. If you are worried about monopoly power forcing consumers to pay more, Microsoft should NOT be your target, the Cable-Satellite-Broadcast Cartel should.

The settlement proposed in early November of last year contains several restrictions and commitments to which Microsoft has agreed. In these commitments, Microsoft permits computer makers to replace access to Microsoft features with access to the competitor's software. This will require that Microsoft change certain interfaces necessary to the Windows'' operating system. However, the list doesn't end there. Microsoft has agreed not to retaliate against its competitors and to ensure this from happening, a three person technical committee will be formed to make sure that Microsoft sticks to the terms of settlement.

As you can plainly see, Microsoft has more than paid for its previous actions. As I believe Microsoft to be a respectable company, I assure you that this settlement will more than suffice.

Sincerely,
Robert Stevens &
Natalie Stevens

Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough. Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user. This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

Washington, DC 20530–0001
January 26, 2002

Dear Mr. Ashcroft:

I am writing in support of the recent settlement between Microsoft and the US department of Justice. I think that government should stay out of free enterprise and this is a classic case where the three years of litigation reflects intense lobbying on behalf of the competition rather than a genuine concern for the American public.

The terms of the settlement go beyond what was originally called for when the lawsuit began. Microsoft will be forced to increase relations with computer makers and software developers, disclose technological information to competitors, grant computer makers broad new rights to configure Windows, and form a three-person team to monitor compliance with the settlement.

While I think that Microsoft is giving away too much, I think there is no alternative since further litigation could be detrimental to Microsoft's and our IT sector's future. Please implement the settlement and look out for the best interests of the American public.

Sincerely,
William Streicher

To: Microsoft ATR
Date: 1/28/02 1:43pm
Subject: Microsoft Settlement

Dear Department of Justice,

I think a quick settlement with Microsoft is in the best interest of all consumers. Throughout this trial I've gotten the feeling that a majority of the issues were in large part due to weaknesses in Microsoft's competitors. My favorite example is Netscape which originally paved the way to making browsing the World Wide Web easy. Unfortunately, they became slow and unresponsive to the new features I wanted so I switched to Internet Explorer. Before the third version of, IE Microsoft's product was inferior. Once it was superior I made the change. If someone wanted to use the Netscape browser it's certainly not hard to find. I saw a link to it on both Time and People magazines'' web sites just last night.

Don't prop up bad businesses with legal proceedings. The strong companies will survive and the weak ones should be tasked with changing their business models or perishing.

Please settle this case so that I can focus on the important things like keeping my job. We all have more important things to focus on.

Sincerely,
Kent Compton

From: Paul Cantrell
To: Microsoft ATR
Date: 1/28/02 1:43pm
Subject: Microsoft Settlement

I am strongly opposed to the proposed final judgment of the Microsoft anti-trust case. It is weak, and unlikely to have any substantive effect on Microsoft's conduct.

The PFJ places far too much trust in Microsoft's willingness to follow the spirit as well as the letter of the settlement. When the PFJ says in section III.J.1, for example, that Microsoft is required to share certain technical details, except when those details would harm security—as determined by Microsoft itself!—it nullifies any real power

the settlement has to force Microsoft to share the details the company most wants to hide.

General opinion in the software world is that obfuscation is the enemy of security. A system is only secure if everyone knows how it works, and agrees it can't be broken. As a software engineer, it is unclear to me how hiding any API, protocol, or documentation would protect or enhance the security of any conceivable ''anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems''. It is eminently clear to me, however, how Microsoft could cite unspecified ''security reasons'' to cripple execution of the judgment. Section III.J.1 is a loophole, and only a loophole. So why is it present in the PFJ? The judgment is rife with similar problems. Microsoft must not be able to ''outsmart'' any judgment in this case. The current settlement fails that test miserably. Thank you for this opportunity for public comment.

Dear Mr. Ashcroft:

I am writing today to encourage the Department of Justice to accept the Microsoft antitrust settlement. A settlement is available and the terms are fair, I would like to see the government accept the settlement and move on.

Many people think that Microsoft has gotten off easy, in fact this is not true. Microsoft has agreed to many concessions in order to reach the settlement. The biggest being that Microsoft agreed to release part of the Windows base code to its competitors. This is so Microsoft's competitors can develop more compatible software. Microsoft has spent years and millions of dollars developing their products, now they are required to hand out part of their work.

There is a big difference between companies that develop new products and companies that copy them. Unfortunately, the government has decided to harass the company that develops them. This issue has been drug out for over three year now; it is time to put an end to it. Microsoft and the technology industry need to move forward. It will be virtually impossible to move forward with this issue hanging over the industry's head, Please accept the settlement allow the industry to move on.

Sincerely,
Arnie Solvang

For the record, I was against the original lawsuit filed against Microsoft. As a consumer, I purchased my PC from Dell with Microsoft software installed. I made this decision based on past experience with their software. My PC came with Internet Explorer as my browser. I have experience in using Netscape and my personal preference is with Internet Explorer. As a consumer I could have made an easy change to my system and gone with Netscape. The original lawsuit was brought because someone felt that Microsoft had an unfair advantage by bundling all of their software together. In my opinion, this is a false premise and tends to lead us done a slippery slope. What will happen if Lotus 1–2–3 decides that Microsoft has an unfair advantage with bundling their Excel with other products. Price and quality were my major reasons for choosing Microsoft software. Because the best way for Netscape to compete is to create products that compete with Word, Excel, Power Point and Outlook Express. I have used Netscape email in the past and sincerely believe Outlook is a far better product.

I retired on 12/31/99 from CSX Transportation as Director of Interline Switching. I have a Masters Degree from Johns Hopkins with a concentration in Information Technology. I believe overturning the original lawsuit and sending it back to the lower court is the correct approach. I believe Microsoft should be held harmless because a settlement will be giving into those members of Congress that opposes big business. As I have stated, ''There are market remedies for consumers who wish to use Netscape as their browser''.

In closing, if someone spends their private capital and comes up with a automobile engine that runs on water, is the government going to step in and force the developer of this new engine to share it with everyone else? I hope your answer is NO, because when or if we adopt such a stand, all of the values and principles for which we stand will have been destroyed.

Sincerely;

I am a software engineer employed in the computer graphics industry. I am not now, nor have I ever been affiliated with Microsoft or any of its competitors (except, of course, that I use products of both). The opinions and comments expressed are my own. I believe the settlement proposed by the Justice Department falls far short of what would be in the best interest of the industry and of the public. I am particularly concerned about the ability of Microsoft to effectively destroy certain popular and widely used standards such as OpenGL and Java.

For software developers, such as me, these standards are valuable tools that we use to produce our products. Once they are firmly established and widely used, we can count on them to be available and supported for a variety of platforms and devices over a relatively long period of time. I consider these to be a kind of public asset that help to ensure that different products can communicate and be compatible with each other in various ways.

Microsoft has the ability to erode or destroy these standards (and the motivation to do so) only because of the monopoly it holds on the operating system. In a competitive environment, no OS vendor would voluntarily drop support for widely used and still popular standards such as these, since that would give its competitors an important advantage in the marketplace.

Suppose that the nation's electrical power were largely provided by a single company that was also in the electrical appliance business. This company realizes that by changing the standards for power distribution, it can make it much more difficult for any other company to connect to the power grid, or to produce appliances that will work in the vast majority of homes. I believe that this is in effect what Microsoft would like to do and IS DOING in certain ways.

I fear that Microsoft next plans to target Internet standards, with the aim of making it more difficult for other software and platforms to effectively use the Internet and interact with Windows platforms. For most

companies, competitive market pressures would prevent this kind of action, but I believe Microsoft has demonstrated that additional regulatory restrictions are required to restrain a monopoly from such practices.

Dear Mr. Ashcroft:

I am writing you today to express my opinion in regards to the Microsoft antitrust dispute. I support Microsoft in this dispute and would like to see this litigation resolved. Microsoft is a good company that has contributed a great deal to our society. Restricting this company will not benefit anyone. I support the settlement reached in November as a means to end this dispute. This settlement is fair and reasonable. Microsoft has agreed to license its Windows operating system products to the 20 largest computer makers on identical terms and conditions, including price. Microsoft has also agreed to design future versions of Windows to provide a mechanism to make it easy for computer makers, consumers and software developers to promote non-Microsoft software within Windows.

During these difficult times, one of our highest priorities should be to stimulate our lagging economy. Restricting Microsoft will not accomplish this end. Please support this settlement. Thank you for your time.
Sincerely,

Melbourne Anderson

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing in full support of the recent settlement between the US Department of Justice and Microsoft. The antirust case has dragged on far too long to date and should be ended as soon as possible. Microsoft is a leading innovator of technology over the last decade. Under British definition a monopoly delivers poor quality products at inflated rates. Microsoft has consistently innovated excellent products and sold them at fair prices. They have also not infringed upon my rights as a consumer. I am free to purchase any software I desire.

The terms of the settlement are not letting Microsoft off easy. They will have to document and disclose for use by competitors its internal interfaces and protocols. They will also be agreeing to not retaliate against computer makers and software developers who develop or promote software that competes with Windows'' operating system products. These concessions give a huge advantage to competition and violate the principles of free market economics.

At any rate the settlement should be relied since the alternative of further litigation would be too much to bear for Microsoft, the IT sector, and our nation's economy. Please take the next step. Thank you.

Sincerely,
Lisa Throneberry

Dear Judge Kollar-Kotally,

I oppose such a preposterous resolution to the Microsoft case. In the last several years, the U. S. Court of Appeals has found Microsoft guilty of violating all rules of the anti-trust laws.

Yet in the framework of the PFJ, better know as the Proposed Final Judgment, the DoJ throws out these findings, indicting Microsoft on all charges of business wrongdoing. More profound and astonishing is how the PFJ permits Microsoft to continue with its monopolistic practices. I am completely convinced you will receive similar sentiments entailing the various loopholes apparent in the final settlement.

With the evidence presented, the PFJ does not even make an attempt to break up the software giant. What the PFJ permits is the following: permitting Microsoft to leverage its current monopoly positions and expand its business into several other technologies markets. In the past most monopolies were either broken up or carefully regulated. Why not Microsoft? Does AT&T ring a bell?

At the same time, severe reprimands by the DoJ only hinder instead of instigating change with Microsofts existing operation methodologies. Time and time again as history will show, Microsoft will abuse its monopoly position. Breaking up Microsofts business into several parts just might be the best antidote to prevent MS from even doing more damage to the industry. In closing your honor, I submit to you my disapproval of the Proposed Final Judgment.

Sincerely,

Mr. Amor Paraso

From: Shanti Kulkarni
To: Microsoft ATR
Date: 1/28/02 1:49pm
Subject: Microsoft Settlement

Regarding the Microsoft settlement, I hope the court will ensure that any settlement is strong enough to ensure a level of competition which provides value to the public and encourages innovation. As was shown by the 1995 ruling, Microsoft will simply weasel out of any agreement that does not include a strong enforcement mechanism. It will use any provided wiggle room to integrate any emerging PC or Internet technology into its all-consuming operating system. Given the monopoly that Windows enjoys, such integration has the effect stifiling innovation by unaffiliated vendors, and denying the public the value of potential competition. It is in the public interest that Microsoft be barred from doing so again, as it did with its Internet Explorer, and is currently doing again with Media Player. I urge the court to reject DOJ's proposed settlement, and any settlement that lacks strong enforcement and heavy penalties for failing to comply with its terms.

Date: 1/28/02 1:51pm
Subject: Comments on U.S. v. Microsoft Corporation settlement

To Whom it May Concern:

I am troubled by the terms of, and procedure for seeking the settlement of, the antitrust lawsuit between the U.S. Department of Justice and Microsoft Corporation.

First, I urge the court to confirm whether the parties have strictly adhered to the requirements of the Tunney Act. Second, I urge the court to investigate whether Microsoft Corporation has improperly discussed details of the settlement with Congress. Third, I urge the court and the parties to confirm that the proposed settlement will have the pro-competitive effects of opening the browser market to third parties, particularly in light of (i) the parameters of the Sherman/Clayton antitrust act; (ii) Netscape/AOL's recent lawsuit against Microsoft for alleged anticompetitive business practices in the web browser market; (iii) improper / unlawful bundling of Microsoft's web browser and operating system; (iv) anticompetitive original equipment manufacturer operating system licensing practices.

In addition, I would like to add the following to the public comment process, as it relates to the conclusion of the Microsoft antitrust proceedings:

As an attorney, a Windows operating system and Microsoft Internet Explorer equipped computer user, and more importantly, an American citizen, I am

troubled by the fact that the following summation of anyone's chance at bringing Microsoft to justice receives this type of response from the popular press: Quoted from http://forum.fuckedcompany.com/fc/phparchives/search.php'search=microsoft

Netscape sued Microsoft. I predict:

1) It finally goes to court after a year

2) Microsoft appeals and tries to delay every court date

3) Microsoft is found guilty

4) They appeal

5) Two years have passed

6) More Microsoft products dominate the market

7) Microsoft settles with an arbitrator for $10 million

8) Netscape is pissed

9) Microsoft wins

(you may insert any company or product into the above places where Netscape is)

Thank you for your consideration of this (informal) comment.

Sincerely,
D. Clinton Webb

Renata B. Hesse
Antitrust Division
U.S. Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001

Dear Ms. Hesse:

My qualifications:

Bachelor of Science in Computer Science 1975

Over 20 years of computer programming, software installation, and computer repair experience

My overall complaints of the content of the ''Proposed Final Judgement''

1) No attempt to remedy the past gains in market share and capital amassed by Microsoft through the unfair, illegal, and anti-competetive business practices employed in the intentional quest to dominate the PC market.

2) No attempt to remedy or control the proliferation of Microsoft Office, which is dominant at least in part due to Microsoft's API secrecy, bundling, tie-in, and interoperability tactics. Forcing complete disclosure of the file formats used would be a minimal attempt at restoring competition to this area.

3) No attempt to regulate Microsoft's behavior in non-desktop PC markets (wireless, handheld, internet services, etc.) where they have the leverage and funding amassed to date to overwhelm the competition in any emerging market that they choose to enter.

4) The PFJ contains enough loopholes and Microsoft-friendly definitions to let this company, famous for its past indiscretions, continue to flaunt the intent and purpose of this judgement.

Specific objections to the terms:

III Prohibited Conduct

J 2 ''(c) meets reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business, (d) agrees to submit, at its own expense, any computer program using such APIs, Documentation or Communication Protocols to third-party verification, approved by Microsoft, to test for and ensure verification and compliance with Microsoft specifications for use of the API or interface, which specifications shall be related to proper operation and integrity of the systems and mechanisms identified in this paragraph. THIS ALLOWS MICROSOFT THE LEEWAY TO REFUSE TO COOPERATE WITH OPEN SOURCE DEVEOPERS, WHOM THEY VIEW AS THE MOST SIGNIFICANT THREAT TO THEIR MONOPOLY.

The DOJ should not allow the criminal to define the terms, but rather specifiy that the API shall be available to developers at reasonable, fixed cost.

VI Definitions

N. ''of which at least one million copies were distributed in the United States within the previous year.''

THIS STIPULATION IS A BARRIER TO ANY STARTUP COMPANY, and is unnecessary.

R.''Timely Manner means at the time Microsoft first releases a beta test version of a Windows Operating System Product that is distributed to 150,000 or more beta testers.''

DOES THIS MEAN THAT MICROSOFT CAN HAVE 149,000 BETA TESTERS WITHOUT REVEALING API SPECIFATIONS TO OUTSIDE DEVELOPERS?

Please, substitute wording that promotes fairness.

U.''Windows Operating System Product? means the software code (as opposed to source code) distributed commercially by Microsoft for use with Personal Computers as Windows 2000 Professional, Windows XP Home, Windows XP Professional, and successors to the foregoing, including the Personal Computer versions of the products currently code named ?Longhorn? and ?Blackcomb? and their successors, including upgrades, bug fixes, service packs, etc.

The software code that comprises a Windows Operating System Product shall be determined by Microsoft in its sole discretion. HERE WE GO AGAIN. LIMITING THE REMEDY TO ONLY ONE SEGMENT OF INFORMATION TECHNOLOGY, WHILE MICROSOFT USES ITS CLOUT IN ANY EMERGING MARKET THAT IT CHOOSES TO ENTER.

Please apply the restrictions more broadly.

Conclusions:

The Proposed Final Remedy is too little, too late. If fails to properly regulate Microsoft's business practices in the future, while wholly neglecting to apply any remedy for the misconduct of the past. The comsumers and software developers and even the hardware developers are NOT adequately served by this document.

If the Department of Justice will not enforce the anti-monopoly law of this country, then where can we, the citizens, look for remedy ?

Re: United States v. Microsoft Corp., Civil No. 98–1232

Dear Ms. Hesse:

Microsoft has been a valued exhibitor and partner in the International Consumer Electronics Show for several years. Bill Gates has also been a featured keynote speaker at the CES several times in the last ten years. In introducing Bill Gates to the audience the last two years I used a collection of concepts I summarize below. I hope that in approving the settlement you consider some of the sentiments expressed. Not only does litigation cost the business community and taxpayers billions of dollars every year, but additionally, long drawn-out court battles distract businesses from focusing on their core productive operations. With the U.S. now officially in recession and in the face of new concerns domestically, a settlement is needed to provide stability for the industry that has driven the new economy over the last decade.

Ultimately, Microsoft's story is our nation's story. It's about how ideas and a small scrappy upstart can become a world leader and change the face of history. Our country and Microsoft started with driven people pursuing a dream and providing a compelling benefit. Microsoft offered anyone access to freedom by providing a simple interface to conquer the complexities of a computer. Our founding fathers gave us freedoms embodied in the structure and the standard of the Constitution and the Bill of Rights. The American Bill of Rights are becoming accepted by the world and improving the world standard of living. So, too, are the Microsoft standards being accepted and improving the lives of millions around the world.

In the Information Age, Microsoft gave us access to information. Microsoft is to other

corporations what our country is to the rest of the world. Both are the new kids that did well. Each started as an idea. Each became a world standard. These standards have changed the world for the better. For computer users, Microsoft made it simple to create, edit and send documents and presentations anywhere in the world. I had to edit presentations recently in Egypt, Germany and Switzerland and I was comfortable this year using others'' computers in these countries as they all used Microsoft products.

Microsoft has improved the world's standard of living. Microsoft standards increase world productivity by making computers everywhere easy to use. Without the Microsoft standard it is doubtful so many people would be comfortably using computers. Microsoft has not only made many investors happy, it directly employs some 40,000 exceptional people in some 60 countries. More, many others are employed because of Microsoft products. Microsoft also exports more than it sells domestically. With this positive economic activity, terrific products, and reputation for charity, any other country would consider itself blessed to have Microsoft headquartered within its borders, adding to its tax rolls and employing its citizens.

There is a Yiddish word, ''mensch''. It means doer of good and applies to someone who you know well and does good things for people. I submit to you that when a company or individual does good things of such magnitude then they too can wear the ''mensch'' mantle. Not only has Microsoft improved the world's standard of living, but its founder Bill Gates along with his wife Melinda, have donated some $21 billion to the Bill and Melinda Gates Foundation for global education and healthcare. The magnitude of how Microsoft has changed the world and this generosity are so large, that I submit to you both Microsoft and Bill Gates deserve the appellation ''mensch''.

Sincerely,
Gary Shapiro

Dear Ms. Hesse:

I am a retired government employee who taught software courses for the Navy. My students included military as well as civilians. These were the teams, made up of both men and women, that produced training manuals and exams for the Navy.

After testing many different software programs Microsoft was chosen for a number of reasons; it was very computer friendly and the company offered help desk assistance when no other company did. At that time, because all of us were new to computers, these were most compelling reasons. I do not understand why our government, in this country of freedom and opportunity, insists on the continued harrassment of this young man. Who's next? What other country in recent times has produced such a creative mind? Has democracy actually come to this?

Sincerely,
Bettye D. Schmollinger

SUBJECT: Microsoft Settlement

Dear Ms. Hesse:

The League of Latin American Citizens—Long Beach Council believes that the proposed settlement of the Microsoft antitrust case amounts to a reward for misconduct. Indeed, the settlement is so good for Microsoft, that it is attempting to buy off those who oppose it with an offer to California and other states to pay their legal costs—if they will step aside and let the sweetheart deal go ahead unchallenged.

This astonishing offer merely confirms the notion that Microsoft believes that all of its errors can be wished away by money. And, it's not the first time that Bill Gates'' company has reached into its treasury and come up with dollars for politicians. During the 2000 political campaign, the company spent more than $6 million on contributions to political campaigns, state parties and political action committees. One can only assume, it hoped to generate political pressure for a favorable settlement.

Whatever the reason, Microsoft has managed to negotiate a settlement, which to a remarkable degree would make it the arbiter of its own compliance—an astonishing turnabout for a company that has repeatedly skirted U.S. antitrust law and found guilty by several courts of abusing its monopoly power. California Attorney General Bill Lockyer is right to resist the settlement and to continue to press for a tough remedy that would limit Microsoft's ability to leverage its Windows monopoly and extend its market domination into more facets of our information age economy.

Nine state Attorneys General and the Corporation Counsel of the District of Columbia chose not to support the current Microsoft settlement and have offered proposals that will adequately address the agreement's loopholes. More specifically, these proposals require that Microsoft fulfill both technical and licensing obligations that will bring greater competition to the software market and greater choice to consumers. In addition, the proposals include more enforceable oversight provisions and stricter penalties in the event Microsoft does not comply with the settlement. The Long Beach Council of LULAC supports these proposals and urges the Court to adopt them.

Subject: Microsoft Settlement

It think the settlement is a step in the right direction. However, I do not think it is a big enought step. I am not one in favor of splitting Microsoft up or fining MS tens of billions of dollars. However, there are some marketing practices that Microsoft is still employing and will continue to employ because they are successful. Unless Microsoft is additionally shackled in some way so that they stop doing these things, Microsoft will use the power and money that they got from their previous illegal business practices to continue to stifle competition and ultimately hurt innovation:

1) Microsoft does innovate and will occasionally surprise me. However, they often eye a successful idea and decide to develop a similar application. This is not bad in an of itself. But, instead of trying to do compete with improved functionality, Microsoft uses their huge cash reserves to worm their way into the market. If they are way behind the competition, they GIVE the new software AWAY—either by integrating it into their operating system or doing special ''deals'' with OEMs so people get the software free or dirt cheap. So, even if the settlement stops Microsoft from making exclusionary deals with OEMs, Microsoft will out-price the competition.

2) Microsoft is a master of the VAPORWARE. They can really put a damper on the sales of a competing product simply by making a press announcement. I wish they would be restricted about the number of days prior to releasing a completely new product could Microsoft announce its development.

And finally, it is 2002—a long time since the original suit was brought and an eternity in terms of the High-Tech industry. Remember, this suit was brought because Microsoft had broken a previous agreement with the DOJ. So, what happens if Microsoft breaks this agreement? Will we have to wait nearly a decade for the next decision—allowing Microsoft to do business as usual in the mean time?

Dear Mr. Ashcroft,

The way that this lawsuit against Microsoft has quickly degenerated into a vengeful exchange of threats of breaking the company up should give pause to any of us in the IT business. It should be acknowledged that Microsoft has not carried itself in the noblest fashion at times, but this alone should not be cause enough to drag the company through the federal courts. Furthermore, if this sort of action can be so easily brought against a company like Microsoft, then other IT companies may soon find themselves in a similar position.

For the sake of clarity, this settlement should be endorsed by all. At it stands, the terms of the settlement go beyond the scope of the original lawsuit. They address the notorious issue of Microsoft's relationship with OEMs, and now Microsoft will have to change the way it sets up contracts with other companies that distribute Windows as well. Of course, its greatest advantage is it will bring to an end this cycle of negative posturing between those on the government's side and those on Microsoft's. My business was noticeably pinched by the lawsuit, and I—and man), others-cannot afford to have the entire IT business in a wait-and-see attitude to see if Microsoft will be split up.

I support this settlement, and convey my hope that this kind of litigation against an American company will not happen again any time soon.

Sincerely,
Mountasir Dbeis

COMMENTS OF AOL TIME WARNER ON THE PROPOSED FINAL JUDGMENT

Pursuant to Section 2(b) of the Antitrust Procedures and Penalties Act, 15 U.S.C. §; 16, AOL Time Warner respectfully submits the following comments on the Proposed Final Judgment (''PFJ'') in the above-referenced matter.

INTRODUCTION

The Proposed Final Judgment sets forth a decree that is too limited in its objectives and too flawed in its execution to meet the Tunney Act's ''public interest'' test. It allows Microsoft to continue to bind and bundle its middleware applications with its Windows Operating System (''OS'')—even though tile Court of Appeals found Microsoft's actions in this regard to be illegal. And its patchwork of constraints on Microsoft's conduct is so loophole-ridden and exception-laden as to render its provisions ineffective. As a result, the PFJ is inadequate to promote competition and protect consumers, and the Court should refuse to find that its entry would be ''in the public interest.'' 15 U.S.C. * 16(e).

The PFJ comes before the Court in an unprecedented posture for a Tunney Act proceeding. This proposed settlement was reached—not as the case was being filed, nor as it was being tried, nor even as it was being appealed—but rather, after the Court of Appeals for the District of Columbia Circuit unanimously affirmed a finding of illegal monopoly maintenance by Microsoft. Such circumstances surely require a more rigorous application of the ''public interest'' standard than a case is settled before the first interrogatory is even served—the usual situation when a Tunney Act review is conducted. Helpfully, a readily available and judicially administrable measure of the ''public interest'' is available for use in this special circumstance: the four-part test for ''a remedies decree'' established by the DC Circuit in this very litigation. United States v. Microsoft, 253 F.3d 34, 103 (DC Cir. 2001). Applying this standard, we believe that the Court should find the PFJ to be in the ''public interest'' only if it (1) ''unfetter[s] a market from anticompetitive conduct''; (2) ''terminate[s] the illegal monopoly''; (3) ''den[ies] to the defendant the fruits of its statutory violation''; and (4) ''ensure[s] that there remain no practices likely to result in monopolization in the future.'' Id. (internal quotations omitted). We believe that there are at least three reasons why the Court should conclude that the PFJ does not meet this test.

First, since July 11,2001 (for the browser) and December 16, 2001 (for other middleware), Microsoft has been implementing many of the PFJ's remedial provisions. Thus, the Court need not speculate about the impact these provisions would have on the industry if they were put in place; rather, it can seek submissions and review evidence on whether these critical provisions are beginning to work as they are being implemented by Microsoft. We believe that any such inquiry will reveal that the original equipment manufacturers (''OEMs'') are not exercising the flexibility that the PFJ ostensibly provides them, because the loophole-ridden PFJ gives too few rights to the OEMs and does too little to protect the OEMs in the exercise of those rights. As a result, there is little reason to believe that the PFJ will prove effective in restoring competition, terminating Microsoft's monopoly, or stripping Microsoft of the fruits of its illegal acts.

How wide a ''gap'' between a hypothetical litigated result and the proposed settlement is permissible in these circumstances is a question that need not be answered here because the PFJ falls so very short of meeting an), reasonable understanding of the ''public interest,'' given its failure to address many of Microsolf's illegal acts and its loophole-ridden provisions in the areas that it does purport to cover.

Second, the PFJ fails to prohibit Microsoft's signature anticompetitive conduct: the binding of its middleware applications to its monopoly operating system, and its bundling of these products to further entrench its OS monopoly. The factual questions that surround these legal issues are quite complex, but here again, the Court has a powerful tool to employ: the extensive factual findings entered by the District Court. (1) These factual findings document Microsoft's purposeful commingling of middleware application code with the Windows OS to harm competition, as well as the contractual bundling of those applications with the OS, to force OEMs to distribute Microsoft's middleware, and to raise distribution hurdles for middleware rivals. Given the PFJ's failure to ban practices that the District Court and the Court of Appeals found to be at the center of Microsoft's illegal maintenance of its OS monopoly, the PFJ does not meet the ''public interest'' standard.

Third, even with regard to those limited objectives that the PFJ does attempt to achieve—i.e., the creation of ''OEM flexibility'' to promote desktop competition—the proposed decree is so ridden with loopholes, exceptions and carve-outs as to render it ineffective. These deficiencies are highlighted when the PFJ is compared to previous remedial plans considered in this case, including Judge Jackson's interim conduct remedies and the mediation proposal offered by Judge Richard Posner (which Microsoft apparently agreed to even before it had been found liable for antitrust violations).

Finally, we believe the Court will find the remedial proposal of the litigating state attorneys general (''Litigating States'' Remedial Proposal'' or ''LSRP'')—and the Court's consideration of that proposal—to be useful in its review of the PFJ. Most immediately, the LSRP provides a benchmark as to what one group of antitrust enforcers believes to be compelled by the ''public interest'' in order to achieve the case's remedial objectives. Moreover, the LSRP provides a helpful point of comparison for some specific aspects of the PFJ—i.e., a way to illustrate why particular PFJ provisions are ineffective, by comparison.

These factual findings were affirmed on appeal. See Microsoft, 253 F.3d at 51–78. In addition, the Court recently held that the factual findings of the District Court ''in support of the liability findings'' should be considered ''undisputed'' for the purpose of this proceeding. (See Transcript of January 7, 2002, at 31.) And third, the Court's consideration of the LSRP will adduce testimony and other evidence that should be weighed in determining whether the PFJ should be approved. Taken as a whole, a comparison of the PFJ with the Litigating States'' Remedial Proposal shows why the latter, and not the former, faithfully meets the remedial objectives set forth by the DC Circuit and serves the ''public interest'' as expressed in the nation's antitrust laws.

I. THE COURT SHOULD USE THE REMEDIAL OBJECTIVES ESTABLISHED BY THE DC CIRCUIT IN THIS CASE AS THE STANDARD FOR ASSESSING WHETHER THE PFJ IS ''IN THE PUBLIC INTEREST.''

Passed by Congress in 1974, the Antitrust Procedures and Penalties Act, commonly known as the ''Tunney Act,'' provides that a proposed consent decree may be entered in an antitrust case only if the district court determines that such entry is ''in the public interest.'' See 15 U.S.C. *16(e). Given that the Court will receive numerous submissions on this point, we do not provide here a recitation of the Tunney Act's provisions, or an extensive analysis of the standard of review under the Act. Instead, we focus on just one, overriding ''procedural'' question: How should the Court measure ''the public interest'' in this unique case? For reasons we will explain below, we believe that the measure of the ''public interest'' to be applied in reviewing the PFJ can be found in the remedial objectives set forth by the DC Circuit in its consideration of this litigation. See Microsoft, 253 F.3d at 103.

First, while the Tunney Act itself does not define ''public interest,'' the case law makes

clear that the Court must begin its analysis ''by defining the public interest'' in accordance with the basic purpose of the antitrust laws, which is to'' ''preserv[e] free and unfettered competition as the rule of trade.'' United States v. American Tel. & Tel. Co., 552 F. Supp. 131,149 (D.DC 1982) (quoting Northern Pacific Ry. Co. v. United States, 356 U.S. 1 (1958)). As a general rule, a court has discretion to reject a proposed consent decree that is ineffective because it fails to address or resolve the core competitive problems identified in the Department of Justice's complaint. United States v. Microsoft Corp., 56 F.3d 1448, 1457–62 (DC Cir. 1995). As this Court stated in United States v. Thomson Corp., 949 F. Supp. 907, 913 (D.DC 1996), the court has a responsibility ''to compare the complaint filed by the government with the proposed consent decree and determine whether the remedies negotiated between the parties and proposed by the Justice Department clearly and effectively address the anticompetitive harms initially identified.'' A court should ''hesitate'' in the face of specific objections from directly affected third parties before concluding that a proposed final judgment is in the public interest. United States v. Microsoft, 56 F.3d at 1462. And it ''should pay ''special attention'' to the clarity of the proposed consent decree and to the adequacy of its compliance mechanisms in order to assure that the decree is sufficiently precise and the compliance mechanisms sufficiently effective to enable the court to manage the implementation of the consent decree and resolve any subsequent disputes.'' Thomson Corp., 949 F. Supp. at 914 (citing United States v. Microsoft, 56 F.3d at 1461–62).

In the context of this proceeding, tremendous guidance as to the content of the public interest test can come from the earlier decision of the Court of Appeals in this case. In that decision, the DC Circuit wrote:

[A] remedies decree in an antitrust case must seek to ''unfetter a market from anticompetitive conduct,'' to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''

Microsoft, 253 F.3d at 103 (quoting Ford Motor Co. v. United States, 405 U.S. 562, 577 (1972) and United States v. United Shoe Mach. Corp., 391 U.S. 244, 250 (1968)). These words, in our view, form the essence of the public interest test to be applied by the Court in this Tunney Act proceeding.

First, on its face, this passage speaks of the object of a ''remedies decree in an antitrust case,'' without differentiating between a decree that is achieved through negotiation and one achieved through litigation. Thus, the Court of Appeals'' ruling would appear to be directly controlling here, insofar as it states the measure of adequacy for any remedial decree, however achieved. There is no apparent reason why the ''remedies decree'' negotiated by the Department of Justice with Microsoft should not have to meet the standard of adequacy generally set forth by the Court of Appeals in its decision.-'' This is particularly true given that the passage merely ''defin[es] the public interest in accordance with the antitrust laws.'' Accord American Tel. & Tel. Co., 552 F. Supp. at 149.[3]

This is not to say that the Court should reject the PFJ if it finds only that it differs in some respects from the remedy that the Court would impose at the end of litigation. For while the public is entitled to a very robust remedy here, especially given the fact that this case has been litigated through trial and affirmed on appeal with judgments against Microsolf, a settlement clearly does not have to match precisely the outcome that would have been achieved in litigation to be deemed acceptable under the tunney Act's public interest test.

Second, the four-part test established by the DC Circuit here would give the Court a clear and manageable standard on which to evaluate the proposed decree's adequacy) Use of the DC Circuit's formulation thus avoids one of the principal bases of controversy and difficulty in Tunney Act reviews -i.e., the lack of a judicially manageable standard for assessing the public interest and the consequent risk that judges will inappropriately use standardless judgment to review an exercise of prosecutorial discretion.[5] Thus, unlike in other Tunney Act cases, where a court lacks an appropriate benchmark on which to measure the purported benefits of the settlement (and thus must be careful not to impose its judgment for that of the Justice Department), here, there is a clear benchmark for the Court to use: the standard set by the Court of Appeals with regard to a ''remedies decree.''

Moreover, to the extent that insisting that the PFJ meet the standard set by the Court of Appeals would result in a more exacting review than the review imposed in other Tunney Act proceedings, that would be appropriate in this circumstance. For while the overwhelming majority of decrees reviewed under the Tunney Act occur in a pre-trial where the court lacks a judicial finding of illegality against which to measure the efficacy of the proposed settlement—this proposed settlement was reached after an appellate affirmance of liability. Because the public has invested its resources and time, and taken the risk to win a judgment of liability and defend that judgment on appeal, it has a right to expect a more rigorous decree that meets a higher standard of review. Under these circumstances, the Court's review under the Tunney Act should not be deferential 1o the Justice Department; instead, the Court should apply the Court of Appeals'' four-part test and determine if the PFJ meets that test.

As explained in more detail below, the PFJ fails to meet the DC Circuit's four-part test, because contrary to the claims of the Department of Justice, it will neither ''provide a prompt, certain and effective remedy for consumers,'' nor ''restore competitive conditions to the market.'' (See CIS at 2.) Specifically, it does not ''unfetter [the] market from anticompetitive conduct,'' because it does not even try to stop Microsoft's illegal binding and bundling practices—or effectively limit Microsoft's ability to coerce OEM behavior to its liking. It does not ''terminate the illegal monopoly'' because it does not effectively promote rival middleware, and because its provisions are so laden with loopholes, exceptions and carve-outs. It does not ''deny to the defendant the fruits of its statutory violation,'' because it allows Microsoft to continue to leverage its OS monopoly to gain market share in other markets.[6] And it does not ''ensure that there remain no practices likely to result in monopolization in the future,'' because it leaves Microsoft free to exploit the OS monopoly to gain don-finance in critical new markets. Failing to address the core anticompetitive wrongs that were found at trial and upheld on appeal against Microsoft, and failing to meet the four-part remedial test established by the DC Circuit, the PFJ is manifestly contrary to the public interest and should be rejected.

II. AS MICROSOFT STARTS TO IMPLEMENT MOST OF THE DECREE'S PROVISIONS, THE COURT SHOULD CONSIDER HOW—IF AT ALL—OEMS ARE RESPONDING.

---

[3] This approach generally comports with other Tunney Act cases, which conclude that an antitrust remedy, including a consent decree, must'' ''effectively pry open to competition a market that has been closed by defendants'' illegal restraints.'' Id. at 150 (quoting International Salt Co. v. United States, 332 U.S. 392, 401 (1947); see also 2 P. Areeda & D. Turner, Antitrust Laws * 327 (1978)). A decree ''must ''break up or render impotent the monopoly power found to be in violation of the Act,'' that is, it must leave the defendant without the ability to resume the actions which constituted the antitrust violation in the first place.''

American Tel. & Tel., 552 F. Supp. at 150 (quoting United States v. Grinnell Corp., 384 U.S. 563,577 (1966)). ''It must also effectively foreclose the possibility that antitrust violations will occur or recur.'' Id. As the Supreme Court noted in International Salt Co., 332 U.S. at 400:

[I]t is not necessary that all of the untraveled roads to [anticompetitive conduct] be left open and that only the worn one be closed. The usual ways to the prohibited goals may be blocked against the proven transgressor.

Additionally, ''antitrust violations should be remedied ''with as little injury as possible to the interest of the general public'' and to relevant private interests.'' /d. (quoting United States v. American Tobacco Co., 221 U.S. 106, I85 (191 I)).

While the Department of Justice urges the Court to adopt a much more lax review, even the government acknowledges that the Court's ''review of the decree is informed not merely by the allegations contained in the Complaint, but also by the extensive factual and legal record resulting from the district and appellate court proceedings.'' (See Competitive Impact Statement (''CIS'') at 68 (November 15, 2001).)

It was precisely the lack of a judicial finding of liability that caused Chief Justice Rehnquist to question the constitutionality of the Tunney Act. See Maryland v. United States, 460 U.S. 1001, 1004 (1982) (Rehnquist, J., dissenting). This argument does not apply in the present case where there has been both a judicial finding of liability (at trial and affirmed on appeal), and there is a standard for review established by an appellate court.

[6] Indeed, Microsoft has actually seen its share of the browser market grow since being found liable for illegal monopoly maintenance. For example, Microsoft's share of the work browser market increased from 69.3 percent in April 2000 (when Judge Jackson issued his finding of liability) to 79.5 percent in November 2001. Over the same period, Microsoft's share of the home browser market increased from 75.7 percent to 81.8 percent. See Browser Trended Reach Report, Jupiter Media Metrix, January 2002.

As noted above, the question before the Court is whether the PFJ is ''in the public interest.'' 15 U.S.C. *sect; 16(e). In making that determination, the statute indicates that the Court may want to consider, inter alia: (1) ''the competitive impact'' of the PFJ, (2) whether it results in the ''termination of alleged violations,'' and (3) ''the impact of [the PFJ] upon the public generally and individuals alleging specific injury.'' Id.

Fortunately, contrary to most other courts conducting Tunney Act reviews, this Court need not struggle with evaluating the ''competitive impact'' of the PFJ in a factual vacuum because Microsoft has been, according to its own statements, implementing some provisions found in the PFJ since last Jul)'', and the bulk of its provisions since December. That means the Court need not base its ''public interest'' judgment on abstract legal and economic analyses only; instead, the Court's analysis can (at least in part) be shaped by a consideration of how Microsoft is beginning to implement parts of the PFJ, and how the PFJ's provisions are starting to work in practice.[7] We believe that such a practical review will demonstrate that the portions of the PFJ in question show little prospect—if any-that they will ''unfetter the market,'', ''terminate the monopoly,'' or ''den),'' to Microsoft ''the fruits of its violation.''

A. There Is No Indication That Microsoft's Implementation Of Major Aspects Of The PFJ Is Even Beginning To Promote Competition Or Helping To Loosen Microsoft's Control Over The Desktop. In the joint stipulation filed with the Court on November 6, 2001, Microsoft stated that it would ''begin complying with the [PFJ] as [if] it was in full force and effect starting on December 16, 2001 .'' (Stipulation and Revised Proposed Final Judgment at 2 (November 6,2001).) While provisions with specific timetables were exempted from this pledge—resulting in an excessive delay for some of the PFJ's competitive protections— many of the PFJ's remedial provisions were covered by it. Thus, with regard to many provisions of the PFJ, the proposed decree has been ''in effect'' since mid-December.[8]

Microsoft's stipulation offers the Court a unique opportunity to learn, not just how the PFJ would serve the public interest once implemented, but instead, whether the PFJ provisions already in effect are showing signs that they are likely to serve the public interest. These provisions have now effectively been in place for 43 days—and by the time of a likely hearing or other proceeding to consider this question (presumably, in March or April), will have been in effect for three to four months.

Microsoft may protest that a three- to four-month period in which parts of the PFJ will have been applied is inadequate to test those remedies. And that is doubtlessly true with regard to some measures of the PFJ's effectiveness, such as whether Microsoft's share of the OS market has shrunk from near absolute to anything less. But there are other measures of the PFJ's effectiveness that should be readily discernible even in this relatively short time.

Among the questions we believe that the court could determine, by the time of a hearing in March or April, would be:

Have the OEMs exercised (or even attempted to exercise)—in any way beyond the prevailing industry practice prior to December 16th—the flexibilities to remove/replace icons, start menu entries, and default settings for Microsoft middleware products, that are purportedly provided in Section III.C.1 of the PFJ? If not, why not?

Are non-Microsoft middleware products gaining .new distribution via the OEMs as a result of the provisions of Sections III.A. and III.C.2 of the PFJ, as implemented? If not, why not?

Are non-Microsoft middleware products, to a greater extent than before implementation of the PFJ, attaining the benefits of an ''automatic launch,'' pursuant to the provisions of Section III.C.3 of the PFJ? If not, why not?

* Is any OEM offering a dual-boot computer, as authorized by Sections III.A.2 and III.C.4 of the PFJ? If not, why not?

* Are there new IAP offerings being made at the conclusion of PC boot sequences, pursuant to Section III.C.5 of the PFJ? If not, why not?

Has any ISV, IHV, LAP, ICP or OEM gained any additional Windows licensing rights that it did not have prior to the implementation of the PFJ, pursuant to Section III.I of the PFJ? If not, why not?

Has Microsoft terminated any payments to OEMs that were anticompetitively advantaging Microsoft's products, and that are now forbidden, pursuant to Sections III.A and III.B of the PFJ?

Based on our knowledge of industry developments, we believe that the answer to each of these questions is ''no,'' with perhaps some very rare and isolated exceptions.[9] Thus, despite Microsoft's proclaimed implementation of large portions of the PFJ, there is scant evidence of OEMs even attempting, let alone succeeding, to offer consumers new choices with respect to middleware products. Even in a relatively short time frame of a few months, one would expect to find numerous OEMs reaching agreements to promote or carry multiple non-Microsoft products. But no such evidence exists. No doubt, that is why countless industry observers and analysts have concluded, after examining the PFJ, that ''It]he changes we will see are minute. Microsoft can control its own destiny. It can do whatever it wants.'' [10] Presumably, it cannot be in ''the public interest'' to settle a case after years and years of litigation—including a finding of liability for the government at trial, affirmed unanimously on appeal by the Court of Appeals (See Microsoft, 253 F.3d at 46)—for a remedial decree that effectuates only ''minute'' changes in the strategy the defendant was using to illegally maintain its monopoly. And yet, that is precisely what appears to be happening, as the effectiveness—or lack thereof- of parts of the PFJ are starting to be observed in application. While we certainly agree with the Department of Justice that it will only be ''over time'' that any remedy could ''help lower the applications barrier to entry,'' (see CIS at 29), that objective will never be achieved if the PFJ does not lead OEMs to even begin to ''offer rival middleware to consumers and.., feature that middleware in ways that increase the likelihood that consumers will choose to use it.'' (Id.) That is: the pro-competitive probative of nothing more than the compelling need for a hearing so the Court can explore how, if at all, the PFJ journey of a thousand miles can never be completed if—as it appears to be the case—the PFJ does not create a market in which OEMs feel free to take that all-important first step. To the extent that much of the CIS suggests that the goal of the remedy is to create OEM flexibility for its own sake—i.e., to make sure that OEMs have the right to choose non-Microsoft products, whether or not they exercise that right—it misses the mark. The goal of this litigation is not to protect OEMs'' rights, but rather to protect consumers'' rights to enjoy a free and competitive market. In such a market, OEMs can be important surrogates for consumers, but only if they actually offer competitive choices. Likewise, to the extent that the other goal of the remedial proceeding is to reduce the applications barrier to entry, that objective is only achieved to the extent that the OEMs actually distribute and promote non-Microsoft middleware—it is not advanced by the unexercised presence of theoretical OEM choice.

Thus, the determination of whether the PFJ will be effective in promoting its purported ends—i.e., fostering OEMs in making those choices and creating opportunities for competition—need not be left for some subsequent proceeding or for antitrust scholars in future years. It can be ascertained now from the submissions that the Court is receiving, or, if those submissions are inadequate, it could be resolved by the Court

[7] If the Court finds that the submissions made to date are inadequate to assess this question, it can, of course, under the Tunney Act, take whatever testimony or evidence is needed to make such a determination. See 15 U.S.C. *sect; 16(f); Section V.B, infra.

[8] Some examples of PFJ provisions Microsoft has ostensibly been complying with since December 16, 2001, include: Section III.A (anti-retaliation); Section III.B (uniform licensing); Section III.C (OEM licenses); Section III.G (anticompetitive agreements); and Section III.I (licensing of intellectual properly).

[9] Although Compaq and RealNetworks reached an agreement in December 2001, whereby Compaq would place Real's player on its personal computers, see RealNetworks Sets Deal With Compaq, The Los Angeles Times, December 13, 2001, it is unclear, among other things, what the terms of the agreement are, what impact it will have on competition and consumer choice, and whether the agreement was motivated, in whole or in part, by the purported ''flexibility'' of the proposed settlement. While the Court should certainly give the Compaq agreement some consideration in its public interest review, the agreement's mere existence is already affecting the marketplace.

[10] See Jeff O'Heir, Analysis: MS & DOJ Reach Agreement, P.C. Dealer, November 12, 2001 (quoting Roland Pinto); see also Randy Barrett, MS-DOJ Pact Disappoints, Interactive Week, Nov. 8, 2001 (quoting Roger Frizzell, Compaq Spokesman, ''Basically, we don't feel there's a big difference between where we're standing today and where we were last week.''); Id. (quoting Mike Griffin, ''We don't anticipate any changes at all.''□.

in a proceeding where evidence is taken and testimony is heard. See Section V.B, infra. The manner in which Microsoft is already implementing portions of the PFJ is among the most probative considerations the Court can weigh in determining how—it at all—the proposed settlement will promote competition in the years to come.

B. The Provisions Of The PFJ Implemented By Microsoft Since July 11th Are Not Showing Signs That They Will Work To Restore Competition In The Browser Market.

In addition to the general applicability of the PFJ's provisions, several of its provisions have been in place—as they relate to the Internet browser—since Microsoft took steps to implement them after the Court of Appeals'' decision last June. As with the more general PFJ provisions discussed above, the Court should examine whether these browser- specific remedial provisions—which will have been in place for eight months by mid-March—have been effective to date. Again, we believe that the evidence to date shows that the provisions are showing no sign of effectuating change in the market; thus, the PFJ—which (with regard to browsers) does little more than codify these unilateral Microsoft actions— does not meet the ''public interest'' standard.

On July 11, 2001, in response to the decision of the Court of Appeals, Microsoft announced a program of ''greater OEM flexibility for Windows.'' See Press Release, Microsoft Corporation, Microsoft Announces Greater OEM Flexibility For Windows, July 11, 2001. Specifically, Microsoft announced that it would amend its OEM license agreements to provide that:

PC manufacturers will have the option to remove the Start menu entries and icons that provide end users with access to the Internet Explorer components of the operating system. Microsoft will include Internet Explorer in the Add/Remove programs feature in Windows XP.

PC manufacturers will have the option to remove the Start menu entries and icons that provide end users with access to Internet Explorer from previous versions of Windows, including Windows 98, Windows 2000 and Windows Me .... Consumers will be able to use the Add-Remove Programs feature in Windows XP to remove end-user access to the Internet Explorer components of the operating system ....

d. These provisions mirror the browser-related provisions found in Sections III.C.1 and III.H.1 of the PFJ. Indeed, they comprise almost the entirety of all browser-related remedial provisions found in the PFJ.

Thus, the question of whether the PFJ fulfills the Department of Justice's promise of an effective remedy for ''restor[ing] the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings,'' can easily be assessed—at least with regard to the browser threat, which was such an extensive part of the Court of Appeals'' decision—by seeing how effective these unilateral Microsoft actions, taken in July of 2001, have been to date. And unlike the provisions discussed above, which were put in place only in December, it cannot be argued that these browser-related provisions have not yet been tested in the marketplace; rather, the□, were in place for the launch of Windows XP, which Bill Gates recently dubbed the ''best-selling release of Windows ever, and one that is creating great opportunities for PC manufacturers and our other partners in the industry.'' [11] In the simplest terms, as we note above, these ''remedies'' will have been in place for eight months by mid-March of 2002.[12]

We believe that the initial evidence shows that these provisions are completely ineffective. We are unaware of a single OEM that has used the ''flexibility'' provided to it by Microsoft to remove Internet Explorer from the Start menu, or from any of its multiple promotional placements on the PC desktop. Nor are we aware of any OEM that has elected to use any competitor to Internet Explorer as a default browser, or to promote alternative browsers to Internet Explorer in any way.

Moreover, there is no indication—more than six months after Microsoft's July 11th announcement and four months after the first shipments of Windows XP—that Internet Explorer's commanding market share in the browser market has fallen in any measurable way. If the provisions of the PFJ are strong enough to ''restore'' competition to the marketplace, which DOJ claims they are (see CIS at 3 (''[t]he requirements and prohibitions [of the PFJ] will ... restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings'')), one would expect to see that the market shares of Microsoft's browser competitors have increased during this time frame. There is simply no evidence of that. Not only is there a dearth of evidence suggesting that the PFJ's provisions are going to restore competition to the level enjoyed by Microsoft's rivals prior to its illegal conduct, but there is no evidence to suggest they are affecting the market at all.

A remedial provision that has no market impact cannot be said to be in the ''public interest,'' especially in a case like this where the damage from Microsoft's illegal campaign to eliminate rival middleware has already been done. In other words, because Microsoft has illegally driven down the market shares of its rival middleware developers, restoring competition to the marketplace requires much more than simply eliminating the illegal practices: only if the status quo ante is restored would OEM freedom of choice be meaningful. And yet, the evidence suggests that the PFJ provisions that relate to the browser will have no market impact, given the practical experience with highly similar proposals put in place by Microsoft last July. This is important evidence for the Court to consider when reviewing the PFJ.

III. THE PFJ IS NOT IN THE PUBLIC INTEREST BECAUSE IT DOES NOT EVEN ATTEMPT TO HALT MICROSOFT'S MOST INSIDIOUS PRACTICE: ITS ILLEGAL BINDING AND BUNDLING OF MIDDLEWARE APPLICATIONS WITH THE WINDOWS OS.

In this submission—and doubtlessly in the many others the Court will receive - we identify a number of specific deficiencies in the PFJ. See Section IV, infra and Attachment B. But one omission stands out above all others: the failure of the PFJ to limit Microsoft's ongoing and insidious efforts to maintain its monopoly- and leverage and entrench that monopoly—by tying its middleware applications to the Windows OS. This conduct—found illegal by the District Court and upheld as illegal by the Court of Appeals (see Microsoft, 253 F.3d at 67)—is left unchecked by the PFJ. By contrast, a remedy to address this practice appeared in the interim conduct remedies offered by the District Court,[13] as well as the remedial proposal designed by Judge Richard Posner (''Posner Proposal'').[14] The practice is also addressed extensively in the litigating states'' proposed remedy. By failing to remedy one of Microsoft's ''signature'' anticompetitive acts, the PFJ—even before reaching its many other defects—falls far short of the four-part remedial standard set by the Court of Appeals, and by the same token, fails to meet the public interest test established by the Tunney Act.

In explaining why it did not seek to limit Microsoft's tying of middleware applications to Windows in the PFJ, the Justice Department has suggested that there was no basis for such a remedy because of the Court of Appeals'' reversal of the District Court's finding of liability under Section 1 of the Sherman Act, and the appellate court's direction that the remedy here should ''focus[] on the specific practices that the court had ruled unlawful.''[15] This analysis fundamentally misapprehends the

[11] See GM Plans White-Collar Cuts, Financial Briefs, The Washington Post, January 9, 2002, at E02.

[12] Given that the length of the PFJ is only 60 months, see Section V.A of the PFJ, an assessment of the effectiveness of a provision after eight months would be highly significant.

[13] We use the interim conduct remedies as a point of reference—notwithstanding the fact that they were vacated on appeal—because the Department of Justice stated publicly that it would ''seek an order that is modeled after the interim conduct-related provisions of the Final Judgment previously ordered in the case.'' See Press Release, Department of Justice, Justice Department Informs Microsoft of Plans for Further Proceedings in the District Court, September 6, 2001; see also, John Hendren, New Judge Puts Heat on Feds, Microsoft: Quick Settlement Urged to Aid Ailing Economy, The Seattle Times, September 29, 2001 (''Government lawyers have said they intended to model their proposed remedy on an interim conduct order by the previous district judge who oversaw the case, Judge Thomas Penfield Jackson.'').

[14] A draft of the mediation proposal, Mediator's Draft #18 (April 5, 2000) (referred to herein as the ''Posner Proposal''), is available at www.ccianet.org/legal/ms/draft18.php3. At the time, several news reports indicated that Microsoft had agreed to the provisions in the Posner Proposal. See, e.g.. Joe Wilcox, Hard to Gauge Extent. Effectiveness of Microsoft Concessions, CNET News.com, March 30, 2000 (the ''software giant has tentatively agreed to sweeping restrictions on how it does business with its partners'').

[15] See Testimony of Assistant Attorney General Charles James, Senate Judiciary Committee (December 12, 2001); see also Q&A.'' Charles James Defends The Deal, Business Week, Nov. 19, 2001 (''People who suggest that [the decree should have ordered Microsoft to sell a stripped-down version of Windows] are not recognizing that the tying claim was eliminated from the case by the appeals court.'').

implications of the Court of Appeals'' ruling: contrary to DOJ's view, the Court of Appeals did not suggest that an anti- tying remedy was inappropriate or unnecessary here; indeed, much of the Court of Appeals'' decision is a strong declaration of how Microsoft's various forms of tying violated Section 2 of the Sherman Act. See, e.g., Microsoft 253 F.3d at 65–67. A remedy that truly ''focused on the specific practices that the court had ruled unlawful'' would have to address the tying practices that the Court of Appeals ''ruled unlawful''; the PFJ does not.

Because Microsoft's various forms of middleware applications tying are critical tactics that it uses to maintain its illegal monopoly, they must be ended if the remedy is to ''terminate the monopoly.''[16] (See Microsoft's Tying Strategies To Maintain Monopoly Power In Its Operating System (''Mathewson & Winter Report''), attached hereto as Attachment A.) Furthermore, the opportunity to gain market share as a result of such tying is one of the principal fruits of Microsoft's illegality, and should therefore be denied to it.[17] As a result, the failure of the PFJ to address Microsoft's tying is a fundamental flax,,'' that alone merits rejection of the proposed decree.

Importantly, we note that the legal and economic arguments presented below are reinforced by the empirical observations set forth in Section II, supra. That is, the legal and economic analysis below which suggests that a remedy without a ban on tying will be ineffective in theory, is supported by the fact that such a remedy—imposed in part since Jul□'', and more substantially since December—is proving to be ineffective in practice.

A. The Court Of Appeals Explicitly Held That Code Commingling—A Form Of Tying Unaddressed By The PFJ—Violates Section 2 Of The Sherman Act.

In affirming the District Court's findings of fact concerning Microsoft's practice of commingling the code for its own middleware products with the code for the Windows OS, the Court of Appeals made clear that such commingling was an unlawful act in violation of Section 2 of the Sherman Act. See Microsoft, 253 F.3d at 65–67. Specifically, the Court of Appeals concluded that Microsoft's ''commingling has an anticompetitive effect * . . [and] constitute[s] exclusionary conduct, in violation of $ 2.'' Microsoft, 253 F.3d at 66- 67 (emphasis added)*[18] According to the appeals court, Microsoft's ''commingling deters OEMs from pre-installing rival browsers, thereby reducing the rivals'' usage share and, hence, developers'' interest in rivals'' APIs as an alternative to the API set exposed by Microsoft's operating system.'' Id. at 66. Moreover, the Court of Appeals affirmed the District Court's finding that such commingling was done, deliberately and intentionally, to advance Microsoft's anticompetitive aims. Id.

Notwithstanding these clear declarations by the Court of Appeals, this practice is not prohibited by the PFJ. Such a prohibition was omitted despite the finding that it is illegal—and despite the Justice Department's recognition that the first remedial objective in a decree should be to ''end the unlawful conduct.'' (See CIS at 24.) Thus, Microsoft remains free to bind its middleware applications, including the browser, to its Windows OS [19]—making it impossible for an OEM, or a consumer, to remove that application from a PC without doing damage to that PC's operating system.

Microsoft's suggestion that competition is adequately served by allowing OEMs to pre-install rival middleware and to remove end-user access to Microsoft middleware—instead of banning commingling—is incorrect for several reasons. First, as the District Court found and the Court of Appeals affirmed, commingling of code strongly deters - and may even prevent—OEMs and consumers from using middleware products offered by Microsoft's competitors (because the Microsoft product is inextricably intertwined with the OS and is thus both easier to use and harder to remove).[20] Why would an OEM include a competing middleware product that will cost money to install and use up valuable space on the hard drive when Microsoft's product is already there and has been so tightly knit with the OS that it cannot be removed without doing damage to the OS? As the Court of Appeals noted (citing the District Court's holding), Microsoft's commingling has both prevented OEMs from pre-installing other browsers and deterred consumers from using them. In particular, having the IE software code as an irremovable part of Windows meant that pre-installing a second browser would ''increase an OEM's product testing costs,'' because an OEM must test and train its support staff to answer calls related to every software product preinstalled on the machine; moreover, pre-installing a browser in addition to IE would to many OEMs be ''a questionable use of the scarce and valuable space on a PC's hard drive.'' Microsoft, 253 F.3d at 64 (citations omitted).

As long as commingling is permitted, OEMs and other third party licensees will have no incentive to take advantage of the limited freedom provided by the PFJ and will continue to use Microsoft's middleware products at the expense of its competitors. As a result, commingling reduces Microsoft's distribution costs for its middleware applications to zero. It also raises the distribution costs of rival middleware application makers—who not only must pay for something that Microsoft gets for free (i.e., distribution via OEMs), but must also pay an added bounty to persuade OEMs to install their applications as the second such application on a PC. This, of course, assumes that such an added payment strategy for such middleware would even be plausible (which is highly doubtful, except in rare cases) and would not be defeated by Microsoft, a rival with roughly S39 billion in cash available to deter the prospect of being outbid by other middleware developers for PC access.

The other way in which code commingling illegally enhances the position of Microsoft middleware is by encouraging applications programmers to write their programs to Microsoft's products. (Mathewson & Winter Report at ¶¶ 14–16.) Third party developers decide how to write their applications based upon what APIs they believe will be available on the broadest number of computers and will enable their products to function most smoothly. See Microsoft, 253 F.3d at 55. Because the PFJ will allow Microsoft to continue commingling its middleware and OS code, it essentially guarantees that Microsoft's application programming interfaces (''APIs'') are universally available in all Windows environments (in other words, on virtually all PCs)—and that software developers who write their applications to Microsoft's APIs can write directly to the OS. This is true regardless of whether or not end-user access to the middleware product is visible. As a result, third party software developers (whose business interests are to develop successful applications, not to challenge Microsoft's monopoly) will almost always write their programs to Microsoft middleware.[21] Thus, Microsoft's commingling practices only exacerbate the ''applications barrier to entry'' that already encourages developers to create software that runs on Microsoft's dominant OS and interoperates with Microsoft's middleware

[16] See Microsoft, 253 F.3d at 46; 15 U.S.C. * 16(e) (in a Tunney Act proceeding, the court is authorized to consider whether the proposed settlement results in the ''termination of alleged violations''); see also Grinnell Corp., 384 U.S. at 577 (a decree must ''break up or render impotent the monopoly power found to be in violation of the Act'').

[17] See Microsoft, 253 F.3d at 51, 103.

[18] In its Conclusions of Law, the District Court broadly condemned Microsoft's decision to bind ''Internet Explorer to Windows with.., technological shackles.'' United States v. Microsoft, 87 F. Supp. 2d at 30, 39 (D.DC 2000) (''Conclusions of Law''). Specifically, the District Court denounced Microsoft's decision to bind Internet Explorer to the Windows OS ''by placing code specific to Web browsing in the same files as code that provided operating system functions.'' United States v. Microsoft, 84 F. Supp. 2d at 50, ¶161 (D.DC 1999) (''Findings of Fact'')*

[19] The danger of according Microsoft this power is exacerbated—and reinforced—by the PFJ's definition of the Windows Operating System Product (''Definition U''), which states that the software code that comprises the Windows Operating System Product ''shall be determined by Microsoft in its sole discretion.'' Thus, Microsoft can, over time, render all the protections for middleware meaningless, by binding and commingling code, and redefining the OS to include the bound/commingled applications.

[20] 20 See, e.g.. Findings of Fact, 84 F. Supp. 2d at 49–50, ¶ 159 (''Microsoft knows that the inability to remove Internet Explorer made OEMs less disposed to pre-install Navigator .... Pre-installing more than one product in a given category.., can significantly increase an OEM's support costs, for the redundancy can lead to confusion among novice users. In addition, pre-installing a second product in a given software category can increase an OEM's product testing costs. Finally, many OEMs see pre-installing a second application in a given software category as a questionable use of the scarce and valuable space on a PC's hard drive.'').

[21] For example, a developer that creates music search software is far more likely to develop a program that runs on Windows Media Player than RealPlayer, knowing that the new program would interoperate more readily with the OS if it runs on Microsoft's program and would have fewer glitches.

products. (See Mathewson & Winter Report at ¶ 16.)

Thus, in the end, as both the Court of Appeals and the District Court concluded here, commingling itself deters OEMs from installing rival middleware. See Microsoft, 253 F.3d at 66; Findings of Fact, 84 F. Supp. 2d at 49–50, ¶ 159. No doubt this is why every other remedial plan contemplated in this litigation—from the Posner Proposal,[22] to Judge Jackson's interim remedial order,[23] to the proposal set forth by the Litigating States [24]—has prominently included a ban on code commingling (or, at the very least, a requirement that Microsoft make available a non-commingled version of Windows). Yet, despite that, despite the Court of Appeals'' holding, and despite the District Court's factual findings, the PFJ fails to prohibit or limit this practice in any manner whatsoever.

Microsoft has already demonstrated its willingness and ability to fend off threats from competing middleware products by illegally commingling code with the Windows OS.[25] As currently drafted, the PFJ gives the company a green light to continue this anticompetitive and illegal practice. The public interest requires that Microsoft's practice of tying its middleware and operating system, via code commingling, be prohibited.

Microsoft shall not, in any Windows Operating System Product (excluding Windows 98 and Windows 98 SE) it distributes beginning six months after the date of entry of this Final Judgment, Bind any Microsoft Middleware Products to the Windows Operating System unless Microsoft also has available to license, upon the written request of each Covered OEM licensee or Third-Party Licensee that so specifies, and Microsoft supports both directly and indirectly, an otherwise identical version of the Windows Operating System Product that omits any combination of Microsoft Middleware Products as indicated by the licensee.

(See Proposed Text ¶ 1 (hereinafter ''States'' Proposed Text''), attached as Exhibit A to Litigating States'' Remedial Proposal (December 7, 2001).)

B. Microsoft Uses A Variety Of Other Tying Practices To Maintain Its Operating System Monopoly; If The Monopoly Is To Be ''Terminated,'' Such Contractual Tying Must Be Prohibited.

The Justice Department's insistence that the remedy in this case should not include a general tying prohibition because the government abandoned its Section 1 tying claim is logically flawed. Contrary to DOJ's assertions, as discussed at length above, the ultimate remedy in this case must ''terminate'' Microsoft's illegally maintained monopoly- and that can only happen if the remedy addresses those behaviors that anticompetitively maintain the Windows monopoly.

The bundling, or contractual tying, of Microsoft's middleware products to its Windows OS is clearly such an anticompetitive behavior: it is the signature tactic used by Microsoft to maintain its monopoly and fend off competitive challenges, and it has been expressly found to be illegal by the Court of Appeals. See, e.g., Microsoft, 253 F.3d at 61 (the restriction in Microsoft's licensing agreements that prevents OEMs from removing or uninstalling IE ''protects Microsoft's monopoly from the competition that middleware might otherwise present. Therefore, we conclude that the license restriction at issue is anticompetitive.'') (emphasis added); see also Mathewson & Winter Report at ¶¶ 13–33. Put another way, various tying practices were found by the Court of Appeals to illegally reinforce Microsoft's OS monopoly and thus must be banned in order to realize the remedial mandate of the Court of Appeals and the public interest objectives of the Tunney Act.

The anticompetitive nature of tying is apparent on its face: it reduces competition and consumer choice, making it less likely for Windows consumers to acquire and use non-Microsoft middleware products for reasons unrelated to the merits of those products. See Microsoft, 253 F.3d at 60 (upholding District Court's conclusion that contractually restricting OEMs'' ability to remove IE ''prevented many OEMs from distributing browsers other than IE''); see also Mathewson & Winter Report at * 23. Microsoft only makes Windows available for license to OEMs in a bundle that includes a number of its middleware applications (e.g., Internet Explorer, Windows Media Player, Windows Messenger, MSN). Microsoft also contractually prohibits OEMs from removing its applications from the bundled offering.

As explained in the attached economic report from Professors Frank Mathewson and Ralph Winter, such tying is anticompetitive and should fall under the purview of these remedy proceedings for four principal reasons: (1) it reinforces Microsoft's monopoly by increasing the applications barrier to entry against OS competitors; (2) it reinforces Microsoft's monopoly by deterring direct challenges to the OS itself as the platform of choice for software developers; (3) it weakens the greatest current competitor to Windows—prior versions of Windows; and (4) Microsoft's more recent practice of tying the Windows Media Player to the OS creates a new variant of the applications barrier to entry problem for potential OS rivals: a content-encoding barrier to entry. (See Mathewson & Winter Report, passim.)

First, tying anticompetitively strengthens Microsoft's OS monopoly by reinforcing the applications barrier to entry against OS competitors. (Id. at ¶¶ ;14–16.) The dominance of the Windows standard in a wide range of applications, including a few particularly important applications, hampers entry into the operating system market because an entrant has to offer both a new operating system and a full set of applications, or hope that applications will quickly develop once the new operating system becomes available. See Microsoft, 253 F.3d at 55 (applications barrier to entry stems, in part, from the fact that ''most developers prefer to write for operating systems that already have a substantial consumer base''). This is referred to as the applications barrier to entry, and the District Court found that it served to protect Microsoft against an OS challenge from IBM in the 1990s. Id. (upholding District Court's finding that ''IBM's difficulty in attracting a larger number of software developers to write for its platform seriously impeded OS/2's success'').[26]

By engaging in tying to gain dominance in key applications markets, Microsoft can turn the already-daunting applications barrier to entry into a virtually insurmountable shield. As the Court of Appeals explained, ''Microsoft's efforts to gain market share in one market (browsers) served to meet the threat to Microsoft's monopoly in another market (operating systems) by keeping rival browsers from gaining the critical mass of users necessary to attract developer attention away from Windows as the platform for software development.'' Microsoft, 253 F.3d at 60. If Microsoft controls the key applications, it can unilaterally decide not to make those applications available for even the most-promising rival operating systems. Microsoft's tying thus anticompetitively advantages its position in the middleware applications market and sustains its OS monopoly as well. (See Mathewson & Winter

[22] See Posner Proposal * 3(9) (Microsoft is enjoined from ''tying or combining any middleware product to or with a Windows operating system unless Microsoft offers a version of that operating system without such middleware product at a reduced price that reasonably reflects the relative costs of the operating system and the excluded middleware.'').

[23] See United States v. Microsoft, 97 F. Supp. 2d 59, 68 (D.DC 2000) (''Microsoft shall not, in any Operating System Product distributed six or more months after the effective date of this Final Judgment, Bind any Middleware Product to a Windows Operating System .... '').

[24] The Litigating States'' Remedial Proposal would prevent Microsoft from unlawfully reducing the competitive threat from non-Microsoft middleware products by commingling middleware and operating system code. The Litigating States'' Remedial Proposal would prohibit the practice of commingling altogether or, alternatively, require Microsoft to offer, upon written request from OEMs or other third part).'' licensees, its operating system on an unbundled basis:

[25] Note that Microsoft's options for exploiting technological means to advance its tying ends are not limited to code commingling. Code commingling, of course, is an extreme version of such tying, in that it prevents OEMs and consumers from removing applications without threatening the integrity of the OS. Other examples discussed during trial include deliberately harming the interoperability of Netscape's Navigator browser, see, e.g., Findings of Fact, 84 F. Supp. 2d at 31, ¶ 84 (finding that Microsoft executives explicitly offered preferred access to APIs to Netscape as an inducement to them to not expose their own APIs); id. at 33, ¶ 90–91 (finding that when Netscape refused this offer, Microsoft withheld necessary Windows APIs from I Netscape, delaying Netscape's Windows 95 browser launch until after the holiday selling season); id. at 50, ¶ 160 (''We will bind the shell to the Internet Explorer, so that running any other browser is a jolting experience.''); and working aggressively to degrade the performance and desirability of Sun's Java software, id. at 109–110, ¶¶ 404–406 (finding that Microsoft harmed development of Java class libraries and cross-platform Java interfaces).

[26] See Findings of Fact, 84 F. Supp. 2d at 19–22, ¶¶ 36–44.

Report at ¶ 66.)[27] Consider, for example, Microsoft Office. At one point, companies such as Corel and Lotus provided the most popular versions of these applications. At that time, to compete with Microsoft's Windows, rival operating systems needed to persuade Corel and Lotus to port their applications to those rival systems. Now that Microsoft has successfully leveraged Windows to obtain dominance in the Office suite of applications, however, rival OS providers would have to persuade Microsoft to port Office to rival systems.

If Microsoft can gain dominance with key middleware applications such as Office, MSN Messenger, and Windows Media Player, it can ensure that rival operating systems cannot meet customers'' demands for the most popular applications. That is, when Microsoft's browser, Microsoft's media player, and Microsoft's instant messenger are dominant in those applications markets, Microsoft may choose not to write its applications to interoperate with a potential rival OS—making it much more difficult for nascent operating systems to compete with Windows.[28] Thus, Microsoft's tying, over time, takes today's very high ''applications barrier to entry,'' and raises it immeasurably higher. (See Mathewson & Winter Report at ¶ 66.)

Second, bring reinforces Microsoft's monopoly by deterring direct challenges to the OS itself as the platform of choice for software developers. (Id. at ¶¶ 17–19.) A clear incentive for Microsoft to tie its Internet Explorer browser with Windows was the threat that Netscape—on its own, or combined with Java software—would eliminate Microsoft's network advantages in the operating system by providing middleware that would offer a competing platform for software developers. As the District Court and Court of Appeals found, Netscape and Java were particular threats to Microsoft's dominance in operating systems because they potentially represented a platform/programming environment in which software applications could be developed without regard to the underlying operating system. See Microsoft, 253 F.3d at 74. With middleware, the success of a new operating system no longer depended on the development of new code by every application developer. (See Mathewson & Winter Report at ¶ 19.)

If rivals develop valuable, widely distributed middleware, software vendors could very well begin to write most of their applications directly to that middleware, and the applications barrier to entry would disappear. By using anticompetitive tying to dominate each promising field of middleware, Microsoft ensures that software developers face a unified field of proprietary Microsoft OS and middleware interfaces. (Id.) Thus, Microsoft's tying practices serve, in this way too, to reinforce and entrench its illegal OS monopoly.

Third, tying weakens the greatest current competitor to Windows—prior versions of Windows. (Id. at ¶¶ 27–30.)[29] Existing versions of Windows provide competitive constraints on Microsoft for a simple reason: if new versions of Windows are insufficiently innovative or too expensive, consumers will choose to retain their older versions of the product. Through tying, however, Microsoft weakens this source of competition in two ways. First, new versions of Windows are marketed as much for new applications as for new OS features. Windows XP, for example, is being marketed in part for its inclusion of new applications, such as Windows Media Player 8.0—not just based on innovations and improvements to the OS itself. Second, middleware applications such as Internet Explorer, Windows Media Player (with the attendant Microsoft Digital Rights Management), and MSN allow Microsoft to track consumer usage. Microsoft's binding of these products to Windows ''thus creates a total product that lends itself to usage and leasing fees. By gradually reducing the price of Windows and increasing the usage fees on its tied applications, Microsoft can shift to a usage or leasing revenue model, rather than a revenue model based on sales. This eliminates the competitive threat front previous versions of Windows[30]* (in addition to providing Microsoft with the fruits of its illegal behavior, as discussed in Section III.C, below). (See id. at ¶ 28.)

Fourth, in addition to these three general ways in which Microsoft's contractual tying reinforces the OS monopoly, Microsoft's more recent tying of its media player to the OS creates yet another special and highly significant reinforcement of the Windows monopoly. (See Mathewson & Winter Report at ¶ 36.) This problem results from the close connection between the media player and Microsoft's proprietary media encoding format, Windows Media Audio (''WMA''). Because Microsoft does not license the WMA format to some rival media players—including, most notably, the only other media player with substantial market presence, Real Player—Microsoft's media player is the only major player that can play content encoded in Microsoft's format. As Microsoft's format becomes more and more widespread—it is currently growing in use at a rate ten times that of its rivals - more and more content will become viewable and playable only via Microsoft's media player, which is only distributed via Microsoft's OS.

In such a market, then, a rival OS would have to overcome not only today's applications barrier to entry to compete with Windows—that is to say, it would have to persuade application writers to write their applications to interoperate with their OS—it would also have to overcome a new, even more daunting ''content encoding barrier to entry'' - i.e., it would have to persuade owners of thousands (or perhaps even millions) of pieces of multi-media content to re-encode their content in formats that the media player used by'' the rival OS could read. (Id. at ¶¶ 37–38.) This barrier to entry applies not only to rival PC operating systems, but also to evolving operating systems for handheld and mobile communications devices, since consumers v, ill want to access the best streaming content using those devices. Thus, the currently daunting applications barrier to entry is raised many times higher by virtue of the tying of the Windows Media Player (and its related proprietary formats) to the Windows OS.[31]

All four of these anticompetitive effects are mutually reinforcing, because of the network effects operating between the applications sector and the operating system market. (Id. at ¶¶ 31–33.) Achieving dominance in applications (through tying) strengthens the dominance of the OS, because buyers in the OS market are more assured of available applications. The greater dominance in the OS market in turn feeds back into greater dominance in applications, since the tying strategies take the form of imposing an

[27] See Microsoft, 253 F.3d at 59–60 (citing District Court's finding that ''Microsoft's imposition of [licensing] provisions (like man','' of Microsoft's other actions at issue in this case) serves to reduce usage share of Netscape's browser and, hence, protect Microsoft's operating system monopoly'').

[28] This fear is not theoretical: the District Court found that Microsoft made just such a threat to Apple, with regard to Microsoft Office. See Findings of Fact, 84 F. Supp. 2d at 95–97, ¶¶ 345–356.

[29] The District Court's Findings of Fact, 84 F. Supp. 2d at 25, ¶ 57, maintain that the Windows leasing agreement prohibits the user from transferring the OS to another machine so that ''there is no legal secondary market in Microsoft operating systems.'' The Findings of Fact then note at ¶ 58 that there is a thriving illegal market. To limit this, Microsoft charges a higher price for Windows to OEMs that do not limit the number of PCs the), sell without the OS pre-installed. One might argue that the durable-goods monopoly problem is eliminated by Microsoft's refusal to allow OEMs to install (without penalty) old versions of Windows. As explained in the attached Mathewson & Winter Report, this is incorrect for two reasons: ''(i) increases in the price of the new version of Windows will reduce overall demand for new PCs, as users invoke the option to keep existing PCs with the old version, and (ii) there is a retail market for new versions of Windows software for installation on existing PCs. Both (i) and (ii) provide channels through which the existing stock of Windows software provides some competition for a new version of Windows (i.e., it increases the elasticity of demand for the new version). If the price of a new version is increased, the demand for the new version is reduced because fewer consumers will purchase new PCs as the price increase for Windows raises the price of the overall package of the PC and the (mandated by Microsoft) new version of Windows, and because some consumers who would have purchased Windows to install on their old PCs will now refuse to do so.'' (See Mathewson & Winter Report at 12 n. 10.)

[30] See Jeremy Bulow, ''Durable-Goods Monopolists,'' Journal of Political Economy 90(2): 314–332 (explaining how leasing, rather than selling, solves the monopolists'' ''problem'' of competition from previously existing stocks of goods); id. at 330 (a durable-goods monopolist may be able to achieve the leasing result through extending its monopoly to service contracts).

[31] This same theory applies to Microsoft's identity-authentication application, known as ''Passport.'' If Microsoft can leverage its OS monopoly to make Passport ubiquitous, it can persuade e-commerce sites to adopt Passport as the sole identity-authentication standard. If that were to happen, a nascent OS competitor would not only have to develop its own identity-authentication application; it would also have to persuade thousands of e-commerce sites to adopt that application for use on their web sites. Thus, Microsoft's tying of Passport to the Windows OS could potentially create yet another barrier to entry in the OS market.

artificial advantage relative to applications of the dominant OS supplier. The greater Microsoft's share across all middleware applications markets, the greater the applications barrier to entry.

Thus, a remedy that does not forbid Microsoft's anticompetitive tying leaves in place one of Microsoft's most powerful tools to maintain its OS dominance—and as a result, does not ''unfetter'' the market or ''terminate'' the illegal monopoly. For this reason, the PFJ's failure to include a ban on bundling is not in the public interest.

C. By Allowing Microsoft To Continue To Tie Its Middleware Applications To Windows, Microsoft Retains One Of The Most Valuable ''Fruits'' Of Its Illegal Acts.

The Court of Appeals made clear that one necessary element of any remedy in this case was to ''deny to [Microsoft] the fruits of its violation.'' See Microsoft, 253 F.3d at 103 (quoting United Shoe Mach. Corp., 391 U.S. at 250). This is in accord with the prevailing doctrine in this area. See Grinnell Corp., 384 U.S. at 577; 2 P. Areeda & H. Hovenkamp, Antitrust Laws ¶ 325(c) (2d ed. 2000).

The Court of Appeals found that Microsoft illegally maintained its OS monopoly by engaging in anticompetitive practices. See Microsoft, 253 F.3d at 51, 66. Here, because of the nature of its monopoly, one of the most lucrative fruits of Microsoft's illegal behavior is the ability to bundle its other software products with the OS and reap gains in those markets as well. In this way, the PFJ's failure to ban such tying clearly renders it deficient, because without such a prohibition it will fail to prevent future violations of Section 2, as discussed above—and also fail to prevent Microsoft from reaping the benefits of the OS monopoly that it illegally maintained. Without such a prohibition, Microsoft will be able to continue profiting from its anticompetitive behavior and will have evaded any real punishment for breaking the law.

For these reasons, as with the ban on code commingling discussed above, every other remedial proposal considered in this litigation included a ban on Microsoft's contractual tying via bundling. A formulation of such a ban was found in Judge Jackson's interim conduct remedies, which—in addition to the ban on binding middleware products to the OS—would also have prohibited Microsoft from ''conditioning the granting of a Windows Operating System Product license ... on an OEM or other licensee agreeing to license, promote, or distribute any other Microsoft software product that Microsoft distributes separately from the Windows Operating System Product in the retail channel or through Internet access providers, Internet content providers, ISVs or OEMs.'' United States v. Microsoft, 97 F. Supp. 2d 59, 68 (D.DC 2000). Judge Posner's proposal would have prohibited tying any middleware product with the OS unless Microsoft offered a version of the OS without the middleware application, and did so at a reduced price. See Posner Proposal * 3(9). The litigating states also have proposed a very similar remedial approach. (See LSRP at 4–6.) Thus, it is only the PFJ, among the various proposals, that has failed to take this essential step to terminate Microsoft's OS monopoly, and deny Microsoft the fruit of its illegal acts. A remedy without such a provision cannot be in the public interest.[32]

IV. THE PROPOSED FINAL JUDGMENT FURTHER FAILS THE PUBLIC INTEREST TEST, BECAUSE IT DOES NOT ACHIEVE EVEN THE LIMITED OBJECTIVES THAT IT HOLDS OUT AS ITS AIMS.

As demonstrated above, the PFJ fails to address Microsoft's anticompetitive tying of middleware applications to the Windows OS, and consequently fails to fulfill the remedial mandate of the Court of Appeals. Yet. even for those anticompetitive acts that the PFJ does attempt to address, it does not provide an adequate remedy for Microsoft's illegal conduct. Indeed, the PFJ is so replete with carefully crafted carve-outs and exceptions that many of its provisions, though well intentioned, are rendered meaningless. The result is that the PFJ will do little, if anything, either to terminate Microsoft's monopoly or constrain its ability to fend off middleware threats in the future. And, as we argue above, the preliminary experience with these provisions—since the onset of their implementation by Microsoft— provides little reason to believe that the PFJ will be effective in practice. See Section II, supra.

While any conduct remedy will, of course, have limitations and the potential for evasion, none of the major defects in the PFJ are inherent in the nature of this sort of remedy. The Litigating States'' Remedial Proposal provides a useful contrast on this point. Unlike the PFJ, the LSRP does not leave certain of Microsoft's anticompetitive acts unaddressed or leave Microsoft with the ability to perpetuate its operating system monopoly by illegally eliminating competitive threats from middleware developers. The Litigating States'' Remedial Proposal prevents Microsoft from continuing its anticompetitive practices, is designed to restore the competitive balance in the marketplace, and seeks to ensure that competitive threats may emerge in the future unhindered by Microsoft's anticompetitive conduct. As such, it fully comports with the Court of Appeals'' decision and provides this Court with a clear roadmap of what the public interest requires in this case.

To avoid undue length or repetition, we do not here provide a comprehensive list of all the numerous inconsistencies, loopholes, and shortcomings of the PFJ; we have included, in Attachment B, a more complete listing for the Court's benefit. (See A Detailed Critique of the Proposed Final Judgment in U.S. v. Microsoft, Attachment B.) In this Section, instead, we focus on six critical deficiencies in remedies that (unlike tying) are purportedly addressed in the PFJ: (1) the PFJ's failure to prevent Microsoft's discriminatory licensing practices; (2) its limited and slow-moving API disclosure provisions; (3) its inadequate protections for OEMs from retaliation; (4) its failure to promote distribution of Java; (5) its ''gerrymandered'' definition of middleware; and (6) its complete lack of an effective enforcement mechanism. Where helpful, we contrast the relevant provision in the litigating states'' proposal for comparison's sake. By comparing the two proposals on a few central issues, it should be clear why the LSRP, and not the PFJ, addresses Microsoft illegal conduct in manner that both comports with the Court of Appeals'' decision and serves the ''public interest'' under prevailing antitrust law.

A. The PFJ Allows Microsoft To Continue Engaging In Discriminatory And Restrictive Licensing Agreements To Curtail The Use Of Rival Middleware Products.

One of the ways in which the District Court found, and the Court of Appeals upheld, that Microsoft illegally protects its operating system monopoly from rival middleware is through discriminatory and restrictive licensing provisions. Specifically, the Court of Appeals found that Microsoft uses its licenses not only to reward OEMs that utilize and promote its products (and to discriminate against those OEMs that wish to promote non- Microsoft products), but also to restrict the manner in which OEMs can distribute rivals'' products. See Microsoft, 253 F.3d at 61–67.

Despite these findings, the PFJ permits Microsoft to continue to employ discriminatory and restrictive licensing agreements to curtail the use of its competitors'' products. As currently structured, the PFJ allows Microsoft to continue its use of discriminatory and restrictive licensing provisions to fend off nascent threats from middleware competitors in several ways. First, the PFJ explicitly allows Microsoft to provide market development allowances to favored OEMs; it likewise allows Microsoft to enter into ''joint ventures'' with OEMs, that, in practice, are little more than shells for arrangements by Microsoft to shower financial rewards on OEMs that are willing to refuse to deal with Microsoft's competitors. Given the intense competition and low margins in the OEM industry, these rewards would create a decisive competitive disadvantage for ''disfavored'' OEMs, forcing them to accede to Microsoft's restrictive terms.

The PFJ's mechanisms for enabling these anticompetitive tactics are surprisingly explicit. Under Section III.B.3 of the PFJ, Microsoft is allowed to pay OEMs ''market development allowances'' to promote Windows products. Thus, OEMs that promote Microsoft products apparently can receive de facto cash rebates on their Windows shipments, while OEMs that deal with Microsoft's rivals ''.',,ill pay full list price. This preferential behavior in the browser market ,,,,,as found illegal by both the District Court and the Court of Appeals.

[32] We have argued elsewhere that there could be alternatives to a ban on contractual tying that might, over time, also prove effective. For example, if a remedial plan included a strong provision to permit licensing of Windows, not just to OEMs, but to third parties as well, and such a regime became effective— so that there was active and effective retail competition for bundled OS applications offerings—then the necessity for banning Microsoft's contractual tying would be somewhat lessened. In such an instance, Microsoft's potential for abusive tying could be disciplined by competition from competing bundles. However, absent such competition—which the PFJ does not create—a ban on contractual tying is absolutely essential to achieve the remedial objectives of this case—and thus, the PFJ's failure to include such a provision is fatal.

See Microsoft, 253 F.3d at 60–61. Microsoft should be allowed to engage in leg/t/mate pricing decisions, but those decisions should be limited to volume-based discounts published in its price lists?[33]

Second, under Section III.G.2 of the PFJ, Microsoft may use ''joint ventures'' to escape any restrictions the proposed settlement would place on its licensing practices. For example, Microsoft may join an OEM in a joint venture for any ''new product, technology or service'' or improvement to any existing ''product, technology or service,'' provided that the OEM contributes significant developer ''or other resources.'' (See PFJ at Section III.G.2.) In such an arrangement, Microsoft can seek, and obtain, a pledge that its partner be ''prohibit[ed] ... from competing with the object of the joint venture ... for a reasonable period of time.'' (Id. at III.G.) Thus, Microsoft could enter into a ''joint development'' project for the ''new product'' of ''Windows X for Preferred OEM Y.'' The OEM's contribution could be entirely in marketing and distribution. Yet, under the language of the PFJ, it appears that Microsoft would have the ability to contractually prohibit OEMs in such joint ventures from offering products or services that compete with Microsoft. Given Microsoft's history of abusive and coercive behavior toward OEMs, it should not be allowed to enter into joint ventures with OEMs that result in exclusive agreements. Otherwise, in no time at all, Microsoft will use the opportunity to squelch competition.

Third, the PFJ purports to provide OEMs with the freedom and flexibility to configure the computers they sell in a way that does not discriminate against non-Microsoft products. Under Section III.C, the PFJ ostensibly prohibits Microsoft from entering into an agreement that would—among other things—restrict an OEM's ability to remove or install desktop icons, folders and Start menus, and modify the initial boot sequence for non-Microsoft middleware. However, the PFJ contains carve-out provisions that may render these prohibitions effectively meaningless. Under the express terms of Section III.C. 1 of the PFJ, Microsoft may retain control of desktop configuration by being able to prohibit OEMs from installing or displaying icons or other shortcuts to a non-Microsoft product or service, if Microsoft does not provide the same product or service. Thus, for example, if Microsoft does not include a media player shortcut inside its ''My Music'' folder, it can forbid an OEM from doing the same. This turns innovation—and the premise that OEMs be permitted to differentiate their products—on its head: under the PFJ, rivals can ''compete'' with Microsoft, but they are never allowed a chance to bring a product to market first, to offer a functionality before Microsoft does, or to benefit from their innovations before Microsoft determines that it is ready to meet (and if history is a guide, extinguish) these competitive challenges.

Additionally, under the PFJ, Microsoft can control the extent to which non- Microsoft middleware is promoted on the desktop by virtue of a limitation that OEMs may promote such software at the conclusion of a boot sequence or an Internet hook-up only if they display no user interface or a user interface that is ''of similar size and shape to the user interface provided by the corresponding Microsoft middleware.'' (See PFJ at III.C.3.) And OEMs are allowed to offer Internet Access Provider (''IAP'') promotions at the end of a boot sequence, but only for their own LAP offerings (whatever that ambiguous limitation means). (See id. at III.C.5.) Thus, under the PFJ, Microsoft maintains the ability to set the parameters for competition and user interface.

In order to promote competition from rival middleware, Microsoft must be prohibited from entering into restrictive and discriminator)'' contractual agreements with its licensees. Although remedial proposals could have been crafted to address these anticompetitive practices, the PFJ falls short of this mark.

By contrast, the Litigating States'' Remedial Proposal would bring Microsoft's unlawful behavior to an end and thus provide competing middleware the opportunity to receive effective distribution through the important OEM channel. Under the LSRP, Microsoft would be required, at a minimum, to offer uniform and non-discriminatory license terms to OEMs and other third-party licensees. The LSRP would also require Microsoft to permit its licensees to customize Windows to include whatever Microsoft middleware or competing middleware the licensee wishes to sell to consumers. (See LSRP at 7–9.)

In addition, the LSRP specifically prohibits Microsoft from employing market development allowances, including special discounts based on joint development projects?[34] It also gives OEMs and other third-party licensees the flexibility to feature non-Microsoft products in ways that increase the likelihood that consumers will use them, without providing broad exceptions that enable Microsoft to avoid its obligations?[35] Thus, it is the LSRP—and not the PFJ—that meets the Tunney Act's ''public interest'' standard.

B. The PFJ Requires Microsoft To Disclose APIs Only In Certain. Narrow Circumstances. Another key element of the government's case against Microsoft was the company's withholding of the operating system's API information from rivals, so as to illegally decade the performance of rival applications. In any market where Microsoft is allowed to withhold APIs, rival software will perform imperfectly in the Windows environment, and Microsoft will illegally gain dominance. Accordingly, in order to promote competition from rival middleware developers, it is essential that Microsoft be required to provide timely access to all technical information required to permit non-Microsoft middleware to achieve interoperability with Microsoft software.

Section III.D of the PFJ imposes an obligation on Microsoft to disclose to Independent Software Vendors (''ISVs''), and others, the APIs that Microsoft middleware uses to interoperate with any Windows OS product. However, the PFJ's requirement for API disclosure is drawn much too narrowly to allow non-Microsoft middleware to compete fairly with Microsoft middleware. Here again, a comparison with the proposal of the litigating states is instructive.

First, the PFJ's disclosure requirement fails to prevent ''future monopolization,'' because it fails to apply to critical technologies that Microsoft is likely to use to maintain the power of its OS monopoly in the future. Because nascent threats to Microsoft's monopoly operating system currently exist beyond the middleware platform resident on the same computer, any effective API disclosure requirement must apply to all technologies that could provide a competitive platform challenge to Windows, including wizard, desktop, preferences, favorites, start page, first screen, or other aspect of any Middleware in that product.'').)

Second, the PFJ creates an apparent exception for Microsoft's API disclosure requirement in the emerging areas of identity authentication and digital rights management (''DRM'')—critical applications that are also important to the prospects of Microsoft's ''future monopolization.'' Section III.J.1.(a) appears to exempt Microsoft from disclosing any API or interface protocol ''the disclosure of which would compromise the security of... digital rights management.., or authentication systems, including without limitation, keys, authorization tokens or enforcement criteria.'' This exception is written much more broadly than any of the limits on Microsoft behavior, and could easily be used to protect Microsoft's APIs relating to DRM and identity authentication applications. The implication of this is that any rival DRM or authentication software will not function as ,,','ell as Microsoft's DRM, Passport, and .Net

[33] Less explicitly, but perhaps even more nefariously, the same provision that authorizes continuation of ''market development allowances'' (i.e., III.B.3) says that Microsoft may also maintain ''programs ... in connection with Windows [OS] products.'' This appears to be a carefully veiled reference to Microsoft's use of ''Marketing Development Funds''—highly discretionary, highly targeted payments to OEMs that can be yet another means of effectively rendering the list price of Windows economically irrelevant. While the PFJ ostensibly says that these ''programs'' must have ''objective criteria,'' ''neutral'' criteria can be easily formulated that have the effect of rewarding favored players and punishing less cooperative OEMs, given the small number of major OEMs in existence.

[34] (See States'' Proposed Text * 2(a) (''Microsoft shall license, to Covered OEMs and Third-Party Licensees, Windows Operating System Products .... pursuant to uniform license agreements with uniform terms and conditions. Microsoft shall not employ Market Development Allowances or other discounts, including special discounts based on involvement or any joint development process... '').)

[35] (See States'' Proposed Text 2(c) (''Microsoft shall not restrict (by contract or otherwise, including but not limited to granting or withholding consideration) an OEM or Third-Party Licensee from modifying the BIOS, boot sequence, startup folder, smart folder (e.g., MyMusic or MyPhotos), links, internet connection network servers, web servers, and hand-held devices. The PFJ does not; by contrast, the Litigating States'' Remedial Proposal expressly provides that Microsoft must disclose all APIs, technical information, and other communications interfaces so that Microsoft software installed on one computer (including personal computers, servers, handheld computing devices and set-top boxes) can interoperate with Microsoft platform software installed on another computer. (See LSRP at 11.)

My Services (formerly known as Hailstorm). Thus, under the PFJ, Microsoft may be able to degrade the performance of any rivals to any of these services.

These markets, however, are just as important to the next stage of the industry's evolution as browsers were to the last stage. DRM solutions, for example, allow content vendors to sell audio and video content over the Internet on a ''pay for play'' basis. Since the most prevalent use of media players in the years ahead will be in playing content that is protected in this fashion, if non-Microsoft media players cannot interoperate with Windows'' DRM solution, those media players will be virtually useless except for ''freeware'' content.[36] Thus, if DRM is exempt from API disclosures under the PFJ, Microsoft can destroy the competitive market for one of the most vital forms of middleware—media players.

The authentication exemption is potentially even more far-reaching. Most experts agree that the future of computing lies with server-based applications that consumers will access from a variety of devices. Indeed, Microsoft's ''.Net'' and ''.Net My Services'' (formerly known as Hailstorm) are evidence that Microsoft certainly holds this belief. These services, when linked with Microsoft's Passport, may allow Microsoft to participate in a substantial share of consumer e-commerce transactions over the Interact, irrespective of which device is used to access the Internet (cell phones, handheld computers, etc.). If Microsoft prevents competition with its Passport standard, it may be able to realize its stated goal of charging a fee for every single e-commerce transaction on the Internet.[37]

Under the guise of security, Microsoft has obtained a loophole in the PFJ that undercuts a critical disclosure requirement. Microsoft's legitimate security concerns— which, of course, are shared by all of its major business rivals—do not require this loophole. Section III.J.2 of the PFJ excludes from disclosure rights any company with a history of software counterfeiting or piracy or willful violation of intellectual property rights, or any company that does not demonstrate an authentic and viable business that requires the APIs. This means that Microsoft only has to disclose to bona fide software rivals whose interests in security and stability are as Meat as Microsoft's. As added protection, Section III.J.l.(b) of the PFJ allows Microsoft to refrain from any disclosure simply by persuading an impartial government body, on a case-by-case basis, that a specific disclosure would put system security at risk. Together, these provisions provide Microsoft with all the room it needs to take legitimate security precautions.

Once again, the litigating states'' proposal provides a useful contrast. It contains no disclosure ''carve out'' to exempt DRM and identity-authentication from the general disclosure obligation imposed on Microsoft. (See LSRP at 11.) Instead, it creates a regime of timely, complete, and comprehensive API disclosure that will allow competitors an opportunity to challenge Microsoft's efforts to entrench its OS monopoly in a market where distributed computing is the dominant model—an opportunity that was sadly missed as the browser became critical to Internet-related applications, due to Microsoft's anticompetitive refusals to share technical information. Thus, once again, it is the LSRP, not the PFJ, that would meet the Court of Appeals'' objectives and the public interest standard.

C. The PFJ Does Not Ban Many Forms Of Retaliation By Microsoft Against OEMs.

The District Court found, and the Court of Appeals upheld, that in order to create a competitive market structure in which non-Microsoft middleware products are able to compete effectively with Microsoft products, licensees, such as OEMs, must have the ability to distribute and promote non-Microsoft products without fear of coercion or interference from Microsoft. Recognizing the central role that OEMs play in the distribution and ultimate usage of non-Microsoft middleware products, the PFJ includes an anti- retaliation provision which is intended to protect those entities that support or promote non-Microsoft products. According to the Department of Justice, this anti-retaliation provision ''broadly prohibits any sort of Microsoft retaliation against an OEM based on the OEM's contemplated or actual decision to support non-Microsoft software.'' (See CIS at 25.)

Unfortunately, the PFJ does not provide the broad protection from Microsoft's retaliation that the government claims it does. Indeed, the PFJ's anti-retaliation provision is so narrow that it will do little, if anything, to protect OEMs that wish to distribute or promote non-Microsoft products. The PFJ's anti-retaliation provision is deficient in numerous respects. First, it appears to create only a narrow range of procompetitive activities that OEMs can engage in without being subject to Microsoft retaliation. For example, the PFJ prohibits retaliation for OEMs that promote rival middleware, but does not appear to prohibit retaliation against OEMs that promote any other type of rival software (which, under the PFJ's language, probably includes rivals to Passport, MS Money, Windows Movie Maker, and MSN Messenger, just to name a few). Even if this glitch were unintentional, the ambiguity might still be sufficient to allow Microsoft to coerce OEMs into avoiding Microsoft rivals.

Second, even within the scope of protected OEM activities, the PFJ appears to bar only certain types of Microsoft retaliation. The PFJ prohibits Microsoft from withholding ''newly introduced forms of non-monetary Consideration'' from OEMs, but is less clear about whether Microsoft may use already-existing forms of consideration to retaliate against OEMs. (See PFJ at III.A.) More importantly, while the PFJ prohibits Microsoft retaliation via an alteration of commercial agreements, it does not appear to prohibit any other form of Microsoft retaliation (e.g., product disparagement) that Microsoft can imagine.[38]

In addition, under Section III.A of the PFJ, Microsoft may, sua sponte, terminate an OEM's Windows license after sending the OEM two notices stating that it believes the manufacturer is violating its license* There need not be any adjudication or determination by any independent tribunal that Microsoft's claims are correct. All that is required are two notices; after that, Microsoft may terminate an OEM's license. This provision means that the OEMs are, at an), time, just two registered letters away from unannounced economic calamity; after all, given Microsoft's monopoly on the operating system, termination of an OEM's Windows license is a death sentence for an OEM's business.

Again, such inadequate safeguards are not inherent in an effective non- retaliation protection. For instance, the Litigating States'' Remedial Proposal prevents Microsoft from taking any action that directly or indirectly adversely affects OEMs or other third-party licensees that in any way develop, distribute, support or promote competing products, thereby providing the type of protection contemplated by the Court of Appeals. (See LSRP at 13–14.) Thus, the Litigating States'' Remedial Proposal clearly prohibits Microsoft retaliation for any procompetitive OEM behavior and prohibits all forms of Microsoft retaliation. Importantly, the LSRP also prohibits Microsoft from retaliating against any individual or entity for participating in any capacity in any phase of this litigation. Again, it is the LSRP that meets the Court of Appeals'' objectives for this case— not the PFJ.

D. The PFJ Does Nothing To Remedy Microsoft's Illegal Campaign To Eliminate Java.

Yet another aspect of the trial court's decision that was upheld on appeal by the DC Circuit was the District Court's finding that Microsoft's actions in eliminating the threat posed by Sun Microsystems'' Java technology were unlawful under Section 2 of the Sherman Act. See Microsoft, 253 F.3d at 74–75. The PFJ, however, omits any remedy for this core abuse. Thus, unlike either the District Court's remedy or the remedy Judge Posner suggested, the PFJ does not protect those specific products, such as Java, that actually compete with Windows today and offer alternatives to Microsoft's dominance.

The Litigating States'' Remedial Proposal addresses this deficiency by requiring that Microsoft distribute Java with its platform software for a period of ten years. (See LSRP at 17–18.) The LSRP recognizes, as did the District Court and Judge Posner, that in order to ensure that rival products such as Java can compete with Microsoft, they must receive the widespread distribution that they could have obtained absent Microsoft's unlawful behavior.

[36] See Brad King, Microsoft Poised for Music Domination, Wired, June 14, 2001.

[37] As Nathan Myrhvold, Microsoft's former chief technology officer, put it, Microsoft's strategy is to ''get a ''vig,'' or ''vigorish,'' on every transaction over the Internet that uses Microsoft's technology.'' David Bank, Microsoft Moves To Rule On-Line Sales, The Wall Street Journal, June 5, 1997, at B1. The term refers to a gambling house's ''cut'' on all bets placed in the establishment.

[38] For example, the PFJ does not appear to foreclose a Microsoft strategy whereby OEMs would be told that senior Microsoft executives and spokespeople will opine that the product of OEM X works better than the product of OEM Y, if OEM Y refuses to install only Microsoft applications.

The requirement that Microsoft distribute Java with its operating system and Internet Explorer browser takes on even greater importance in light of Microsoft's recent behavior. For example, although the Court of Appeals upheld the trial court's finding that Microsoft targeted and destroyed independent threats from the Java programming language, see Microsoft, 253 F.3d at 53–56, 60, Microsoft announced less than a month later that it was dropping any support for Java from Windows XP. As The Wall Street Journal reported at the time, ''This favors Microsoft's new technologies, and will inconvenience consumers .... [I]f you want your Web page accessible to the largest number of people, you may want to drop Java'' and switch to Microsoft's competing set of products, which is under development and is known as NET.''[39] Thus, notwithstanding the Court of Appeals'' holding that Microsoft illegally maintained its monopoly by requiring major independent software vendors to promote Microsoft's JVM exclusively (i.e., by requiring developers, as a practical matter, to make Microsoft's JVM the default in the software they developed), Microsoft is again acting illegally to maintain—and further entrench—its operating system monopoly against Java's middleware threat.

To remedy the specific and extensive anticompetitive tactics aimed at Java, as found by the District Court and affirmed by the Court of Appeals, Microsoft should be ordered—as outlined in the Litigating States'' Remedial Proposal—to distribute with its platform software a current version of the Java middleware. This would ensure that Java receives widespread distribution, thus increasing the likelihood that it can serve as a viable competitive platform to Windows. Although rivals such as Java will likely remain small players compared to the dominant Windows OS, their existence on the competitive fringe is critical to provide some competitive discipline to Microsoft on pricing and coercion matters. Moreover, the existence of these rivals creates a base for future developments that might one day provide true alternatives to Windows.

E. The PFJ Includes A ''Gerrymandered'' Definition Of Middleware. Though not readily apparent, the effectiveness, or lack thereof, of the PFJ's restrictions on Microsoft's behavior heavily depends on the proposed agreement's definition of ''middleware.'' Under the proposed settlement, OEMs are protected from retaliation and can promote competitive alternatives to Microsoft products only in the area of middleware. Thus, if rival software falls outside of the definition of middleware, Microsoft can essentially use its coercive might to prevent that software from being distributed via OEMs. Conversely, if a Microsoft product is not classified as middleware, Microsoft is permitted to use coercion to force its adoption and promotion.

The PFJ adopts a new, and greatly narrowed, definition of middleware, both in terms of ''Microsoft Middleware Products'' and ''non-Microsoft Middleware.'' The result is significant because under the newly created definition, Microsoft may be able to subvert many of the PFJ's restrictions. Tile Litigating States'' Remedial Proposal defines middleware in a manner consistent with the definition adopted by both the District Court and the Court of Appeals.[40] It thus prevents Microsoft from using a definitional shell game to avoid changing its unlawful behavior.

The District Court and the Court of Appeals adopted the same definition of middleware: software products that expose their own APIs; are written to interoperate with a variety of applications; and are written for Windows as well as multiple operating systems. See Microsoft, 253 F.3d at 53; see also Findings of Fact, 84 F. Supp. 2d at 17–18, ¶¶ 28–29. Thus, while the DC Circuit discussed browsers and the Java technologies as leading examples of middleware, Microsoft, 253 F.3d at 59–78, it never adopted an exclusive list limited to specific products (as the PFJ does).[41] Importantly, the Court of Appeals also agreed with the District Court that the appropriate category of ''middleware'' applications that merit protection against Microsoft's anticompetitive conduct includes .any application that could operate separately or together with other such applications to create even the ''nascent'' potential for alternative platforms that could compete with Microsoft's OS monopoly. Id. at 52–54, 59–60, 74.

These standard definitions of middleware were also endorsed in the Posner Proposal, which, as noted above, Microsoft was reportedly ready to accept last year. Section 2(3) of the Posner Proposal defined middleware broadly, to include any ''software that operates between two or more types of software.., and could, if ported to multiple operating systems, enable software products written for that middleware to be run on multiple operating systems.'' Moreover, the substantive portion of the Posner Proposal, in Section 3(8)(c), explicitly included not just enumerated products, but also an)'' ''middleware distributed with such operating system installed on one personal computer to interoperate with any of the following software installed on a different personal computer or on a server: (i) Microsoft applications, (ii) Microsoft middleware, or (iii) Microsoft client or server operating systems.''

The PFJ departs significantly from these established definitions of middleware and instead adopts wholly new definitions for both ''Microsoft Middleware Products,'' and ''non-Microsoft Middleware.'' These definitions include several flaws that Microsoft may be able to use to anticompetitively advantage its applications, continue to profit from the fruits of its illegally maintained monopoly, and evade the practical consequence of the PFJ for many product lines.

To start, the PFJ's definition of ''Microsoft Middleware Products'' appears to limit this category to five specifically-listed existing products and their direct successors? This makes no sense for two reasons. First, why define the most critical term in the proposed settlement narrowly when Microsoft has already demonstrated its skill at evading consent judgments?[42] And second, why does the list include certain Microsoft products, but arguably not their virtually indistinguishable cousins: i.e., Outlook Express, but not Outlook; Windows Messenger, but not MSN Messenger; the Microsoft JVM, but not MSN RunTime; Internet Explorer, but not MSN Explorer. Likewise, Microsoft middleware applications such as the MSN client software and Passport appear to be excluded. The significance of these omissions cannot be overstated. For example, although Microsoft must allow OEMs, under the PFJ, to remove end-user access to Internet Explorer, the decree's language appears to allow Microsoft to ban any effort to replace MSN Explorer with a competitor. This is a step backwards from the status quo.

Additionally, Section III.H.2 of the PFJ explicitly limits OEM flexibility to set non-Microsoft Middleware as a default so that it can be automatically invoked: the PFJ appears to allow OEMs to do so only with competitors of ''Microsoft Middleware Products'' that (1) appear in separate Top-Level Windows, with (2) separate end-user interfaces or trademarks. Thus, Microsoft might be able to avoid the PFJ's provisions simply by embedding Microsoft middleware with other middleware, or not branding it with a trademark. That means Microsoft—not the OEMs, and certainly not the market—would determine the scope of desktop competition and the pace of desktop innovation.

Conversely, the definition of the rivals to Microsoft Middleware Products— ''non Microsoft Middleware Product''- is also jury-rigged to advantage Microsoft. Under Section IV.N of the PFJ, protected middleware products are limited to those applications ''of which at least one million copies were distributed in the United States within the previous year.'' Thus, developers have no protection from Microsoft's well-honed predatory tactics until they can obtain substantial distribution.

The PFJ's middleware definition also does not explicitly include web-based services, the most important future platform challenge to the Windows monopoly. These web-based services represent an important and growing type of middleware, and the PFJ's failure to explicitly cover them may allow Microsoft to recreate and extend its desktop monopoly to new platforms.[43]

[39] John R. Wilke and Don Clark, Microsoft Pulls Back Its Support for Java: New Windows XP System Won't Include Software Needed to Run Programs, The Wall Street Journal, July 18, 2001.

[40] (See States'' Proposed Text ¶ 22(w).)

[41] See also Microsoft, 253 F.3d at 59 (referring to browsers as exemplary of ''any middleware product, for that matter''); id. at 74 (Java is a set of technologies that ''is another type of middleware posing a potential threat to Windows'' position as the ubiquitous platform for software development'').

[42] The PFJ does contain a generic middlewaredefinition, see Section VI.K.2, but this applies only to new products, and therefore does not capture an)'' product now in existence.

[43] See Rebecca Buckman, Microsoft Says Its Future Lies in Subscriptions, The Wall Street Journal, May 31, 2001.

The newly created and narrowly crafted definitions of middleware in the PFJ pave the way for Microsoft to avoid many of the prohibitions on its conduct. The middleware definitions in the LSRP, on the other hand, are consistent with those endorsed by the District Court and Court of Appeals, and ensure that the protections from Microsoft's illegal conduct are extended to Microsoft's competitors in critical middleware markets.

F. The PFJ Lacks A Meaningful Enforcement Mechanism.

For any remedy against Microsoft to be effective, it must include a strong, timely, and meaningful enforcement mechanism. The PFJ creates an extraordinarily weak enforcement authority—one that likely will be overwhelmed and co-opted by Microsoft. More specifically, as currently drafted, there are two principal problems with the PFJ's enforcement mechanism.

First, the proposed decree leaves all enforcement to a single, three-person Technical Committee (''TC''). With no looming antitrust proceedings to put pressure on Microsoft to behave, Microsoft will have every incentive to hinder the efforts of the TC. Moreover, Microsoft will have substantial insights and influence over the TC—Microsoft will appoint at least one member of the TC (the first two members will appoint the third); the TC will be stationed full-time on Microsoft premises; and the TC will rely for many types of enforcement on a compliance officer hired and paid for by Microsoft. In light of all this, it would be easy to imagine a situation where the TC, during the entirety of its existence, never took a single action critical of or hostile to Microsoft, no matter what behaviors Microsoft engaged in.

Second, the enforcement authority has no power other than the authority to investigate. The TC cannot expedite claims, assess fines, or otherwise move quickly to redress Microsoft's illegal behavior. If the TC finds any abuse, its only recourse will be to the courts, through mini-retrials of United States v. Microsoft. Moreover, under Section IV.D.4.(d) of the PFJ, the TC is prohibited from using any of its work product, findings, or recommendations in any court proceedings. Thus, even if the TC eventually refers a matter to the courts, the proceedings will have to start from scratch. The history of the 1994 consent decree shows the futility of this type of approach.

By contrast, the Litigating States'' Remedial Proposal recommends the creation of a Special Master who is empowered and equipped to investigate Microsoft's behavior in a manner that is prompt and resolute. The appointment of a Special Master with defined remedial powers is essential if Microsoft's unlawful behavior is to be curbed and competition restored to the marketplace. Thus, the creation of a Special Master provides for a mechanism that is much more effective in ensuring Microsoft's compliance with the settlement decree, and does not suffer from the defects identified above in the PFJ's TC proposal.

First, unlike the TC in the PFJ, a Special Master, as selected by the Court, would be independent. He or she would not be dependent on Microsoft for resources, appointment, or other needs.

Second, under the Litigating States'' Remedial Proposal, the Special Master would have the authority to identify, investigate, and quickly resolve enforcement disputes. For example, under the States'' proposal, the Special Master would have the power and authority to take any and all acts necessary to ensure Microsoft's compliance. (See States'' Proposed Text ¶ 18(b).) The Special Master would have the benefit of both business and technical experts. (See id. ¶ 18(d).) Upon receipt of a complaint, it would be required to make an initial determination of whether an investigation is required within fourteen days. After notifying Microsoft and the complainant of its decision to investigate, Microsoft would then have fourteen days to respond. After Microsoft's response, the Special Master would be required to schedule a hearing within twenty-one days, and fifteen days after the hearing, would be required to file with the Court its factual findings and a proposed order. (See id. ¶ 18(f).)

Unlike the enforcement mechanism in the PFJ, the creation of a Special Master as outlined by the States would prevent disputes over Microsoft's compliance from becoming wars of attrition that would drain the system and guarantee Microsoft victory. The history of this case, and of antitrust regulation in general, suggest the need for an enforcement mechanism that can ensure the timely resolution of any disputes and minimize any demand on judicial resources. The enforcement provisions contained in the Litigating States'' Remedial Proposal accomplish these objectives.

V. THE CIRCUMSTANCES OF THIS CASE STRONGLY MILITATE IN FAVOR OF GATHERING EVIDENCE AND TESTIMONY—EITHER IN A HEARING, OR THROUGH THE USE OF THE RECORD FROM THE REMEDIAL PROCEEDING—TO DETERMINE IF THE PFJ MEETS THE PUBLIC INTEREST TEST.

We believe, for the reasons presented above, that the PFJ fails the Tunney Act's ''public interest'' test and should be rejected. At the very least, however, there is ample basis for the Court to conclude that a rigorous hearing is needed to air the objections to the PFJ and resolve the doubts that the Court hopefully has about the proposed decree. While it need not be a lengthy proceeding, the Court may also want to consider accepting evidence and taking testimony- or alternatively, making use of record evidence it will receive in the upcoming proceeding concerning the LSRP. The question of what can be learned about the PFJ's prospects for effectiveness, since its partial implementation began in July (and, in other respects, December), is especially critical, and would benefit from additional fact-finding by the Court.

A. The Complexity And Significance Of This Case—And The Inadequacy Of The CIS -All Militate In Favor Of A Hearing On The PFJ. Of all the cases in which courts have reviewed proposed consent decrees to make a public interest determination under the Tunney Act, the case most similar to the present action is American Tel. & Tel. Co., 552 F. Supp. at 131, aff'd sub nom Maryland v. United States, 460 U.S. 1001 (1983), in which Judge Greene subjected the government's proposed consent decree with AT&T to intense judicial review.[44] In AT&T, the court recognized that the proposed settlement not only would dispose of ''what is the largest and most complex antitrust action brought since the enactment of the Tunney Act, but [] itself raises what may well be an unprecedented number of public interest questions of concern to a very large number of interested persons and organizations.'' American Tel. & Tel. Co., 552 F. Supp. at 145.[45] In light of the size and the complexity of the case,[46] 46 as well as its ''unfortunate history'' and the interests of third parties, the court held an extensive hearing to address key issues raised by the consent decree and the comments of interested parties. Id. at 147, 152. The case for an extensive hearing on the PFJ in this proceeding is overwhelming for similar reasons.

First, this is an extremely complicated case, to say nothing of the profound consequences any settlement will ultimately have on the computer and Internet industries. The economic significance of the computer industry is unquestioned. In such an environment, expert economic analysis is critical to help the Court not only understand the incentives that will drive Microsoft's response to any proposed settlement, but also assess whether the PFJ will succeed in bringing the monopolist's unlawful behavior to an end and promoting competition in a market that has long been restricted. Given the complexity of this case, the Court should not approve the PFJ without an adequate hearing to consider the many- and often technical—objections to it that will doubtlessly be raised in the Tunney Act submissions.

Second, in temps of the impact that an□, proposed settlement in this case will have on the public, Judge Greene's depiction of the AT&T case is, once again, more than fitting here: ''[t]his is not an ordinary antitrust case.'' Id. at 151. Microsoft is one of our nation's largest corporations. It plays a central role in one of the country's most critical and important industries, and thus in our country's economy. Any settlement that

[44] Similar to the case at hand, Judge Greene in ,4 T& T had a well-developed factual record on which to base his public interest determination. In .4 T&T, the parties reached their settlement following a period of discovery, pretrial motions, and an eleven-month trial. Shortly before the evidence phase was to end, the Department of Justice and the defendant agreed upon, and submitted to the court, a proposed final judgment.

[45] Here, of course, the proposed consent decree was reached after a full trial on the merits, as well as an affirmance by the Court of Appeals, upholding the District Court's findings of liability against Microsoft. The court also acknowledged that if approved, the proposed decree ''would have significant consequences for an unusually large number of ratepayers, shareholders, bondholders, creditors, employees and competitors,'' and would affect ''a vast and crucial sector of the economy.'' /d. at 152.

[46] The Senate sponsor of the Tunney Act, Senator Tunney, specifically cited a case's complexity as a factor militating in favor of conducting a hearing on the adequacy of a decree. See 119 Cong. Rec. S3453 (daily ed. February 6, 1973) (statement of Sen. Tunney).

addresses Microsoft's illegal conduct in a manner that is consistent with the Court of Appeals'' decision and prevailing antitrust law will have far-reaching consequences on numerous organizations, both public and private, as well as on Microsoft, its employees, shareholders, competitors, and most importantly, consumers. Thus, a hearing to consider the breadth and depth of these consequences is in order before the PFJ is approved.

Third, a hearing should be held to require the Justice Department to answer the many questions surrounding the PFJ—raised here, and doubtlessly elsewhere—that the Competitive Impact Statement ignores or fails to adequately address. Why was a new, ''gerrymandered'' definition of middleware used in the PFJ—instead of the definition used by both the trial and appellate courts, and in every other remedial proposal? Why was a Java- related remedy omitted, when that was such a key part of the case? Why were only some forms of retaliation, for only some procompetitive acts, prohibited? And most importantly, why does the PFJ not address all of the anticompetitive wrongs that were found at trial, and upheld on appeal—including, most especially, Microsoft's unlawful tying? These questions are not answered by the CIS, as the Tunney Act directs and the public interest demands, and as the Court would surely desire. A full review of these questions, and many others, is needed by the Court before it can approve the PFJ (if it is inclined to approve the PFJ).

Thus, in light of the specific objections from third parties revealing the PFJ's numerous deficiencies—and the oddity of the differing remedial proposals now before the Court—the Court should hear oral argument and, if necessary, take additional testimony. Giving the government an opportunity to explain the omissions in its proposed settlement, and third parties the opportunity to demonstrate the efficacy of the litigating states'' proposal, will afford the Court the necessary basis on which to make its public interest determination in this important and unprecedented case.

B. The Court Should Conduct A Proceeding—Taking Evidence And Hearing Testimony, If Necessary—To Determine How The PFJ's Provisions Have Functioned Since Some Were Put In Place In 2001.

A second rationale for a hearing is to develop a factual record concerning the point we make in Section II, supra: namely, that the Court can assess the prospects for the likely effectiveness of the PFJ by seeing how those provisions that have been implemented are starting to work—or not—in practice.

Above, we have suggested that the empirical record developed in the PC industry since Microsoft's July 11, 2001 announcement of ''greater OEM flexibility for Windows,'' and since Microsoft began to implement many of the PFJ's remedial provisions on December 16, 2001, should be examined carefully by this Court as it determines whether the PFJ is in the ''public interest.'' We also express the view that these provisions have, in fact, been ineffectual in promoting competition and are showing no signs that they will yield change in the competitive position of non-Microsoft middleware—and as a result, cannot be said to be in the public interest.

At the same time—while we doubt it, seriously—we recognize it is theoretically possible that there may be reasons why these provisions have not yet shown signs of effectiveness, but would be effective over time. At least, that is what Microsoft and the Justice Department are likely to assert. If the Court is inclined to give these assertions any credence, that is all the more reason for the Court to conduct a proceeding—taking evidence and hearing testimony, if necessary- to make a determination on such claims based on empirical evidence, rather than relying upon hypothetical contentions or abstract theories. Such a proceeding is authorized by the Tunney Act, see 15 U.S.C. * 16(f), and would be appropriate in this instance.

Evidence and testimony from the OEMs can make clear whether they are taking advantage of the ''new flexibility'' ostensibly being provided under the PFJ—and if not, why not. Given the OEMs'' likely fears of retaliation from testifying in such a proceeding—as reflected by their apparent (and understandable) reluctance to testify in the remedial proceeding—the Court may want to consider appointing a Special Master to take evidence from the OEMs confidentially.[47] Likewise, evidence and testimony from non- Microsoft middleware companies can indicate how the provisions of the PFJ, after they have been in place for several months, are—or are not—enabling them to compete with Microsoft. The same can be said for OS rivals to Microsoft.

The point is that while we firmly believe that the publicly available information and reports all indicate that the PFJ's provisions, as implemented since December 16th (and the browser-related PFJ provisions, as implemented since July 11th), have done little or nothing to promote competition, the Court may wish to base such a conclusion upon a judicially developed record that would allow both proponents and opponents to offer explanations and evidence in support of their views. Such a proceeding could be of a more informal nature, i.e., the Court could solicit comments from the relevant parties and industry experts; or it could be conducted by a Special Master, as we suggest above; or it could be a more formal, trial-type undertaking. All of these approaches are authorized under the Tunney Act, which grants wide discretion to the court to adopt whatever form of proceeding it considers most effective. See 15 U.S.C. § 16, passim. But on one point, the Act, or at least its legislative history, is rather firm: ''[T]he court must obtain the necessary information to make [a] determination that the proposed consent decree is in the public interest.'' 1974 U.S.C.C.A.N. 6535, 6538–39 (H.R. Rep. 93–1463, quoting S. Rep. 93–298, at 6–7 (1973)) (emphasis added). Some sort of proceeding to examine these questions is justified in these circumstances,[48] and could be helpful to the Court in its consideration of the practical effects of the PFJ.

C. In Making Its ''Public Interest'' Determination. This Court Should Take Into Account The Evidence That Will Be Adduced In The Upcoming Remedial Proceeding. Finally, the Court should take advantage of the Tunney Act's broad procedural flexibility to use the record evidence that will be amassed in the upcoming remedial proceeding as it make its ''public interest'' determination in this review. The Court's Tunney Act review of the PFJ in this proceeding can be substantially assisted by the record developed in the forthcoming proceeding on the LSRP. As we have argued, the Court's objectives in both proceedings are the same—namely, to terminate Microsoft's illegal conduct, prevent the recurrence of such conduct, and create a market structure in which competition does not simply exist in theory, but actually yields real alternatives to Microsoft's products. Moreover, the Court's analysis in both proceedings is guided by the[49] same legal principles. See Section I, supra.

Many of the questions the Court must answer in the course of reviewing the PFJ—e.g., What sort of anti-retaliation provisions are needed to empower OEMs and foster real competition? Must third parties be empowered to promote competition through offering alternatives to the ''Windows bundle'' for a remedy to be effective?—will be addressed, in whole or in part, in the remedial proceeding. To the extent that these questions can only be answered by hearing testimony from some of the same individuals and the same sources in the remedial proceeding, the Court's reliance on that evidence in this proceeding would result in a more comprehensively informed review, streamline the Court's resolution of the issues, and lead to a much more efficient use of judicial resources.

The Tunney Act itself grants the Court wide discretion to undertake any procedures it ''may deem appropriate'' in making its public interest determination. 1 5 U.S.C. * 1 6(0(5). This includes using evidence from another proceeding. See American Tel. & Tel. Co., 522 F. Supp. at 136. As the court noted in AT&T, ''[i]n a Tunney Act proceeding the Court is not limited by the rules of evidence but may take into account facts and other considerations from many different sources.'' Id. at 136 n. 7 (emphasis added). In that case, the court relied on a report by the Antitrust Subcommittee of the House Committee on the Judiciary, which had conducted an investigation of the matter, to fill in gaps left in the court record. Id. at 136. Ira court can

[47] The Court is authorized to appoint a Special Master to conduct inquiries as part of this Tunney Act proceeding. See 15 U.S.C. * 16(f)(2). Making a determination as to why OEMs have failed to use their ''new found freedoms''—and whether they are likely to do so in the future—would seem to be a task well suited to a Special Master.

[48] While Congress made clear, in enacting the Tunney Act, that such hearings were to be the exception, and not the rule, see 1974 U.S.C.C.A.N. 6535, 6539 (quoting S. Rep. 93–298, at 7 (1973)), this may well be one of those cases where an evidentiary inquiry is called for.

[49] This is not to say that the PFJ should be rejected merely because it is not identical to the remedy that the Court might impose in the remedial proceeding. See supra note 2. Conversely, acceptance of the PFJ would not preclude the Court from imposing a different remedy in the proceeding being pressed by the litigating states.

weigh an evidentiary record compiled by the Congress, it surely can weigh an evidentiary record of its own creation in a related proceeding. [50]

The Court is currently overseeing a wide range of discovery, both written and oral, in the remedial proceeding. Testimony will presumably be taken from a host of witnesses that will establish, among other things: how Microsoft deals with OEMs, including how various Microsoft practices limit OEM flexibility in configuring the desktop; [51]how Microsoft has used the commingling of code, and other forms of binding its middleware to the OS, to reinforce the applications barrier to entry; how Microsoft has used discriminatory and anticompetitive licensing agreements to limit the distribution and use of rival products; how Microsoft's illegal conduct has worked to destroy Java; how Microsoft's .Net initiative repeats the illegal monopoly leveraging tactics it successfully used to decimate Netscape; how Microsoft's concealment of APIs decades the performance of non-Microsoft products and services; and how Microsoft has manipulated industry standards and developed proprietary standards and formats that limit the interoperability of competing products.

This evidence, which will be presented during the Court's remedial hearing later this Spring, will form the basis on which the Court crafts its remedy in the ongoing litigation. It is our view that this evidence will affirmatively demonstrate why the LSRP, and not the PFJ, fulfills the mandate of the Court of Appeals and comports with well settled antitrust law. By the same token, it will also demonstrate why the PFJ fails to redress Microsoft's illegal behavior in a manner consistent with tile public interest.

Because many of the questions the Court faces in this proceeding mirror those in the remedial proceeding, the Court should take the record evidence from the remedial proceeding into account in conducting its Tunney Act review of the PFJ. Simply put, by utilizing this evidence, the Court will adduce the information it needs to make its ''public interest'' determination in a manner that encourages greater efficiency and avoids unnecessary delay or duplication.

CONCLUSION

The Court should refuse to find that entry of the PFJ is ''in the public interest.'' The PFJ does not unfetter the market from Microsoft's dominance; it does not terminate the illegal monopoly; it does not deny to Microsoft the fruits of its statutory violations; and it does not end Microsoft's practices that are likely to result in monopolization in the future. More specifically, the PFJ does not even attempt to address, let alone end, Microsoft's illegal binding and bundling practices that have done so much to fortify its OS monopoly and to harm desktop competition. And its limited provisions are so filled with loopholes and exceptions that they are rendered ineffective. At the very least, the Court should refuse to approve the PFJ until after it has concluded an extensive review, including an inquiry into whether the PFJ's provisions—as implemented by Microsoft since last year—are showing signs of effectively restoring competition to the marketplace. The Court could conduct an evidentiary hearing, appoint a Special Master, and/or rely upon the record that will be adduced in the trial on the Litigating States'' Remedial Proposal to meet its evidentiary needs.

In the end, it is the proposal of the litigating states—not the PFJ—that meets the public interest standard. The Court should reject the PFJ, and impose a strong, effective and forward-looking remedy that addresses Microsoft's proven anticompetitive conduct in a manner consistent with the mandate of the Court of Appeals and the nation's antitrust laws.

TABLE OF CONTENTS

[50] Although the circumstances in which the AT&T court considered the subcommittee's report are different from those here, the Tunney Act clearly allows this Court to rely on evidence from a variety of sources. The legislative history of the Act makes clear that Congress did not intend to limit the techniques a court could use to make its public interest determination. See 1974 U.S.C.C.A.N. 6535, 6539 (quoting S. Rep. No. 93–298, at 6 (1973)) (''Section 2(f) sets forth some techniques which the court may utilize in its discretion in making its public interest determination. It is not the intent of the Committee to in any way limit the court to the techniques enumerated.'')* Indeed, Congress anticipated that by giving trial courts wide discretion to collect evidence and conduct procedures in the way they saw fit, courts would be able to adduce the necessary information in the least complicated and most efficient manner possible* See id. (''The Committee recognizes that the court must have broad discretion to accommodate a balancing of interests... It is anticipated that the trial judge will adduce the necessary information through the least complicated and least time-consuming means possible.'').

[51] As we note above, the OEMs appear understandably reluctant to testify in the remedial proceeding* This is all the more reason to use a Special Master (or other procedural device) to ascertain confidentially their views of the PFJ's provisions and the likely effectiveness of those provisions. See supra note 47 and accompanying text.

INTRODUCTION

We have been engaged in this case as professional economists [1] to assess the economic incentives and effects of Microsoft's tying practices. Our specific charge is to determine whether Microsoft is tying middleware applications to its operating system (''OS'') in a manner that protects and reinforces its monopoly power in the market for operating systems. Middleware is software that runs on the OS platform, i.e., that calls on the basic operating system through application programming interfaces (''APIs'') of the OS in order to invoke functions of the OS, but which in turn contains its own published APIs that allow higher-level applications to run on the middleware itself.[2] To execute our mandate, we have reviewed the economic incentives at play in this market, conducted interviews with various software developers, and studied the key documents in this case, including the Proposed Final Judgment and the Competitive Impact Statement of the U.S. Department of Justice, the submissions made on behalf of Microsoft, and the Comments Of AOL Time Warner On The Proposed Final Judgment.

Based on our analysis, we conclude that Microsoft has tied its middleware applications to its Windows operating system in ways that preserve and reinforce its monopoly power in the market for operating systems on PCs, damaging competition and harming consumers. The anti-competitive use of tying strategies to maintain a monopoly in this manner is, in our understanding, a violation of Section 2 of the Sherman Act. We conclude that market forces alone do not discipline Microsoft to limit the integration of middleware code into its OS or the bundling of middleware products with its OS to efficiency-enhancing levels. Rather, Microsoft has the ability to tie in ways that lack pro-competitive justification, and in any event has incentives to use tying strategies to integrate applications into its OS more aggressively than justified by efficiency.

We begin in the next section with a brief description of the tying strategies at Microsoft's disposal. We then demonstrate through economic analysis that Microsoft has substantial incentives to tie its middleware products to its monopoly OS to reinforce and entrench that monopoly. Given these incentives, Microsoft's history, and the evidence in this case, we conclude that Microsoft has engaged, and is engaging, in anti-competitive tying, and is doing so in a way that maintains its OS monopoly, to the detriment of consumers and competition.

MICROSOFT HAS MANY TECHNIQUES AT ITS DISPOSAL FOR TYING MIDDLEWARE TO WINDOWS.

Microsoft has various means of binding its middleware products to the Windows operating system. Before describing these practices and the ways in which Microsoft uses them to reinforce its OS monopoly, we explain the general concept of middleware and why Microsoft's licensing of middleware with its OS in the Windows package constitutes tying.

Middleware is exemplified by products such as Internet browsers, including Microsoft's Internet Explorer (''IE'') and Netscape's Navigator, media players, instant messaging, and middleware applications platforms such as Java. By a strategy of tying middleware to the OS, we mean any constraint that Microsoft's operating system be bought with (or bound to) Microsoft middleware products, or any contractual or financial inducement to this end. Microsoft has argued that various middleware applications, especially IE and Windows Media Player (''WMP''), are essential components of an integrated operating system rather than distinct products, and that tying or bundling these products with the core operating system therefore does not constitute tying. Microsoft's argument is incorrect.

Middleware products, such as browsers and media players, are sold in separate markets. Users can obtain Navigator or RealPlayer without purchasing an operating system in the same transaction. Users can also obtain IE or MSN Messenger without obtaining Windows. Until Microsoft bundled WMP into Windows, users could obtain these two products in separate transactions. Moreover, these products are clearly sold by different suppliers. The Court cannot give serious weight to Microsoft's argument that once WMP, for example, is integrated into Windows, the media player ceases to be a separate product: If this argument were accepted, then the mere fact that Microsoft integrates application code into the operating system would itself be a defense for its actions. In other words, tying, as a means of reinforcing a monopoly position, would constitute its own defense. The law, we suggest, cannot intend this.

Tying involves contractual arrangements whereby Microsoft puts pressure on original equipment manufacturers (''OEMs'') or end-users to acquire Microsoft applications as a condition of acquiring Windows. It includes requirements that OEMs install Microsoft applications, rather than applications developed by Microsoft's rivals, and prohibitions on removing or uninstalling those applications. It also includes financial inducements to adopt Microsoft applications when Windows is purchased and installed. Each of these requirements is enforced through Microsoft's coercive power to harm non-adhering OEMs.

Tying also involves desiring the OS so that Microsoft's applications are integrated into the OS code, leaving rival applications unnecessary or even dysfunctional. This type of tying includes: (a) basic integration of code; (b) efforts by Microsoft to hinder disintegration; and (c) efforts to hamper the interoperability of rival applications. Basic integration involves providing, as part of the OS, services previously offered as stand-alone applications. This could be done in a purely modular fashion without the commingling of application code into the kernel of the operating system. If done in this manner, the products can be easily removed and replaced with competing products in a ''plug and play'' fashion. Technological efforts that hinder disintegration, however, have stronger anti-competitive overtones. These include: commingling code in a manner that hampers, and perhaps even bars, the replacement of the products or default options; designing the OS so that Microsoft's applications are chosen as default applications; making it difficult for OEMs or users to replace the icons or launch sequences; and creating utilities to ''sweep'' the Windows desktop and replace non-Microsoft icons. Note that some of these forms of tying, such as hampering rivals'' performance, entirely lack pro-efficiency rationales, while all of them can be used in inefficient, anti- competitive manners. The remainder of this paper demonstrates that Microsoft has strong incentives to engage in such anti-competitive, inefficient bundling, and that it is doing so in a manner detrimental to competition with the goal of maintaining its extant monopoly in operating systems.

ECONOMIC ANALYSIS SHOWS THAT MICROSOFT HAS SUBSTANTIAL INCENTIVES TO USE TYING TO SUSTAIN ITS OPERATING SYSTEM MONOPOLY, HARMING CONSUMERS AND COMPETITION.

Microsoft has maintained that its tying is efficient and that it should be allowed to determine the level of integration of applications into its operating system. Microsoft argues that it should be free to tie its products together in any fashion it sees fit, as this type of product integration is efficient and promotes innovation with eventual consumer benefits. These arguments generally claim to defend Microsoft's intellectual property, and are expressed in terms of the general advantages of product integration, rather than defining specific benefits to users from Microsoft's practice of tying particular middleware products, such as IE or WMP, into the Windows package.

Microsoft's claim amounts to the belief that market forces alone achieve the optimal degree of product integration and separation without any further regulatory or legal constraints. As a matter of economic theory, this argument fails to take note of Microsoft's position as a dominant producer in a market with substantial barriers to entry. For this general market-forces argument to be valid, Microsoft would need to demonstrate that competitive vigor in the market will discipline Microsoft to engage only in tying that enhances efficiency. But such complete reliance on market forces to achieve efficiency, in turn, requires open entry, while the evidence in this case has shown that there are significant barriers to entry in the OS market. This leaves Microsoft in a position to exploit any strategic and anti-

[2] Middleware and operating systems, i.e., any software which exposes APIs so that higher level applications run on top of the software, are together referred to as platform software.

competitive motives to integrate. As a matter of market reality, as we shall explain, the evidence demonstrates that Microsoft has engaged in tying to an excessive degree, with the sole purpose of achieving anti-competitive aims in general and OS monopoly-preserving aims in particular.

With respect to the practices of tying middleware, Microsoft's interests are not aligned with those of competition and consumers: Microsoft can benefit without improving its product by using tying strategies to reinforce and strengthen its existing OS dominance.

A. As a general matter, absent legal constraints, Microsoft possesses substantial economic incentives to integrate its products in a manner that reinforces its OS monopoly.

Below, we set forth four theories that explain why Microsoft's practice of integrating its applications with the Windows OS helps to maintain its OS monopoly, in a way that is detrimental to consumers and competition. First, tying helps to sustain the applications barrier to entry, and thus serves to enhance Microsoft's OS dominance. Second, tying deters direct challenges to Windows'' position as the dominant platform and thereby maintains or enhances Microsoft's OS dominance. Third, tying involves dynamic leveraging that permits Microsoft to achieve a monopoly in complementary applications as insurance against any possible erosion of the OS monopoly. Put another way, a monopolist, such as Microsoft which produces a pair of perfectly complementary products, aims to protect its full monopoly power by ensuring its future monopoly in at least one of the complementary products. Fourth, tying permits Microsoft to mitigate the competitive constraints on its operating system monopoly provided by previous releases of the OS. These four theories are not mutually exclusive; each of them contributes to a full understanding of Microsoft's anti-competitive conduct. And, to make matters worse, each of these anti-competitive results is mutually reinforcing because of the network effects operating between the applications sector and the operating system market.

(]) Microsoft ties its applications to its operating system us a way of sustaining the applications harrier to entry. Microsoft has a general incentive to engage in anti-competitive tying to protect its dominance in operating systems against the possibility of competitive developments in applications markets. The first means by which it accomplishes this is through enhancing the applications barrier to entry[3] The dominance of the Windows standard in a wide range of applications, or in a few particularly important applications, makes entry into the operating system market more difficult because an entrant has to offer both a new operating system and a full set of applications, or somehow rely on the chance that applications ,,,,,ill quickly develop once the new operating system becomes available. In this way, an entrant faces a ''chicken-and-egg'' problem because of the indirect network effects in the operating system: the entrant could not succeed without a set of applications available to purchasers of its operating system; yet, few software developers would invest in the development of new applications based on an operating system without a large market share. This is referred to as the applications barrier to entry. The dominance of Windows as a standard for applications leads to the applications barrier to entry and growth in the operating system market.

Microsoft is able to sustain this barrier by exploiting a collective action problem among buyers. When Microsoft ties by supplying the OS with an application such as IE or WMP, users must incur a series of costs to replace the application. These costs include purchasing or downloading the substitute browser or media player, installing the application, and incurring any uncertainty associated with the possible compromise in the functional integrity of the system. In an application market, buyers would collectively be better off if each incurred the costs of purchasing from competing suppliers, because doing so would ensure greater competition in the future application market. However, Microsoft's tying practices preclude this result.

Buyers'' purchase decisions with respect to either the operating system or applications collectively affect the future market structure because Microsoft will achieve dominance if most buyers choose Microsoft products. Once Microsoft achieves dominance, network externalities sustain this dominance so that the market structure becomes a monopoly as a result of buyers'' previous purchase decisions. The impact of each buyer's purchase decision on the future market structure, however, is negligible. Moreover, buyers do not take into account the impact of their purchase decisions on other buyers. As a result, even a small disadvantage to purchasing a competing product in the operating system or applications markets is enough to make the individual buyer prefer Microsoft's product.

The result is that buyers'' decisions make them collectively worse off. The future dominance of Microsoft and the higher prices faced by buyers are a result of their collective decision to purchase Microsoft's applications. Microsoft exploits this collective action problem and pursues dominance in the applications markets through its tying practices. [4]

(2) Microsoft ties applications to its operating system as a way of deterring direct challenges to Windows position as the dominant platform for software developers.

Microsoft's incentives for anti-competitive tying are particularly strong in the case of applications that might allow for the development of direct substitutes to the monopolized operating system. A clear incentive for Microsoft to tie its IE browser with Windows has been the threat that Netscape, either individually or combined with Java software, could eliminate Microsoft's network advantages in the operating system, by providing middleware (which serves potentially as universal translation support between any application and any operating system) that would provide a competing platform for software developers. This was a particular threat to Microsoft's dominance in operating systems because it potentially represented a platform/programming environment in which software applications Could be developed without regard to the underlying operating system. Middleware provides a layer of software between applications and the operating system and can accommodate a new operating system with a change in a single set of code. Without middleware, the success of a new operating system would depend on the development of new code by every application developer. This incentive also explains Microsoft's initiatives to develop a Microsoft version of Java in an attempt to undermine the universal-translator aspect of Java.

Some economists have argued that the backwards compatibility of Microsoft's version of Java, i.e., the ability of all general Java applications to run on Microsoft's version, rules out the hypothesis that Microsoft designed its version of Java for the purpose of stifling the potential threat to its dominance in operating systems. [5] This argument is wrong in its static assumption about compatibility. Given the history of the industry, the fact that Microsoft's initial version of Java was universally compatible with Java applications does not lead one to believe that if Microsoft dominated not just browsers but also Java in the future, it would continue to assure both compatibility of applications and free distribution of the pair of middleware products. Were Microsoft to establish dominance in the potential browser-Java bypass of its operating system dominance, why would it allow the bypass to be freely and effectively available? The concerns expressed by Microsoft's executives about the risks of ''commoditization'' of the operating system are well known. [6] Middleware generally has the potential to act to varying degrees as a universal translator

[3] See U.S. v. Microsoft, 84 F. Supp. 2d 9 (D.DC 1999) (''U.S. Findings of Fact''), 36ndash;44.

[4] In the economics literature, modem theories of anti-competitive exclusion, including tying as exclusionary, are linked by the theme that exclusionary contracts have an impact on individuals outside an individual buyer-seller contract. See Dennis Carlton and Michael Waldman (2001) ''The Strategic Use of Tying to Preserve and Create Market Power in Evolving Industries,'' unpublished working paper; Eric Rasmussen et al., (1991) ''Naked Exclusion,'' American Economic Review 81 (5): 1137–1145; Michael Whinston (1990) ''Tying, Foreclosure, and Exclusion,'' American Economic Review 80(4): 837–859; and Philippe Aghion and Patrick Boulton (1987) ''Contracts as a Barrier to Entry,'' American Economic Review 77(3): 388–401.

[5] ''Microsoft's Java virtual machine ... allowed for all programs written for the original (''pure'') Java to be run on it. Thus it preserved backward compatibility with the original Java that ran on all operating systems. Because of that, Microsoft's actions were not anti-competitive.'' Nicholas Economides, ''The Microsoft Antitrust Case,'' Journal of Industry, Competition and Trade.'' From Theory to Policy, March 2001, p. 20 of working paper version.

[6] In a 1995 memo to his ''Executive Staff and direct reports,'' Microsoft CEO Bill Gates stated that Netscape was ''pursuing a multi-platform strategy where they move the key API into the client to commoditize the underlying operating system.'' (5/26'95 ''The Internet Tidal Wave,'' PI. Ex.20, p. MS98 0112876.3.)

between an operating system and specific applications, because (as the name suggests) middleware intermediates between the operating system and applications: it invokes calls through an operating system's APIs and in turn issues its own APIs to applications. To accommodate a new operating system, instead of each application requiring re-coding for compatibility, only the ''bottom half'' of the middleware application must be reprogrammed. If twenty applications run on top of a particular middleware program, for example, compatibility with a new operating system could be achieved by reprogramming the middleware program instead of reprogramming each application. Middleware thus mitigates the indirect network effects of the operating system—and could potentially diminish the dominance of any operating system that these network effects support.

(3) Microsoft has incentives to tie to achieve a monopoly in complementary applications as insurance against possible future erosion Of its OS dominance.

A common response to the argument that monopolies can profit through leveraging into a second market is that monopoly profits can be collected only once: a tie into a complementary market with an increase in the price of the tied good by a dollar will reduce the demand price of the first good by a dollar. According to this response, there is no incentive to leverage. In the simplest, static world in which there are no industry dynamics, no uncertainty, and no variation in consumer demand, this ''one-monopoly theory'' is correct. This theory, however, fails when there is uncertainty about the preservation of monopoly. If the initial monopoly is at some risk, then an incentive for leverage arises as insurance against the loss of monopoly profits. In the event that the first monopoly fails and the second succeeds, the monopolist will have preserved a monopoly in at least one of the markets. [7] Consistent with the common response, having a monopoly in only one of the pair of markets is sufficient to collect the full monopoly profits. If either market's monopoly is uncertain, the monopolist has an incentive to create monopolies in both markets, and thus increase the likelihood of being able to obtain monopoly profits in at least one market.

If Microsoft fears for the longevity of its operating system monopoly, or believes that operating systems are in a mature market with limited prospects for growth, it will have strong incentives to make minor sacrifices to Windows functionality in order to obtain dominance in high-growth markets. This is particularly true if the sacrifices (such as damaging relationships with OEMs and consumers by forcing them to accept an inferior browser or media player) have negligible effects on demand for Windows. The greater the threat to its OS dominance in the future, the more incentive Microsoft has to establish a dominant supplier position in an application market, such as the browser or media player market. To take a hypothetical future contingency, if the development of middleware means that the future OS market turns out to be more competitive than the current market, then Microsoft's actions to achieve dominance in the application market will leave it with dominance in one product of a pair of complementary products, rather than dominance in neither. Microsoft's incentive to establish dominance in key applications is thus strengthened by the fact that Microsoft's monopoly in the operating system market is not guaranteed to always be airtight. [8]

The gains from leveraging are especially strong where network effects are present in applications markets or these markets otherwise promise large potential growth in revenues for any firm that establishes early dominance. [9] Network effects have three implications that make Microsoft's tying practices particularly effective in reinforcing its OS dominance. First, in the early stages of the market's development, purchasers will be on alert for signals of which standard will eventually become dominant, in order to reduce their exposure to later costs of converting to the dominant standard. Tying a new application with the dominant Windows operating system will send strong signals to purchasers that will help to ''tip'' the market toward Microsoft's favored products, particularly given Microsoft's history. Second, a feedback loop will cause both the tying and Microsoft's dominance to steadily accelerate. As Microsoft begins to gain a substantial share in an application market, it will be able to engage in more overt forms of tying, as customers grow to accept even inconvenient results from Microsoft's ant/- competitive behaviors (such as poor interoperability with rivals) because of the reinforcing network effects. This, in turn, will accelerate the tipping toward Microsoft dominance. Third, once Microsoft's dominance is established, proprietary standards and continued tying will lock in this dominance, not just on current production but on ''future applications in the same functional space. While all of these effects promote Microsoft's dominance in applications, it is the feedback effect of this control over applications to reinforce the OS dominance that is relevant for the matter at hand. Network effects or network economies refer to the positive value that any single user derives from the number of other users adopting the same operating system. See U.S. Findings of Fact ¶¶ 39–42 and ¶¶ 65–66 for application to Microsoft. For a general description of networks and positive feedback, see Carl Shapiro and Hal Varian (1999) Information Rules Boston: Harvard Business School Press, pp. 173–225.

The standard ''one-monopoly'' theory, however, tells us that when there are two perfectly complementary products A and B, a monopoly over either, or a monopoly on both, allows the identical profits and results in the identical effects. (This theory holds in a static framework that sets aside the other three theories that we discuss.) With respect to an OS with a set of applications that are virtually universally adopted by all PC users, a monopoly over the OS alone is identical in its effect and in its incentives to a monopoly over the set of applications alone or a monopoly over both the OS and the set of applications. That is, there is only one monopoly: the economic role of tying under the monopoly-insurance theory is not creating a new monopoly, but rather preserving the monopoly (the monopoly being at least one monopoly position in the OS-applications pair). The monopoly-insurance theory thus explains the anti-competitive use of tying to preserve a monopoly in violation of Section 2 of the Sherman Act.

The monopoly-insurance theory of tying has the effect of reinforcing Microsoft's monopoly position even if the preservation-of-monopoly requirement of Section 2 of the Sherman Act is construed narrowly to apply only to Microsoft's existing monopoly on operating systems for PCs. The reason (discussed below) is that all of Microsoft's incentives for tying applications to Windows are mutually reinforcing. Even if Microsoft's incentive for tying were primarily to insure a monopoly in the event that the Windows OS monopoly failed in the future (the insurance theory), one effect of the tying is to reduce the chance that the Windows OS monopoly actually does fail, because of the strengthening of the applications barrier to entry. The impact is preservation, though imperfect, of Microsoft's monopoly in the operating system market.

Microsoft's operating system also has durable-goods qualities that create further anti-competitive incentives for tying.

Part of Microsoft's argument that it should be free to ''innovate'' rests on the notion that an important source of ''competition'' in selling new versions of Windows is the existing stock of old versions of Windows.[10]

[7] This idea is developed formally in J.P. Choi and C. Stefandis (2001), ''Tying, Investment and the Dynamic Leverage Theory,'' The RAND Journal of Economics 32(1): 52–74.

[8] See U.S. Findings of Fact ¶¶ 33–35, 60–64.

[9] It may appear that any preservation-of-monopoly theory must Be applied narrowly to Microsoft's monopoly power in operating systems. If this were the case, then the insurance theory of tying just described would not apply, since this theory explains why tying to establish dominance in a new market can be profitable because of the profits that can be captured in that new market, instead of why it is profitable to protect the monopoly in the operating systems market.

[10] The District Court's Findings of Fact maintain that the Windows leasing agreement prohibits the user from transferring the OS to another machine so that ''there is no legal secondary market in Microsoft operating systems'' (¶ 57). The Findings of Fact then note (* 58) that there is a thriving illegal market. To limit this, Microsoft advises OEMs that Microsoft will charge a higher price for Windows to OEMs that do not limit the number of PCs they sell without the OS pre-installed. One might argue that the durable goods monopoly problem is eliminated by Microsoft's refusal to allow OEMs to install (without penalty) old versions of Windows. This is incorrect for two reasons: (i) increases in the price of the new version of Windows will reduce overall demand for new PCs, as users invoke the option to keep existing PCs with the old version, and (ii) there is a retail market for new versions of Windows software for installation on existing PCs. Both (i) and (ii) provide channels through which the existing stock of Windows software provides some competition for a new version of Windows (i.e., it increases the elasticity of demand for the new version). If the price of a new version is increased, the demand for the new version is reduced because fewer

Continued

While it is true that the durable-goods aspect of the OS market (i.e., the ability of consumers to retain their existing versions of the OS instead of buying a new version) disciplines Microsoft, it only does so in the sense that Microsoft earns fewer profits than it would in a hypothetical world in which it were to lease its OS. The claim that the OS market is, in fact, more competitive than this hypothetical market does not weaken the claim that Microsoft's position in the OS market is dominant and that its activities are illegal.

Moreover, this ''durable good monopolist'' feature of the market contains an incentive for Microsoft to engage in illegal bundling. The strategy of leasing as a means of escaping the durable monopolist's dilemma is well established and has been thoroughly analyzed by economists.[11] Rather than selling the product into the market in each period, if the monopolist seller of a durable good can lease the product on a period-by-period basis, it can retain complete control over the supply of the good into the market in each period. This allows the monopolist to set monopoly prices in each period instead of being constrained by the consumers'' option to continue using the already-purchased stock (or version) of the product. The monopolist who leases for a period can lease both previous and current production together to achieve monopoly profits; doing so eliminates the competitive discipline that would otherwise occur as past sales re-enter current and future markets. If Microsoft could move to a business plan of leasing rather than selling software, it would completely eliminate competition from old versions of the software: as Microsoft leases new versions of software, it could retire leases on old versions. This would serve to protect the monopoly power that Microsoft enjoys from its OS. Tying can allow Microsoft to implement this leasing strategy so as to avoid the durable good discipline. Specifically, tying the use of the OS to some complementary transaction that can be leased, or priced on a per-use basis—rather than sold—provides Microsoft with the opportunity to collect a revenue stream that is immune to the competitive discipline imposed by previous versions of the OS.

The escape from the durable monopolist's dilemma via leasing thus creates another incentive for tying. Tying allows Microsoft to move closer to the leasing outcome by facilitating the collection of transaction fees based on current usage. [12] The set of middleware products that potentially puts Microsoft in the position of collecting a fee on Internet transactions serves this role. These products are IE, WMP, Microsoft's Digital Rights Management (''DRAM'') software, as well as the Net My Services initiative. The Digital Rights Management software, with WMP, will initially support a market for music and video products. The combination of these middleware applications, enabling the Microsoft e-commerce network, will then support the transition to Internet sales transactions of a broad variety of products. As Microsoft begins to shift its revenue structure from Windows sales to Internet transaction fees, it will seek to control the key Internet access choke points such as browsers, media players, and digital rights management. Tying facilitates this control. Moreover, Microsoft can directly charge usage fees for its media player software that it cannot charge for the OS. While the durable-goods monopoly theory of Microsoft's tying incentives can be seen most directly as a theory of the incentive to dominate applications that facilitate a leasing business plan, one important impact of dominating these applications is to preserve Microsoft's dominance in the market for operating systems. The impact, in other words, is a preservation of Microsoft's OS monopoly.

As an empirical matter, versions of Windows are converging in their substitutability. This convergence of versions strengthens tile durable-good monopolist incentive to tie in two ways. First, it increases Microsoft's incentive to escape the durable-good monopolist discipline on prices, since the easier it is to substitute the current version of Windows with existing versions, the stronger this discipline is. Second, there are, in principle, two ways of leasing to escape tile durable-good monopoly discipline. Microsoft could rent the OS or tie it to an application and collect the corresponding stream of revenues each time the application is used. The converging substitutability of Windows'' versions renders the former more difficult, increasing the incentive to escape the durable-good discipline by tying applications. Thus, the increasing substitutability among sequential versions of Windows, even if later versions are superior, reinforces Microsoft's incentives to extend its monopoly to dimensions, such as Internet sales, in which it can charge a rig [13] or rent the application.

(5) Microsoft's anti-competitive tying incentives are mutually reinforcing and are manifest in strategies that lack any competitive justification.

The incentives for anti-competitive tying that we discuss are mutually reinforcing because of the network effects operating between the applications sector and the operating system market. Achieving dominance in applications (through tying) strengthens the dominance of the OS, because buyers in the OS market are more assured of available applications; the greater dominance in the OS market in turn feeds back into greater dominance in applications, since the tying strategies take the form of imposing an artificial advantage relative to applications of the dominant OS supplier. The greater Microsoft's share across all applications markets, the greater the applications barrier to entry. Greater shares in applications markets create a feedback effect of even greater dominance in the OS market. The source of this feedback effect is an ''indirect network effect'': the greater the penetration of any operating system, the more applications will be written to it, and consequently, the more valuable the operating system will be ''to any user. Since the OS monopoly is not perfect, Microsoft will therefore take advantage of anti-competitive opportunities to generally strengthen the applications barrier to entry. As a general principle, therefore, any extension of Microsoft's monopoly to a set of important applications reinforces its monopoly in operating systems.

Microsoft has a clear incentive to engage in tying in the form of hampering rival applications and coding its own applications to be defaults to the detriment of consumer choice. This type of tying has a negligible negative effect on the demand for Windows, and by tipping high-growth markets, could provide Microsoft with long-term profits. Given that the Windows source code is both complex and proprietary, Microsoft can engage in this type of tying surreptitiously. For example, Microsoft can alter the algorithms that set ''favorites'' in folders and task bars so that Microsoft-preferred applications and web sites are used more frequently. In addition, Microsoft can cause subtle performance problems for rival applications in Windows environments. This type of tying, however, is consistent only with anti-competitive behavior—no efficiency benefits result from ham-ting rivals or setting Microsoft options as defaults.

B. Microsoft's anti-competitive incentives are particularly powerful in the markets for browsers and streaming media, as well as the adjacent markets for content-encoding, digital rights management, e-commerce: and convergence.

In markets with network effects and perceived similarity in product functions, directional changes in market shares can ''tip'' the market toward a dominant outcome because consumer expectations as to which format will dominate are self-realizing. In other words, the expectation on the part of consumers that a particular format will dominate leads each consumer to choose that format because of the rational concern that other formats will not be supported—accelerating the dominance and confirming the expectations of consumers. Consider the browser and the media player as examples. In the browser market, Microsoft has achieved the dominance that it sought, and its monopoly power in the OS continues. These are related: browser dominance reinforces OS monopoly power.[14] The connection is that browser dominance

consumers will purchase new PCs as the price increase for Windows raises the price of the overall package of the PC and the (mandated by Microsoft) new version of Windows, and because some consumers who would have purchased Windows to install on their old PCs will now refuse to do so.

[11] See Jeremy Bulow ''Durable-Goods Monopolists,'' Journal of Political Economy 90(2): 314–332 or Jean Tirole (1988) The Theory of Industrial Organization, Cambridge: MIT Press, p. 81.

[12] See Jeremy Bulow (1982:330) who suggests that a durable-goods monopolist may be able to achieve the leasing result through extending its monopoly to service contracts; these are analogous in principle to the application restrictions in the matter at hand.

[13] The term ''rig'' or ''vigorish,'' a term used by Microsoft, refers to a gambling house's ''cut'' on all bets placed in the establishment. See Allen Myerson, Rating The Bigshots: Gates vs. Rockefeller, The New York Times, May 24, 1998, at 4 (''The Gates crowd speaks ... of collecting a ''vigorish'' or ''vig''.... Now Microsoft wants to collect a rig on Internet access too.'').

[14] See U.S. Findings of Fact ¶¶ 68–72.

increases the applications barrier to entry and simultaneously removes the direct middleware threat posed by Netscape. Both of these effects in turn serve to increase the demand for the Windows OS through network effects as buyers anticipate continued dominance of Microsoft formats in both the operating system and applications markets; the two effects thus reinforce the dominance of Windows OS.

Now that Microsoft has effectively achieved dominance in browsers, and through this reinforced its dominance in operating systems, the stage is set for applying the same tactics to markets for other applications. The media player market represents an important current market in which Microsoft's anti-competitive strategies are at play. In the media player market, Microsoft's first incentive for tying is to protect its dominance in the market for operating systems by deterring the development of new middleware platforms. Streaming media players will be essential for Internet browsing in the future because of their ability to enhance Internet content rendering under bandwidth constraints. If Microsoft achieves dominance in the media player market (and as noted above, the ''tipping point'' argument suggests that a trend to dominance can quickly translate into a highly dominant market share), any entrant into the operating system market would also have to provide a media player compatible with the WMP format. For this reason, the applications barrier to entry incentive is especially powerful for streaming media players. Rival operating systems will be unable to provide a functional (i.e., Windows Media Audio-compatible) media player since the Windows Media Audio format is proprietary and Microsoft refuses to universally license it. [15] Because compatibility with streaming media is vital to future operating systems, Microsoft's dominance over operating systems will be ensured. The observation that Microsoft licenses the software for playing downloaded media, but not the software for streaming media, suggests that Microsoft is strategically aware of the profit-enhancing power of retaining exclusive property rights on media streaming software.

To elaborate: with respect to other applications, an entrant into the OS market could—at least in theory- provide an OS plus a set of applications. However, even this potential entry strategy is not available in the case of the media player application, because the use of a media player by a user depends not just on products that could be provided by the new entrant, but on the proprietary formats chosen by Internet sites using media player software. In this sense, the provider selection of Microsoft's proprietary format creates a content-encoding barrier to entry for streaming media players. Again, this reinforces Microsoft's monopoly power over the OS market.[16]

An additional anti-competitive incentive for dominating an application market is to secure a monopoly position in at least one product in the application/OS pair in order to achieve monopoly profits even in the event that the OS dominance is not sustained. This is discussed above in Section III.A.3. The possibility that the OS dominance is not sustained means that the joint monopolist could not necessarily collect the maximum profits through the OS price alone. Dominance of the application market would secure, or at least increase the likelihood of, monopoly profits.

This incentive is particularly relevant to streaming media markets. For example, the OS dominance could be at risk as consumers move to handheld devices for computing and accessing the Internet that do not require Windows OS. Presumably, however, these customers will still wish to play music and see videos on such devices. To the extent that WMP and its accompanying format achieve dominance for streaming media, Microsoft will maintain monopoly power in the pair of products consisting of the OS plus the media player. (Recall that the essential measure of monopoly in the markets for a pair of complementary products is dominance in at least one of the products.) Thus, streaming media players and formats hold the potential for Microsoft to maintain its original monopoly.

Additionally, significant gain accrues ''to Microsoft if its DRM technology dominates the related market for audio and video files. Using encryption technology, DRM technology permits only users with licenses to play the packaged file. The license has a key to unlock the encryption. Should a user without a license attempt to play the file, the application initializes with an application that permits the user to acquire the license. Applications with DRM technology and Windows Media Device Manager enable the use of WMP on devices other than conventional desktop computers. Since market participants will tend to limit their investments to the likely dominant standard, Microsoft can easily become the sole provider of DRM solutions. Moreover, this will be a critical market for Microsoft, since users will require licenses for downloading, and content providers require certificates for encryption. The alternatives of mutual interoperability or even open standards are equally plausible conceptually, but not in Microsoft's interests. Microsoft thus has incentives to use tying to ensure that its DRM solution remains proprietary and becomes dominant. Microsoft can ensure this outcome by making its media player format the format of choice for both users and content providers, and tying WMP to Windows ensures this choice. Once again, this creates a content- encoding barrier to entry that permits Microsoft to maintain its monopoly power in the pair: OS plus WMP as an application. Because of the durable-goods nature of Microsoft's OS monopoly, as described in Section III.A.4 above, Microsoft has additional incentives to tie streaming media technologies to the OS. Indeed, the greatest value for locking in the dominant streaming media and DRM formats may be the rig that Microsoft hopes to collect from Internet transactions. [17]

Dominating the media player format so as to collect a vig on transactions would position Microsoft to collect transactions revenue that may well exceed revenues available from Windows software licenses alone—even if Microsoft's dominance of the OS market is secure. As we discussed in Section III.A.4, monopolists of durable goods recognize that past sales constitute future competition (here, older versions of Windows compete with current and future versions of Windows). The monopolists face a competitive constraint against increasing prices even in the absence of any significant rivals. Such monopolies naturally seek ways to circumvent the constraint. In the case of Windows, the constraint is potentially circumvented by the collection of the rig on transactions.

What is the link between dominance in operating systems, streaming media, digital rights management, e-commerce, and convergence? Microsoft ,,,,'ill attempt to use its dominance in any of these markets to increase the use of Microsoft-favored products in all of these markets. In contrast to the potential situation where different players are strong in each market, Microsoft will leverage its dominance in any market to strengthen its position in all of them. Microsoft's incentive e to do this lies in the many revenue streams that it currently forgoes. For example, Microsoft does not currently charge web sites for the use of Windows media formats. If Microsoft establishes dominance in the media player market, as it translates to dominance in e-commerce hosting, Microsoft will no longer have any constraint on fully exploiting this revenue stream. Once again, this links back to the original dominance in Microsoft's OS. All of these applications are mutually reinforcing and serve to preserve the monopoly power that accrues from packaging Microsoft's OS with complementary applications.

C. The theorized benefits of product integration that may exist in some cases do not apply to the markets at issue in this case.

As a theoretical matter, of course, in many transactions, purchasers would prefer to buy bundles of products and services. Purchasers of glass prefer to have borates included, drivers prefer to have steering wheels with their cars, and purchasers of shoes typically prefer to have laces included. The relevant question here is whether computer applications are similar to those examples—i.e., whether browsers and other middleware such as streaming media players are ''mere inputs'' into the overall ''Windows experience.''

The economics of software markets cast doubt on Microsoft's efficiency'' arguments

[15] Note that licensing at a monopoly royalty would have a similar effect of foreclosing competition.

[16] Microsoft's action with respect to inducing media content providers to code exclusively with Microsoft's proprietary formatting (in Windows Media Audio) is analogous to Microsoft's attempt in the browser market to induce Interne/content and services providers to optimize their content for its Internet Explorer software instead of the competing browser of Netscape. See U.S. Findings of Fact ¶¶ 311,328, and 337.

[17] Microsoft has already established general strategies for obtaining control over e-commerce standards.

These connections are the Microsoft Passport, .Net, and .Net My Services initiatives.

for integration of its own browser and media player with the OS.

As discussed above, many forms of tying have no efficiency justification. Contractual provisions limiting the acceptance of rival technologies, or efforts to redesign code to harm rivals'' performance, create economic loss. As further discussed above, Microsoft has these forms of tying at its disposal, incentives to use them, and a historical record of using them.

Microsoft's claims regarding the efficiencies of its contractual tying—i.e., that it reduces consumer time costs and confusion to have a set of default options provided with a personal computer ''out of the box''—confuse the benefit to consumers of having a browser and its media player bundled along with the OS, with the benefit of having Microsoft's choice of applications bundled with the OS. The efficiencies that come with providing an integrated package of an OS and various applications are not specific to Microsoft's applications. In a market where OEMs were free to offer whichever packages of software consumers desired (e.g., Microsoft Windows with RealPlayer and IE, or Microsoft Windows with WMP and Netscape), the market would provide those varieties of packages preferred by consumers. The market would respond fully to the efficiencies associated with the purchase of a full package of hardware, OS, and software applications, and in addition, the market would be free to offer the variety that consumers demanded.

Our analysis supports the hypothesis that Microsoft's tying of IE and WMP and its efforts to gain DRM dominance are not driven by efficiency concerns. Although selection of some defaults is necessary on each PC, there appear to be no engineering efficiencies to the integration of the choice of default into the OS. To the contrary, choice and market competition (and consequently, efficiency) suffer when knowledgeable OEMs (who act as informed agents of consumers) face artificial barriers to playing that role, such as when Microsoft commingles code or makes Microsoft applications difficult to permanently remove as default settings. By designing system software to hamper the installation or operation of rival software suppliers, Microsoft reinforces the applications barrier to entry; the impact is a strategic reduction in competition and a reinforcement of Microsoft's OS monopoly.

Additionally, the usual arguments made to justify integration in other markets are largely inapplicable to software application markets. It is often argued that integration occurs (i) to reduce transaction, distribution or production costs, or (ii) to increase the value of the final product.

The argument that transaction and assembly costs justify integration does not apply to major software applications. For example, consumers want to purchase some integrated packages of complementary products such as functioning automobiles because separate purchases of steering wheels, engines, dashboards, seats, etc. would impose enormous transaction and assembly costs. By contrast, software markets allow assembly at low cost even without integration, provided that monopolists are legally prohibited from impairing interoperability. With OEMs acting as purchasing and assembly agents for end-users, it is no more efficient for Microsoft to create OS-and-application bundles than for multiple OEMs (or third-parties who can then license such bundles to OEMs) to create those OS-and-application bundles desired by end-users.

Forced integration of particular software brands does not increase value. Instead, it causes an efficiency cost to the extent that end-users value the product variety entailed in the variety of inputs. The value of variety is lost with integration. Steering wheels in cars are typically undifferentiated commodities that comprise a trivial portion of the value of the final product. Thus, even though a consumer could replace the steering wheel with limited effort, there is little reason to do so because a different steering wheel is unlikely to improve the performance of the overall product. By contrast, technological development in software applications markets means that different applications can differ substantially in what they deliver to consumers. Loss of product variety as a result of integration can be costly.

(2) Contrary to Microsoft's claims, issues of pricing and innovation provide further evidence that Microsoft's tying harms the marketplace and consumers.

Microsoft has argued that the extension of monopoly power across a set of complementary products may produce consumer benefits if the monopolist charges lower prices than would be charged if independent monopolists were to separately produce two or more complementary products. In the latter case, each independent monopolist would raise prices higher than the level that would maximize the combined profits of all the monopolists. Thus, according to this theory, consumers benefit from Microsoft's monopoly leveraging through lower prices.

This theory imagines a static world in which innovation and entry are non-existent, and firms simply set prices to maximize profits, given unchanging demand and unchanging technology. The practical implications of the theory for the real world of rapidly changing technology and potential dynamic competition (as opposed to monopoly positions that are airtight) are minimal. In an economic theory that incorporates industry dynamics, strategies taken by a dominant firm to eliminate a firm in a complementary market remove a potential rival or entrant in the primary market. In the reality of software markets, this anti-competitive effect clearly overwhelms any theoretical, static price effect: innovation and dynamic competition thus are, and should be, the focus of the Microsoft case. The driver of consumer benefit in these markets is innovation: over the past ten years, while prices of applications have fluctuated only moderately, the performance of applications has gown dramatically. New applications, such as browsers and media players, have become important sources of consumer benefit, while improvements in existing applications such as financial software have yielded strong consumer benefits. In any analysis on the impact of tying, the most important question is the impact on innovation, not price. Tying harms innovation by preserving Microsoft's monopoly position, protecting it against dynamic competition to the detriment of consumers.

Microsoft argues that a single monopolist over two products has greater incentives to innovate than two separate monopolists. If two complementary products are monopolized separately, the argument goes, each monopolist ignores the positive benefits that accrue to the other firm from an increase in its own pace of innovation. In the matter at hand, this theoretical efficiency would argue that if Microsoft had a monopoly in operating systems, while Novell had a monopoly in browsers, Novell would not innovate as much as possible because it would not take into consideration the positive effects of browser innovation on operating system demand. This reasoning also suggests that innovation in the industry would be enhanced if Microsoft's OS dominance were to be extended further into still more applications markets. The key point missed in this theory is that any extension of Microsoft's OS monopoly power would dampen innovation into substitutes for Microsoft's OS. Enhancing the applications barriers only reduces the incentive for any firm to engage in OS or applications innovation. If an application could be open to competition—i.e., if it could be characterized by some rivalry or competition, as an alternative to Microsoft's integration—then unrestrained competition would strengthen rather than weaken innovation. While Microsoft's dominance in the browser market today may be a fait accompli, untying the OS and media player will lead to such greater competition in media player innovation.

Significantly for this case, untying would also increase competition in the operating system market. As discussed earlier in Section III.A, tying protects Microsoft's operating system dominance by maintaining the applications barrier to entry and weakening or deterring direct platform challenges. If there are separate monopolists in adjacent markets, each will have the incentive to enter or sponsor entry into the other's market, leading to competitive pressure in both markets.[18]

GVIDENCE IN THIS CASE, THE CONCLUSION IS THAT MICROSOFT HAS ENGAGED, AND IS ENGAGING, IN ANTI-COMPETITIVE TYING IN ORDER TO PROTECT AND STRENGTHEN ITS OPERATING SYSTEM MONOPOLY.

A. Microsoft's options, incentives, and history create a strong presumption that Microsoft's tying harms OS competition and consumers.

The District Court's Findings of Fact confirm that it is Microsoft's ''corporate practice to pressure other firms to halt software development that either shows the potential to weaken Microsoft's applications

[18] Of course, that monopolist competition will only occur if the first monopolist is not permitted to use anti- competitive tactics to foreclose the market for unintegrated rivals.

barrier to entry or competes directly with Microsoft's most cherished software products.'' [19] As a historical matter, Microsoft has clearly engaged in anti-competitive, inefficient tying with other applications. [20]For example, Microsoft has forbidden OEMs from changing system defaults so as to make non-Microsoft products the ''default application'' in ''out of the box'' packages.[21] While Microsoft allows the ''installation icons'' of competing applications to be installed on desktops ''out of the box,'' installation icons disappear if they are not invoked. In an even more subtle form of contractual tying, Microsoft requires applications that run with Windows to obtain a certification from Microsoft. This permits Microsoft to monitor and perhaps discipline its applications rivals. [22] While some of these practices differ in form from strict tying (a certification requirement for software is not the same as a contractual requirement that OEMs use Microsoft products), the effect is similar in that Microsoft is signaling to all other market participants that applications may only run with Windows by Microsoft's permission.

Microsoft's profit incentives dictate that Microsoft would tie its products together much more aggressively than efficiency alone would suggest. With regard to the question of the nature of competition in the media player market, one of the current objects of Microsoft's tying, and, in particular its tying of WMP, is clear: as the District Court determined, the ''multimedia stream [represents] strategic grounds that Microsoft [needs] to capture.''[23] That—and not efficiency—is the driving force behind Microsoft's conduct.

B. The evidence indicates that Microsoft is anti-competitively tying the browser and the media player with its operating system.

In the absence of tying, Microsoft would provide an operating system and applications such as the browser and media player that were developed and offered in a modular, plug-replaceable fashion. The applications codes for the browser and the media player would not be commingled with the OS code, but would instead communicate with the OS through a set of well defined APIs. Publishing the APIs and interface protocols in this non-tying world would enhance the value of Microsoft's operating system by ncouraging competition in the innovation of the complementary good—the browser and the media player. Greater competition and functional value in the market for a complementary good always benefit a firm by increasing the demand for its product. In the absence of anti-competitive incentives to reinforce barriers to entry, this strategy would maximize the profits that Microsoft obtains from its operating system. The fact that Microsoft does not engage in such a business strategy demonstrates, in the absence of evidence that tying is efficient, that Microsoft is motivated by anti-competitive'' incentives.

Microsoft openly engages in contractual tying and basic technological integration. By developing and marketing Windows XP as an integrated package of operating system and popular applications, Microsoft directly ignored the findings of fact and law by U.S. courts.[24] Microsoft's history makes it likely that Microsoft is also engaging in various forms of OEM coercion to raise rivals'' distribution costs and encourage the distribution of its own middleware products. Consistent with our analysis, this tying generally serves the purpose of Microsoft profitability and reinforcement of its OS dominance, rather than consumer benefit. Microsoft directly engages in anti-competitive tying when it prevents OEMs and end-users from removing or uninstalling IE and WMP. Microsoft does this through code commingling between the media player and the operating system that renders substitution for WMP difficult, or even impossible.

MTC–00028284—0095

Another example of anti-competitive tying is that Microsoft renders its own DRM technology software non-interoperable with other media players because of DRM's interaction with Window XP's own ''secure audio path'' software. While this is not tying in the sense of designing the operating system to be incompatible with rival applications, it does involve designing an application—DRM—that limits the compatibility of rival applications in a closely related market, the market for media players.

More generally, Microsoft anti-competitively undermines the functionality and utility of rival streaming media players and formats. For example, Microsoft denies a license for playing files streamed in Windows content encoding formats to its principal competitor, RealNetworks, thereby reducing the utility to consumers of RealNetworks'' products. Microsoft also disadvantages rival content-encoding formats by designing WMP to record only in Windows media formats. These actions have, in the past, served to reduce consumers'' perceptions of rivals'' performance—for example by deliberately making consumers'' use of Netscape ''a jolting experience'' [25] or damaging MP3 quality and functionality.[26]

In general, OEMs perform a screening function, as agents of consumers, by ensuring that the software products provided out of the box are compatible with each other and with the operating system? Consumers are aware that OEMs perform this function. Consumers are also aware that OEMs'' reputations are based partly on packaging high- quality software products, so that OEMs have the incentive to choose the best software products for the price. Consumers are in general not aware of the contractual restrictions imposed in various contractual arrangements that might explain the choice of media player, including, for example, any threat not to license the Windows OS to the OEM unless all Windows applications are included as defaults. Nor are consumers aware of any financial incentives offered to OEMs by Microsoft to include only Microsoft applications as default options. Contractual tying alone will thus cause consumers to infer, for reasons unrelated to merit, that Microsoft's applications are the optimal products for them.

As suggested above, the interaction of all these effects, combined with rational expectations, can easily lead to the rapid foreclosure of competition. The force of self-realizing expectations is especially strong when one firm or one format is a natural focal point for consumer expectations. In markets where any number of formats could be sustained as dominant because of self-realizing expectations (economists term this ''the multiplicity of rational expectations equilibria''), a focal point property of any one equilibrium can be important in predicting which equilibrium will be sustained. There could hardly be a stronger focal point than the Microsoft/Windows format for predicting the likely dominant (and perhaps sole) format. The history of the PC software industry is one of the dominance of Microsoft

[19] See U.S. Findings of Fact ¶ 93.

[20] Microsoft has a track record of placing code for Microsoft applications in the same files as code providing functions for its OS in order to achieve its anti-competitive ends. This includes the illegal commingling of code for Microsoft's Internet Explorer with the operating code and the tying of with the OS. See U.S. Findings of Fact ¶¶ 161–229.

[21] See U.S. Findings of Fact ¶ 357, relating to Microsoft's attempts through tying and other means to induce users to select Microsoft's Internet Explorer as the preferred, perhaps only, path to the web. It is possible for consumers to incur the cost to change defaults, but the incentives to do this are very small.

[22] See Steven Vaughan Nichols, Resisting the Windows XP Message, ZDNet, May 9, 2001 (''I can't help but wonder if... independent software vendors will have trouble getting that all-important signature for [their] programs .... [W]hy do I feel certain that giving Microsoft absolute power over all XP apps probably doesn't spell good news for anyone in the tech business—except Microsoft?'').

[23] —,3 See U.S. Findings of Fact i 112.

[24] ''In June ... seven appeals judges ruled unanimously that Microsoft was a monopoly that had violated the antitrust laws by integrating its Web browser into its Windows operating system in an effort to freeze out other browsers. [The Court of Appeals ruled that] Microsoft shouldn't be allowed to design Windows in a way that limits consumer choice—the ability of users to discover and easily use other companies'' products and services. [Despite this,] the company went on to launch a new version of Windows—Windows XP—that continued to integrate tightly into the operating system new features that are crucial to extending Microsoft's monopoly onto the next battleground: Internet-based services. And it added these features in a way that hinders consumer choice.'' Walter S. Mossberg, For Microsoft. 2001 Was a Good Year, But At Consumers'' Expense, The Wall Street Journal, December 27, 2001.

[25] See U.S. Findings of Fact ¶ 160.

[26] See Ted Bridis, Technology Industry Aims to Render MP3 Obsolete, The Wall Street Journal, Apr. 12, 2001, at A3. (''Under Microsoft's new restrictions ... MP3 music ''sounds like somebody in a phone booth underwater,'' says P.J. McNealy, an analyst who researches Internet audio issues for Gartner Inc .... early testers of beta versions of Windows XP already complain that the most popular MP3 recording applications—which compete with Microsoft's format—don't seem to function properly, apparently because of changes Microsoft made to how data are written on CD-ROMs under Windows XP. Microsoft says that while other software vendors'' products may not be ''optimized'' to run with Windows XP, those products should run acceptably with the operating system.'').

standards[27] The prediction that the Microsoft standard will predominate in the media player market is natural, perhaps inescapable, for a consumer—uninformed about the media player market specifically—debating about which format to adopt. While it is arguable that strong network effects might yield dominance by a single firm in a good or service and its complements, it is uncertain whether a monopoly outcome is inevitable absent tying. In this context, tying assures OS dominance and is therefore anti-competitive.

Thus, Microsoft's coercion of OEMs to select WMP for the ''out-of-the-box'' experience, and to obscure the differences in capabilities between WMP and rival products, could weaken consumer awareness of the various functionalities available in the open market.

This would increase expectations of a single dominant format, which in turn would accelerate that dominance. The dominance in the media player market, to emphasize the applications-OS interaction once more, reinforces Microsoft's dominance in operating systems.

CONCLUSION

We show in this report that Microsoft has substantial incentives to engage in ant/-competitive tying of its middleware products with Windows. It has incentives to use contractual inducements to OEMs to bundle Windows with its own middleware instead of rival products; commingle applications code into the kernel of the operating system; and hamper the interoperability of rival applications. We also show that Microsoft's tying—in all of its forms—reinforces Microsoft's monopoly in operating systems.

Microsoft's incentives to anti-competitively bundle fall into four mutually reinforcing categories. First, by tying its middleware applications to the Windows operating system, Microsoft can strengthen the applications barrier to entry against its OS competitors. This reinforces Microsoft's OS monopoly. In order for entrants in the operating system market to succeed, they must have a wide variety of applications available for consumers to purchase. But software developers will invest in the creation of new applications only for operating systems that have widespread distribution. If Microsoft attains dominance with both the operating system and key middleware applications, it can ensure that its OS rivals will be unable to meet consumer demands for the most popular applications. With a dominant position in applications markets, Microsoft may choose not to write those applications to interoperate with rival operating systems, thus enhancing the already significant applications barrier to entry.

Second, tying reinforces Microsoft's OS monopoly by deterring direct challenges to the OS position as the platform of choice for software developers. Since programmers can write calls to middleware products, Microsoft's dominance in these products reduces the possibility that a universal translator (middleware) between operating systems and applications would threaten the Windows monopoly. Just as with the browser, Microsoft weakens this competitive threat to operating systems by integrating the potential substitutes directly into the OS.

Third, tying can provide a method of dynamic leveraging to ensure a future monopoly. This involves a direct counterargument to the familiar ''one-monopoly theory,'' which states that a monopolist cannot collect more profits through a monopoly on a pair of complementary products (an operating system and an application) than through a monopoly on either product alone. Where the future entry into each product is uncertain, establishing a monopoly on both products in the pair increases the chance that the monopolist will retain a monopoly on at least one product in the future and therefore is positioned to collect full monopoly profits. In our context, the fact that the Windows monopoly over operating systems is not airtight creates an incentive for Microsoft to leverage its dominance so as to increase the likelihood of future dominance in at least one class of products—the operating system or applications. Dominance in applications provides (partial) insurance against the loss of monopoly power in operating systems, but the key is the preservation of monopoly in at least one of the pair of products: the OS and one or more important middleware applications.

Finally, tying IE and WMP into the OS and locking in Microsoft's streaming media and DRM formats put Microsoft in a position to potentially collect a tax on e-commerce transactions. Tying thus facilitates the move by Microsoft to a business strategy of collecting revenues from per-transaction royalty of its software, rather than outright sale of its software. This business strategy lessens the competition that Microsoft, as a durable-good monopolist, faces from the sales of its own previous versions of Windows. In this sense, the strategy, and its facilitation through tying, reinforce Microsoft's dominance in operating systems.

Product integration can theoretically be beneficial in some markets. Purchasers prefer to purchase some bundles of inputs, such as steering wheels with cars or laces with shoes.

These efficiencies do not apply to the bundling of middleware with Windows. Purchasing a personal computer with a full set of applications and default options ''out of the box'' is valuable for many consumers. But the efficiencies that come with an integrated package of an OS and various applications are not specific to Microsoft's applications. In a market where OEMs were free to offer whichever packages of software consumers desired, without integration of applications into the operating system, and without Microsoft's tying constraints or inducements, the market would provide the variety of packages preferred by consumers. Moreover, the engineering efficiencies claimed for the integration of middleware code into the operating system appear to be negligible, and are therefore more than offset by the anti-competitive effects of tying. In fact, a software design organized around modular programming of the operating system and middleware applications would achieve the efficiencies associated with modular programming and would allow for plug-and-play replacement of the software.

In the absence of tying, Microsoft would offer an operating system and middleware applications that were distinct in the sense of modular programming. For example, neither browser nor media player code would be commingled with OS code: instead, both would communicate with the OS only through a set of published APIs. Microsoft would enhance the value of its operating system by encouraging competition in the innovation of the complementary good—i.e., the browser and the media player. This strategy would maximize value to consumers and the profits that Microsoft obtains from its operating system. The fact that Microsoft does not engage in such a business strategy demonstrates, in the absence of evidence that its tying is efficient, that Microsoft is motivated by anti-competitive incentives that maintain its OS monopoly.

VI. APPENDIX: CURRICULUM VITAE OF FRANK MATHEWSON

G. FRANKLIN MATHEWSON—Professor of Economics, Director of the Institute for Policy Analysis, University of Toronto

Ph.D. Stanford University

B.Com. University of Toronto

ACADEMIC POSITIONS

1996-present Director, Institute for Policy Analysis, University of Toronto.

1969-present Professor of Economics, Department of Economics, University of Toronto.

1969-present Research Associate, Institute for Policy Analysis, University of Toronto.

1995–1996 Acting Chair, Department of Economics, University of Toronto.

1985 Visiting Professor, Center for the Study of the Economy and the State, University of Chicago, Spring Quarter.

1984 Visiting Scholar, Graduate School of Business, University of Chicago, Spring Quarter.

1978–1983 Associate Chairman and Director of Graduate Studies, Department of Economics, University of Toronto.

1970–1982 Professor of Economics, Faculty of Management Studies, University of Toronto.

1978–1979 Senior Research Associate, Ontario Economic Council.

1976–1977 Visiting Research Fellow, Department of Political Economy, University College, University of London.

HONORS AND FELLOWSHIPS

* Social Science and Humanities Research Council Research Fellowship: 1994, 1991, 1989, 1987, 1986, 1985

* Social Science and Humanities Research Council Leave Fellowship: 1983–1984

* Canadian Council Leave Fellowship: 1976—1977

* Canada Council Doctoral Fellowship: 1966–1969

* Woodrow Wilson Fellowship: 1965

PROFESSIONAL AFFILIATIONS

* Editorial Board, Journal of Economics of Business, 1992-present.

[27] This is similar to the screening function that upscale department stores provide in selecting high-quality products. Intermediaries in retail markets invest in establishing brand names or trust on the part of consumers. :s See U.S. Findings of Fact 33—35, 53, 60, and 62–64.

* Editorial Board, Managerial and Decision Economics, 1994-present.

* Editorial Board, Economic Inquiry, 1987–1997.

* Editorial Board, Journal of Industrial Economics, 1990–1995.

* Associate Editor, International Journal of Industrial Organization, 1982–1988.

VII. APPENDIX: CURRICULUM VITAE OF RALPH WINTER

RALPH A. WINTER— Professor of Economics and Finance, University of Toronto

Ph.D. Economics, University of California at Berkeley

M.A. Statistics, University of California at Berkeley

B.Sc. Mathematics and Economics (with honors), University of British Columbia

ACADEMIC POSITIONS

1988-present Professor of Economics and Finance, University of Toronto

1985–1988 Associate Professor, Department of Economics and Faculty of Management Studies, University of Toronto

1979–1985 Assistant Professor, Department of Economics and Faculty of Management Studies, University of Toronto

HONORS AND FELLOWSHIPS

* Olin Senior Research Fellowship, Yale Law School, i 988

* National Fellowship, Hoover Institution, Stanford University, 1986–1987 Harry, Johnson Prize (with M. Peters), for best article in the Canadian Journal of Economics, 1983

* Canada Council Doctoral Fellowship, 1975–1979

* John H. Wheeler Scholarship, University of California at Berkeley, 1974–1975

* Dean's Honors List, University of British Columbia, 1974

RESEARCH GRANTS

* Social Sciences and Humanities Research Council Research Grant: 1983–1985, 1986-1987, 1988–1989, 1990, 1991–1993

Social Sciences and Humanities Research Council Post-Doctoral Research Fellowship: 1981–1982 and 1982–1983

PROFESSIONAL AFFILIATIONS

* International Editorial Board, Assurances

* Editorial Board, Journal of Industrial Economics

PROFESSIONAL APPEARANCES

* British Columbia Utilities Commission, regarding capital structure and equity risk premium for Pacific Northern Gas, 1998

Canadian Radio-Television and Telecommunications Commission, regarding price cap regulation for telephone companies, 1996

Alberta Energy and Utilities Board, regarding fair rate of return for TransAlta Utilities Corporation and Alberta Power Limited, 1996

* Expert witness, Nielsen case, before the Canadian Competition Tribunal, 1994

Ontario Energy Board (EBRO 483,484), regarding fair rate of return for Centra Gas, 1993 (written submission)

Ontario Energy Board (EBRO 4790), regarding fair rate of return for Consumers Gas, 1992

Expert witness, Chrysler case, before the Canadian Competition Tribunal, 1988

O'Melveny & Myers LLP
555 13th Street, NW
Washington, DC 20004

January 2002

INTRODUCTION

This Court may approve the parties'' Proposed Final Judgment (''PFJ''), but only if it first determines that the proposed decree is ''in the public interest.'' In reviewing the PFJ, we acknowledge that there are some beneficial and important restrictions put on Microsoft's unlawful conduct. In too many instances, however, these restraints are inevitably swallowed up by broad exceptions and grants of power to Microsoft. The result is that the proposed settlement will do little, if anything, to eliminate Microsoft's illegal practices, prevent recurrence of those acts, and promote competition in the marketplace. The public interest requires more, and the Court should thus reject the proposed settlement.

The purpose of this document is to expose—on a point-by-point, provision-by-provision basis—the many loopholes, ''trap doors,'' and other critical deficiencies in the PFJ. We present the issues in an order that tracks the proposed decree itself so that they may be easily followed. We also provide ''real world'' examples where helpful. In general, the PFJ suffers from several global, overarching flaws. First, in critical places, the language used in the PFJ to define the protections for competition are not broad enough to cover behavior the Court of Appeals held to be unlawful. Rather, only specific rights are granted, only specific competitive products are protected, and only specific anticompetitive practices are banned. In many cases, the rights and limitations are further clawed-back through carefully crafted carve-outs that benefit Microsoft.

Second, the proposed decree relies too heavily on the personal computer (''PC'') manufacturers (original equipment manufacturers or ''OEMs'') to implement design changes—particularly in the critical area of middleware—without sufficiently ensuring their independence from Microsoft's tight clasp. The PFJ also follows timelines that are too loose and too generous to a company with the engineering resources and product-. update capabilities of Microsoft.

Third, in too many places, the constraints on Microsoft (once the exceptions are taken into account) devolve into a mandate that Microsoft act ''reasonably.'' Aside from the obvious concern about Microsoft's willingness to do so given its track record, this formulation is problematic for other reasons. It does little more than restate existing antitrust law (such provisions cannot be said to be ''remedial'' if they, in essence, are merely directives to refrain from future illegal acts). And, in terms of enforcement, alleged violations of such ''be reasonable'' provisions can only be arrested through proceedings that will become, in essence, mini-retrials of U.S. v. Microsoft itself.

In sum, a consent decree that causes little or no change in the defendant's behavior cannot be found to advance the public interest, especially when the defendant's conduct has been found by both the district and appellate courts to be in violation of the law. As such, based on the numerous shortcomings outlined below, the Court should disapprove the PFJ.

SECTION-BY-SECTION CRITIQUE OF THE PFJ

Section Ill of the PFJ: Prohibited Conduct

A. Retaliation

The Scope Of The Protection Is Narrow: Section III.A of the PFJ appears to be directed at preventing Microsoft from retaliating against OEMs that attempt to compete with Microsoft products, but Microsoft is constrained only from specified forms of retaliation. If it retaliates against an OEM for any non- specified reason, that retaliation is not prohibited. This formulation is particularly problematic because the protected OEM activities are narrowly and specifically defined. Retaliation against an OEM for installing a non-Microsoft application that does not meet the middleware definition is not prohibited; nor is retaliation against an OEM for removing a Microsoft application that does not meet the middleware definition.

For example:

MSN and MSN Messenger do not appear to be middleware under the PFJ's highly specific definition of a ''Microsoft Middleware Product.'' Given this uncertainty, an OEM cannot know with confidence that it is protected from retaliation if it removes the icon and start menu promotion for MSN and/or MSN Messenger.

If client software to support Sun's Liberty Alliance (a competitor to Microsoft's Passport) were developed, it would probably not be middleware under the PFJ definition. Thus, Microsoft can retaliate if an OEM adds that software.

More generally, it is odd to have a formulation that de facto approves of Microsoft's retaliation against OEMs, except where that retaliation is forbidden. That is, given that competitors to Passport, .Net My Services (formerly ''known as Hailstorm), Windows Movie Maker, Microsoft Money, gaming programs, and Microsoft Digital Photography programs—even when shipped through the OEM channel—may not be included in the scope of protected competition, Microsoft would be free to retaliate against OEMs that promote those competitors.

Finally, the provision is substantially weakened in that only certain types of retaliation (i.e., retaliation by changing contractual relations and retaliation by changing promotional arrangements) are forbidden, as opposed to prohibiting any form of retaliation whatsoever. In order to eliminate Microsoft's ability to unlawfully protect its OS monopoly, it is essential that Microsoft be prohibited from taking any action that directly or indirectly adversely affects OEMs or other licensees who in any way support or promote non-Microsoft products or services.

Non-Monetary Compensation Provision: Microsoft is free to retaliate against OEMs that promote competition by withholding any existing form of ''non- monetary Compensation''- only ''newly introduced forms of non-monetary Consideration'' may not be withheld.

OEM Termination Clause Will Intimidate OEMs: Microsoft can terminate, without notice, an OEM's Windows license, after sending the OEM two notices that it believes the licensee is violating its license. There need not be any adjudication or determination by any independent tribunal that Microsoft's two predicate claims are correct; after just two notices to any OEM of a putative violation, Microsoft may terminate without even giving notice. This provision means that the OEMs are, at any time, just two registered letters away from an unannounced economic calamity. Obviously, that danger will severely limit the willingness of the OEMs to promote products that compete with Microsoft.

Pricing Schemes Will Allow Microsoft to Avoid Effects of the Decree.'' Microsoft can price Windows at a high price, and then put economic pressure on the OEMs to use only Microsoft applications through the provision that Microsoft can provide unlimited consideration to OEMs for distributing or promoting Microsoft's services or products. The limitation that these payments must be ''commensurate with the absolute level or amount of'' OEM expenditures is hollow—given that it is not clear how an OEM's costs will be accounted for, for this purpose.

Pricing

Microsoft Can Use Rebates To Eviscerate Competition. Under Section III.B of the PFJ, Microsoft can provide unlimited ''market development allowances, programs, or other discounts in connection with Windows Operating System Products.'' This provision severely weakens the protection for OEM choice, functioning the same way as the rebate provision discussed above, but without any tether or limiting principle whatsoever. Arguably, Microsoft can charge $150 per copy of Windows, but then provide a $99 ''market development allowance'' for OEMs that install WMP.

Presumably, this is intended to be circumscribed by Section III.B.3.c, which provides that ''discounts or their award'' shall not be ''based on or impose any criterion or requirement that is other, vise inconsistent with.., this Final Judgment,'' but this circular and self-referential provision does not ensure that the practice identified above is prohibited. While Microsoft should be allowed to engage in legitimate pricing decisions, those decisions should be limited to volume-based discounts offered on a non-discriminatory basis.

C. OEM Licenses

Microsoft Retains Control Of Desktop Innovation: Under Section III.C of the PFJ, Microsoft would retain control of desktop innovation by being able to prohibit OEMs from installing or displaying icons or other shortcuts to non- Microsoft software/products/services, if Microsoft does not provide the same software/product/service. For example, if Microsoft does not include a media player shortcut inside its ''My Music'' folder, it can forbid the OEMs from doing the same. This turns the premise that OEMs be given flexibility to differentiate their products on its head.

For example:

Sony—as a PC OEM and a major force in the music and photography industries—would be uniquely positioned to differentiate the ''My Music'' and ''My Photos'' folder. And yet, Sony's ability to do so turns solely on the extent to which Microsoft chooses to unleash competition in these areas.

Microsoft Retains Control Of Desktop Promotion.'' Microsoft also, very oddly, can control the extent to which non-Microsoft middleware is promoted on the desktop, by virtue of a limitation that OEMs can promote such software at the conclusion of a boot sequence or an Internet hook-up, via a user interface that is ''of similar size and shape to the user interface provided by the corresponding Microsoft middleware.'' Thus, Microsoft sets the parameters for competition and user interface.

Promotional Flexibility For IAPs Only, And Only For The OEM's ''Own'' IAP: OEMs are allowed to offer IAP promotions at the end of the boot sequence, but not promotions for other products. Also, OEMs are allowed to offer IAPs at the end of a boot sequence, but only their ''own'' IAP offers. Given that this phrase is ambiguous, Microsoft may attempt to read this provision as limiting an OEM's right to offer an IAP product to those IAPs marketed under the OEM's brand. Helpfully, the Competitive Impact Statement suggests otherwise, but whatever this phrase means, it is a needless restriction on an OEM's flexibility.

D. API Disclosure

APIs Defined Too Narrowly: Microsoft can evade the disclosure obligation provided under Section III.D of the PFJ by ''hard-wiring'' links to its applications, and through other predatory coding schemes. Additionally, the disclosure is limited to ''APIs and related Documentation.'' This is too narrow and can be evaded. Moreover, the provision for the disclosure of ''Technical Information'' found in Judge Jackson's interim conduct remedies has been eliminated. These disclosures are necessary to provide effective interoperability.

G. Anticompetitive Agreements

Joint Development Agreements Can Subvert Protections Of The Settlement. The protection against anticompetitive agreements is substantially undermined by the exception in Section III.G of the PFJ that allows Microsoft to launch ''joint development or joint services arrangements'' with OEMs and others. Under this provision, Microsoft can ''invite'' OEMs, ISVs, and other industry players to enter into ''joint development'' agreements and then resort to an array of exclusionary practices.

For example:

Microsoft invites OEM X to form a ''joint development'' project to create ''Windows for X,'' a ''new product'' to be installed on the OEM's PCs. As long as Microsoft's activities are cloaked under this rubric, it is exempt from the ban on requiting the OEM to ship a fixed percentage of its units loaded with Microsoft's applications, and other protections designed to promote competition.

H. Desktop Customization

Add/Remove Is For Icons Only, Not The Middleware Itself.'' The add/remove provisions in Section III.H in the PFJ only allow for removal of end-user access to Microsoft middleware—not removal of the middleware itself. This position is inconsistent with the language in the Court of Appeals'' opinion on commingling or the ''add/remove'' issue.

If Microsoft's middleware remains on PCs (even with the end-user access masked), then applications developers will continue to write applications that run on that middleware—reinforcing the applications barrier to entry that was at the heart of this case. Allowing Microsoft to forbid the OEMs from removing its middleware, and allowing Microsoft to configure Windows to make it impossible for end-users to do the same, allows Microsoft to reinforce the applications barrier to entry, irremediably.

As we have seen with the implementation of this approach (i.e., icon removal only) with regard to Internet Explorer in Windows XP, Microsoft can use the presentation of this option in the utility to make it less desirable to end-users. Moreover, limiting the required ''add/remove'' provision to icons only is actually a step backward from the current state of affairs in Windows XP, where code is removable for several pieces of Microsoft middleware.

Why Are Non-MS Icons Subject To Add/Remove?: The PFJ gives Microsoft an added benefit: it can demand that OEMs include icons for non-MS middleware in the add/remove utility. Why this should be required, in the absence of any finding that assuring the permanence of non-Microsoft middleware on the desktop is anticompetitive, is bizarre. This essentially treats the victims of Microsoft's anticompetitive behavior as if they were equally guilty of wrongdoing.

Microsoft Can Embed Middleware And Evade Restrictions: Under Section III.H.2, end-users and OEMs are allowed to substitute the launch of a non- Microsoft Middleware product for the launch of Microsoft middleware only where that Microsoft middleware would be launched in a separate Top-Level Window and would display a complete end-user interface or a trademark. This, in essence, allows Microsoft to determine which middleware components will or will not be subject to effective competition. By embedding its middleware components in other middleware (and thereby not displaying it in a Top Level Window with all user interface elements), or by simply not branding the middleware with a trademark, Microsoft can essentially stop rivals from launching their products in lieu of the Microsoft products.

Harder For Consumers To Choose Non-Microsoft Products Than Microsoft Products: In the same provision (III.H.2), Microsoft may require an end-user to confirm his/her choice of a non-Microsoft product, but there is no similar ''double consent'' requirement for Microsoft Middleware. There is no reason why it should be harder for users to select non-Microsoft products than Microsoft products.

Microsoft Can ''Sweep'' The Desktop, Eliminating Rival Icons: Additionally,-the OEM flexibility provisions are substantially undermined by a provision that allows Microsoft to exploit its ''desktop sweeper'' to eliminate OEM-installed icons by asking an end-user if he/she wants the OEM-installed configuration wiped out after 14 days. Thus, the OEM flexibility provisions will only last on the desktop with certainty for 14 days, and after that period, persistent automated queries from Microsoft can reverse the effect of the OEM's installations. The effect of this provision is to severely devalue the ability of OEMs to offer premier desktop space to ISVs—and to undermine the ability of OEMs to differentiate their products and provide consumers with real choices. Desktop ''MFN'' Requirements: Finally, nothing in the decree appears to forbid Microsoft from requiring—especially where non-middleware is concerned—so- called MFN agreements from the OEMs. These agreements tax OEM efforts to promote Microsoft rivals by requiring that equal promotion or placement be given to Microsoft products, often without compensation.

I. Licensing Provisions

Licenses Put In Hands Of OEMs Only—The), May Not Be Able To Use Them Without Help: The OEM licensing provision is limited in its effectiveness because the OEMs are prevented in Section III.I.3 from ''assigning, transferring, or sublicensing'' their rights. This may severely limit their ability to partner with software companies to develop innovative software packages to be pre-installed on PCs. This provision is especially harmful when contrasted with the broad partnering opportunities afforded to Microsoft under Section III.G. In addition, the OEMs'' willingness to use these provisions—even if they have the financial and technical wherewithal to do so—may be limited by the weakness of the retaliation provisions discussed above.

Reciprocal License? ''Equal Treatment'' For Law Abiders And Law Breakers Is Not Equal: Under Section III.I.5, the PFJ requires ISVs, OEMs, and other licensees to license back to Microsoft any intellectual property they develop in the course of exercising their rights under the settlement. But that simply rewards Microsoft for having created the

circumstances (i.e., having acted illegally) that necessitated the settlement in the first place. Microsoft should not be able to obtain the intellectual property rights of others simply because those law abiding entities have been required to work with a lawbreaker.

In addition, this provision may inadvertently work as a ''poison pill'' to discourage ISVs, et al., from taking advantage of the licensing rights ostensibly provided to them in Section III.I. The risk that an ISV would have to license its rights to Microsoft will be a substantial deterrent for that ISV from exercising its rights under Section III.I.

J. ''Security and Anti-Piracy'' Exception to API Disclosure

The Settlement Exempts The Software And Services That Are The Future Of Computing: One of the most seemingly innocuous provisions in the PFJ is, in fact, one of the biggest loopholes: the provision found in Section III.J.1 that allows Microsoft to withhold from API, documentation or communication protocol disclosure any information that would ''compromise the security of .... digital rights management, encryption or authentication systems.'' This provision raises several critical concerns:

Digital Rights Management Exception ''Swallows'' Media Player Rule: Since the most prevalent use of media players in the years ahead will be in playing content that is protected by digital rights management (''DRM'') (i.e., copyrighted content licensed to users on a ''pay-for-play'' ''basis), allowing Microsoft to render its DRM solution non-interoperable with non-Microsoft Media Players and DRM solutions essentially means that non-Microsoft media players will be virtually useless when loaded on Windows computers.

Authentication Exception Allows Microsoft To Control Internet Gateways, Server- Based Services: Most experts agree that the future of computing lies with server-based applications that consumers ,,,,,ill access from a variety of devices. Indeed, Microsoft's ''.Net'' and ''.Net My Services'' (formerly known as Hailstorm) are evidence that Microsoft certainly holds this belief. These services, '',,,'hen linked with Microsoft's ''Passport,'' are Microsoft's self-declared effort to migrate its franchise from the desktop to the Internet.

By exempting authentication APIs and protocols from the PFJ's disclosure/licensure requirement, the settlement exempts the most important applications and services that ,,','ill drive the computer industry over the next few years. If Microsoft can wall off Passport, .Net, and .Net My Services with impunity—and link these Internet/server-based applications and services to its desktop monopoly—then Microsoft will be in a commanding position to dominate the future of computing.

Additional Problems Raised By Numerous Provisions in Section III No Ban On Commingling Of Code.'' Nothing in the agreement prohibits Microsoft from commingling code or binding its middleware to the OS. This was a major issue in the case; the Court of Appeals specifically found Microsoft's commingling of browser and OS code to be anticompetitive; it rejected a petition for rehearing that centered on this issue. And yet, the PFJ would permit this activity to continue.

The danger of the absence of this provision is reinforced by what is found in the definition of the Windows Operating System Product (''Definition U''), which states that the software code that comprises the Windows Operating System Product ''shall be determined by Microsoft in its sole discretion.'' Thus, Microsoft can, over time, render all the protections for middleware meaningless, by binding and commingling code, and redefining the OS to include the bound/commingled applications.

Too Many Of The Provisions Require A Mini-Retrial To Be Enforced: In numerous places throughout Section III, the limitations on Microsoft's conduct are basically rephrased versions of the Rule of Reason. For example, in Section III.F.2, Microsoft may enter into restrictive agreements with ISVs as long as those agreements are ''reasonably necessary;'' likewise, the Joint Venture provisions found in Section III.G also employ a rule-of-reason test. As such, they simply restate textbook antitrust law, and alleged violations of these provisions could only be resolved through mini-trials.

Server Interoperability Issues (Found in Sections III.E, III.H and III.J) Only Full Interoperability Can Reduce Microsoft's Barriers To Desktop Competition: The PFJ's proposed server remedy will fail to provide meaningful, competitive interoperability between Microsoft desktops and non-Microsoft servers because:

The applications barrier to entry is central to this case and to Microsoft's desktop monopoly. A remedy that provides true server interoperability can be a powerful tool to reduce the applications barrier to entry. The server has the same potential to provide an alternative platform as did the browser or Java. In that sense, it is directly analogous to middleware products.

Microsoft has plainly recognized the threat that non-Microsoft servers pose as an alternative applications platform and has acted to exclude those products from full interoperation with the desktop and to advantage its own server products. It is able to do so because it controls the means by which servers may interoperate with the functions and features of the Windows desktop. In order to succeed in establishing non-Microsoft servers as an effective alternative application platform, both consumers and application developers have to be convinced that such servers: (1) can overcome the interoperability barriers that Microsoft has erected, and (2) have become viable alternatives to Microsoft's own servers, insofar as they can fully interoperate with the desktop.

An incomplete interoperability remedy fails to meet this test. Neither consumers (professional IT managers) nor server application developers will be attracted to non-Microsoft servers that lack any important interoperability functionality. If important interoperability barriers are left in place, IT managers simply will not buy the product and the remedy will fail to achieve its intended purpose. This is an important guiding principle.

The proposed decree allows Microsoft to continue to exploit dependencies between its desktop applications or its desktop middleware and its servers or handheld devices to exclude server and handheld competition. Section III.I Excludes Competing Server Vendors From The Benefits Of Section III.E's Disclosures: Section III.I limits Microsoft's obligation to license its desktop-server Communications Protocols to ISVs, IHVs, IAP, ICPs, and OEMs; thus, server competitors are excluded from the group of companies that Microsoft must license information to under section III.E.

The Failure To Define ''Interoperate'' Is A Mistake: Neither Section III.E nor any other provision of the PFJ defines the meaning of ''interoperate.'' The failure to define ''interoperate'' is tantamount to the Department of Justice's (''DOJ'') prior failure to define ''integrate'' in the 1995 consent decree, and will form the basis for unending disputes over the scope of Microsoft's disclosure obligations. ''Communications Protocol'' Is Defined Too Narrowly And Too Ambiguously: The definition of ''Communications Protocol,'' which determines the scope of server information to be disclosed by Microsoft, is highly ambiguous and potentially very narrow in scope:

It appears to be limited to the Windows 2000 server, and thus may exclude Microsoft's Advanced Windows 2000 server and Datacenter server.

It is unclear whether ''rules for information exchange'' that ''govern the format, semantics, timing sequencing, and error control of messages exchanged over a network'' mean the rules for transmitting information packets over a network, or the rules for formatting and interpreting information within such packets.

It appears to be limited to information exchanged via LANs and WANs, and therefore may exclude information exchanged over the Internet. In other words, having illegally seized dominance over browsers, Microsoft will be allowed to use that power to establish de facto proprietary protocols for Internet communication and keep them entirely to itself. Even in its broadest possible meaning, the term ''Communications Protocols'' is insufficiently broad or comprehensive to require disclosure of the information. needed to permit interoperability between non-Microsoft servers and the full features and functions of Windows desktops.

Section III.J's Carve-Out Eliminates the Most Important Disclosures: What little Section III.E provides, Section III.J takes away by permitting Microsoft to refuse to disclose the very protocols and technical dependencies it is currently using to prevent non-Microsoft servers from interoperating with Microsoft desktops and servers.

Section IV Of The PFJ: Compliance and Enforcement

A. Enforcement Authority

Enforcement Authority Is Too Difficult To Employ: Clearly, what is missing from the agreement is a quick, meaningful, and empowered mechanism for preventing and rectifying Microsoft's inevitable violations of

the agreement. Thus, while the provision allowing Microsoft to cure any violations of Sections III.C, D, E, and H before an enforcement action may be brought is not itself objectionable, it is but one of a number of provisions that make enforcing the agreement cumbersome, expensive and time-consuming.

B. Technical Committee / D. Voluntary Dispute Resolution

Source Code Access Is Not Enough: While it is helpful that the Technical Committee (''TC'') will have access to Microsoft's source code and can resolve disputes involving that issue, the TC is otherwise powerless to compel Microsoft's compliance with the agreement in any other respect. The prospects that Microsoft will accept the decisions of the TC in a voluntary dispute resolution process are near zero. And the entire mechanism seems designed to extend disputes indefinitely: no time limits or time-lines are specified for dispute resolution.

As it stands now, a party injured by Microsoft's violation of the decree can complain to the TC, which will then conduct an investigation: Once the investigation is complete, the TC will presumably issue some decision; while the investigation is ongoing, the TC is supposed to consult with Microsoft's Compliance Officer, for an indefinite period;

If the TC concludes that Microsoft violated the agreement, and Microsoft does not agree to change its behavior or rectify the wrong, then the TC must decide whether to recommend the matter to the DOJ for further action;

Once recommended, the DOJ—after some review period—may decide to take action, and apply to the court for a remedy, or it may not; * And once the DOJ applies for action, the process in court to obtain relief or remedy may extend for an indefinite period.

This is obviously a lengthy and ineffective process for ensuring that Microsoft complies with its obligations under the decree. In an industry where time is of the essence and delays can be fatal, the built-in delays that allow Microsoft to drag its feet are wholly unacceptable.

Technical Committee's Investigation Has Only Limited Use: The work of the Technical Committee cannot ''be admitted in any enforcement proceeding before the Court for any purpose,'' and the members of the TC are forbidden to appear.

Thus, under the terms of the decree, the substantial time, effort and expense that can go into a TC process may need to be duplicated in an enforcement action—adding to the complexity and expense that the process will pose for victims of Microsoft violations.

Section V Of The PFJ: Termination

A. Five-Year Limit

Five-Year Coverage Is Inadequate: Given the scope of Microsoft's violations, the time period required to restore effective competition, and the pattern of willful lawbreaking on Microsoft's part, a five-year consent decree is inadequate.

B. Two-Year Extension

Penalty For Knowing Violations Is Too Lenient: Amazingly, the PFJ provides that no matter how many knowing and willful violations Microsoft engages in, the restrictions found in the settlement may be extended only for a single two-year period. Thus, if Microsoft is adjudged to have engaged in such a pattern of violations, it essentially has a ''free reign'' to repeat those violations with impunity.

Section VI Of The PFJ: Definitions

A. APIs

API Definition Too Narrow: This is discussed above.

I. ISV

Definition Is Not Forward-Looking: The definition of ISV is drafted too narrowly and should more clearly encompass developers of software products designed to run on new versions of the Windows operating system and next generation computing devices.

K. Microsoft Middleware Product

Definition Exempts Too Much Middleware: Much of the decree is based on this definition—the OEMs'' flexibility turns on what is included or excluded from this category of application. And yet the definition, which is different from the definition used by the District Court (affirmed and employed by the Court of Appeals) is fatally flawed.

First, there are only five existing products that can be known with certainty to be ''Microsoft Middleware Products.'' That means that highly similar items, such as MSN, MSN Messenger, MSN Explorer, Passport, Outlook, and Office may be excluded from the definition of middleware. Why Windows Messenger would be covered by the PFJ, but MSN Messenger would be exempt; or why Internet Explorer would be covered, while MSN Explorer would be exempt—if this is, in fact, how the provision operates—is a mystery. Why ambiguity would be accepted in such a critical area is an even greater mystery.

Given the uncertainty, Microsoft may attempt to retaliate against OEMs that remove even the icons for its applications; it may also attempt to prohibit end-users from removing these applications (or even their icons). This is a step backward from the status quo (even in Windows XP); the ambiguity is a gaping hole.

Second, the generic middleware definition, which applies only to new products, and therefore does not capture any product now in existence, allows Microsoft to define which products are included or not, by virtue of Microsoft's trademark and branding choices. Thus, as long as Microsoft buries these products inside other applications, they are not independently considered middleware.

Third, as suggested in the points above, the definition misses the future platform challenges to Microsoft's Windows monopoly: web-based services. These services should be specifically defined and included in the class of protected middleware.

N. Non-Microsoft Middleware Product

Only Developers With Substantial Resources □Viii Be Protected: The competitive offerings protected by the decree are narrowly limited to offerings that fall within the definition of ''Non-Microsoft Middleware Products.'' Again, as noted above, the guarantees of OEM flexibility, promotion, and end-user choice apply only to these specified products—not to any other software applications.

And yet, sadly, this narrow definition extends protection only to applications ''of which at least one million copies were distributed in the United States within the previous year.'' Thus, ''an innovator in his garage,'' creating a new form of middleware to revolutionize the computer industry, has no protection from Microsoft's rapacious ways until he can achieve the distribution of 1 million copies of his software.

Also, as noted above, ''web-based services'' are not captured in this definition, notwithstanding their importance to future competition to the Windows OS.

R. Timely Manner

Netscape, All Over Again: Microsoft's obligation to disclose APIs and other materials needed to make applications interoperable with Windows in a ''timely manner'' is keyed off the definition of that term in Section R. But Microsoft retains complete control over this timeline because the definition provides that Microsoft is under no obligation to engage in these disclosures until it distributes a version of the Windows OS to 150,000 beta testers. Thus, as long as Microsoft restricts its beta testing program to 149,999 individuals until very late in the development process, it can effectively eviscerate the disclosure requirements. Our review of the available documentation shows, for example, that Microsoft had no more than 20,000 beta testers 1 for Windows XP until very late in the release cycle; thus, had this provision been in place during the Windows XP release cycle, Microsoft would have been under no obligation to release APIs until the eve of product shipping.

Slow disclosure of APIs is precisely how Microsoft defeated Netscape's timely interoperability with Windows 95. Thus, in this way, not only is the decree inadequate to prevent future wrongdoing, it does not even redress proven illegal acts in the past.

U. Windows Operating System Product

The scope of Microsoft's disclosure obligations under the agreement are determined in large part by the meaning of ''Windows Operating System Product.'' The definition of Windows Operating System Product leaves Microsoft free to determine in ''its sole discretion'' what software code comprises a ''Windows Operating System Product.'' In other words, Microsoft's disclosure obligation is subject entirely to its discretion.

Note that the number of ''beta testers'' will be much smaller than the number of ''beta copies'' of a product that is being prepared for release.

From: Philip Johnson
To: Microsoft ATR
Date: 1/28/02 1:57pm
Subject: Microsoft

I feel Microsoft has done no wrong and should be left alone to innovate and sell their products at whatever the market will bear. They are no more a monopoly than a lot of other companies, so if you are going to penalize them for that then you need to take action against say AOL also and companies like them.

From: Wildcat
To: Microsoft ATR
Date: 1/28/02 1:57pm
Subject: Microsoft Settlement

I certainly hope you take into account that the effects of Microsoft's business practices are *still* being felt, even today... A brand new computer with anything *other* than Windows on-board is still almost unheard of, many hardware manufacturers don't support Linux or offer drivers for it, and many corporate websites are designed almost exclusively for Internet Explorer in *spite* of the W3C standards that are meant to make the ''World Wide Web'' more accessible to *all* available browsers. I realize that these last two points (drivers and web design) are almost entirely due to the preferences of the manufacturers and designers respectively, but those people are basing those decisions on the atmosphere fostered by Microsoft that it is and shall be the only creator of operating system and web browser software.

Recently, I experienced this form of ''browser discrimination'' firsthand. My browser of choice is Netscape, and I was finding it difficult to access a major retailer's website and on-line shopping outlet — my browser kept choking out. I e-mailed a report of this technical glitch, and received a reply suggesting I use Internet Explorer. To me (to use an analogy), this is like being unable to get a clear picture of CNN from my cable company, only to be told that my RCA television is the problem, and that the CNN signal is designed specifically for a Sony. The bottom line is, I've never been a big fan of Microsoft, and would really rather not give them my money, but as long as they're allowed to operate as they have in the past decade, they're going to wind up with a share of the profit on almost anything I buy, whether I know it or not, whether I *like* it or not.

Thank you for allowing me to state my opinion.

Subject: Microsoft Settlement

To Whom it may Concern,

I would like to add my voice to those in adamant opposition to the proposed Microsoft Settlement. Please reject this proposal in favor of a much stronger remedy.

Please review the current proposed settlement and make sure that it adequately represents the interests of open-source advocates, and consumers of open-source products. Essentially, the question that needs to be addressed first and foremost is ''Are the barriers to entry for competition with Microsoft reduced to a reasonable level for both commercial and volunteer competitive efforts?''. Secondly, I would ask ''Is the punitive element of this ruling sufficient to make executives reluctant to engage in similar anti-competitive behaviour, and stockholders reluctant to support executives who do?''.

I trust that you'll come up with an equitable ruling that represents the current and future interests of consumers, even if the economy must suffer.

Sincerely,
Aaron McHugh

Subject: Microsoft Settlement

Dear Sirs,

As a citizen of the United States of America, and an employee in the High-Tech sector of our nations economy, I feel compelled to write and voice my disagreement with the proposed Microsoft anti-trust settlement. For the past two decades, I have watched again and again as Microsoft leverages its monopoly position to wipe out what were once healthy high-tech markets. Their actions have had a continued, chilling effect on the industry which will be felt long into the future. However one of the few remaining areas where Microsoft has not yet accomplished their monopolistic goals, is in the education market.

It's likely that Microsoft would leverage their monopoly to take the education market if they could, but they've likely hesitated in order to avoid undue attention while the current cases are being judged. However, if the proposed settlement (of product donation to the schools) is allowed to continue, our legal system will in effect be sanctioning, even demanding, that Microsoft flood this additional market with its product and drive out competitors from this area as well. In effect, the proposed settlement will simply reward Microsoft's monopolistic practices by providing them another monopoly in the education market.

I urge the Justice Department, The Court, The Judge, anyone else involved, to -reject- the proposed settlement and -insist- on a more fair remedy.

Microsoft is not like some poor farmer who has to hand over his old tractor to cover back taxes. The settlement amount is just a tiny percentage (3%) of the -huge- cash hoard they have accumulated through their monopolistic practices. Short of breaking up the company (which I still think is justified) certainly we should at the very least, insist that they pay their costs like the rest of us do, in cash. Anything less only reinforces their monopolistic position.

Thank you for your consideration in this matter,

David E. Jorgensen

From: Patrick Purcell
To: 'Microsoft.atr(a)usdoj.gov'
Date: 1/28/02 1:57pm
Subject: Microsoft Settlement

Hello

My name is Patrick Purcell. As an Applications Developer and consumer of commercial software , I feel I must comment on the proposed Final Settlement.

I will make the following general comments and then move on to specific items in the documents .(Civil Action No 98–1232 and Civil Action No 98–1232 CKK).

It is my understanding that judgment against Microsoft stands. Microsoft was found in violation of the Sherman Act. I believe the original remedy should stand. In document Civil Action No 98–1232 CKK Section III H 3 Microsoft would be prohibited from modifying third party icons,menus, and shortcuts without asking for permission of the user.

The description does not prevent from Microsoft continually asking the user if changes should be made.

In effect the user could be nagged to making a change.

I believe the language should be strengthen to prevent Microsoft from nagging or making

adjustments through a needed software upgrade (in the case of a software fix).

In document Civil Action No 98–1232 CKK Section III J Microsoft is not obligated to license or disclose its API to third parties.

The API allows a programmer to develop software and take advantage of services the operating system offers.

Having a closed API excludes developers from using the operating system to its full extent and does not provide a level playing field. An open API would level the playing field.

It is possible to have a public API and not compromise security and encryption.

The open source software Linux list all its API while providing a high level of security.

The encryption software Pretty Good Privacy (PGP) provides the API and an excellent level of encryption.

Both Linux and PGP clearly illustrate it is possible to provide your complete API to all and still provide levels of security.

An open API would not preclude making a profit. For example Stronghold is a commercial secure web server based on the Apache web server. Stronghold is a successful product using an open API from the Apache web server. Another example is the Apple product, Mac OS X which is based on FreeBSD Unix.

On December 13, 2001, the ECMA General Assembly ratified the C# and common language infrastructure (CLI) specifications into international standards. The ECMA standards will be known as ECMA-334 (C#) and ECMA-335 (the CLI). The C# is a programming language developed by Microsoft. By having ECMA (http://www.ecma.ch) ratify C# and CLI as international standards, Microsoft lost direct control of the future development of these technologies. However Microsoft opened the API to the public to strengthen the acceptance of these technologies. Microsoft recognizes that publishing the API has benefits. Microsoft would not be overall negatively affected from publishing its complete API for its operating system. The actual publishing of the API could be done through an agency such as ECMA.

The above statements are my sole opinions and do not represent the views of my employer.

I hope you will consider these statements in making a final decision.

Sincerely

Patrick Purcell

From: Burt Harris
To: Microsoft ATR
Date: 1/28/02 2:01pm
Subject: Microsoft Settlement .

I want to register my support for the proposed settlement of the Microsoft antitrust case. The proposed settlement takes reasonable steps to address the underlying issue without crossing the boundry into the punitive actions that its opponents seem to want inforced.

As a observer of the situation it strikes me that many of the proponents of harsher terms have lost site of the fact that the settlement is intended to be a remedy, not a punishment. This seems to be driven by the fact that many of the financial backers of these groups are in fact competitors of Microsoft.

I for one, want to make sure that the settlement primarily addresses remedying any wrongs suffered by consumers (which I think are actually relativily few) as opposed to benefiting Microsoft's competitors, especially those competitiors who operate outside the narrowly drafted ''market'' for Intel based operating systems.

From: Juanita Bergh
To: Microsoft ATR
Date: 1/28/02 2:02pm
Subject: Microsoft Settlement

I have been and still am rather disgusted at the lawsuit against Microsoft. At the time the lawsuit was filed, I was not an employee of Microsoft. Now I am, but my feelings have not changed. I worked for a software company for 10.5 years before joining Microsoft. We used Netscape as a browser for a short period, but then our company switched to Internet Explorer. I don't recall at what point that was. But at the time I was using Netscape, the browser was given away free as an incentive to get people to switch to using their browser. Does this sound familiar? Isn't this part of Netscape/AOL Time Warner's complaint against Microsoft? That by offering it free and making it available as part of the operating system, Microsoft is engaging in non-competative acts. Hmmm. I wonder why it wasn't illegal when Netscape was first trying to gain market share. That's the main reason we used Netscape, it was free and relatively easy to use. However, we found the Internet Explorer worked better for us. There are differences and distinctions between the two that I'm not terribly familiar with as I have no desire to see if Netscape has become more attractive. I have heard that Netscape offers an easy way of uploading data, which isn't available in IE. I also have heard that Mac users prefer Netscape. The browser that fills the need best is the browser that will be used.

The last couple of times we purchased a computer, it came preloaded with a several different internet connectivity options. We did not choose to use any of them because we wanted to use a different one.

The fact of the matter is, that if someone wants to use a software product, they will use it whether it comes preinstalled or not. It's not as though we're talking about a couple hundred dollars to purchase Netscape; I can download it today for free. I'm not sure if Netscape used to have a charge or what those charges are, but it's rather hypocritical to complain about someone else giving something away free when you're doing the same thing. As I said earlier, who cares if it's preloaded or not; many users today are sophisticated enough that they'll find and load what they want.

Another complaint that bugs me in the lawsuit states that OEM's cannot really add much to change the way windows loads; this really irks me because I don't want to get a different look and feel from windows based on the hardware that I purchase! Is that user-friendly? We had a Packard-Bell that loaded a bunch of junk from PB and it drove us crazy, we disabled it because we didn't want it. I want to be able to purchase hardware based on price, not how it interacts with the os that I choose!! There's also the issue of support and service packs; who's going to support those changes? The OEM? Microsoft? Do I get pushed back and forth because the OEM says it's not their problem and Microsoft says it's been changed so they can't help either? There is nothing worse than trying to support a product that has been modified; all your updates are delayed, because when Microsoft releases a fix, the OEM has to do the same thing. I know how this works; I worked for a software company in the support area for 5 years and you cannot support something once someone else has modified it. This is NOT in the consumer's best interests for any software company to allow that. I know that it happens and it has it's advantages, but it's also a miserable position for the consumer who needs an update or help.

I have worked in the computer industry for 11.5 years now and I am tickled that consumers have pretty much selected one OS that we can use as a basis for developing our own applications. The macintosh died in the business application market because Apple's focus appears to be the graphic / educational market. We used to support our applications on the macintosh for many years, but finally discontinued that because it just wasn't a good business proposition for us. Many, many software companies have thrived by developing on the Microsoft platforms because Microsoft is the company that bothers to find out what consumers want and strives to give it to us. That's why Microsoft thrived and Apple did not. Apple had great potential and is doing fine, but they could've been the Microsoft.

Netscape/ AOL Time Warner would be smarter to use their money to improve their products so they can compete based on the products'' merit, not to try to cripple a successful rival.

One more comment on the ''monopoly'' issue. Microsoft is not a phone company or utility company where the customer has never had a choice; Microsoft has earned it's OS monopoly because no other OS has provided customers with what they want. We love to bash Microsoft (well, not since I've become an employee) for system bombs and crashes, but the fact remains that Microsoft has made it possible for millions of users to be able to use and afford a computer. My parents, in-laws, and grandparents, who never grew up using a computer are able to use email and word processing programs because it's easy, simple, and uniform. I can help them figure things out with a phone call because the OS behaves the same way no matter what type of computer they have! My grandparents would never have thought of using a computer in the pre-windows days.

Microsoft contributes a great deal of money, software and time for charitable issues; if anyone has the issues of the consumer at heart, it's Microsoft.

Thanks for listening,

Juanita Bergh

Subject: Microsoft Settlement
Renata Hesse
Department of Justice, Antitrust Department
601 D St NW
Suite 1200
Washington, DC 20530

Dear Ms. Hesse,

I am a State Senator from Iowa and I also the owner of construction contracting business. In my capacity as a State Senator I am chairman of the state government committee and also serve on the commerce committee. I chose to serve on these committees because as a business owner I am acutely aware of negative impact over regulation can have on business.

It is from this unique perspective that I am writing you today to encourage you to settle the Microsoft anti-trust case

The suit against Microsoft was brought under anti-trust laws that were developed in at a time in our history when our nation was growing into the industrial and economic leader it is today. These laws were meant to protect American consumers from harm inflicted by monopoly companies. These laws have served their purpose in the past. However, in this case, I do not think they apply. The government and Microsoft's critics have yet to prove consumer harm as a result of Microsoft actions or practices.

As a businessman and strong supporter of our free-market system, it is apparent to me that Microsoft's only crime is giving the American public a superior product, and therefore has been able to build a loyal following of committed users. Assumedly, Microsoft worked very hard to develop its products and market. They should not be punished for this or for having the business savvy to take action to protect their market.

A closer look at this suit and the lobbying efforts that have fueled it will expose disturbing realities. Microsoft's competitors do not appreciate that technology consumers are overwhelmingly loyal to Microsoft products. However, instead of committing to production of new products that may allow them to more successfully compete in our free-market, they have banded together and found a way to use outdated anti-trust laws for their own purposes.

The settlement before you is truly a compromise for Microsoft. Certainly, Microsoft will be held to the severe provision of this settlement, not the least of which is the sharing of intellectual property. However, negotiating settlement is the best solution for the technology industry and our economy in general. When this settlement is approved it will send a signal to the technology industry that the threat of government interference has been lifted.

Sincerely,
Senator Steve King

Cliffside Park, NJ 07010
January 28,2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

After three years of seemingly endless litigation, I was frankly relieved to hear that Microsoft had reached a tentative settlement with the Justice Department in November. This settlement is good for consumers and therefore no further action is needed on the federal level.

The terms of the settlement cover many areas and will require numerous concessions from Microsoft. One area of concession is in relation to intellectual property rights. Microsoft has agreed that if a third party's exercise of any options provided for by the settlement would infringe any Microsoft intellectual property right, Microsoft will provide the third party with a license to the necessary intellectual property on reasonable and non-discriminatory terms. And to assure this provision and every other one is followed, Microsoft will be monitored by a three-member Technical Committee.

As a former worker in the tech industry, I understand the importance of Microsoft's products to our economy. Although I did not feel this suit had any merit to begin with, I realize at this point the best development is to move forward. I hope your support for this settlement continues and that the recent suit by AOL will also be terminated. It is not worth the time and money of the Justice Department to continue to pursue these actions against Microsoft, a successful, entrepreneurial company, that has contributed to the success of the U.S. economy and our technological breakthroughs. Without the efforts of Microsoft, the global computer industry would not have the standards and success we witness today.

Sincerely,
Kevin Port

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

In all honesty the Proposed Final Judgment stinks. I disapprove of the tactics uses to get what they want. As one can see, MS, with disregard to the rules put in place, will continue to violate all anti-trust laws. The Proposed Final Judgment is not a panacea to the Microsoft debacle but, in fact, avoids the whole issue altogether.

Undeniably true and accurate, Microsoft is guilty of breaking these laws. Under the final settlement, the DoJ allows MS to retain most of its profits gained through past illegal activities. Therefore, the PFJ will not compensate parties harmed through Microsofts egregious acts.

In addition, the PFJ will not take into account all Microsoft gains made through its illegal maneuverings. With all due respect, the final settlement is basically acknowledging the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? I can assure you that the message is clear and simple.

The PFJ encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. With all due respect your honor, I am outraged at such a preposterous proposal that only helps Microsoft to remain intact and continue with its unethical practices. Thus, I conclude by respectfully submitting my disapproval to this Proposed Final Judgment.

Respectfully,
Mrs. Nimfa Paraso

To Whom it May Concern:

Regarding the Microsoft Settlement, as a recent purchaser of a new computer preloaded with Microsoft XP, I believe that MS has gone too far in automating updates from my personal computer to their system. I see the XP software, attempting to contact MS every time that I am on the internet. I firmly believe that the software should have been designed to request my explicit permission before sending information regarding my personal machine.

Furthermore, I think that MS's exclusive and proprietary relationships are not in my best interest, and prevent the further innovation of many independent software developers. It was very clear to me when loading other software on my XP system, which vendors had not paid the price for MS's exclusive arrangements and were suffering from the dramatic negative messages that I received when trying to load ''unapproved'' software.

If I had known the nature of XP when purchasing my new computer, I would have insisted at the time that the manufacturer supply me with another operating system.

Microsoft was found guilty in this case. They have a history of similar behavior (examples include DR-DOS and Stac Electronics). They are currently targeting Real Networks using similar tactics to the ones used against Netscape.

I do not believe that the proposed final judgement will restrain Microsoft's anticompetitive conduct. It does not appear to do anything to remedy the effects of their past unlawful conduct.

Their current .Net initiative attempts to leverage their desktop monopoly to gain a dominant position online services. They should not be allowed to do this.

Subject: Microsoft Settlement

To whom it may concern:

After having read the provided case documents, I have come to the following conclusion:

The proposed Final Judgement for United States v. Microsoft as currently written fails to provide a concise and enforceable order from the courts. It is inadequate to the task of addressing the needs of the People. Given Microsoft's past history of compliance with court orders, I feel that it's business practices would be difficult to enforce without consequences being written into the Final Judgement.

Such consequences should be related to the grant of monopoly for copyrights and patents. In effect, should Microsoft continue predatory business practices in a monopolistic fashion, then the United States should revoke the grant of copyright to the various versions of Windows software and Internet Explorer, as well as the foundation source code. This code would be then be placed in the public domain. This removes the need for monitoring for compliance and reminds Microsoft that it undertakes business at the discretion of the People of the United States.

Additionally, the issue which is at the heart of the case—what constitutes a computing platform, is clearly left unanswered by the proposed final judgement as written. Without delving into a lengthy argument here, at least recognize that support for open source and public standards by which the Internet emerged is clearly a wise and prudent action which encourages innovation and discourages format lock-in.

For these reasons and many others, I strongly recommend that the court reject this proposed Final Judgement.

Sincerely,
Chris Arsenault

To Whom It May Concern:

As US citizen, I am outraged at our government's prosecution of Microsoft, and I believe the whole antitrust case should be closed. I don't need a paternalistic government to tell me which software I should buy or to use my tax dollars prosecuting companies whose products I enjoy and find immensely valuable. This is not the proper role of government, and such antitrust actions must, by their nature, ultimately be destructive of consumer choice in the marketplace.

Please accept this letter as one citizen's plea for a government that protects me from force and fraud—not from valuable products successfully marketed by successful companies.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I understand the Courts will make their final decision next week on whether the proposed Microsoft settlement benefits the public. I'd like to express my feeling on this issue.

Microsoft did not get off easy. The settlement was arrived at after extensive negotiations with a court-appointed mediator. The Company agreed to terms that extend beyond what was expected in the suit.

They also agreed to design future versions of Windows, starting with an interim release of Windows XP, to provide a mechanism to make it easy for computer companies, consumers and software developers to promote non-Microsoft software within Windows. This mechanism will make it easy to add or remove access to features built in to Windows or to non-Microsoft software. Consumers will have the freedom to choose or change their configuration at any time.

Microsoft really needs to get back to business because they helped the economy far more than they could ever hurt the economy. Let's end the litigation!!

Sincerely,
Jack Gelin

Subject: Microsoft Settlement

I am opposed to the Department of Justice's settlement with Microsoft. I believe it is not in the public interest due to the many loop holes in the settlement agreement. I believe that the nine states which are opposing this settlement are acting in the public interest. I urge the D.O.J. to join forces with these nine states, who are seeking stiffer penalties and safeguards to be imposed on Microsoft. If the D.O.J. settlement with Microsoft is enacted it will allow Microsoft to return to business as usual, which is to abuse it Monopoly position to squash competition and innovation to the detriment of the general public.

Thank you,
Fred Murhammer

To Whom it may concern-

I am writing as a US taxpayer, voter, and citizen to protest the Proposed Final Judgment in the matter of the United States vs. Microsoft antitrust lawsuit.

I do not feel that the solution as proposed either punishes Microsoft for previous anticompetitive behavior, reduce the barriers to entry for vendors other than Microsoft innovating in the field, or inhibits Microsoft from engaging in monopolistic behavior in the future.

A number of well reasoned arguments have been written on the subject, and I won't revisit them here. One good one can be found at: http://www.kegel.com/remedy/remedy2.html I feel that the best way to protect the market without unduly punishing Microsoft shareholders would be to sever Microsoft into separate companies, and require that those companies interact with each other in an above-the-board way. They should use only each others published APIs. There should be clear delineation of the money being spent and earned on individual products. Furthermore I am shocked by the timing of this agreement. The Justice Department has abandoned all attempts to preserve the appearance of enforcing the law. A cynical observer might conclude that the defendant in this case was successful in purchasing influence during the last Presidential election season.

Thank you for your attention.

US Department of Justice Page 1 of 1
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

This letter is to give my support to the Microsoft and Department of Justice settlement. Microsoft is one of our greatest companies and I resent the government interference in what is basically competition between technology companies. I doubt whether Microsoft has done anything that the other firms have not. More likely, the other firms could not compete and have gone crying to the government. They just want a bigger piece of the pie.

You don't have to look any further than AT&T to see the havoc that can result from breaking up certain so-called monopolies. AT&T was deemed a monopoly while we had the best service in the world. Now, no one can understand the half-dozen phone bills received each month from strange sounding phone companies. Phone companies come and go with alarming frequency, and those that stay in business seem to be merging all back together. I often wonder if I would have been better off if AT&T had been left alone.

The same may be true for Microsoft. In any event, Microsoft and the Justice Department have reached an agreement. Microsoft has agreed to open the company up to third party innovation; has agreed to disclose internal source codes for Windows; and agreed to an oversight committee. This is more than fair.

I urge you to give your approval to this agreement.

Thank you for your consideration of my views.

Sincerely,
Bonnie Wood

Subject: Microsoft ''settlement''

Greetings,

I am writing to strongly oppose the terms of the ''settlement'' offer in the Microsoft antitrust case. That Microsoft has violated the law is without question. But the proposed settlement in fact rewards that company for its misdeeds, rather than punishing them. I must remind you that the marginal cost of software is a tiny fraction of its retail price, and therefore the stated monetary value of the cost to Microsoft is far in excess of the actual cost to that company. Furthermore, this ''punishment'' allows Microsoft to expand its market share in education, which has long been one of their weakest markets. In other words, this does not punish Microsoft at all, and in fact rewards their lawbreaking activity, handing them more of a monopoly on a silver platter.

As an administration and political party which prides itself on being ''tough on crime'', I would urge you to not reward Microsoft for commiting a crime whose impact on society is unmeasurable. The nation awaits your decision, and hopes that you will bring about justice in this case.

Introduction

Having examined the proposed consent final judgment for USA versus Microsoft, we offer the following comments. We note at the outset that the decision to push for a rapid negotiation appears to have placed the Department of Justice at a disadvantage, given Microsoft's apparently willingness to let this matter drag on for years, through different USDOJ antitrust chiefs, Presidents and judges. The proposal is obviously limited in terms of effectiveness by the desire to obtain a final order that is agreeable to Microsoft. We are disappointed of course to see a move away from a structural remedy, which we believe would require less dependence upon future enforcement efforts and good faith by Microsoft, and which would jump start a more competitive market for applications. Within the limits of a conduct- only remedy, we make the following observations.

On the positive side, we find the proposed final order addresses important areas where Microsoft has abused its monopoly power, particularly in terms of its OEM licensing practices and on the issue of using interoperability as a weapon against consumers of non-Microsoft products. There are, however, important areas where the interoperability remedies should be stronger. For example, there is a need to have broader disclosure of file formats for popular office productivity and multimedia applications. Moreover, where Microsoft appears be given broad discretion to deploy intellectual property claims to avoid opening up its monopoly operating system where it will be needed the most, in terms of new interfaces and technologies. Moreover, the agreement appears to give Microsoft too many opportunities to undermine the free software movement.

We also find the agreement wanting in several other areas. It is astonishing that the agreement fails to provide any penalty for Microsoft's past misdeeds, creating both the sense that Microsoft is escaping punishment because of its extraordinary political and economic power, and undermining the value

of antitrust penalties as a deterrent. Second, the agreement does not adequately address the concerns about Microsoft's failure to abide by the spirit or the letter of previous agreements, offering a weak oversight regime that suffers in several specific areas. Indeed, the proposed alternative dispute resolution for compliance with the agreement embraces many of the worst features of such systems, operating in secrecy, lacking independence, and open to undue influence from Microsoft.

OEM Licensing Remedies

We were pleased that the proposed final order provides for non-discriminatory licensing of Windows to OEMs, and that these remedies include multiple boot PCs, substitution of non-Microsoft middleware, changes in the management of visible icons and other issues. These remedies would have been more effective if they would have been extended to Microsoft Office, the other key component of Microsoft's monopoly power in the PC client software market, and if they permitted the removal of Microsoft products. But nonetheless, they are pro-competitive, and do represent real benefits to consumers.

Interoperability Remedies

Microsoft regularly punishes consumers who buy non-Microsoft products, or who fail to upgrade and repurchase newer versions of Microsoft products, by designing Microsoft Windows or Office products to be incompatible or non- interoperable with competitor software, or even older versions of its own software. It is therefore good that the proposed final order would require Microsoft to address a wide range of interoperability remedies, including for example the disclosures of APIs for Windows and Microsoft middleware products, non-discriminatory access to communications protocols used for services, and non-discriminatory licensing of certain intellectual property rights for Microsoft middleware products. There are, however, many areas where these remedies may be limited by Microsoft, and as is indicated by the record in this case, Microsoft can and does take advantage of any loopholes in contracts to create barriers to competition and enhance and extend its monopoly power.

Special Concerns for Free Software Movement

The provisions in J.1 and J.2. appear to give Microsoft too much flexibility in withholding information on security grounds, and to provide Microsoft with the power to set unrealistic burdens on a rival's legitimate rights to obtain interoperability data. More generally, the provisions in D. regarding the sharing of technical information permit Microsoft to choose secrecy and limited disclosures over more openness. In particular, these clauses and others in the agreement do not reflect an appreciation for the importance of new software development models, including those ''open source'' or ''free'' software development models which are now widely recognized as providing an important safeguard against Microsoft monopoly power, and upon which the Internet depends.

The overall acceptance of Microsoft's limits on the sharing of technical information to the broader public is an important and in our view core flaw in the proposed agreement. The agreement should require that this information be as freely available as possible, with a high burden on Microsoft to justify secrecy. Indeed, there is ample evidence that Microsoft is focused on strategies to cripple the free software movement, which it publicly considers an important competitive threat. This is particularly true for software developed under the GNU Public License (GPL), which is used in GNU/Linux, the most important rival to Microsoft in the server market. Consider, for example, comments earlier this year by Microsoft executive Jim Allchin: http://news.cnet.com/news/0–1003–200–4833927.html ''Microsoft exec calls open source a threat to innovation,'' Bloomberg News, February 15, 2001, 11:00 a.m. PT

One of Microsoft's high-level executives says that freely distributed software code such as Linux could stifle innovation and that legislators need to understand the threat.

The result will be the demise of both intellectual property rights and the incentive to spend on research and development, Microsoft Windows operating-system chief Jim Allchin said this week. Microsoft has told U.S. lawmakers of its concern while discussing protection of intellectual property rights . . .

''Open source is an intellectual-property destroyer,'' Allchin said. ''I can't imagine something that could be worse than this for the software business and the intellectual-property business.'' . . .

In a June 1, 2001 interview with the Chicago Sun Times, Microsoft CEO Steve Ballmer: again complained about the GNU/Linux business model, saying ''Linux is a cancer that attaches itself in an intellectual property sense to everything it touches. That's the way that the license works,''1 leading to a round of new stories, including for example this account in CNET.Com: http://news.cnet.com/news/0–1003–200–6291224.html ''Why Microsoft is wary of open source: Joe Wilcox and Stephen Shankland in CNET.com, June 18, 2001. There's more to Microsoft's recent attacks on the open-source movement than mere rhetoric: Linux's popularity could hinder the software giant in its quest to gain control of a server market that's crucial to its long-term goals.

Recent public statements by Microsoft executives have cast Linux and the open-source philosophy that underlies it as, at the minimum, bad for competition, and, at worst, a ''cancer'' to everything it touches.

Behind the war of words, analysts say, is evidence that Microsoft is increasingly concerned about Linux and its growing popularity. The Unix-like operating system ''has clearly emerged as the spoiler that will prevent Microsoft from achieving a dominant position'' in the worldwide server operating-system market, IDC analyst A1 Gillen concludes in a forthcoming report*

. . . While Linux hasn't displaced Windows, it has made serious inroads. . .] . . In attacking Linux and open source, Microsoft finds itself competing ''not against another company, but against a grassroots movement,'' said Paul Dain, director of application development at Emeryville, Calif.- based Wirestone, a technology services company*

. . . Microsoft has also criticized the General Public License (GPL) that governs the heart of Linux. Under this license, changes to the Linux core, or kernel, must also be governed by the GPL. The license means that if a company changes the kernel, it must publish the changes and can't keep them proprietary if it plans to distribute the code externally. . .

Microsoft's open-source attacks come at a time when the company has been putting the pricing squeeze on customers. In early May, Microsoft revamped software licensing, raising upgrades between 33 percent and 107 percent, according to Gartner. A large percentage of Microsoft business customers could in fact be compelled to upgrade to Office XP before Oct. 1 or pay a heftier purchase price later on.

The action ''will encourage—'force'' may be a more accurate term—customers to upgrade much sooner than they had otherwise planned,'' Gillen noted in the IDC report* ''Once the honeymoon period runs out in October 2001, the only way to ''upgrade'' from a product that is not considered to be current technology is to buy a brand-new full license.''

This could make open-source Linux's GPL more attractive to some customers feeling trapped by the price hike, Gillen said. ''Offering this form of ''upgrade protection'' may motivate some users to seriously consider alternatives to Microsoft technology.'' . . .

What is surprising is that the US Department of Justice allowed Microsoft to place so many provisions in the agreement that can be used to undermine the free software movement. Note for example that under J.1 and J.2 of the proposed final order, Microsoft can withhold technical information from third parties on the grounds that Microsoft does not certify the ''authenticity and viability of its business,'' while at the same time it is describing the licensing system for Linux as a ''cancer'' that threatens the demise of both the intellectual property rights system and the future of research and development.

The agreement provides Microsoft with a rich set of strategies to undermine the development of free software, which depends upon the free sharing of technical information with the general public, taking advantage of the collective intelligence of users of software, who share ideas on improvements in the code. If Microsoft can tightly control access to technical information under a court approved plan, or charge fees, and use its monopoly power over the client space to migrate users to proprietary interfaces, it will harm the development of key alternatives, and lead to a less contestable and less competitive platform, with more consumer lock-in, and more consumer harm, as Microsoft continues to hike up its prices for its monopoly products.

Problems with the term and the enforcement mechanism Another core concern with the proposed final order concerns the term of the agreement and the enforcement mechanisms. We believe a five-to-seven year term is artificially brief, considering that this case has already been

litigated in one form or another since 1994, and the fact that Microsoft's dominance in the client OS market is stronger today than it has ever been, and it has yet to face a significant competitive threat in the client OS market. An artificial end will give Microsoft yet another incentive to delay, meeting each new problem with an endless round of evasions and creative methods of circumventing the pro-competitive aspects of the agreement. Only if Microsoft believes it will have to come to terms with its obligations will it modify its strategy of anticompetitive abuses.

Even within the brief period of the term of the agreement, Microsoft has too much room to co-opt the enforcement effort. Microsoft, despite having been found to be a law breaker by the courts, is given the right to select one member of the three members of the Technical Committee, who in turn gets a voice in selecting the third member. The committee is gagged, and sworn to secrecy, denying the public any information on Microsoft's compliance with the agreement, and will be paid by Microsoft, working inside Microsoft's headquarters. The public won't know if this committee spends its time playing golf with Microsoft executives, or investigating Microsoft's anticompetitive activities. Its ability to interview Microsoft employees will be extremely limited by the provisions that give Microsoft the opportunity to insist on having its lawyers present. One would be hard pressed to imagine an enforcement mechanism that would do less to make Microsoft accountable, which is probably why Microsoft has accepted its terms of reference.

In its 1984 agreement with the European Commission, IBM was required to affirmatively resolve compatibility issues raised by its competitors, and the EC staff had annual meetings with IBM to review its progress in resolve disputes. The EC reserved the right to revisit its enforcement action on IBM if it was not satisfied with IBM's conduct.

The court could require that the Department of Justice itself or some truly independent parties appoint the members of the TC, and give the TC real investigative powers, take them off Microsoft's payroll, and give them staff and the authority to inform the public of progress in resolving compliance problems, including for example an annual report that could include information on past complaints, as well as suggestions for modifications of the order that may be warranted by Microsoft's conduct. The TC could be given real enforcement powers, such as the power to levy fines on Microsoft. The level of fines that would serve as a deterrent for cash rich Microsoft would be difficult to fathom, but one might make these fines deter more by directing the money to be paid into trust funds that would fund the development of free software, an endeavor that Microsoft has indicated it strongly opposes as a threat to its own monopoly. This would give Microsoft a much greater incentive to abide by the agreement.

Failure to address Ill Gotten Gains

Completely missing from the proposed final order is anything that would make Microsoft pay for its past misdeeds, and this is an omission that must be remedied. Microsoft is hardly a first time offender, and has never shown remorse for its conduct, choosing instead to repeatedly attack the motives and character of officers of the government and members of the judiciary.

Microsoft has profited richly from the maintenance of its monopoly. On September 30, 2001, Microsoft reported cash and short-term investments of $36.2 billion, up from $31.6 billion the previous quarter—an accumulation of more than $1.5 billion per month.

It is astounding that Microsoft would face only a ''sin no more'' edict from a court, after its long and tortured history of evasion of antitrust enforcement and its extraordinary embrace of anticompetitive practices—practices recognized as illegal by all members of the DC Circuit court. The court has a wide range of options that would address the most egregious of Microsoft's past misdeeds. For example, even if the court decided to forgo the break-up of the Windows and Office parts of the company, it could require more targeted divestitures, such as divestitures of its browser technology and media player technologies, denying Microsoft the fruits of its illegal conduct, and it could require affirmative support for rival middleware products that it illegally acted to sabotage.

Instead the proposed order permits Microsoft to consolidate the benefits from past misdeeds, while preparing for a weak oversight body tasked with monitoring future misdeeds only. What kind of a signal does this send to the public and to other large corporate law breakers? That economic crimes pay!

Please consider these and other criticisms of the settlement proposal, and avoid if possible yet another weak ending to a Microsoft antitrust case. Better to send this unchastened monopoly juggernaut a sterner message. 1 http://www.suntimes.com/output/tech/cst-fin-micro01.html ''Microsoft CEO takes launch break with the Sun-Times,'' Chicago Sun Times, June 1, 2001.

Subject: ''Microsoft Settlement''

Gentlemen:

URGENT REQUEST!!!

Three years ago, the U. S. Department of Justice charged Microsoft with having engaged in anti-competitive behavior based on allegations by its top competitors. I feel that Microsoft was singled out in this action taken, and now I realize that The Justice Department is in the final stages of deliberating on the proposed Microsoft settlement to decide whether to accept the settlement or to litigate it further.

Personally, I believe that the proposed settlement offers a reasonable compromise that will enhance the ability of seniors, like myself, and all Americans, as well, to access the internet and use innovative software products to make their computer experience easier and more enjoyable. I am e-mailing you at this time to request that you not allow Microsoft's competitors to undermine the settlement negotiated with the federal government and nine states; although, the settlement is tough on Microsoft as it is, I feel it is a fair outcome for all parties concerned particularly senior consumers. I feel that it not only will benefit the seniors, but this settlement more importantly will have a very positive impact on the American economy and will help to pull the Country from the jaws of recession in which we have been experiencing over the past year.

I feel that consumer interests have been served well, and that now the time has come to end this costly and damaging litigation. Continuing with this legal battle further will only benefit the wealthy competitors, lawyers, and special interest groups.

Please do not litigate this matter further, and go ahead and accept the settlement for the betterment of the public interest; all the Country.

Sincerely,
Lettie Ann Poe

Dear Judge Kollar-Kotally-

I implore you to reconsider the guidelines set forth in the Proposed Final Judgment. Most honorable one, please analyzes the true facts in the final settlement and judge

accordingly. In the past week it has been brought to my attention a most astonishing development in the MS case. A Final Settlement has been reached between the two parties. However, based on the details provided to me, the PFJ overturns findings by the U.S. Court of Appeals indicts Microsoft on violating antitrust laws. After further review of the proposed settlement I find it hard to believe the Justice Department would withdraw their charges against Microsoft. In fact, based on the assessments made on the proposal, Microsoft will go scotch free from any charges of wrong doing in the matter. How can this be?

There are several glaring flaws in the PFJ. However, non-so more apparent than allowing an absentee landlord to govern Microsoft. With all due respect, the final settlement provides no security to restrict MS from breaking any laws in the future. In my humble yet accurate opinion, the future governing body, implementing certain rules or regulations and forcing MS to adhere by them, will not be stringent nor forceful enough to make any dramatic changes.

Similarly, I am not convinced that these stiff penalties applied to MS will ensure the security and future growth of other companies. A stiffer penalty and a whole new framework of laws must be established to justly punish MS. The Proposed Final Judgment abstains from such justification and order. I conclude therefore by objecting to the Proposed Final Judgment.

All the Best,

Attorney Hesse:

I am emailing to urge the approval of the settlement of the Microsoft antitrust case. The DOJ, Microsoft and the Attorney Generals that have signed onto this case deserve enormous credit for finding a way to settle this case.

Our economy is the envy of the rest of the world because we have created a successful free-market based competition. As with any competition there are winners and losers. Microsoft has been the leader of the software industry for so many years because they create good products at a decent price. The people who run this company have worked hard to achieve this and work even harder to protect the companies leading status.

While there are those who believe Microsoft has engaged in unfair practices and even harmed consumers, I fail to see where this has been proven over the last 4 years of this case. I believe that many of those involved in this case have come to see it is a losing battle. Microsoft will not be broken up.

Settleing this case is the right thing to do.

Respectfully,
Grant Young

8 Domidion Court
Middletown, New Jersey 07748
January 3, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

I am writing you to express my belief that the time has come to end the Microsoft antitrust case. The Justice Department's proposed settlement plan should be implemented immediately.

I believe the plan is more than fair from the complainants'' standpoint. The procedures and policies Microsoft will adopt exceed the original demands of its competitors. Microsoft will have to share code, change marketing and licensing practices, and submit to government oversight. The company will open itself up to more than mere market competition; it will be required to aid its competitors. This is more than sufficient.

This company should be allowed to return to the business of developing and producing the world's most accessible computer systems. It's time to end this case.

Sincerely,
Stephen Calandrino

Ms. Renata B. Hesse, Antitrust Division
601 D Street NW, Suite 1200
Washington, DC 20530–0001
Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough.

Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user.

This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

Sincerely,
Americo Cardillo

Subject: Microsoft Settlement

Hello,

I understand you are collecting comments on the proposed Microsoft settlement under the provisions of the Tunney Act. Please count me as an interested party (consumer and citizen) who is OPPOSED to the settlement as it currently stands.

I would like to see the settlement re-negotiated with terms that are more carefully selected to protect competitors to Microsoft and especially to change the provisions that could potentially allow Microsoft to inhibit competition from non-commercial software projects such as the Open Source software available on the GNU/Linux platform. As a Monopoly, Microsoft must be actively restricted from tilting the proverbial ''level playing field'' by their legal and marketing influences. I do not think the current settlement proposal does enough to assure a fair competitive environment.

Thank you,

January 28, 2002

TO: Renata B. Hesse

U.S. Department of Justice

In 1976, I purchased a computer to use in my business. It was an IBM and I was forced to use their proprietary ''operating system.'' Application programs for this computer were limited as to vendors because each vendor had to develop their software for use on a specific machine or operating system.

When Microsoft entered the scene, they utilized an ''open architecture'' approach allowing their ''operating system'' to utilize any brand of computer. Because their ''operating system'' was not specific to a particular hardware brand, the soffware application developers were able to write application programs that would work on any computer running the DOS operating system. Because of this ''open architecture'' we consumers were given the choice of many more computer hardware manufacturers, rather than being limited to the manufacture's computer that ran our intended application.

There are several operating systems available that offer an alternative to MS DOS or Windows. Microsoft has been a boon to the small business computer user and to the U.S economy as well.

The government's antitrust activities directed at Microsoft has damaged our economy to a much greater extent than leaving Microsoft to the forces of a free market.

I believe in free markets and I am convinced that a new competitor would have eventually developed a challange to Microsoft by offering a viable alternative.

It is time for the government to stop pursuing this destructive course of antitrust prosecution.

Accept the settlement and let the industry move forward.

Thank you for taking the time to listen to my concerns.

Dear Judge Kollar-Kotally,

I oppose the proposed resolution in the MS case, better know as the Proposed Final Judgment. Over and above the usual economic risks presented by an unchecked monopolist—rising prices and monochromatic innovation the nations computer infrastructure will be increasingly vulnerable to attack if a single software system predominates.

Obviously I am referring to Microsoft.

Suppose that 80 or 90percent of the world's grain supply came from a single variety of corns. We would be faced with the unacceptable risk that some single disease, might wipe out an enormous portion of our food supply. Having only one kind of operating system or one kind of browser would make it terribly easier for saboteurs to bring the entire Internet to its knees. For one entity, such as Microsoft, to control 80 to 90 percent of the market for PC operating systems, Internet browsers, e-mail readers, and office productivity software is clearly a significant security risk. To then allow that monopoly to actively attempt to drive out its remaining competition would hardly be in the public interest. Diversity is the key in producing economic prosperity and improving the society as a whole.

It's now up to you, Judge Kollar-Kotally, to decide whether the proposed settlement between Microsoft and the DoJ is a correct and just solution. However I believe it contains too many loopholes to create the desired effect, changing MSs behavior, let alone bring forth a certain types of diversity which would enhance our security.

Subject: Microsoft Settlement

As a professional developing both computer hardware and software, I feel that the proposed DOJ settlement with Microsoft will not prevent Microsoft from continuing to act contrary the the best interest of the public.

In particular, non-profit organizations are particularly harmed by allowing Microsoft to refuse cooperation. If non-profit organizations developing software for free distribution are not in the public interest, what is ? Microsoft became the unstoppable behemoth that it is today through unsavory and illegal commercial tactics. It must be held accountable and punished.

The proposed DOJ settlement appears to be written by Microsoft, for Microsoft.

Please strike down this proposal, and continue to pursue a solution which adequately addresses past Microsoft actions, and prevents future abuses.

Sincerely,
John A. Watlington

Subject: Microsoft Settlement

As I'm sure many have pointed out, the current settlement is deficient for many reasons. I would like try to summarize the most important issues as I see them:

Microsoft was found to be a monopolist due to the applications barrier to entry. Microsoft has shown itself very adept at leveraging it's desktop monopoly to creating barriers to entry, as well as defending that desktop monopoly. Therefore an effective settlement must take into account that the monopolist is strong, smart, unrepentant, and resistant to any measures that diminish it's control.

The necessary and sufficient remedy to a monopolist is the possibility for competition in this case, several things would be helpful to allow this to occur:

1) Microsoft must lack the ability to use intellectual property protection (patents, trade secrets, etc.) to prevent —any— entity (company, open source coalition, etc.) to create and distribute (in any way they choose) their own implementation of Microsoft functionality in any of their products. In other words, they must not be allowed any means to stop another entity from creating and distributing their own implementation of anything they want.

2) Microsoft must expose the functional specifications of all of their products so that others could implement them. This includes protocols, file formats, APIs, etc. It should also include all information it's own developers have regarding future directions. I should emphasize that I believe that Microsoft has a right to keep secret their own implementation. Requiring the monopolist to publish the source code to all of their software (without granting the license to copy or compile it) would be effective, but would go too far in my opinion.

3) Microsoft should be prohibited from using their PC desktop monopoly to promote (in any way) other business initiatives. Eastman Kodak's experience with their photo software is telling cautionary tale on this point. As is AOL's/Real's struggles with the MS media player. In particular, the control Microsoft aims to obtain with passport is in need of very close scrutiny. Any effective settlement should prevent the monopolist from approaching these or other initiatives in this manner.

4) Any settlement should prohibit Microsoft from taking any action that discourages alternative desktop operating system adoption. A particularly egregious examples is the rumored OEM license agreement prohibiting the ability to boot to other operating systems if a Microsoft operating system is also present. This works

to prevent Dell, Gateway, etc. from giving the public an option to have a PC that would multiboot BE, Linux, etc. in addition to windows. Clearly this helps the monopolist maintain it's monopoly, but hurts consumers. Another example would be discontinuing existing support of on alternative platforms. Microsoft should be prohibited from, for example, releasing windows versions of MS Office without simultaneously releasing a Mac version. I would not go so far as to say that they should be forced to release a Linux version of Office, but that would be nice (and I'd buy it if they did even at full retail of $500 or whatever they are charging these days).

5) Because the harm they cause is hidden in secret agreements, Microsoft should be prohibited from keeping secret any contracts they enter into.

They should all be available for public review.

I believe that Microsoft would balk at any settlement that effectively addressed any of these points. That they object should not be of any concern to the public or justice because they benefit from intellectual property laws (cf their BSA campaign). As they have built their corporation on the benefit of these laws and have been found to have gone too far and become a monopoly, they must be subject to measures that could not be fairly applied to an entity that had not violated the law to the detriment of consumers. I do not expect them to take kindly to the notion that they must compete on price and quality alone, but it would be of great benefit to consumers, innovation, and the global economy if they had to.

I urge the Department of Justice to ensure that any settlement effectively address these concerns.

Thank You,
Philip Long

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Attorney General Ashcroft:

I was pleased to hear that the Department of Justice and many of the states decided to settle the Microsoft antitrust case. I would like the judge handling the case to approve the settlement.

In my opinion, this case should never have been brought against Microsoft. Through hard work and innovation, Microsoft has changed our world for the better. Microsoft has broken the inter-operability barrier and operational obfuscation that the likes of IBM, Sperry-Rand, Digital Equipment Corporation, Varian, ATT and others carefully nurtured prior to the 1980's.

For this, Microsoft is being punished under the guise that they have engaged in anti-competitive behavior. Do you remember the way ATT handled the release of the original Kernigan and Ritchy UNIX into the public domain and the antics of the ''UNIX Consortium''? That was anti-competitive behavior. Nothing breeds contempt like success. However, in the interest of wrapping up this suit, I support Microsoft's decision to be bound by the terms of the settlement agreement.

Microsoft has gone so far as agreeing to disclose to its competitors various interfaces internal to the Windows operating system. As a development systems engineer, I find nothing inhibiting about the public interfaces. They have also agreed not to take action against those who violate Microsoft's intellectual property rights. Similarly, they will not take action against computer manufacturers who ship computers containing the competition's software.

Settling this case is in the best interests of all involved. I urge the Court to approve this settlement agreement. Thank you.

Sincerely,
Peter Olend

January 27,2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

Approval of the Microsoft case settlement will be in the best interests of America. The case has gone on long enough for the parties to state their cases and present their evidence. Also, the settlement addresses all the issues in the litigation and goes beyond the scope of the litigation. The parties could agree to terms beyond the litigation, but the judge would be restricted to only the formal issues. So, the settlement is better than anything even the judge could do. What is more, the settlement means that there would be no time consuming and potentially derailing court proceedings. The economy does not have stability needed for growth when one of America's leading industries is in an unsettling wrangle.

The settlement will provide greater flexibility, cooperation and stability within the information technology industry. Microsoft will open up its business practices and software code. A committee of technically skilled and recognized software engineering expert parishioners will see that the terms are followed and hear and investigate any complaints.

Enriching our legal system further is counter productive to expanding businesses. A one time legal business charge this past year, of 2/3 of a billion dollars to defend itself from its own government, is outrageous. The U.S. government is very concerned about what Enron did to their employee's retirement funds and they should be. But on a much larger scale, the government should look at what their actions did to the Microsoft stockholders'' retirement funds.

We look forward to your leadership of bringing the Gov. vs. Microsoft's legal case to an end and focus on the real threat against the U S.- the terrorist.

Thank you.
Sincerely,
Steve and Suzanne Orton

I believe that the Proposed Final Judgement in the Microsoft case is flawed, principally because it allows continued ''bolting'' of non— integral software to the Windows operating system, in such a way as to minimize the opportunity for other (non -Microsoft) competing products in the market space for these types of non—integral software. Competitiveness and the American economy are not served by allowing Microsoft, in spite of the Judges'' ruling that they had acted unlawfully, to continue these practices.

Dear Judge Kollar-Kotally,

I am opposed to the back-room deal cut between Microsoft and the DoJ. Several close friends and relatives have informed of this matter entailing a proposed settlement, notoriously understood as the Proposed Final Judgment. Truthfully from where I sit, I dont like what I see.

I cant believe the Justice Dept. threw out all court findings indicting Microsoft for all illegal activities. First of all the Proposed Final Judgment grants MS a government mandated monopoly that threatens to destroy any and all serious Microsoft competitors. Im all for free enterprise and what it symbolizes. To strike a huge blow against the spirit of free enterprise, one need not look any further than to allow MS to monopolize every sector, whether it is the gaming industry or the

software industry, by eradicating most if not all competitors. By all means diversity is one essential ingredient in maintaining a healthy industry and more importantly a thriving economy.

I submit my disapproval to the Proposed Final

Judgment.

MTC–00028333

From: Argo, Rich W.
To: Microsoft ATR
Date: 1/28/02 2:10pm
Subject: Microsoft Settlement

I believe that the proposed settlement is a bad idea.

First and foremost, the proposed settlement primarily deals with Microsoft's dealings with OEMs. While this is a start, it does not go nearly far enough.

It also does not appear to enable OEMs to ship a PC with no operating system on it at all. Many users wish to install Linux, FreeBSD or many other free and open source operating systems and should not be forced to pay for an operating system that they do not want to use.

Furthermore, additional provisions need to be implemented in the settlement that will force Microsoft to make versions of Microsoft Office available for the 3 most popular desktop operating systems Currently that would be Linux, Macintosh and Windows. Currently Microsoft only produces versions for Windows and Macintosh. Macs aren't used in the business world very much and are more expensive relative to Intel-based PCs—which is what Microsoft Windows runs on. If there was a version of Office available for Linux, there would then be a choice for consumers that use Intel processors. This would open up competition for operating systems on the Intel processing platform as many businesses are reluctant to switch to another OS since they may not be able to run Office applications. In order to help enforce the spirit of this proposal, provisions would have to be implemented to force Microsoft to release versions of Office concurrently on all platforms.

Additionaly, all Windows API's should be open so that competitors that wish to produce software for Windows would be allowed to compete fairly with Microsofts products. All Microsoft Office file formats should be standardized with an open API so that anyone wishing to compete with an Office-like package could do so fairly.

Microsoft should not under any circumstances be allowed to ship any additional Microsoft software product free of charge along with their Windows operating system. The only exceptions to this rule should be utilities such as Notepad, WordPad and the various command line utilities that currently ship with Windows. Internet Explorer should not ship as a free part of Microsoft Windows. Neither should Microsoft Money. No Microsoft software that competes with another software product should be included with the operating system. If other competing products are offered for download for free from competitor's sites, then Microsoft should be allowed to offer free downloads for those kinds of products, but should not be allowed to ship those with the operating system. If they are allowed to do so, they are unfairly extending their monopoly power. If Microsoft so wishes to ship a software product in with their operating system, they should have to submit that request to a third party committee that would vote on whether or not to allow said inclusion, but only after a 90 day period whereby anyone wishing to protest said inclusion is given the opportunity to do so before the committee in person, via email or paper mail.

If Microsoft is found to have violated any part of the settlement they should be fined a minimum of $1 billion. On the surface, this may sound like an exorbant amount. However, nothing short of this will likely prevent Microsoft from violating the settlement and adequately punish them if they do.

Thank you,

Richard W. Argo

MTC–00028337

From: satteson@pclink.com@inetgw
To: Microsoft ATR
Date: 1/28/02 2:27pm
Subject: Microsoft Settlement

I'm writing to express my reservations about the proposed settlement of the anti-trust case between the United States (as represented by the Justice department) and Microsoft Corporation. I speak as a concerned citizen with broad and significant computing experience. I've used computers in various capacities for over twenty years and have worked with half a dozen different operating system families, including the complete Microsoft family of products from MS-DOS to XP. I also have wide experience with many computer applications from both Microsoft and other parties.

I have provided network and systems administration of Microsoft and Linux systems on a part-time basis and rely on secure and stable computing environments in my primary occupation as a research and development consultant to startup medical device companies.

The proposed settlement offers insufficient redress of Microsoft's previous wrongs and provides too little protection from this company's ongoing anti-competitive practices. While a just settlement should address Microsoft's past practices, I am more concerned that a settlement provide adequate protection to consumers, competitors, and indeed the economy as a whole, from

Microsoft's ongoing and likely future anti-competitive practices.

With the release of it's latest, highly-integrated operating system product, XP, Microsoft has demonstrated that it has no intention of voluntarily curbing the sorts of predatory anti-competitive practices that have enabled it prosper at the expense of competitors and consumers alike. In my experience, succeeding generations of Microsoft operating system products have integrated increasing numbers of middleware applications, and the configuration tools needed to replace these applications with third party products have become more obscure and less effective, locking many consumers into a monolithic, Microsoft-only environment.

The lack of choice implied by Microsoft's monolithic model of computing is contrary to the workings of free market enterprise and is ultimately harmful to consumers. It is apparent that this trend has the goal of maintaining and expanding Microsoft's dominant position in the desktop computing marketplace.

The unnecessarily tight integration of middleware applications into its operating system products is far from the only illegitimate tool that Microsoft has used to dominate the desktop market in the United States. Microsoft has plausibly been accused of: extorting exclusive installation of its products on computers by OEM manufacturers via differential pricing, of corrupting open software standards to gain exclusive access to important domains of computing, and waging so-called FUD (fear, uncertainty and doubt) campaigns against competitors and consumers. An appropriate settlement would address not only the particulars of continued forced, artificial integration of its products but as many of the other tools against free competition that Microsoft has been using as is possible. It is bad public policy and poor economics to allow a single entity to maintain its position in the marketplace via unfair and illegal practices. Among the particular adverse effects of Microsoft's continued anti-competitive behavior are: stifled innovation, corruption of the marketplace, deterioration of the United State's position in the world's information technology economy and unnecessary security vulnerabilities.

Though Microsoft claims to be a leader in innovation, the record suggests that it is instead a follower (or perhaps a gatekeeper) of innovation. The Netscape saga illustrates this point. Microsoft failed to take the internet and its potential seriously until web's usefulness and the great value of effective browser technology were demonstrated by Netscape. Once Netscape was too successful to ignore, Microsoft used all of the anti-competitive tools at its disposal to neutralize Netscape. If Microsoft is allowed to escape effective punishment for this infraction, it will continue its current practices and will be a brake on rather than an engine of innovation. This result would be a loss for everyone, except perhaps Microsoft.

The stifling of innovation is just one of many symptoms of the market distortion created by Microsoft's all too effective use of anti-competitive tactics. There are a number of other ills created by this induced market failure, the most obvious of which are increased prices and lower product quality. Indeed, Microsoft has managed to defy the trends toward lower price and higher quality that typify all other aspects of the computer industry. As hardware has become ever more capable and less expensive, the cost of the software provided by Microsoft has remained high and improvements in quality have been slow and ''grudging'' at best. An overall effect of these opposing trends has been that Microsoft has been able to garner an increasing, and I would say, excessive fraction of every dollar spent on computers. Microsoft is richly rewarded by the market distortions that it has been able to engineer. It is time for these distortions to come to an end, and for the market to freely assert itself. Then the winners will be not only the consumers, who will get better quality at a lower price, but other hardware and software producers who will be able to command a more equitable share of the revenues from their products.

In the long run, Microsoft's illegitimate domination of the domestic information technology (IT) market threatens the United States'' preeminent position in the international IT marketplace. Though Microsoft has a global reach, it is clear that its market power is neither as pervasive nor as potent as it is domestically. Because these overseas markets are less burdened by Microsoft's stifling anti-competitive practices, they can be more efficient and innovative. If this disparity is allowed to persist, it is likely that the United states will suffer an erosion of its now strong position in the world IT economy. The best way for the United States to prevent this deterioration is to open the domestic market to free and fair competition by preventing Microsoft from exerting its anti-competitive tools to distort the domestic IT market.

Microsoft has a history of using its market dominance to gloss over security problems with its products. Rather than act quickly to patch and publicize its security vulnerabilities, Microsoft uses all means at its disposal to suppress news of and information about its security problems. This ''security through obscurity'' approach is well know to be one of the worst possible responses to computer security problems; it leaves the computing community open to security problems for much longer than is necessary. It is typical for weeks or even months to pass between the discovery of a Microsoft security flaw and the company's issuance of a proper security patch. This poor security behavior is completely unacceptable in the face of the heightened security concerns following the events of September 11. Though Microsoft has recently paid lip service to improving the security of its products, it has shown no inclination to replace its antiquated and dangerous security model with a more open, proactive and effective model. Indeed, its recently issued code of security ethics for Microsoft professionals calls for strict adherence to the security through obscurity model. This code dictates that these professionals'' paying customers be kept in the dark regarding security vulnerabilities until such time as Microsft deems it appropriate to reveal the problem. Microsoft's bad citizenship in regard to security is dangerous and should not be tolerated. A properly formulated settlement of the current case should include measures to force Microsoft to follow a more appropriate security model.

Microsoft's anti-competitive practices are not merely illegitimate and contrary to the principles of market capitalism and free enterprise, they greatly harm the American people in a significant number of concrete ways. The proposed settlement fails to address these ills in any meaningful sense. It needs to be reformulated to provide appropriate and strong protection of the market and the people from Microsoft's rapacious and counterproductive practices. A strong and effective settlement would not only serve the cause of justice, it would preserve an important sector of the United States'' economy from unnecessary harm.

It is imperative that the Justice department act in a wise and decisive manner and prevent Microsoft from continuing to isolate itself from market discipline via unfair and illegitimate means.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I object to the so-called Proposed Final Judgment in to Microsoft case.

As every one knows, Microsoft continues to violate anti-trust laws set in place many years ago. The Proposed Final Judgment goes against all logic. Previously the US Court, has found Microsoft guilty of breaking the anti-trust laws. However, under the proposed final settlement, MS is permitted to retain most of its profits gained through their illegal activities. The PFJ will not compensate parties injured by the Microsoft debacle.

The PFJ does not take into account all Microsoft gains made through its illegal maneuverings. The final settlement basically acknowledges the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? Do you think the public will be in favor of such a move?

The PFJ encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. With all due respect your honor, I am outraged at such a preposterous proposal that only helps Microsoft to remain intact and continue with its unethical practices. Thus, I object to this

Proposed Final Judgment. It solves nothing in the matter.

Sincerely,
Simplicio, Tualla Jr.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

For nearly four years now, the Microsoft antitrust case has been mired in the federal courts. Finally, after six months of negotiation, Microsoft and the Department of Justice were able to reach an agreement, and in November, their settlement was proposed. That settlement is currently pending approval. Next week, the courts will reconvene and determine whether the settlement serves the best public interest. I ask you, Mr. Ashcroft to support the finalization of the settlement.

Microsoft and the Justice Department have agreed on a wide variety of terms and conditions, all of which are aimed at preventing monopolistic behavior and restoring a competitive balance within the technology market. For example, Microsoft has agreed not to enter into any contracts wherein a third party is compelled to distribute or endorse Microsoft software either exclusively or at a fixed percentage. Microsoft also plans to reformat future versions of Windows so that competitors will be able to introduce their own products directly into the Windows operating system. This will enable computer makers and software developers to use Microsoft as a springboard to launch their own software.

I do not believe that further action against Microsoft needs to be taken on the federal level. In fact, it is likely that extended litigation could be detrimental to an already damaged economy. I ask you to support the finalization of the settlement.

Sincerely,
Jason Walker

Lets'' do what is good for the Country and put this litigation behind us.

Time to MOVE ON! I know, AOL and other competitors of Microsoft would love to have Microsoft destroyed, broken up, have all there software coding made public, and all there money taken away. After all, there main crime was competing and being better and smarter than everyone else. Whatever crime thy did commit had nothing to do with them being successful. The Public chose them over Apple, and many other Operating Systems years age because the provided a great produce that worked with a lot of different hardware, which allowed the price of a PC to be affordable. They and there work has only benefited the public, the US economy, and most of Microsoft's competitors. After all, Where would AOL be today if no Microsoft? Do we want to distort the marketplace and get rid of Microsoft? What does this tell the next Microsoft? Don't be too successful or the government will get rid of you. Is this what the free enterprise system is all about? A monopoly is the result of good business moves against bad business moves. This is All about Microsoft's competitors wanting the Government (States and Federal) to do what they couldn't, which is compete.

Thanks,
Richard Deno

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

The Department of Justice and Microsoft have finally reached a decision ending the three-year-long antitrust suit against the company. I want to add my support to this settlement. It has gone on for far too long. We are trying very hard to come out of a economic downturn, which I think was precipitated by the lawsuit, and we need to focus on more important matters than nitpicking over what should be the final decision in the Microsoft lawsuit.

Microsoft has also been more than accommodating with the demands from the Justice Department. Microsoft has agreed to a technical committee to oversee future compliance (consisting of software engineers, not lawyers); Microsoft has agreed to a uniform price list; Microsoft has agreed to internal interface disclosure; Microsoft has agreed to open the company up to third party innovation. This is more than fair.

I urge you to give your support to this agreement.

Sincerely,
Melvin Young

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft,

Microsoft's behavior is such that due to their size and capitalization, they can and will dominate any market they choose. Recently, they decided to compete directly with their ''Microsoft Partners'', firms who integrate and install Microsoft networks by essentially offering the same technical services that firms such as ours do. It is only in the last couple of weeks that Microsoft has rescinded their push to compete with us, primarily, I belive, because they would like us to support them in their fight with the Department of Justice. If this letter is read by Microsoft, I am sure that our business involving their products is toast.

The settlement with Microsoft is a joke. If anything it will tighten Microsoft's hold on the computer market, increase prices and make the US less competitive in the world market.

January 28, 2002

To Whom it May Concern,

I am writing to express my very strong concern about the nature of the settlement proposal in the DOJ case against Microsoft. I believe that the settlement has major flaws and will do nothing to limit Microsoft in its future attempts to quash competitors in the IT industry.

My work is in IT for a non-profit organization. I use computers daily, including Microsoft products. I do not think Microsoft is ''evil'' but I am greatly

concerned that the company has shown an ongoing history of using its monopoly position to overtake and overwhelm competitors. Microsoft's ''shadow'' on the software and IT industry is huge. They have the ability to out-spend and out-last almost all of their competitors, and if they don't do that, they try to buy them out. With their new products such as Windows XP, Xbox game console, PocketPC handheld computers, they continue the same behavior.

I am not a person that usually writes letters such as this, but because of my involvement in the IT industry and the importance for the future, I felt compelled to write. The recent events with Enron only highlight more fully to me that the US Government has a definite oversight responsibility in industry. I do not believe that market forces alone will protect against abuse. Microsoft has been found to be a monopoly that misuses its position to protect and grow its markets. That behavior must be stopped. Please reconsider the decision and make strong, enforceable structural changes in Microsoft for the good of consumers and the industry. The US Government dealt with monopolistic issues with IBM and the industry did not disappear. Neither did IBM. I believe that the entire computer industry will be better off with a stronger penalty for Microsoft.

Sincerely yours,
William W. McLendon, Jr.

Subject: microsoft settlement

In regard to the settlement between Microsoft Corporation and the Department of Justice: On the findings of the District Court and the Court of Appeal, the settlement is no more than a gift from the DOJ to Microsoft, giving it the right and power to continue its monopolistic and predatory practices in spite of the above- mentioned legal judgements. In fact, its monopoly power would be effectively increased by the failure to require anything which would restrict the ability of XP, Hailstorm, and Microsoft's other current releases to control the user's access to the Internet and the World Wide Web and prevent any other competing innovative products from obtaining a foothold. A radical modification of what appears to be a shameful collusion to allow Microsoft to continue business as usual in defiance of the legal judgements of the courts is imperative for the continuance of free development, innovation, and entrepreneurship in this country (and even to some extent in the developed world).

I strongly believe that Microsoft and the American public deserve a fair, equitable, and timely settlement of the Microsoft dispute. Microsoft is the firm that ''got their first'' and through their innovative technologica and economic skills built the business that exists today. The entire technological industry is exploding now and growth has it's own momentum. Much of it is due to Microsoft that got the ball rolling. Now is the time to quit the haggling and let Microsoft get on with its business, unencumbered by repeated challenges.

I became a small stockholder in the 1980's because my intuition told me they were on track. They had the key that opened the door then, and I believe they still are a wonderful example of American ingenuity in an open market. Have me become a nation that punishes the successful? I hope not.

Subject: To the District Court: Microsoft Antitrust case...
January 28, 2002
Honorable Court Officials,

I am writing today because I have been made aware of the Tunney Act permitting public comment on the proposed settlement between the U.S. Department of Justice and Microsoft Corp.

I strongly believe that the proposed settlement does little or nothing to curb the anticompetitive practices of which Microsoft has been found guilty. In particular, the settlement doesn't resolve the issue of software bundling, which is a fundamental part of the case against Microsoft. Under the terms of the settlement agreement, Microsoft will essentially be given carte blache to include whatever software components they desire into the Windows system which is pre-installed on approximately 90% of computer systems sold, and which has been shown to have a monopoly market. This permits them to continue to use their operating system monopoly to create monopolies in new markets, directly counter to antitrust law.

Microsoft has, in the face of legal action, monopolized the internet browser market, and is in the process of creating a monopoly in audio-visual software with Windows Media Player. The new Windows XP operating system requires users to register with Microsoft. This is just the first part of a plan to maintain a comprehensive database of almost all computer users. It will then be used to monopolize internet commerce using the .NET and Passport services being deployed by Microsoft. This is all being done with blithe disregard to the antitrust findings made by the U.S. court. This attitude (being above the law) was plainly evident in the demeanor of Bill Gates during the trial. Microsoft has preferred to spend vast quantities of money to make the case go away, mostly playing a game of delaying tactics. I feel this settlement gives them exactly what they want, and is antithetical to any concept of fairness.

Microsoft will probably try to ''stuff the ballot box'' with comments in favor of the settlement. It is a well known Microsoft tactic to use pseudo-'grassroots'' marketing efforts on internet newsgroups and bulletin boards, and I expect them to do that in this instance. I urge the court to see through this underhanded scheme and make a decision based on logic, precedent and fairness.

I am a computer user who uses several different systems: Macintosh, Linux and Windows, and I am deeply concerned about the future and what choices we consumers will have. Thank you very much for your time. I'm confident you will do the right thing.

Introduction

Having examined the proposed consent final judgment for USA versus Microsoft, we offer the following comments. We note at the outset that the decision to push for a rapid negotiation appears to have placed the Department of Justice at a disadvantage, given Microsoft's apparently willingness to let this matter drag on for years, through different USDOJ antitrust chiefs, Presidents and judges. The proposal is obviously limited in terms of effectiveness by the desire to obtain a final order that is agreeable to Microsoft.

We are disappointed of course to see a move away from a structural remedy, which we believe would require less dependence upon future enforcement efforts and good faith by Microsoft, and which would jump start a more competitive market for applications. Within the limits of a conduct-only remedy, we make the following observations.

On the positive side, we find the proposed final order addresses important areas where Microsoft has abused its monopoly power, particularly in terms of its OEM licensing practices and on the issue of using interoperability as a weapon against consumers of non-Microsoft products. There are, however, important areas where the interoperability remedies should be stronger. For example, there is a need to have broader disclosure of file formats for popular office productivity and multimedia applications. Moreover, where Microsoft appears be given broad discretion to deploy intellectual property claims to avoid opening up its monopoly operating system where it will be needed the most, in terms of new interfaces and technologies. Moreover, the agreement appears to give Microsoft too many opportunities to undermine the free software movement.

We also find the agreement wanting in several other areas. It is astonishing that the agreement fails to provide any penalty for Microsoft's past misdeeds, creating both the sense that Microsoft is escaping punishment because of its extraordinary political and economic power, and undermining the value of antitrust penalties as a deterrent. Second, the agreement does not adequately address the concerns about Microsoft's failure to abide by the spirit or the letter of previous agreements, offering a weak oversight regime that suffers in several specific areas. Indeed, the proposed alternative dispute resolution for compliance with the agreement embraces many of the worst features of such systems, operating in secrecy, lacking independence, and open to undue influence from Microsoft.

OEM Licensing Remedies

We were pleased that the proposed final order provides for non-discriminatory licensing of Windows to OEMs, and that these remedies include multiple boot PCs, substitution of non-Microsoft middleware, changes in the management of visible icons and other issues. These remedies would have been more effective if they would have been extended to Microsoft Office, the other key component of Microsoft's monopoly power in the PC client software market, and if they permitted the removal of Microsoft products. But nonetheless, they are pro-competitive, and do represent real benefits to consumers.

Interoperability Remedies

Microsoft regularly punishes consumers who buy non-Microsoft products, or who fail to upgrade and repurchase newer versions of Microsoft products, by designing Microsoft Windows or Office products to be incompatible or non- interoperable with competitor software, or even older versions of its own software. It is therefore good that the proposed final order would require Microsoft to address a wide range of interoperability remedies, including for example the disclosures of APIs for Windows and Microsoft middleware products, non-discriminatory access to communications protocols used for services, and non-discriminatory licensing of certain intellectual property rights for Microsoft middleware products. There are, however, many areas where these remedies may be limited by Microsoft, and as is indicated by the record in this case, Microsoft can and does take advantage of any loopholes in contracts to create barriers to competition and enhance and extend its monopoly power.

Special Concerns for Free Software Movement The provisions in J.1 and J.2. appear to give Microsoft too much flexibility in withholding information on security grounds, and to provide Microsoft with the power to set unrealistic burdens on a rival's legitimate rights to obtain interoperability data. More generally, the provisions in D. regarding the sharing of technical information permit Microsoft to choose secrecy and limited disclosures over more openness. In particular, these clauses and others in the agreement do not reflect an appreciation for the importance of new software development models, including those ''open source'' or ''free'' software development models which are now widely recognized as providing an important safeguard against Microsoft monopoly power, and upon which the Internet depends.

The overall acceptance of Microsoft's limits on the sharing of technical information to the broader public is an important and in our view core flaw in the proposed agreement. The agreement should require that this information be as freely available as possible, with a high burden on Microsoft to justify secrecy. Indeed, there is ample evidence that Microsoft is focused on strategies to cripple the free software movement, which it publicly considers an important competitive threat. This is particularly true for software developed under the GNU Public License (GPL), which is used in GNU/Linux, the most important rival to Microsoft in the server market.

Consider, for example, comments earlier this year by Microsoft executive Jim Allchin:

http://news.cnet.com/news/0–1003–200–4833927.html ''Microsoft exec calls open source a threat to innovation,'' Bloomberg News, February 15, 2001, 11:00 a.m. PT

One of Microsoft's high-level executives says that freely distributed software code such as Linux could stifle innovation and that legislators need to understand the threat.

The result will be the demise of both intellectual property rights and the incentive to spend on research and development, Microsoft Windows operating-system chief Jim Allchin said this week. Microsoft has told U.S. lawmakers of its concern while discussing protection of intellectual property rights .

''Open source is an intellectual-property destroyer,'' Allchin said. ''''I can't imagine something that could be worse than this for the software business and the intellectual-property business.''

In a June 1, 2001 interview with the Chicago Sun Times, Microsoft CEO Steve Ballmer: again complained about the GNU/Linux business model, saying ''Linux is a cancer that attaches itself in an intellectual property sense to everything it touches. That's the way that the license works,''1 leading to a round of new stories, including for example this account in CNET.Com:

http://news.cnet.com/news/0–1003–200–6291224.html ''Why Microsoft is wary of open source: Joe Wilcox and Stephen Shankland in CNET.com, June 18, 2001. There's more to Microsoft's recent attacks on the open-source movement than mere rhetoric: Linux's popularity could hinder the software giant in its quest to gain control of a server market that's crucial to its long-term goals

Recent public statements by Microsoft executives have cast Linux and the open-source philosophy that underlies it as, at the minimum, bad for competition, and, at worst, a ''cancer'' to everything it touches.

Behind the war of words, analysts say, is evidence that Microsoft is increasingly concerned about Linux and its growing popularity. The Unix-like operating system ''has clearly emerged as the spoiler that will prevent Microsoft from achieving a dominant position'' in the worldwide server operating-system market, IDC analyst A1 Gillen concludes in a forthcoming report.

* While Linux hasn't displaced Windows, it has made serious inroads. . .]. . In attacking Linux and open source, Microsoft finds itself competing ''not against another company, but against a grassroots movement,'' said Paul Dain, director of application development at Emeryville, Calif.- based Wirestone, a technology services company.

Microsoft has also criticized the General Public License (GPL) that governs the heart of Linux. Under this license, changes to the Linux core, or kernel, must also be governed by the GPL. The license means that if a company changes the kernel, it must publish the changes and can't keep them proprietary if it plans to distribute the code externally.

Microsoft's open-source attacks come at a time when the company has been putting the pricing squeeze on customers. In early May, Microsoft revamped software licensing, raising upgrades between 33 percent and 107 percent, according to Gartner. A large percentage of Microsoft business customers could in fact be compelled to upgrade to Office XP before Oct. 1 or pay a heftier purchase price later on.

The action ''will encourage—'force'' may be a more accurate term—customers to upgrade much sooner than they had otherwise planned,'' Gillen noted in the IDC report. ''Once the honeymoon period runs out in October 2001, the only way to ''upgrade'' from a product that is not considered to be current technology is to buy a brand-new full license. ''''

This could make open-source Linux's GPL more attractive to some customers feeling trapped by the price hike, Gillen said. ''Offering this form of ''upgrade protection'' may motivate some users to seriously consider alternatives to Microsoft technology.''

What is surprising is that the US Department of Justice allowed Microsoft to place so many provisions in the agreement that can be used to undermine the free software movement. Note for example that under J.1 and J.2 of the proposed final order, Microsoft can withhold technical information from third parties on the grounds that Microsoft does not certify the ''authenticity and viability of its business,'' while at the same time it is describing the licensing system for Linux as a ''cancer'' that threatens the demise of both the intellectual property rights system and the future of research and development.

The agreement provides Microsoft with a rich set of strategies to undermine the development of free software, which depends upon the free sharing of technical information with the general public, taking advantage of the collective intelligence of users of software, who share ideas on improvements in the code. If Microsoft can tightly control access to technical information under a court approved plan, or charge fees, and use its monopoly power over the client space to migrate users to proprietary interfaces, it will harm the development of key alternatives, and lead to a less contestable and less competitive platform, with more consumer lock-in, and more consumer harm, as Microsoft continues to hike up its prices for its monopoly products.

Problems with the term and the enforcement mechanism Another core concern with the proposed final order concerns the term of the agreement and the enforcement mechanisms. We believe a five-to-seven year term is artificially brief, considering that this case has already been litigated in one form or another since 1994, and the fact that Microsoft's dominance in the client OS market is stronger today than it has ever been, and it has yet to face a significant competitive threat in the client OS market. An artificial end will give Microsoft yet another incentive to delay, meeting each new problem with an endless round of evasions and creative methods of circumventing the pro-competitive aspects of the agreement. Only if Microsoft believes it will have to come to terms with its obligations will it modify its strategy of anticompetitive abuses.

Even within the brief period of the term of the agreement, Microsoft has too much room to co-opt the enforcement effort. Microsoft, despite having been found to be a law breaker by the courts, is given the right to select one member of the three members of the Technical Committee, who in turn gets a voice in selecting the third member. The committee is gagged, and sworn to secrecy, denying the public any information on Microsoft's compliance with the agreement, and will be paid by Microsoft, working inside Microsoft's headquarters. The public won't know if this committee spends its time playing golf with Microsoft executives, or investigating Microsoft's anticompetitive activities. Its ability to interview Microsoft employees will be extremely limited by the provisions that give Microsoft the opportunity to insist on having its lawyers present. One would be hard pressed to imagine an enforcement mechanism that would do less to make Microsoft accountable, which is probably why Microsoft has accepted its terms of reference.

In its 1984 agreement with the European Commission, IBM was required to affirmatively resolve compatibility issues raised by its competitors, and the EC staff had annual meetings with IBM to review its progress in resolve disputes. The EC reserved the right to revisit its enforcement action on IBM if it was not satisfied with IBM's conduct.

The court could require that the Department of Justice itself or some truly independent parties appoint the members of the TC, and give the TC real investigative powers, take them off Microsoft's payroll, and give them staff and the authority to inform the public of progress in resolving compliance problems, including for example an annual report that could include information on past complaints, as well as suggestions for modifications of the order that may be warranted by Microsoft's conduct. The TC could be given real enforcement powers, such as the power to levy fines on Microsoft. The level of fines that would serve as a deterrent for cash rich Microsoft would be difficult to fathom, but one might make these fines deter more by directing the money to be paid into trust funds that would fund the development of free software, an endeavor that Microsoft has indicated it strongly opposes as a threat to its own monopoly. This would give Microsoft a much greater incentive to abide by the agreement.

Failure to address Ill Gotten Gains

Completely missing from the proposed final order is anything that would make Microsoft pay for its past misdeeds, and this is an omission that must be remedied. Microsoft is hardly a first time offender, and has never shown remorse for its conduct, choosing instead to repeatedly attack the motives and character of officers of the government and members of the judiciary.

Microsoft has profited richly from the maintenance of its monopoly. On September 30, 2001, Microsoft reported cash and short-term investments of $36.2 billion, up from $31.6 billion the previous quarter—an accumulation of more than $1.5 billion per month.

It is astounding that Microsoft would face only a ''sin no more'' edict from a court, after its long and tortured history of evasion of antitrust enforcement and its extraordinary embrace of anticompetitive practices—practices recognized as illegal by all members of the DC Circuit court. The court has a wide range of options that would address the most egregious of Microsoft's past misdeeds. For example, even if the court decided to forgo the break-up of the Windows and Office parts of the company, it could require more targeted divestitures, such as divestitures of its browser technology and media player technologies, denying Microsoft the fruits of its illegal conduct, and it could require affirmative support for rival middleware products that it illegally acted to sabotage. Instead the proposed order permits Microsoft to consolidate the benefits from past misdeeds, while preparing for a weak oversight body tasked with monitoring future misdeeds only. What kind of a signal does this send to the public and to other large corporate law breakers? That economic crimes pay!

Please consider these and other criticisms of the settlement proposal, and avoid if possible yet another weak ending to a Microsoft antitrust case. Better to send this unchastened monopoly juggernaut a sterner message. sturde@az.com

From: Scott Shriver
To: Microsoft ATR
Date: 1/28/02 2:33pm
Subject: Microsoft Settlement

To Whom It May Concern:

I hope it's not too late to voice my objection to any plan requiring Microsoft to provide computers to schools as part of a settlement in the

DOJ's antitrust suit against the corporation.

As the computer lab supervisor in an Ohio middle school, I never thought I'd see the day when I'd turn down the possibility of free computer equipment or software. We sure could use whatever assistance may be provided in our goal of increasing student access to computers and the Internet. The substantial costs of modern technology makes it difficult to provide quality technology instruction in any but the most affluent schools. I know the objective is to penalize Microsoft in a way that helps our nation succeed in reforming and invigorating our public school system, but as well-meaning and obvious as this solution may seem, to give such a ''gift'' of computers will create several potential difficulties.

I have used ''Wintel'' computers for many years and have only recently replaced worn-out machines with comparable Apple iMac computers. I have used identical software on both machines and find that the Macintosh is far easier to instruct with and keep running. Maintenance and troubleshooting time has been slashed. Networking, even between Macintosh and Windows machines has never been easier. Our school is now reaching the conclusion of a long process of migrating to the Mac platform.

Apple has worked hard, I am sure to maintain a niche in the education market and has rebounded from recent economic problems. They would have difficulty competing with a company that is literally giving away their products to schools. The proposed settlement will cost Microsoft some money, to be sure. But the gains made by the company as it seeks to make inroads into the education sector will, I believe, more than make up for the heartburn of giving away product. In fact, I would liken this settlement solution to Brer Rabbit's briar patch: they may complain about the cost, but they would relish the opportunity to get away with a forced increase in marketshare. It is my

opinion that to provide any settlement to Microsoft which would erode Apple's ability to continue to provide great service and equipment to the education market does a disservice to the corporation as well as to schools.

Couldn't Microsoft be asked to provide either free technology OR a comparable amount of money that might be used to purchase technology of choice for the schools?

Thank you for your time and attention.

Very sincerely,

R. Scott Shriver

Dear Judge Kollar-Kotally,

I honorably object to the Proposed Final Judgment in the Microsoft case. There are several flaws with in the final proposal. One noticeable error is keeping Microsoft intact and not severely admonishing them for violating anti-trust laws. Another apparent defect entails the ineptitude to establish an effective mechanism that implements restrictions or regulations on MS.

As stated in the proposed settlement, Microsoft must comply with restrictions encompassed in the agreement. A three man compliance team will oversee and insure that Microsoft comply with the stated rules and regulations. Taking a closer look however, this three-man oversight team will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team.

Yet, in the likelihood of any enforcement proceeding, all findings by the oversight committee will not be allowed into court. The sole purpose of the committee is to inform the Justice Department of all infractions by Microsoft. Subsequently the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions.

What does this all mean? Translation- the oversight committee purely is an absentee landlord, who will not scrutinize Microsofts business dealings. Therefore in all fairness, the Proposed Final Judgment does not sufficiently provide the appropriate restrictions or penalties placed on Microsoft. What reassurance do we have that Microsoft will not continue to abuse it monopoly position and break the anti-trust laws? I can assure you that the Proposed Final Judgment will not effectively address the question in this matter. Therefore I respectfully submit to the court my objection to this Proposed Final Judgment.

Sincerely,

Eric Fontanilla

Subject: Microsoft Settlement

Dear Sirs:

I am writing this in regards to the proposed Microsoft settlement. I am against accepting the proposal as currently understood.

Perhaps it is only my naivety that I continue to imagine that one of the roles of government is to protect the little guy from those more powerful then himself. In that vein, Microsoft is the bully on the block that us little people need government to step in and protect us from. The ''slap on the wrist'' provided by the settlement as currently proposed does not, in my view, do any more than say to Microsoft that it is acceptable to continue to be the bully on the block. This proposed settlement would be akin to telling the bully at school to give back 1 cent of every dollar extorted from your classmates, hardly a just penalty.

Thank you for considering my arguments against accepting the proposal before you.

Sincerely,

Steve Bentley

Dear Mr. Ashcroft:

I am writing to express my support of the settlement reached between the Justice Department and Microsoft in the antitrust case in federal court.

I am glad that this case is in its final stages. Microsoft and its competition have spent far too much time competing in court rather than in the marketplace. The case has drained resources on both sides for far too long and should be brought to an end as soon as possible.

In order to foster greater competition and consumer choice, Microsoft has agreed to design future versions of Windows to provide a mechanism to make it easier for computer makers, consumers and software developers to promote non-Microsoft software within Windows. It is in the public's best interest to implement this agreement so that the industry and consumers can take advantage of the new opportunities for competition and choice.

Sincerely,

Jerry Roberts

To whom it may concern,

I have used Microsoft products for many years. I want you to know that I believe their products are superior in many ways to their competitors. I enjoy the fact that many of their products are integrated into their operating system. This is a feature that is very useful for people like me, with little computer savvy.

Even though I don't consider myself a technical wizard, I am by no means a hapless victim who cannot choose software that is useful to me. And I do not think that the government has any right to decide what can be in my computer. Also, I resent the idea that a successful business and its products are a threat to anyone, especially me.

This antitrust case was brought about by Microsoft's whiny competitors, not disgruntled customers. Failed businesses must not be allowed to set the rules for the markets in which they failed. Continued application of the antitrust laws against successful businessmen can only lead to corruption and economic disaster as shown in many other countries.

I want to see an America where success is not discouraged or punished, but embraced and held as a goal for others to reach for. I want a free America where anyone with enough intelligence and hard work can be a self-made man like Microsoft Chairman Bill Gates.

And lastly, and most importantly, Microsoft has a fundamental right to its property. It is the government's job to protect this right, not to take it away.

Regards,

Clayton Fellner

Subject: Microsoft Settlement

It is my belief the current proposed settlement with Microsoft is insufficient to punish Microsoft for illegally attempting to extend its desktop operating systems monopoly and to prevent it from re-attempting illegal activities in the future. While I believe an oversight board is necessary to ensure Microsoft's compliance with the court's ruling, I do not believe an oversight board alone is enough.

In the past, Microsoft has used its control of proprietary protocols and application programming interfaces (APIs), and extensions to open protocols and APIs, to prevent third party software from interacting properly with Windows. This has forced users wanting to use these protocols with Windows to use other Microsoft software, rather than third party software. It is also clear Microsoft intends to use similar tactics to establish a lock on Internet traffic and e-commerce through its control of .NET/ HailStorm, MSN, and its other online properties. By causing Windows to require use of Microsoft online properties such as Passport, and building hooks to other

Microsoft online properties into Windows, Microsoft hopes extend its desktop operating system monopoly to control the Web sites a user sees and uses on the Internet. Businesses trying to reach consumers via the Internet will have to do business with Microsoft or lose a vast majority of their audience.

I propose two additions to the settlement that will hopefully deny Microsoft the ability to illegally extend their current monopoly into new markets while allowing the company to retain its current monopoly and its ability to innovate:

(1) Require Microsoft to publish all of its proprietary application programming interfaces (APIs) and protocols, and require its software to comply with published protocols. By forcing Microsoft to publish all of its proprietary protocols and APIs, the settlement would ensure non-Windows software could interoperate freely with Windows desktop software. Microsoft would also be required to comply with public specifications from third parties, since it has ''embraced and extended'' public protocols in the past in such a way as to prevent users from using third party software with Windows. The oversight board, in addition to ensuring Microsoft publishes all of its protocols and APIs, would monitor Microsoft for compliance with its own standards and standards published by others. It would receive and investigate complaints from third parties questioning the corporation's compliance, and take appropriate action if Microsoft was found to be incorrectly implementing standards to lock users into using only Microsoft software.

(2) Require Microsoft to divest MSN and its other online properties, and bar it from owning online services in the future. This will prevent Microsoft from using its desktop monopoly to gain a monopoly on Internet traffic in general and Internet-based e-commerce in specific. Microsoft would be free to develop innovative new software solutions, but would be unable to use them to coerce users to use its online services only. Adding these provisions to the Microsoft anti-trust settlement will both tangibly punish Microsoft for attempting to illegally extend its monopoly and help prevent it from doing the same in the future. Microsoft's monopoly in desktop operating systems would remain intact, as well as Microsoft's freedom to innovate. These measures would force the corporation to be a good industry citizen by denying it the capability to take advantage of its desktop operating system monopoly to dominate other markets.

Thank you for your time and consideration.

Dear Judge Kotelly,

I have been informed that you have the responsibility of reviewing the Microsoft antitrust case. I wanted to take a second of your time to express my opinion on this matter. As many know, the Microsoft Corporation has been trying to corner the computer market for nearly a decade. This latest move in attempting to get what is essentially a governmental exemption from antitrust laws. Please do all you can to stop this abuse of our justice system and to help us retain our free market system. Competition is vital to our survival as a nation. Please don't let Microsoft have their way with us and our government. Thank you for your time.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft

Why is there hesitation in Washington to finalize the settlement in the Microsoft case? The cost to the taxpayers of this nation for the government's attacks on one of our nation's most successful companies has been enormous. Not only have we funded what appears to be a vindictive attack via our tax dollars; we have watched billions or trillions of dollars in value evaporate from our personal investments, our profit sharing programs, and our retirement and mutual funds as the market values of Microsoft and other technology related firms fell precipitously as a direct result of the government's illogical efforts.

I'm just a middle class American and a small time investor, but the losses on just the 200 shares of Microsoft stock I owned was nearly equivalent to one-year s tuition and board for my daughter at Miami University. That is not an insignificant amount to me, and it is the Justice Department I have viewed though this process as the ''enemy'' of the consumer, not Microsoft! The posturing of the Department and that of many state attorney generals lining up for their ''dibs'' reminds me a bunch of blood sucking parasites.

My suspicion is that there must be BIG MONEY SPECIAL INTERESTS that prodded the original investigations and that must continue to do so, and that disturbs me. In a market economy, the government generally should not take ''sides'' in commercial and marketing issues Letting Microsoft get back to business would significantly help end the recession; spending tax money on more litigation certainly would not help the national recovery.

I run a small business and have been a Microsoft user since the mid-80s. I have been using Microsoft not because they were a monopoly holding a gun to my head, but because they have created decent and useful products. We don't use them for all our needs; and in fact use Novell and IBM/Lotus for our networking requirements because of their features and benefits. I don't like their latest activation'' policies on XP products, but not once have I felt ''trapped'' or ''manipulated'' into having to buy, use or upgrade Microsoft products.

Please—can't we, for the public good, just get this case over with, and let Microsoft and others in the industry get back to the business of computers.

Sincerely,
Thomas Ulrich

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing today to encourage the Department of Justice to accept the Microsoft antitrust settelment. The issue was brought about by the former administration that simply did not understand the technology industry. They ignored one of the things that makes our country the best in the world, our free enterprise system. Then to top it all off, they extended their socialistic philosophy to apply antiquated antitrust laws to a band new industry.

In the free market, Microsoft rose to the top because they had the best products. Their products are user friendly and Microsoft has made them very easy to integrate and at lower cost than the alternitives. It is no wonder that where people had a choice most choose Microsoft software. Under the terms of the settelment Microsoft has agreed to allow computer makers the flexibility to install and promote any software they see fit. Microsoft has also agreed not to enter into any agreement that would require a computer maker to use a fixed percentage of Microsoft software. I beleive that computer makers will continue to predominatly pre install Microsoftware because it is the best and most computer buyers will chose a Microsoft windows based computer when making a new perchase. This is not a monoply problem, Microsft simply is, supplying a better product and most people know it.

My experiance as supervisor of an electric power generation plant for over 15 years, offered me the oppertunity to try many brands of computer software products and computer equipment. What I found over time

was that even when cost was not a consideration, products that were not Microsft based, did not perform satisfactorly. Microsoft products and windows based computers were simply the best. On top of that we experianced significant savings over other options. Sure Microsoft has made a lot of money, but can you imagine the cost to the people of our nation if Microsoft and all they have provided for us vanished or had never existed? This is my plea for justice in our mecanized and technological society. Microsoft has gotten to where they are by developing better products, not by crushing their competitors.

This suit and the fact it has gone on for over three years is simply mind-boggling. It is time to end it. DO NOT PUNISH MICROSOFT FOR BEING BETTER. Please acept the Microsoft antitrust settelment.

Sincerely,
Dennis C. Daggett

Washington, DC 20530

Dear Mr. Ashcroft:

For over three years the Department of Justice and the Microsoft Corporation have been pouring millions of dollars down the drain due to court costs. The antitrust suit that was filed against Microsoft has not only cost these two entities millions, but look at what happened to the market after the suit was launched. The suit has cost more than millions, just look at the recession that it has partially caused.

Although the suit should have never been initiated to begin with, I am relieved to see that a settlement has been reached. The settlement is the best thing that could have happened to the antitrust case, and it will benefit the economy. Microsoft's competitors can now produce and ship software that competes with Microsoft's, and will not have to worry about Microsoft trying to prevent that. They have agreed not to retaliate against competitors, which is a move that will boost competition and result in an overall better product. This will encourage people to hit the stores, which will push up the economy. Everyone wins.

I support this settlement, and urge you to implement as soon as possible.

Sincerely,
Helen Bauch

Dear Mr. Ashcroft:

I am what you is usually called a ''head hunter''. I try to find qualified personnel for companies. I therefore have a good idea of how the business world is doing, or not doing. Unfortunately, it is not doing very well, and I put much of the blame for this on the antitrust suit brought against Microsoft. This case was totally unwarranted. All these firms started out on the same playing field.

Microsoft is a firm that created a product that people wanted. Bill Gates standardized computer software, allowing the average person to understand computers, and computer programs. There was no need to have five different programs to do a spreadsheet. Bill Gates simply was the best at giving the consumer what they wanted.

Microsoft has been more than accommodating to the Department of Justice's demands. Microsoft has agreed to a technical committee to oversee future adherence; Microsoft has agreed to grant computer makers broad new license to configure Windows as to promote non-Microsoft software; Microsoft has agreed to terms that extend far beyond the products and procedures that were actually at issue in the original suit.

Let's put this matter to rest. I urge you to give your support to this agreement. We need to help our country get beyond this pettiness.

Subject: Microsoft Settlement

Hello,

The current status of the Microsoft anti-trust case scares me.

When I first got into computers it was 1995 and I thought Windows 95 would be the way to go. The price was better than Apple Macintosh and the whole platform seemed better for programmers. After a short time I became frustrated by the stability of Windows so I began searching for a better alternative.

Then fortune struck! It was late 1996 and I was looking through a Macintosh related magazine when I came across an article about the BeBox by Be, Incorporated. This brand new and highly innovative computer had dual processors and ran the Be operating system, all of which was engineered from the ground up to be modern, or as they called it, a system for the next millennium. I hopped on the Internet right away and looked into buying one of these BeBoxes and found to my surprise that I could get one for a very good price. This system made me happy because I never had any mysterious system problems that required me to waste my time reinstalling as I had done many times with Windows.

Soon thereafter BeOS was up and running on Intel compatible computers and being a total computer geek I had always wanted a laptop computer. So in 1998 I purchased a Dell Inspiron 3000, which I had figured would be able to run BeOS. I was right, Be had the resources to make this possible and I was able to stay current with their latest developments.

There is an alternate side to this Dell computer. It was purchased only weeks before Windows 98 was released yet I did not get any credit for the purchase and was given an ugly hacked version of Windows 95 that made it look like Windows 98. Here's another reason I'm very upset by Microsoft. To my absolute horror this unstable factory installation only lasted about a week before I had to do a clean install of Windows! You'll note that this is the one of the disputed factors in the antitrust case, the tying in of Internet Explorer to Windows 95 is not only a questionable business practice, but it made my brand new very expensive computer a pile of junk.

I called Dell about this and since it was a software problem they brushed it off. I then called Microsoft and before I even talked to an actual person I was informed that I would have to pay them money to even talk to anyone! I instantly hung up the phone and felt angry, sad, and helpless to this ugly situation. I thought to myself, ''why after having spent over $3000 am I being treated this way?'' It was at this time that I decided I did not agree with the Microsoft End User License Agreement and called Dell back to see about getting compensation for this. Dell told me it would not be possible.

I eventually brushed it off because I was primarily a BeOS user and had great hope that Be would be able to continue developing their amazing OS. Unfortunately, Microsoft's stranglehold made it nearly impossible for BeOS to be installed on factory systems and now the result is that for all anyone knows, BeOS will never be updated again! Palm, Inc. has recently purchased the technology and there may be a chance that the public will see another version, but there's just no way to tell.

Microsoft has steadily moved from shrewd business to leveraging everyone into doing what they want. As a computer science student and a part-time consultant I deal with Microsoft in some way everyday. This is not by choice! If I were to attempt to discontinue the use and/or support of Microsoft products I would be putting myself into obscurity. It might be a case where I won't be able to view important documents that are only readable by the latest version of Microsoft Office, or it might be that a web page is only designed to be viewed in Microsoft Internet Explorer. Ask any Macintosh user what would happen if these applications were not available for their platform.

Microsoft is a massive corporation that has gone beyond mere profit and has long been in the business of screwing people over. Even as they have been on trial for being a monopoly they have been making their position stronger. They recently purchased Great Plains Software here in Fargo, North Dakota, and I'm sure it won't take long before they're dominating the small business software market.

As a user who depends on computers for my livelihood I feel depressed about this, and I know that I'm not alone. This American company is making people across the entire planet feel as I do, please do something soon so that at the very least we can enjoy a good variety of platforms. My hope is that your decision will be such that Palm sees opportunity with BeOS and that other small truly innovative companies also see openings thereby giving users like me a choice. As for today the future of computing is gloomy, grayed over by the drab blanket that is Microsoft.

Without your intervention I see absolutely no hope for small truly innovative companies like Be.

Do not simply settle for handing power off to Apple; give it all back to the people. I want Microsoft to hurt as badly as they've hurt me.

Sincerely,
Peter Schultz

I would like to give an opinion no the Microsoft case.

Microsoft is a powerful, innovative company. The sould be congratulated on their success, not punished. In the United States, if we allow people to be creative and innovative then our society will be a better place. By restricting and punishing people for being excellent at what they do, people will be less inclined to take risks and improve our lives. Microsoft's success is at the heart of a capitalistic society. They must continue to innovate and produce new products or else they will fail as a business.

They should not be punished for being successful.

Dave Parsh

Dear Mr. Ashcroft:

I understand that Microsoft and the Department of Justice have decided to reach a settlement in the antitrust lawsuit that has been dragging on for the last three years. I never agreed with this case from the beginning, and I hope to see this settlement finalized in the near future.

Settling now will only have positive effects on the industry as well as the economy. Microsoft will share information with its competitors regarding Windows, and redesign the operating system to allow other companies'' software to be placed within the system. Competition will increase and the consumers will see many more choices in the marketplace.

Thank you for stopping this litigation. We need to put this case to rest so that Microsoft can get back to creating great products, and the government can focus its energies on more important issues.

Sincerely,

Dear Judge Kollar-Kotally,

I am filing my personal objection to the proposed final judgment on the Microsoft case. Supposedly, the Court has found Microsoft guilty of violating all rules of proper business ethics and practices. However with the PFJ, the Department of Justice throws out, if not abandons all previous court findings that indicts Microsoft. In fact, the PFJ permits Microsoft to continue with its monopolistic and predatory practices, which in my opinion is a detriment not only to the software sector but also to the technology industry as a whole. Without a doubt, I strongly believe you will receive thousands of similar appeals encompassing the many flaws that are apparent in the proposed final settlement. My main focus entails one fundamental flaw clearly noticeable in the proposed settlement: The PFJ does not effectively break up Microsoft, but in fact allows Microsoft to leverage its current market position, or should I say, Monopoly to expand its business into several other technology markets. Under the general rule, most monopolies in the past, such as AT&T and Standard Oil, are either broken up or carefully regulated. However, Microsoft is given a pardon or a waiver to this general rule of thumb altogether. The implementation of reprimands by the Justice Department is not a cure-all to the MS calamity. As history has proven over and over again, Microsoft will undoubtedly abuse its monopoly position at the expense of others. Unless something extraordinary is done such as breaking up Microsofts business into several parts or meting out severe punishment, Microsoft will persistently continue to implement illegal business practices. I submit to the Court my rejection to the Proposed Final Judgment.

All the Best,
Jennifer Fontanilla

I urge you to reject the negotiated settlement with Microsoft.

The only way I see that you can prevent monopolistic and anti-competitive practices that have continued to this day is to separate the Applications and Operating Systems divisions of Microsoft into different companies. It is essential that their Application programs be ported to work with operating systems other than Windows.

I am seriously concerned that representatives of our government could have negotiated a settlement with Microsoft that does nothing to punish them for the acts they have been found guilty of, and does nothing to prevent such acts in the future. I urge you to open all proceedings to public scrutiny so we can see just what transpired that allowed this to happen. I question the impartiality and motivations of those responsible.

Thank You

MTC–00028368

From: Gregg Williams

To: Microsoft ATR
Date: 1/28/02 2:41pm
Subject: Microsoft Settlement

Dear Department of Justice:

I am writing regarding the Microsoft settlement as someone with more-than-average credentials to have an opinion. From 1979 to 1988, I was Senior Editor of BYTE magazine, the personal computer industry's first major magazine. From 1988 to 1998, I worked for Apple Computer, where I wrote to third-party developers about the advantages of the Mac OS platform over the Microsoft Windows platform. In both jobs, it was my responsibility to be aware of Microsoft's acts and how they affected the computer industry.

With that introduction, let me add my voice to that of the many people and companies who believe that the Department of Justice's proposed settlement is not in the public interest. The final judgment after a trial should punish the guilty, discourage similar offenses in the future, and if possible, repair the damage done. The proposed settlement actually causes harm, in several ways: It does not provide the remedy that it was meant to; it implicitly encourages the reoccurrence of similar wrongdoing; and it does not address significant larger issues that need attention.

The final judgment for this case is important in more than just its immediate context; it also has important consequences in our increasingly digital world. Our country (and the world) has most of its eggs in one basket—Microsoft's—and this is dangerous. Just as any natural ecology is endangered when its diversity is lessened and one species dominates, so is our digital ecology endangered by Microsoft's overwhelming market share and its stifling of competition. As just one example, observe the devastating effects of the denial-of-service attacks against amazon.com and other online businesses a few years ago. They would not have been as effective if a significant fraction of the country's Internet users had not been using Microsoft's email programs. Also, all hacker attacks are tied to the vulnerability of a specific product; if there were, say, three email programs and three browser programs in common usage (instead of Microsoft's Outlook and Internet Explorer), such attacks would injure fewer users, spread more slowly, and consume less Internet bandwidth than is the case today. For the above reasons, this judgment is doubly important, and the currently proposed judgment is doubly dangerous. I believe that a good final judgment must both prevent further wrongdoing and counteract Microsoft's dominance in current and future markets. Any attempt to regulate Microsoft's conduct MUST be given the resources to succeed, and its workings MUST be visible to the public. Without these two provisions, Microsoft will evade lawful punishment again, just as it did in the mid-1990s.

Finally, Microsoft should be made aware that it has no say in selecting or refusing its punishment. Nor should the court be pressured into compromise for fear that punishing Microsoft will damage this nation's economy. In fact, it is Microsoft's actions that are causing long-term damage, and any judgment that leads to competition, innovation, and meaningful customer choice will help repair that damage our economy.

I support the efforts of the states that are pressing for a more comprehensive punishment for Microsoft's illegal acts. As an informed and active citizen, I expect nothing less.

I submit my opinion to the Department of Justice with great respect, out of a deep concern for this nation's long-term technological and economic health.

To The Department of Justice

I hope Judge Colleen Koller-Kotelly does not forget about all of us who use Microsoft products and are very satisfied with their performance. They produce a very good product that is easy to use. You get what you pay for! Unfortunately, I have a MAC Power Book and MSN does not have a compatible internet program. At present I have AOL (overpriced) but plan to buy a new laptop that is MSN compatible and cancel my AOL. Has anyone ever told us how many cancel AOL?.....or only brag about how many sign up. Fortunately, the world is full of choices and I am no longer interested in contributing to dissenting states with my AOL monthly fee. Netscape did themselves in and AOL was stupid to buy them. Everyone should read Erick Schonfeld's January 25, 2002 ''A RIDDLE: WHY DOES NETSCAPE STILL EXIST?''. He tells it like it is!

AOL stock is down 50% since I sold mine and a lawsuit against Microsoft is not going to bring it back up.

I am getting fed up with my tax dollars paying for goverment funded lawsuits and in the States vs Microsoft it needs to be settled in a reasonable manner. If Microsoft had beeen contributing to Clinton as the illegal Asian money he probably would have told the DOJ to back off and let Netscape finance their own lawsuit. As it should have been. The nine disssenting states are beginning to sound revengeful and stupid.

I guess they see success and money and their fangs go out. They seem to be blind to the fact that a reasonable settlement could also affect the business in their state in a positive manner. Microsoft is not asking them to divulge their secrets.

I shall be watching the outcome and look forward to my new laptop and cancelling AOL.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I want to express my support for the Microsoft settlement negotiated last November. I was against the lawsuit against Microsoft and felt a break-up of the company was totally unjustified; consequently, I think the compromise is a necessary move to allow us to move on.

The terms accepted in the agreement are very generous to the competition. Computer manufacturers will have greater flexibility in trading Microsoft software for non-Microsoft products on the Windows operating system without obligation, while software developers will gain access to Windows internal code and even be able to license Microsoft intellectual property.

The terms highlight the fairness of this proposal, which will be regularly monitored by an objective group of technical experts in order to confirm its implementation. I ask that you allow these measures to go through without further legal action. Thank you very much.

Sincerely,
Sam Lama

From: Mister Thorne
To: Microsoft ATR Date; 1/28/02 2:42pm
Subject: Microsoft Settlement

I am offering my comments on the Proposed Final Judgment (PFJ) that was submitted by the United States in Civil Action No. 98–1232. I am also sending you these comments via USPS.

I am encouraging the Court to not accept this settlement for these reasons:

1. The settlement is ineffective;

2. The settlement does not serve the public interest;

I encourage the Court to determine an effective remedy, one that (1) ends the unlawful conduct; (2) avoids a recurrence of the violation and others like it; and (3) undoes the anticompetitive consequences of that unlawful conduct.

Effect of Proposed Remedies

The PFJ is ineffective. It does not restore ''competitive conditions in the personal computer operating system market'' as the U.S. claims in its Competitive Impact Statement (CIS). In fact, the PFJ does nothing toward that end.

As the U.S. noted in its complaint, ''PC manufacturers (often referred to as Original Equipment Manufacturers, or ''OEMs'') have no commercially reasonable alternative to Microsoft operating systems for the PCs that they distribute.'' The PFJ does nothing to alter that. Instead, it offers a series of

restrictions and prohibitions aimed at opening the market for ''middleware.'' It offers nothing to restore a competitive market for operating systems for personal computers.

The PFJ does not ''obtain prompt, effective and certain relief for consumers.'' On the contrary; it's effect will be to leave consumers with no viable choice for personal computer operating systems, other than different versions of Windows, or for browsers, other than different versions of Internet Explorer. Consumers will not reap the benefits of competition among operating systems or browsers, as they have the benefits of competition among OEMs.

In the CIS, the U.S. claims that the PFJ ensures that ''consumers will be able to choose to use'' non-Microsoft products like Internet browsers. That assumes that such competing products will come to market, but this is unlikely given that Internet Explorer is given away at no cost. As Jon DeVaan, a Senior Vice President of Microsoft, would testify (see Microsoft's offer of proof in opposition to the entry of the government's proposed final judgment): ''No sensible company devotes large resources to projects from which it sees no potential return on its investment.'' The PFJ does nothing to open the market for Internet browsers or other applications, and so it does nothing to give consumers more choice.

In the CIS, the U.S. says the PFJ ''forbids Microsoft from stopping OEMs from offering dual-boot systems.'' Yet the Court has determined that there exists an ''applications barrier'' to entry to the market for personal computer operating systems. The PFJ does nothing to remove that barrier.

The District Court concluded that Microsoft violated the Sherman Act, and the Court of Appeals upheld the ruling, determining that Microsoft's ''commingling of browser and operating system code constitute exclusionary conduct, in violation of s 2,'' of the Sherman Act. Yet the PFJ does not address the issue of commingling and leaves Microsoft free to integrate whatever it wishes with Windows, to continue to use its operating system monopoly to extend its reach into new, emerging markets.

The PFJ requires Microsoft to disclose to ''ISVs, IHVs, IAPs, ICPs, and OEMs'' the APIs used by Microsoft Middleware to interoperate with Windows. The provision requires the disclosure to occur in a ''Timely Manner.'' But ''Timely'' means only after Microsoft has sent any new version of Windows to at least 150,000 beta testers. The result is that if Microsoft distributes a new version of Windows to 149,999 beta testers, they don't need to disclose the APIs to anyone.

The PFJ contains a provision that if Microsoft engages in ''willful and systemic violations of the agreement,'' then the ''requirements and prohibitions'' in the PFJ may be extended for two years. What the U.S. is basically saying is this: ''if the agreement proves ineffective, our plan is to extend it!''

Finally, things have changed since the U.S. filed its complaint. Microsoft's dominance in the market has continued to grow. It's share of the market for operating systems, browsers, and common applications like word processors, spreadsheets, and e-mail software has increased. And Microsoft is moving on, leveraging its monopoly for operating systems to extend its control of the market with its .NET initiative.

The .NET initiative is Microsoft's program to offer a new development platform, one that sits above the operating system. As Steve Ballmer, CEO of Microsoft, notes, this initiative is ''the pillar on which we are building the next version of Microsoft.'' When the initiative was announced, Ballmer commented: ''Starting this year, everything we do will revolve around Microsoft .NET.'' Having conquered the market for personal computer operating systems, Microsoft is poised to conquer new, emerging markets.

In the CIS, the U.S. says appropriate injunctive relief in an antitrust case should: (1) end the unlawful conduct; (2) avoid a recurrence of the violation and others like it; and (3) undo the anticompetitive consequences of the unlawful conduct. The PFJ achieves none of these objectives. Microsoft's unlawful conduct in the browser market is history, the PFJ does nothing to reopen that market, and it leaves Microsoft free to continue to violate the Sherman Act. And Microsoft's leaders have suggested that that is precisely what they plan to do.

As the U.S. stated in its complaint, ''Microsoft has made clear that, unless restrained, it will continue to misuse its operating system monopoly to artificially exclude browser competition and deprive customers of a free choice between browsers,'' and ''Microsoft's conduct with respect to browsers is a prominent and immediate example of the pattern of anticompetitive practices undertaken by Microsoft with the purpose and effect of maintaining its PC operating system monopoly and extending that monopoly to other related markets.''

Microsoft's leaders continue to give us reason for concern. At the start of the trial, Steve Ballmer stated in an e-mail message sent to Microsoft employees: ''Microsoft's business practices [are] entirely consistent with the way other companies throughout our industry compete.'' After the Court of Appeals upheld the District Court's finding that Microsoft violated the Sherman Act, Steve Ballmer made these statements:

''I do not think we broke the law in any way, shape, or form. I feel deeply that we behaved in every instance with super integrity.''

''We were born a competitor, and we'll continue to compete as we have in the past: vigorously and responsibly.''

These statements from the company's CEO do not portend a change in the way Microsoft conducts business.

Comments made by the leaders of Microsoft after the court determined it broke the law illustrate what many informed commentators have noted: ''Microsoft just doesn't get it.'' While we can expect Microsoft to follow the restrictions in the PFJ, we cannot expect it to live up to the spirit of it. And why not? Thomas Friedman, a New York Times columnist put it well in a column he wrote after the District Court ordered a breakup of the company: ''Microsoft isn't a threat because it's big. GE is big, Intel is big, Cisco is big. Microsoft is a threat because it is big and deaf to some of the bedrock values of the American system.''

The PFJ is ineffective. It does not ''eliminate Microsoft's illegal practices, prevent recurrence of the same or similar practices, and restore the competitive threat that (other software) products posed prior to Microsoft's unlawful undertakings'' as the U.S. claims.

Rather, it cements Microsoft's position as the sole supplier of personal computer operating systems for the Plaintiffs, It allows Microsoft to continue to dump products on the market in order to maintain market dominance. It allows Microsoft to continue to tie its applications to its operating systems, effectively closing the market to would-be competitors. And it allows Microsoft to build upon its monopoly position to establish market reliance on its next-generation development platform (.NET).

The Public Interest

It is in the public interest for the U.S. to enforce antitrust law; it is not in the public interest for the Court to accept the PFJ. That's because the PFJ does not address the central issue in this matter: Microsoft's monopoly position, and its abuse thereof, in the market for operating systems for personal computers.

The public has benefited from competition among PC manufacturers. We've benefited from lower prices, increased functionality, and those innovations that naturally occur when firms compete fairly in a dynamic and open market. If the PFJ is entered as is, then Microsoft is left with its monopoly. And that means no increased competition for operating systems despite the U.S. claim in the CIS that the PFJ would restore ''competitive conditions in the personal computer operating system market.''

The U.S. offers no justification for its claim of increased competition for operating systems: none at all. While the PFJ might enhance competition for middleware, it leaves Microsoft in the same monopoly position it was in at the beginning of this action. In fact, since 1990, when the FTC first investigated Microsoft for antitrust, the company's position has only gotten stronger.

The lack of any effective corrective action in the PFJ lets others know that they can get away with similar tactics, that it will take so long for antitrust complaints to be resolved that they don't even matter. The courts are seen as so slow to act that—in a rapidly changing and advancing market—they can be ignored, and that is definitely not in the public interest.

The public interest would be better served by some remedy that ensures that Microsoft won't be back in court, yet again, for antitrust violations. But that is precisely what we can expect given that Microsoft's leaders have stated that they did nothing wrong, that they operated within the law and always have, that they plan on conducting their business as they have in the past, even after the Court of Appeals upheld the District Court's determination that Microsoft employed ''anticompetitive means to maintain a monopoly in the operating system market.''

The public interest is served by ''the Government defining the contours of antitrust laws so that law-abiding firms will have a clear sense of what is permissible and

what is not.'' Entry of the PFJ works against that. It says, in effect, that if a company has the resources, then it can violate antitrust law.

It can raise all sorts of ridiculous arguments to support its violations. It can use obfuscation to avoid answering questions. It can present the court with bogus exhibits that are not what they are claimed to be. It can protest that an antitrust action is simply a means for the U.S. to help the company's competitors, or that the U.S. doesn't know enough about computers or the computer industry to enforce antitrust laws there. The company can buy so much time that the courts and, hence, the laws become ineffective: by the time the courts act, the company has achieved its objectives, and after the courts act, the company keeps its ill-gotten gains. How is that in the public interest?

An Effective Remedy

I encourage the Court to accept nothing less than an effective remedy, one that serves the public interest, that restores competition in the market for personal computer operating systems and applications, and which discourages Microsoft from continuing to function with limited regard for antitrust law.

But this is problematic. The new administration seems to have little interest in pursuing this matter, even though it is charged with enforcing the law and the court has determined that Microsoft broke the law.

One effective way to open the market could be done by executive order, rather than court order. If the Plaintiffs can require that all their personal computers run Microsoft Windows, then they can just as well require that all their computers run some other operating system, such as UNIX. And there are good arguments in favor of such a change.

Just about every personal computer on just about every desk in just about every government office is equipped with Microsoft Office and Internet Explorer. That application suite includes the most common applications, comprising something like 95% of the applications that 95% of computer users use 95% of the time. That same application suite is available (from Microsoft) for the Macintosh operating system, which is a UNIX-based operating system.

So, if the Plaintiffs adopted a program to use UNIX instead of Windows with their personal computers, the ''applications barrier'' would be fairly low. (The ''applications barrier'' is a fallacy; Windows isn't more popular than Macintosh because there are so many more applications avaiable for Windows; the reason there are so many more applications for Windows is because Windows is more popular, the Plaintiffs and Corporate America long ago having decided that desktop computers must be IBM compatible.)

Of course, the Plaintiffs also make use of specialized applications. Public agencies of all sorts use specialized applications to manage more and more of their operations; a wide variety of government workers use specialized applications on a regular basis. So, there is a real barrier to adopting an operating system other than Windows: specialized applications that were written for Windows need to be rewritten for UNIX. But there is also an opportunity to eliminate that barrier now.

With its .NET initiative, Microsoft claims it is reinventing its business. Steve Ballmer claims that as .NET versions of its products are released, they will make non-.NET versions of products obsolete in four to six years. And that means that the Plaintiffs, unless they intend to use obsolete products in the future, have these two choices: either they can remain dependent on Microsoft and adopt .NET, or they can start to become independent now; they can switch from Windows to UNIX.

While the DOJ claims (without support) that the PFJ is good for the economy, what would be a boost for the economy is for the Plaintiffs to adopt UNIX. The plaintiffs are a sizeable market for software developers. If the Plaintiffs adopt UNIX, ISVs will develop software for UNIX. And, in a marketplace not controlled by Microsoft, one in which market forces are allowed to operate freely, we'll have open competition, and the benefits of it.

And we won't have to worry about a single firm having sole control of an important component of our modern economy. In two decades, the personal computer has gone from being as popular as ham radio, to being an essential tool, and fundamental to our way of life. We could not enjoy our modern way of life were it not for the development of the personal computer and the software that makes it so useful in so many ways.

The public isn't served when there is only one source of oil, or one bank. or one TV station. And the public is not served by having just one supplier of the most basic software for personal computers. The public is served by free and open competition, and the Plaintiffs have a responsibility to enforce the laws that apply.

I don't think the settlement contained in PFJ is good for the public or the economy. I would like to see the Court require a settlement that accomplishes what the U.S. claims this settlement accomplishes.

Sincerely,
Mister Thorne

Your Honor:

As you know, there was a time in America when Roosevelt had to launch an aggressive campaign against corruption in the corporate world. History has already shown us what happens when industries, because they are monopolies, have too much power. The question is not supposed to be considered on a situation basis, the antitrust laws were made so that, among other reasons, the general public would not and COULD NOT be taken advantage of. Therefore, with all due respect,I don't think that Microsoft should be allowed to abuse antitrust laws.

Thank you sincerely for your time,
Cynthia Roy

Microsoft is clearly a monopolist and stifles competition. A deeper punishment is vital to the industry and also to retain the authority of the government in anti-trust matters.

Microsoft is predatory and parasitic. They are incredibly arrogant about this case. The DOJ has to demonstrate that the US is a country of laws not of men. They have been found to be monopolists. Do the right thing and punish them. Don't let their wealth, power, and treachery get them off the hook.

They frequently make changes to their OS and applications for no reason other than to diminish competition.

Please do the right thing and punish Microsoft.

Subject: The Microsoft Anti-trust Case

Dear To whom it may concern,

I am a user of the OS/2 (operating system from IBM). I have found this to be a technologically superior product over any of the operating systems offered by Microsoft, especially their latest version, Windows XP. I Believe that their further bundling of an instant messager (The MSN Instant Messanger), the 3 year limitation on usage, Cd burning software and other included multimedia software makes it clear and obvious that Microsoft is trying to extend and/or maintain their monopoly. Unfortunately, OS/2 has been in decline for a number of years from what I believe to be unfair monopolistic marketing tactics of Microsoft. As a result, vendors of OS/2 related products have also diminished over the years. Contrary to arguments by Microsoft that their products encourage competition, I believe the opposite is true; that Microsoft's marketing practices actually discourages competition and stunts technological growth.

Consequently, I do not believe that the Department of Justice's proposed settlement

with Microsoft, in its current form, is anywhere near adequate and that stricter measures need to be imposed on the company to prohibit such tactics from being used in the future.

In addition, I am appalled that after all the effort, my tax dollars, and other resources that the Department of Justice has used and this is the best settlement that they can come up with. Futhermore, I am greatly troubled that the other Attorney Generals have fought so hard over the past years and have spent enormous amounts of their money, and then settle for this unrealistic package.

Re: Microsoft Settlement.
Dear Ms Hesse,

I am a lawyer for low income people. I am also a ?Consumer Fellow? to the Business Law Section of the American Bar Association. I was an Official Observer on behalf of consumers on the drafting committee of the National Conference of Commissioners on Uniform State Laws that revised Article 9 of the Uniform Commercial Code. I am on the Board of an organization opposing the Uniform Computer Information Transaction Act in the states.

Thank you for the opportunity to comment on the Microsoft settlement. I share generally the opinion of Hon. Darrell McGraw, the Attorney General of my state, the State of West Virginia.

It is my personal position that the settlement between Microsoft and the U.S. Department of Justice is not in the public interest. The settlement does not offer remedies that sufficiently address Microsoft's illegal, anticompetitive behavior as a monopoly that puts grabbing market share above the quality of the software it produces. The settlement fails to include critical provisions that will counter Microsoft's monopolistic tactics, and does not contain appropriate and enforceable penalties for non-compliance. Changes to the settlement must be made to address these issues, in order to bring the benefits of competition, choice and innovation to consumers.

Sincerely,
/s/

26 January 2002

Dear Mr. Ashcroft:

As a former Federal Government employee who was forced to retire on 2 October 1998 due to a major reduction in force (RIF) in the Defense Department (I was over 55 years of age and I had more than 5 years of service), I have been following the Microsoft antitrust case. Personally, I feel that Microsoft should be left alone. Microsoft has been very good for the economy and the technological advancement of our country. Because of its innovative software, they have brought about increased computer literacy. Can any other software company say the same? Microsoft has also been very flexible in agreeing to the terms of the settlement beyond what is required in any antitrust case.

Microsoft agreed to not enter into any agreements that would obligate a third party to distribute or promote any Windows technology exclusively or for a percentage of sales. I am sure competitors will like that. They have also agreed to allow access to their operating systems protocols that are used to operate within their server to the competition for use with their software. That sounds generous to me.

Now that Microsoft has gone out of their way to cooperate, shouldn't we? Let us end this litigation and move on to more pressing issues. Thank you.

I do not agree with the current proposed settlement as it stands. I have signed Dan Kegel's petition being submitted to you. Also, I ask you to reconsider your position and read Dan's website. http://www.kegel.com/remedy

Without fixing this problem now we, as a nation, are consigning ourselves and future generations to facing a severe monopoly in the software market in America. Competition in this market in a fair and equitable basis lowers prices for vital research and business functions of public and private markets. Most significantly, from my point of view, research funded by the government cannot afford a Microsoft dominated market. Linux and open source free software is just now setting research programs free of huge licensing overheads. American business needs a cost reduction in software licensing, especially in desperate economic times in the IT market.

All the horror stories of excited young companies with fresh new ideas and new technology being eaten and destroyed by Microsoft should fuel your drive to tame this monster! If Microsoft had decent ethics and treated people right, I wouldn't feel this way or be writing this letter. In fact, you would not have the case you have. I respect the work and time Dan Kegel has put into his review of the proposed settlement. Please give it your consideration. Thank you,

I am extremely disappointed in the government's proposed settlement of the Microsoft case. The judge found that Microsoft had abused its monopoly power to crush the competition and rig the retail environment to ensure that consumers would have virtually no choice but Microsoft. The proposed settlement barely gives Microsoft a slap on the wrist and does nothing to make the market work as intended: in a free and fair competition.

However, with a Republican administration in charge, I am not surprised that the DOJ chose to ''wimp out'' and let Microsoft off the hook. The Microsoft settlement, like the Enron debacle, demonstrates that those with big money don't have to play by the same rules as the rest of us. If they contribute enough to the right campaign coffers, and use buzzwords like ''free market'' and ''competition'' to cover their dirty deeds, they can usually get

government officials to either gut existing regulations and rewrite tax laws to their specifications, or at least look the other way when they break the rules. And this means that big corporations like Microsoft and Enron can get away with almost anything.

I'd like to have faith in the U.S. system of justice, but I doubt the DOJ will redeem itself on this case. My only hope is Microsoft does not yet own the EC, and Europe will refuse to be bought out or bullied. That might at least slow down the Microsoft juggernaut.

Subject: Microsoft Settlement
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing to express my views surrounding the Microsoft settlement. I believe that the agreement is fair and reasonable, and would like to see the issue put behind us. Not only does the settlement address the concerns that brought about the case in the first place, but it also sets up guidelines of how to deal with possible future problems. Microsoft has made unprecedented concessions in an effort to end this debacle, and I will outline just a few of them for you.

Under the settlement, Microsoft has agreed to grant computer makers new rights to configure Windows so as to promote non-Microsoft software in direct competition with programs included within Windows. Microsoft will document and disclose for use by its competitors various interfaces that are internal to Windows operating system products. Also, Microsoft has agreed to license Windows to the twenty largest computer manufacturers, which make up a vast majority of PC sales.

There will always be those that try to pull down whoever is on top, just as there will always be those that support it. I feel that if this case is judged by the value of its merits, rather than the depth of the lobbyists'' pockets, it is apparent that the original problems have been solved. I believe that the suit has been pushed by competitors rather than consumers. It has negatively affected our entire industry. In short, three years has been long enough. It is time to allow Microsoft and the IT industry as a whole to return their focus to innovation, rather than litigation. We must ensure our country's place in the world technology market, and the best way to do it is by moving on. I thank you for your time and consideration of my thoughts.

Sincerely,
Douglas W. Lantz, President

Dear Judge Kollar-Kotally,

Id like to make my position known that I am against the Proposed Final Judgment. MS has been given all the breaks in the case. The Proposed Final Judgment pretty much seals the deal with Microsoft walking away unscathed. Justice must be served and MS should be dealt with accordingly. I again concur with my previous statement by saying I oppose this Proposed

Final Judgment.

Sincerely,
Edith Landero,

Subject: Microsoft Settlement

Dear Renata Hesse:

As a United States citizen, I urge you to withdraw your consent to the revised proposed Final Judgment settlement in the United States v. Microsoft Corp. antitrust case. The limitations and punishments imposed upon Microsoft do not sufficiently restore the competitive conditions previailing prior to Microsoft's unlawful conduct.

The Settlement only prevents Microsoft from future monopolistic practices; it does not punish Microsoft for previous unlawful behavior. The advantages of immediacy and certainty of the proposed Final Judgment are not sufficient cause for abandonment of pursuit of further litigation.

The damage done to individuals and businesses by design of Microsoft and its engineers and practices requires more punitive measures than a slap on the wrist and a promise to never get caught at doing it again.

I urge you to pursue litigation of the issue of remedy, whether as set forth in the Final Judgement entered by the District Court on June 7, 2000, or as one of the other remedy proposals described in the Competitive Impact Statement, section (V) Alternatives to the Proposed Final Judgement.

Thank you for your time and consideration,

Karina J. Montgomery DOB 1/13/70

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I tried to fax this to you on my personal letterhead but your fax lines were constantly busy. There must be a lot of people like me wanting to express our concerns.

As a businesswoman and a veterinarian's wife who has been following the Microsoft antitrust case, I believe the settlement is pretty fair. I have a lot of respect for Microsoft; they've contributed to the prosperity of the ''90's, produced well-paying jobs, and provided great software at reasonable prices. Since the technology sector accounts for a third of economic growth, I am afraid what might happen to the industry if litigation continues.

Microsoft has been very cooperative throughout this ordeal. Not only have they agreed to document and disclose various Windows'' internal interfaces to competitors. They also agreed to the establishment of technical team to monitor Microsoft's compliance to the settlement. What other company would risk such great exposure to competitors?

Unfortunately, the technology industry faces numerous challenges in protecting the entrepreneurial spirit we depend on. Some special interests are lobbying for increased litigation, regulation, and legislation that could impact entire industries and threaten this country's economic vitality. Should we allow this to happen?

Sincerely,
Charlene Howe

Dear Judge Kollar-Kotally:

As a long time political activist I am concerned about the leniency regarding the proposed settlement between the Department of Justice and Microsoft in U.S. v. Microsoft. It is my belief that this will not put an end to Microsoft's monopolistic practices.

The settlement abandons the principle that fueled consumer criticism and which gave rise to this antitrust case in 1998: Microsoft's decision to bind—or ''bolt''—Internet Explorer to the Windows operating system in order to crush its browser competitor Netscape. This settlement gives Microsoft ''sole discretion'' to unilaterally determine that other products or services which don't have anything to do with operating a computer are nevertheless part of a ''Windows Operating System product.'' This creates a new exemption from parts of antitrust law for Microsoft and would leave Microsoft free to bolt financial services, cable television, or the Internet itself into Windows.

The settlement does nothing to deal with the effects on consumers and businesses of technologies such as Microsoft's Passport. Passport has been the subject of numerous privacy and security complaints by national consumer organizations. However, corporations and governments that place a high value on system security will be unable to benefit from competitive security technologies, even if those technologies are superior to Microsoft's. Why? Microsoft controls their choices through its monopolies and dominant market share, and still is able to dictate what technologies it will include.

The weak enforcement provisions in this proposed deal leave Microsoft free to do practically whatever it wants.

A three-person technical committee will be appointed, which Microsoft appointing one member, the Department of Justice appointing another, and the two sides agreeing on the third. This means that Microsoft gets to appoint half of the members of the group watching over its actions.

The committee is supposed to identify violations of the agreement. But even if the committee finds violations, the work of that committee cannot be admitted into court in any enforcement proceeding. This is like allowing a football referee to throw as many penalty flags as he likes for flagrant violations on the field, but prohibiting him from marching off any penalties.

Finally, Microsoft must comply with the lenient restrictions in the agreement for only five years. This is not long enough for a company found guilty of violating antitrust law. The end result is that this proposed settlement allows Microsoft to preserve and reinforce its monopoly, while also freeing Microsoft to use anticompetitive tactics to spread its dominance into other markets.

After more than 11 years of litigation and investigation against Microsoft, surely we can— and we must—do much better than this flawed proposed settlement between the company and the Department of Justice.

Sincerely,

Tracy Lindgren

Enclosed please find my personal comment on the proposed settlement in the U.S. vs. Microsoft antitrust action. The comment comes in the form of four attachments.

The first attachment is a text copy of a letter containing my main comment.

The second attachment contains a text copy of an appendix to that letter, going through the proposed settlement in detail and providing a point-by-point critique.

The third and fourth attachments contain the letter and appendix above again, but in .PDF format rather than text, making for more attractive viewing and printing.

Thank you for the opportunity to provide a comment.

Washington, DC 20530–0001

To the United States Department of Justice, and to the United States District Court for the District of Columbia:

I am writing to take advantage of the public comment period regarding the proposed settlement in the antitrust action United States v. Microsoft Corporation, provided under the Tunney Act. I thank you for the time you will take to consider my opinions. Many of the letters you will receive as public comments on the settlement will come from computer industry professionals—persons in the pay of either Microsoft or their competitors. I am neither. Nor, for that matter, do I have informal connections to the software development industry. My profession has been that of a research astrophysicist at prestigious research institutions. I mention this to indicate both that I believe I have the competence to critically examine the settlement and the opinions for and against, and that I have no direct or indirect material stake in the outcome of this settlement.

Despite my independence from the computer industry, as an citizen and a computer user I have strong feelings about this settlement. I believe that this settlement is not only contrary to the public interest, but would damage it instead.

As I understand, it is not illegal for Microsoft to hold an effective monopoly in personal computer operating system software. What is illegal is for Microsoft to maintain that monopoly, and attempt to extend their monopoly into other domains, using predatory or anti-competitive practices. The District Court has found that Microsoft has done this; the Court of Appeals has confirmed this judgment, and the Supreme Court has effectively confirmed it again by choosing not to hear a further appeal by Microsoft. Therefore,

Microsoft has once and for all been declared guilty of such illegal conduct. Numerous Supreme Court decisions in anti-trust cases have indicated that any remedy arising out of a successful anti-trust action should deny the offending corporation the fruits of its violations. And yet, despite the fact that Microsoft was judged guilty by the court of damaging several companies illegally by its actions, there are *no* penalties aimed at making amends for Microsoft's past actions contained in this settlement. In fact, while there are numerous terms clarifying how future operations by Microsoft can be considered legal, there is *nothing*, anywhere in the settlement, that penalizes Microsoft for its past actions. In light of those past Supreme Court decisions, and in light of the flagrant nature of Microsoft's violations of the law (given that this is the second Federal anti-trust action against them, and their violation of the previous consent agreement), a settlement that entirely fails to penalize Microsoft for their past actions and denies them the fruits of their illegal conduct cannot possibly be considered to be ''in the public interest.''

Instead, the focus of the agreement appears to be simply to prevent future anti-trust violations. This approach is tantamount to saying ''it's OK that you violated anti-trust law and illegally damaged other companies a second time, but you should stop it now.'' Perhaps a better way to describe it is as saying ''Stop, or I shall say ''stop'' again!'' It fails to penalize Microsoft for the wrongs already done, and only tries to instruct Microsoft to obey a law that (being a law) they're supposed to obey anyway! This alone would be unacceptable; but in addition, the settlement as written does very little new to hinder Microsoft from continuing to maintain its monopoly, or extend it into other areas, using anti-competitive tactics. Indeed, analysts within the computer industry press have typically described the settlement as demanding almost nothing new from Microsoft. Legal specialists in technology antitrust issues not employed by Microsoft or their competitors have described the settlement as ''business as usual for Microsoft . . .no significant change in the way it develops its products or sells to the marketplace.''

It is true that the agreement outlines constraints on Microsoft's business practices, with the apparent intent of preventing Microsoft from using its influence as a monopoly holder either to force unfair agreements on other hardware or software vendors or to retaliate against them for actions involving non-Microsoft software. However, these constraints are extremely limited in scope, are defined in terms of subjective descriptions which are not easily enforceable, and are laden with loopholes. An appendix to this letter covers several specific flaws in the agreement in more detail; meanwhile, I wish to make several general points.

My appendix below notes how, because of subjective descriptions and loopholes, the agreement fails to set viable restrictions on Microsoft regarding the topics it actually considers. Such subjective descriptions and loopholes matter, because Microsoft has a history of using such flaws to violate agreements coming out of legal actions. For example, the consent decree originating from

the earlier anti-trust action was meant to prevent such actions as the bundling of Windows 98 and Internet Explorer, but this current anti-trust action had to be started because of subjective terms Microsoft successfully entered into the previous agreement that allowed them to ignore its constraints. In the time this action has taken, Microsoft's monopolies have become even more firmly entrenched. To the extent that the requirements of Microsoft in the agreement are concrete, they are comparable to what Microsoft has been doing up to this point. And it is patently absurd to constrain a company guilty of the sorts of actions demonstrated in this court case simply be requiring them to act ''in good faith.'' In other words, not only does the agreement fail to punish Microsoft for its past illegal actions—actions which have damaged or even destroyed other companies attempting to compete—but the agreement also fails in the considerably less ambitious task of clearly defining illegal actions or procedures that Microsoft must avoid.

Finally, there are many topics not addressed by the agreement at all, such as Microsoft's use of proprietary standards in file formats, and how those standards combined with Microsoft's monopoly status effectively block competing products from the marketplace. Microsoft has an effective monopoly on certain types of productivity software, such as word processors and spreadsheets (Microsoft Word and Excel, now bundled together as part of Microsoft Office). Because these monopolies are so entrenched, competitors cannot produce competing software of these types unless their software can read and write Microsoft file formats. Rather than attempting to beat such competitors in the open market, Microsoft has repeatedly acted to prevent competition from taking place at all by keeping the internal file formats for these software packages secret, and by periodically changing those file formats to block potential competitors'' attempts at reverse-engineering them. That this topic is not addressed at all is yet another major failure of the agreement.

What are the consequences of these failures? Dreadful, if Microsoft's past actions predict their future ones. There has been a long history of companies profoundly damaged, or even completely destroyed, by Microsoft's anti-competitive business practices. Digital Research and Stac are two examples of companies whose products were essentially run off the market in a flood of fraud and misinformation and, in the latter case, simple copying of their technology (for which Microsoft lost in court). This case has centered on the damage to Netscape, Sun and Apple by Microsoft's actions; there are many other such companies. we are left with a situation where an environment of innovation and competition is stymied—stymied by fear of even bothering to enter the market, given the expectation that Microsoft will do anything to destroy your enterprise.

In the courtroom, it has been demonstrated that Microsoft has falsified and even destroyed evidence. Despite these events, accepted as fact in a court of law, no criminal penalties have been forthcoming. In recent months, we have seen news stories covering attempts by Microsoft to manipulate public opinion in unethical fashion, ranging from organized efforts to get employees to stuff online ballot boxes/polls about Microsoft and their products, to writing letters to officials on Microsoft's behalf using the names of people who are deceased.

Given this past history, that the Department of Justice would arrive at such an empty settlement with Microsoft is bizarre. After all, the verdict from the District Court was strongly in the Federal Government's favor. While the Court of Appeals subsequently rejected the breakup order, they clearly affirmed Microsoft's guilt. The position of the Federal Government was strong, and Microsoft's announcements of what penalties or restrictions they would not accept in a judgment should have carried no more weight than the assertions of a convicted felon that he ''would not accept'' jail time. It has been noted by Rep. John Conyers Jr., the ranking member of the House Judiciary Committee, that this settlement in fact is less onerous for Microsoft than the terms that Microsoft was willing to concede in settlement talks *before* it lost the case in the Court of Appeals.

Conyers went on to describe the settlement as ''like losing a game by forfeit when your team was ahead with the bases loaded and your best batter on deck.'' (Washington Post, 2 November 2001) Or, as an acquaintance wrote, ''Can someone explain to me how you can win the trial, win the appeal, have the Supremes deny cert to the defendant, and then let the perps walk?''

So why ''forfeit''? Why this settlement? The most commonly-encountered explanation is that the settlement springs purely from politics: the executives of Microsoft were major campaign contributors to the current administration. For example, Robert Lande, a professor of antitrust law who has followed the case closely, has commented that ''Microsoft broke open the champagne when Bush was elected.'' This may or may not be an accurate assessment of the source of this agreement; but it is a difficult suspicion to dismiss; and if this suspicion is true, the claim that the agreement is in the public interest seems even more preposterous. Another explanation offered for this settlement has come from Microsoft and its employees, who have argued that the settlement is indeed in the public interest simply because it halts the continuing hindrance of the operations of the leading computer software company, and therefore is good for the high-tech industry and the economy. These statements are the modern-day equivalent of ''what's good for General Motors is good for America,'' and they are false. It is true that our modern economic engine depends strongly upon the continuing innovation of the computer industry. However, that innovation depends in turn upon the ability of many different sources to imagine and create new software, and for those creations to be able to compete for public attention. It is indeed a bad thing to stifle the ability of the nation's largest software company to produce new products; but it is not an acceptable alternative to stifle the ability of everyone *but* that company to innovate instead.

In short, this settlement is a disaster for the citizens of the United States. It is the polar opposite of an action in the public interest.

It neither penalizes Microsoft for its past illegal, destructive acts, nor does it force the kind of change in Microsoft's current business practices necessary to prevent further predatory, anti-competitive behavior. This despite a contempt for the public and the law displayed in Microsoft's behavior in the courtroom and up to this very moment. If this settlement is upheld, I can guarantee that over its five year course, the problem with Microsoft will only worsen. This may result in yet another court challenge against Microsoft; but we have seen in this case alone how Microsoft attempts to slow the pace of court action as long as possible, the better to create a ''fait accompli'', as they successfully have here. If history, and this and the previous agreements in particular, are any guide, Microsoft will yet again be able to hang on to their ill-gotten gains, and be faced with a set of ''restrictions'' that effect no change and allow them to continue to reinforce their monopolies. The resulting damage to the prospects for innovation and competition in the high-tech sphere will be incalculable, and to the public interest even more so. If Microsoft's hegemony in the computer industry is allowed to solidify further, as this agreement would guarantee, then we will bequeath to our children the kind of future that the early anti-trust actions against Standard Oil or Jay Gould were intended to prevent: where one entity controls the dominant new industry in our economy. We can be better ancestors than that. I therefore urge you, as strongly as I can, not to accept this settlement.

Thank you for your consideration.

Sincerely,

Dr. Christopher A. Metzler

Alexandria, VA 22305

APPENDIX: SOME DETAILED COMMENTS ON THE TERMS OF THE AGREEMENT

The most significant complaint about this agreement is a general one. Microsoft has been found to be a monopoly by a court of law; that verdict has been affirmed by the Court of Appeals, and the Supreme Court has chosen not to review that affirmation. Therefore, under existing antitrust laws, Microsoft is required to conduct its business practices in a non-predatory/non-anti-competitive fashion. This is a standing requirement of law upon Microsoft. As noted in my letter, the agreement as written holds no penalties for past action, only ''restrictions'' upon future behavior. In my letter, I noted how these ''restrictions'' are ineffective; below, I go into more detail on some of these. But most important of all is the fact that such restrictions should be unnecessary; they attempt to restrict Microsoft from doing things that are illegal in the first place, since as a monopoly Microsoft is bound not to conduct its business in a predatory fashion. For example, requiring Microsoft in the agreement not to retaliate against companies that sell competing products with their computers is no great accomplishment; that was already illegal! In fact, enumerating such restrictions, and then

providing exceptions shortly afterward, gives the impression that there are certain terms under which Microsoft is actually *allowed* to violate the law. This cannot be considered acceptable.

Below are specific comments on parts of the agreement.

—Section III, Part A—

Section III, Part A. has several problems. First, it only restricts what Microsoft can do against OEMs, which means makers of ''Personal Computers'' according to the definition given later in the settlement.

The definition of ''Personal Computers'' used in the agreement excludes a wide class of technologies which should not be. For example, a maker of machines which are intended to be used as servers does not fall under this definition—odd given that the distinction between machines intended as desktop PCs and machines intended as servers is often blurry. The phrasing in this Part indicates that Microsoft is perfectly free to retaliate however they choose for whatever they choose against manufacturers/vendors of server hardware.

Second, it says that Microsoft cannot retaliate by altering commercial relations with OEMs. But they can certainly retaliate by doing nice things for everyone *but* the target OEM. That might seem to be forbidden from the next clause in that sentence (including the parenthetical remark), but it isn't; that only forbids withholding *non-monetary* Consideration that others get. They can withhold new *monetary* Consideration that others get without running afoul of the agreement.

Furthermore, this Part restricts retaliation, but it doesn't restrict Microsoft from entering into really predatory licenses with companies with whom they hadn't previously been doing business. In other words, Microsoft could act so that if you were not previously licensing Windows, and wanted to be, you'd better not do anything that upsets them (such as described in Subparts 1, 2 and 3 of this Part, III A.) or you'll only get a bad license from them. You might think this is prevented by Part B immediately following; but that only applies to ''Covered OEMs'', not new ones.

Next, Section III, Part A restricts Microsoft from retaliating against OEMs that ship Personal Computers that include Windows and another OS or will boot more than one OS; but it doesn't restrict them from retaliating against companies that ship or are contemplating shipping machines which do not include a Windows OS at all. Against OEMs that ship some of their Personal Computers with only a competing operating system installed, or with no operating system installed, Microsoft is perfectly free to retaliate however they like.

Next, OEMs which are not Covered OEMs can have their Windows licenses terminated without the notice and opportunity to cure described here as to be provided to Covered OEMs. What is the purpose of this distinction? Why do only the bigger OEMs get this protection? The obvious reason is ''to lock them into selling Windows.'' In other words, a clause assisting Microsoft in further solidifying its monopoly is contained within the agreement itself!

Finally, the last paragraph says that Microsoft is not prohibited from providing Consideration if it's commensurate with the OEM's effort/expenses related to Microsoft products. But since Microsoft is not required to provide this Consideration, this means that they can use this provision of Consideration as a carrot for the kind of behavior they want OEMs to follow. The first part of this restriction might seem to forbid that, since it talks about withholding Compensation—but that's non-monetary compensation only. They could certainly give monetary compensation (i.e. kickbacks) under this ''restriction.'' One might think this is prevented by the restrictions in Part B immediately below—but again, that only applies to Covered OEMs, not new ones.

—Section III, Part B—

Similar to the guarantees of license termination warnings/ opportunities to cure described in the previous Part, the presence of such volume discounts, and different volume discount schedules for 1–10 vs. 11–20 Covered OEMs, strongly discourages those OEMs from selling any other OS. This is another clause which *helps* Microsoft maintain its monopoly.

—Section III, Part C—

Since the constraints of this part only apply to Microsoft's interactions with OEMs—makers of ''Personal Computers''—other hardware manufacturers, such as people making machines which are intended to be used as servers, *can* be restricted by Microsoft from exercising the options listed here.

—Section III, Part D—

Under these terms, in order to obtain information about the Windows APIs etc., one has to join MSDN or ''similar mechanisms.'' What are the terms of so joining? Presently, MSDN subscriptions cost a lot of money. This constraint seems to be saying that to get Microsoft to play fair, everyone has to pay them! Furthermore, what's to prevent Microsoft from making joining this mechanism difficult for entities they wish to punish or abuse?

Also, this section requires Microsoft to begin providing access to APIs in a ''Timely Manner,'' which is defined as ''the time Microsoft first releases a beta test version of a Windows Operating System Product that is distributed to 150,000 or more beta testers.'' So if they only release it to 149,999 beta testers, this time never arrives (and so the restrictions which are to occur at that point don't)?

Clearly, this ''Timely Manner'' demand is easily circumvented. And, for the purposes of this agreement and definition, what's a beta tester?

If the software is sent to a company, such as a member of MSDN, to be tested, does that company count as one beta tester? Or are there as many as the company has employees that *ever* sit down in front of a machine. This is not clear, and is full of possibilities for exploitation.

—Section III, Part F—

This section hinges on the ban against ''retaliating''; it is not clearly defined what would constitute ''retaliation.''

Furthermore, the entities used in this Part are defined in terms of the term ''Personal Computer,'' which again is defined in a very restrictive fashion. Again, Microsoft is allowed under this Part to retaliate against manufacturers of machines which are intended to be used as servers, for example.

—Section III, Part G—

Once again, Microsoft is permitted under this Part to retaliate against a wide class of hardware manufacturers and vendors because of the bizarre definition of ''Personal Computer'' used in this agreement.

Furthermore, an exception is provided where Microsoft ''obtains a representation that it is commercially practicable'' for the other party to do equal or bigger business with competing software. Nowhere does the agreement indicate from where such a representation of feasibility must come—it could come from inside Microsoft itself!

The agreement does say that the representation should be obtained ''in good faith''; but that's subjective, and absurdly generous to a company that has been found guilty of repeated abusing past agreements.

—Section III, Part H—

In Subpart 1, allowing MS to present the options for MS or non-MS software to people as ''one group'' or ''the other group'' virtually guarantees no one will use the non-MS stuff.

Regarding the exceptions 1. and 2. to the rest of Part H, both listed near the end of the part, 2. is an enormous loophole! It allows Microsoft, and their Windows OS, to shun some non-Microsoft software simply because Microsoft or some capability of Windows itself claims that software is not up to snuff. It could be a ridiculous claim; but in the time it takes to sort it out, the practical damage to the company providing that software is done, and Microsoft's monopoly position is that much stronger. And, of course, ''reasonably prompt'' is a subjective term, and based on their past behavior, Microsoft can be counted upon to interpret it to their advantage.

—Section III, Part I—

Again, this section is hobbled both by the use of subjective terms (''reasonable'') and the bizarre definition of ''Personal Computer'' used throughout this agreement.

Subpart 5 seems to be saying that in any agreement Microsoft signs to give people APIs or documentation or similar information, like they're supposed to provide under the agreement, Microsoft can in turn require the software makers to license to Microsoft any intellectual property rights they might have associated with anything the software companies might do that's described in this Judgment, even if those properties are unrelated to the project for which the APIs/ etc. are used. This effectively authorizes one of Microsoft's more strongly anti-competitive tactics!

—Section III, Part J—

This is perhaps the most flawed Part of the entire agreement. Regarding Subpart 1 . .who decides whether disclosure of a particular piece of information compromises the security of anti-piracy etc. systems? Microsoft? They can just say that it does, without substantiation, and thus avoid terms of this agreement. Any disagreement with Microsoft's claim, and they just drag it out forever in court while the other company dies. This sequence of events could not be more predictable. It will happen. Count on it.

Furthermore, it is important to note that effectively all communications protocols of interest include some sort of authentication process, that Microsoft's future plans involve license subscription with online verification, etc. The claim can be made that none of their APIs, relevant documentation, or Communications Protocols are completely empty of information on security protocols, software licensing, encryption, authentication, digital rights management, etc. This clause basically means that Microsoft can withhold pretty much everything. It is a loophole through which a supertanker could be sailed.

Regarding Subpart 2, how is it determined whether a licensee has a history of willful violation of intellectual property rights? Is it from past legal convictions, or findings against them in civil courts?

Or is it just that Microsoft says so? And who decides whether he licensee has ''a reasonable business need for the API, Documentation, or Communications Protocol''? Microsoft? And who gets to decide whether the standards Microsoft gets to establish for certifying the authenticity and viability of the business are in fact ''reasonable'' or ''objective''? Microsoft has stated that they do not consider Open Source to be a viable model; does this mean that no one writing Open Source software would be allowed to look at the APIs or Communications Protocols? Apparently, according to the terms in this agreement.

In particular, this is an effective lock-out for designers wishing to create free software relating to anything which contains ''security''-type subsystems (of the types listed in the Subpart). And regarding 2d), since the third party, that gets to test/ensure verification and compliance with Microsoft specifications, has to be approved by Microsoft, what's to stop Microsoft from using this third party evaluation as a barrier to other companies'' bringing their products to market? Nothing in this judgment.

This Part is a disaster.

—Section IV, Part A—

The presence of subjective terms such as ''reasonable opportunity'' seems like a recipe for further delays while court actions proceed.

—Section IV, Part B

Three people is not a sufficiently large group to vigorously pursue everything the Technical Committee is tasked to oversee. Furthermore, the small size of the committee makes it strongly susceptible to politics: a pro-Microsoft administration means two pro-Microsoft members on the Committee voting in the third member. To a great many people, this committee appears to be an empty gesture.

And the constraint on public comments by the TC has enormous ramifications. It prevents whistle-blowing, for example. If the system breaks, and two members of the Committee are protecting Microsoft, the third can't say anything about it.

—Section IV, Part D

Subpart 4c) indicates that ''If the TC concludes that a complaint is meritorious, it shall advise Microsoft and the United States of its conclusion and its proposal for cure.'' No provision is made for what happens next. What if Microsoft disagrees with the Committee? What mechanism exists to decide what the appropriate response to the complaint will be? How long can Microsoft drag out the proceedings?

Subpart 4d) is, to be blunt, appalling. Under this agreement, if the TC finds that Microsoft has been brazenly violating this agreement, that fact can't be used in any court proceeding? And the Committee members can't talk about it in any legal proceeding? This is simply absurd; it seems intended to make sure that the Committee cannot actually accomplish anything.

—Section V, Part A—

This Part defines the length of the agreement as five years. This is too short for any penalty agreement, of course; anyone following this case knows that Microsoft can drag out a court action for three years at a minimum.

—Section VI—

''Consideration'' is poorly-defined. It is not sufficiently general; there are many other forms of compensation than are listed here. Under the definition of ''Microsoft Middleware Product,'' existing technologies which are not listed there—such as IIS, SQL software, etc.—are not Microsoft Middleware Products, and so Microsoft can go ahead and continue to exploit secret capabilities of the kernel/APIs in their design, and thus maintain an unfair advantage over competing software.

As noted above several times, the definition of ''Personal Computer'' is far too narrow. In particular, there is often no practical distinction between desktop, ''intended-for-single-user'' machines, and machines intended to be used as servers. Excluding servers from the definition (and thus from the constraints of any agreement) makes no practical sense.

Also as noted above, ''Timely Manner'' is defined in an easily-circumvented fashion.

The definition of ''Windows Operating System Product'' notes that Microsoft alone gets to decide what is part of the Windows OS and what is not. If this restriction had been in place in the past, many of the claims Microsoft made in this case, later disproven, would simply have been accepted as fact. This is a bad definition.

Dear Judge,

I want to let you know that I am against the Proposed Final Judgment. Microsoft should not go unpunished for leveraging their illegal monopoly and utilizing anti-competitive behavior. MSs fruits of their illegalities must be dealt with in a proper manner. The PFJ does non-of this. Thus I submit my stance opposing the Proposed Final Judgment. Thank you for your time in the matter.

Respectfully,

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

I am writing to you today to encourage you to bring the litigation against Microsoft to an immediate and decisive closure. I must state that I have been unequivocally and strongly against this case from its very inception. It appears evident to me that it is very unfair to punish a company for excelling in their industry. I am a volunteer instructor with a non-profit organization teaching senior citizens how to enrich their lives by becoming computer literate. This is no easy task but at the close of every session I thank God that Microsoft has been so innovative and far sighted as to integrate their basic Operating System with applications to provide the User with a basis of commonality that makes the learning process infinitely easier. This applies not only to senior citizens but also to those individuals learning the use of new software to increase their knowledge and consequently leading to industrial efficiency. Prior to my retirement I vividly remember the days when it was a nightmare when attempting to home-brew our own integrated system. I have experienced the fact that Microsoft has expended every effort to provide us with the features that we sorely needed.

As I dwell upon the past three years I conclude that it must have been very taxing on the IT industry, the economy, Microsoft and its employees. I understand that Microsoft has spent millions of dollars in their defense—money that could have been put into the development of new products

resulting in further advancement of technology and industrial efficiency. The employees of Microsoft have had to endure an air of uncertainty during this entire situation. As a citizen I am extremely concerned with the possible flight of talent that is the backbone of Microsoft's awesome capability.

It is difficult for me to understand the problems related to the proposed, but rejected, settlement. Judging from what the media has reported, Microsoft has agreed to the terms included in the settlement as well as to the terms brought forth on issues that were not considered to be unlawful. To name two concessions, Microsoft has agreed to avoid agreements that would obligate any third party to exclusively distribute Windows technology. Additionally, Microsoft will not obligate software developers to refrain from developing competing software. Frankly, I personally cannot understand why Microsoft should have to divulge the code that makes up their Operating System. I would certainly include that in the realm of being proprietary and intellectual property. To put it more strongly, to me it smacks of being a case of sour grapes by certain other organizations that have not been as successful.

MTC–00028394 0002

Chairman Greenspan commented, with words to the effect, that the Guide-On that is going to lead the economy of our nation out of the doldrums is technology. It is our future. There is absolutely no doubt in my mind that Microsoft has been a major contributor to technology. As a result, and to reiterate, I personally would like to see this matter closed as soon as possible and I am sure that I am among many who share this same point of view. Thank you for your time and giving me this opportunity to voice my opinion.

Sincerely,
Joe G. Ike

Subject: Microsoft Settlement

Sir:

The Intellectual Property Group strongly urges the government to conclude that the proposed settlement with Microsoft is wholly inadequate to encourage Microsoft to comply with applicable legal and ethical practices.

Microsoft has often played the game that simply because an action is not specifically illegal, then it is acceptable to take the action, even if such action is contradictory to common business ethics. In many cases, Microsoft has taken this concept a step further and unilaterally decided that certain laws are extremely limited, as in the case of failing to identify communications with Congressional representatives because, as Microsoft alleges, they are not part of the government (referring specifically to Microsoft's interpretation of the Tunney Act). In fact, Senator Tunney recently declared, with respect to Microsoft's interpretation of the law, ?I do have some pride in my legislative record and my history of service in the Senate, and I don\'t like to have my words and my intention being misinterpreted,? reported at http://www.siliconvalley.com/docs/news/depth/tunney012602.htm. ?The disclosure provisions were designed to help ensure that no defendant can ever achieve ! through political activities what it cannot obtain through the legal process.? Id. ?Failure to comply with these provisions raises an inference or, at a minimum, an appearance of impropriety.? Id. Microsoft has a long record of disregarding the law and intellectual property rights of others in favor of its determination to sustain its monopoly. Microsoft executives have often criticized competition without factual basis, and have launched smear campaigns against people who take positions contrary to their immediate business interests. Moreover, Microsoft has a long record of campaigning against fair competition by other technologies, including open source technologies. Microsoft has attempted numerous times to quash and tarnish the goals of the open source movement. Such tactics are not only fundamentally unfair and unethical, but also against the interest of consumers, especially in view of Microsoft's dismal software security record.

The Intellectual Property Group urges the government to insist on a settlement or verdict that serves to benefit consumers. Such a settlement would not only require Microsoft to timely share relevant portions of its software code with the business community, but would also require that it agree to offer reasonable royalties to intellectual properties in which it holds a controlling interest. Without this second aspect to the settlement, smaller companies could be subject to intimidation and lawsuits by Microsoft. Such actions would stifle competition and result in fewer choices for consumers.

Sincerely,
Dave Ashby
The Intellectual Property Group

From: Todd Symionow
To: Microsoft ATR
Date: 1/28/02 2:58pm
Subject: Microsoft Settlement

The settlement that the DOJ and Microsoft came up with is ineffectual and is bad for the people of the United States. After reading the agreement, it appears to me that Microsoft dictated the document to the DOJ, who typed it up for them. Microsoft has received a judgement of being a Monopoly by the courts.

Microsoft should have received a fine of several billion dollars, plus stiff oversight into its practices (like IBM had to go through). The settlement does not punish Microsoft for its illegal and monopolistic activities and doesn't prevent it from continuing to operate in illegal and monopolistic ways. The most important part of the case was ignored by the DOJ—Microsoft's tying of software to its operating system. The largest harm that Microsoft has done to the citizens of the United States is the integration of more and more software into its operating system (Microsoft calls it middleware). Every time Microsoft integrates another program into the operating system, it harms the marketplace by killing competition, forcing us to use Microsoft's proprietary technology (such as activeX, rather than Java), and preventing us from uninstalling unwanted features/software. Microsoft keeps talking about innovating. When it talks about innovation it's really talking about monopolization.

The agreement talks about removing shortcuts and icons. The real answer is for the web browser (and other middleware) to be separate from the operating system so that the consumer can choose which browser (middleware) to use. This wasn't in Microsoft's monopolistic interest, because having the browser (middleware) separate from the operating system prevented Microsoft from locking consumers into using Microsoft's proprietary technologies. I am extremely concerned about Microsoft's .net technology. Not only is Microsoft tying all of their products into .net, but they are beginning to require consumers to use it. An example includes the messaging and multimedia features built into Windows XP. To take advantage of these features, you have to sign up for a Passport (.net) account. This is another form of Microsoft's illegal and monopolistic behavior.

Microsoft has continuously broken previous consent decrees. I have no confidence that Microsoft will abide by this decree either. Besides, this decree is just a slap on the wrist. The world's largest monopoly in history must be fenced-in and controlled so that it doesn't continue to harm consumers. I truly feel that the current DOJ, under the current Pro-business Bush administration is doing a disservice to the American people by not dealing with Microsoft more harshly. This is a turning point. Our government has the opportunity to change Microsoft's behavior now and to restore competition in the computer software marketplace. The Microsoft settlement will not restore competition and it does not punish Microsoft for its illegal, monopolistic actions.

I do not support the current Microsoft Settlement. The opinions expressed in this email are my own.

Subject: Microsoft Settlement

To whom it may concern

I don't feel that the current Settlement will curtail or discourage Microsoft from continuing the same illegal practices. Something has to be done to truly level the playing field. There are many talented and creative people who do not further our current technology because they know that Microsoft would use their money to crush it no mater how good it is. Almost all of my co-workers feel the same way. And many of them feel that Microsoft has the DOJ in it's

pocket and will be able to get away with what ever it wants to. If people could commit a crime that would make them $50,000,000,000 and all they had to do was give back $1,000,000,000 most people would do it as many time as they were allowed. And with the current settlement, Microsoft WOULD NOT be giving up a billion dollars and WOULD be furthering their Monopoly! I read an editorial in Barrons, December 10th, metro section in which a Dr. Jeffrey Smith gave a very good analysis and solution to the problem. I would highly recommend a read of the article and especially his solution.

Thank You,

David Anderson

This is my opinion and I am not speaking for JPL or NASA.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft: I am supportive of the Department of Justice's efforts to settle the antitrust case against Microsoft. I prefer the remedies provided by the settlement agreement, as opposed to breaking up Microsoft. Anticompetitive business practices will be curtailed by Microsoft's agreement; for example, it will become easier for consumers to remove features of Windows from their computers and replace them with other software programs. Additionally, Microsoft has agreed not to retaliate against software developers who promote software that competes with Windows. The settlement agreement provides the appropriate remedies to the complaints made by the plaintiffs. No further action should be taken against Microsoft at the federal level.

Sincerely,

William Rossi r

Dear Mr Ashcroft,

This letter is to show my support for the pending settlement of the Microsoft Amti-trust case. The compromise represents a fair resolution to this legal dispute.It has gone on long enough.

Microsoft has made the Computer easy to use and the breakup of this great company is a poor decision to make. The proposed settlement provides flexibility for computer makers with uniform licensing, rights to re-configure Windows with other programs, abilities to license Microsoft technologies and to have access to the Windows internal code. With these conditions in place Microsofts rivals will have ample opportunity to carry on their own operations and will allow Microsoft to operate without further disruption, which of course, will be an asset to the computer consumer and the current struggling economy.Don't breakup this fine company that has put the world at our fingertips.

Dear Mr. Ashcroft: Thank you for finally ending the antitrust lawsuit against Microsoft with a settlement that is more than fair. I personally feel that enough is enough. We have expended millions of dollars on this suit already, and I believe our tax dollars could be more prudently allocated.This is a strong agreement. It grants computer manufacturers new rights to configure systems with access to various Windows features. In addition, it creates a governmental technical oversight committee to review Microsoft software codes and books, and to test Microsoft compliance to ensure that Microsoft abides by the agreement. The only term of the settlement I believe is inappropriate is the internal interface disclosure. I do not believe that Microsoft should have to divulge any information to its competitors relating to how it designs or secures its product. This particular term defies the very foundation upon which this nation was built: free enterprise. Your decision demonstrates insightful leadership on your part. I am glad that our Attorney General is a friend of American business. In my opinion, no more action should be taken at the federal level in this case.

Thank you.

Dear Judge Kollar-Kotally,

Your honor I submit my objection to the Proposed Final Judgment. Apparently, there are several loopholes encompassed in the framework of the final proposal, which favors Microsoft. The proposed final settlement does not dish out any due justice or punishment on the side of Microsoft. At the same time no devices are in place to ensure MS compliance to the stated rules enclosed in the settlement.Although being closely monitored, Microsoft will not have any direct supervision to reassure the company complies with the stated agreement. A three-man compliance team overseeing Microsoft remain in alignment to the stated rules and regulations. This three-man oversight team will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team. All findings by this committee will not be allowed into court. The sole purpose for such a committee is to inform the Justice Department of all infractions committed by Microsoft. Subsequently the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions. When all is said and done, the oversight committee is just window dressing. In turn, who will not strictly oversee Microsofts business moves? In my opinion, the Proposed Final Judgment does not provide sufficient and appropriate restrictions or penalties against Microsoft. What reassurance do we have against Microsofts illegal and illicit activities? I can assure you that the Proposed Final Judgment does not effectively address the question. I am against the Proposed Final Judgment. It in fact pardons MS of all wrongdoing.

Dear Mr. Ashcroft:

I hope that this settlement will mean the end of any further action at the federal level and put an end to any more attacks on Microsoft. Microsoft has never been a monopoly and the government certainly has no place telling people how to run their businesses.

Microsoft is willing to put this behind them; they are sacrificing potentially millions of dollars in profits in order to get a settlement agreed upon. They are giving up access to their source code without retaliating when it is used to compete with Microsoft products. This alone will cover any complaints against Microsoft by allowing a greater number of products to be used in what were predominantly Microsoft areas.

I hope that his will satisfy everyone, as it well should. Microsoft is going above and beyond what was expected of them and it should be appreciated.

Sincerely,
Hugh Queen

From: Betty Brennan
To: Microsoft ATR
Date: 1/28/02 3:04pm
Subject: Microsoft Settlement

Please settle the Microsoft case with the current findings. We feel the prosecution of Microsoft has been and is detrimental to the entire economy. The public has been penalized by actions of the federal government in this unreasonable prosecution by the government, Microsoft competitors, various states where the competitors reside and a prejudiced judge. We feel Microsoft has a better product and should not be prosecuted for making the best successful economy in history and its prosecution led to the recession. It appears the other giants, i.e. Exxon and Mobil, merging banks, merging lumber companies, etc. manage to merge and be monopolistic to the detriment of the regular citizen causing increased prices and the federal government does not interfere. While Microsoft gets punished for going it alone (without political aid) and the other giants lobby Congress, we (everyday citizens) have to pay the higher prices.

Please settle this matter with the current decisions and do not carry it out any longer. Forcing Microsoft to help their competitors is unAmerican.

Dear Mr. Ashcroft:

This is to voice my support for the settlement recently reached between the Department of Justice and Microsoft. In my opinion, this lawsuit should never have happened. The basis of antitrust laws is damage to the consumer and monopolization of the market. There was no damage to the consumer. Bill Gates, through Microsoft, has helped consumers enormously. He standardized computer software. You do not need five different programs to do something. Nor is the price exorbitant; in fact, prices for software have gone down. Microsoft put out a better product at a better price. His competitors had every chance, and still do, to put out a better product and they have not. Instead, they have gone crying to the federal government citing lack of competition. While it is true that Microsoft plays to win, so does every other firm in the IT business ?? indeed, in any business. Microsoft has tried to be fair in meeting the Department of Justice demands. Microsoft has agreed to open the company up to more competition, agreeing to allow other developers more of its copyrighted code to aid in the development of third party programs; Microsoft has agreed to a uniform price list; Microsoft has agreed to disclose interfaces that are internal to Windows'' operating system. This is more than most companies would do.

I urge you to support this agreement and allow us to put this matter to rest.

Subject: Microsoft Settlement

Dear DOJ,

From time to time, I hate Microsoft and its product.

At all times I hate this antitrust effort. It is unnecessary. Costly. Hypocritical. History is replete with antitrust prosecutions that have wreaked nothing but havok. Doing something to end a government-granted monopoly is one thing. Attacking the most successful company of our day is another. They got to the top by offering what the public wanted. We paid them all the way.

Let those who have the skills and honest desire punish Mr. Gates and company in the market place. There are many out there. If Microsoft lets down even for a minute, they will suffer ? alternatives abound, as the Apple, Linux, and AOL-Netscape-Lindows possibilities show.

In the end, it is not Microsoft that beat AOL, Sun, Apple and the rest of them ? it was I and other consumers who chose a cheap, relatively reliable, available standard in computing. The rest remind me of Carl Marx ? riding on the coattails of their betters and trying to bite the hand that has enabled them to feed themselves. It's disgusting, and you should find something more constructive to do with my tax dollars.

Best regards,
Paul L. Svitenko, Esq.

Dear Judge Kollar-Kotally,
I am in opposition to the Proposed Final Judgment in the Microsoft case. Undoubtedly, MS continues to violate business practices. The Proposed Final Judgment does not punish Microsoft for its past violations to the anti-trust laws. Microsoft is guilty of breaking several anti-trust laws. Under the final settlement, Microsoft is permitted to retain most if not all profits gained through their illicit activities. Subsequently, the PFJ will not compensate parties injured or harmed through Microsofts egregious misdeeds.
In addition, the PFJ will not take into account all Microsoft gains made through its illegal maneuverings. With all due respect, the final settlement is basically acknowledging the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? I can assure you that the message is clear and simple.
The PFJ encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. With all due respect your honor, I am outraged at such a preposterous proposal that only helps Microsoft to remain intact and continue with its unethical practices. In conclusion I submit to you my objection to this Proposed Final Judgment.

Please don't let Microsoft get away with it. Microsoft would have been just fine if not for their cut throat business practices. Releasing a OS that compeats fairly on the market would mean that microsft would have about 50–60% market share. But when a hardware manufacturer has to sign an agreement to only sell computers with only the one type of operating system it hurts all of us. Competition is what makes our capitalist economy go round and when the OS manufacturer stops that from happening we become little more than a communist commune. Their control of the market has been unmeasurable and this control has damaged the way we live, the way we learn, and the way we work. Microsofts Monopoly has cost businesses in the US alone Billions in dollars that could have been paid back to stock holders or be used to pay off loans and help the economy instead of hurting it. Don't let Microsoft screw us all again make them work with binders on for awhile and see if they can deal with some of their own medicine.

Dear Judge Kollar-Kotally-
Please consider my disapproval at the Proposed Final Judgment. Consider the true facts in the matter and judge accordingly.
From my understanding a Final Settlement has been reached between the two parties. However the Proposed Final Judgment will overturn the evidence found by the U.S. Court of Appeals indicting Microsoft in violation of antitrust laws.
The proposed settlement has the Justice Department withdrawing their charges against MS. In fact, based on the assessments made on the proposal, Microsoft will be cleared of all wrongdoing in the matter. How can this be?
There are several glaring flaws in the PFJ. However, non-so more apparent than allowing an absentee landlord to govern Microsoft. With all due respect, the final settlement provides no security to restrict MS from breaking any laws in the future. In my humble yet accurate opinion, the future governing body, implementing certain rules or regulations and forcing MS to adhere by them, will not be stringent nor forceful enough to make any dramatic changes. Similarly, I am not convinced that these stiff penalties applied to MS will ensure the security and future growth of other companies,
A whole new framework of laws must be established to justly punish MS. The Proposed Final Judgment abstains from such justification and order. Again I submit my objection to the stated Proposed Final Judgment.
Sincerely,
Eduardo Tualla

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing today regarding the settlement that was reached between the Department of Justice and the Microsoft Corporation in their three year long antitrust battle. I believe that this case has been propagated for far too long and the money and resources expended on both sides of this dispute could have been put to better use elsewhere.

The terms of this settlement are fair. Microsoft has agreed to design all future versions of its Windows operating system to work in conjunction with the products of its competitors. The company will also cease any action that may be considered retaliatory. Adherence to this settlement will also be ensured by a government appointed oversight committee which will monitor Microsoft. It is clear to me that this settlement addresses the issues that were brought in this suit and then some. The reluctance of some people to accept these terms is proof that they are more concerned with perpetuating their own political agendas than they are with finding a suitable solution to this problem.

Thank you for supporting this settlement and for allowing me to voice my opinion on this issue.

Sincerely,
Marty Irwin

Subject: Microsoft Settlement

I am writing in the hope that my thoughts and concerns may be heard by the court of Judge Colleen Kotar-Kelley. I'll be brief. The settlement, as proposed by the DOJ, the accepting states and Microsoft is fair to all concerned and the general in public. This case has only minimally been about consumer protection from a monopoly and has largely been about protecting the interests of a very few, large corporate and government interests to make sure that their brand of technology isn't usurped by vendors like Microsoft who work to find unique technologies and incorporate them into a coherent, useable form for large numbers of people to benefit from the technologies use. In regard to this competition, the proposed settlement is very fair, for two of it's primary stipulations, in my mind. The first is that OEM's are assured that Microsoft can not take retribution on the OEM's if the OEM's decide they find one technology more compelling than a Microsoft technology. It also provides the means for Microsoft's competitors to find out about underlying interfaces into it's applications and operating systems, by allowing the sharing of specific technology information,

but which does so, in a controlled atmosphere that protects Microsoft's rights to it's intellectual property.

This is the most important reason to accept this proposal. It DOES protect the intellectual capital of this company without the wholesale rape and plunder of it's most important technological secrets. In a communist/socialist system, one would expect that the details of how a successful business is operated would be viewed in extreme detail without any regard for the rights of those individuals who have worked so hard to make that company a success. But this is America. Organizations and individuals in our society have the right to protect and keep private the fruits of their hard work and share those fruits with others in a way that rewards those who worked to create those fruits. Microsoft's competitors, including the states who are objecting to this settlement (these states also have compelling interests on the behalf of Microsoft's competitors in my humble opinion) care not about competition, but how to get as much intellectual property as possible and eliminate Microsoft as a threat to their very profitable franchises which are far from affordable for the average consumer (which is what they keep telling us this is all about, that this is for Jane and Joe consumer).

Finally, I am not surprised, even in the light of all the stuff that has gone on at ENRON, that the loss of billions of dollars from investor funds (holding Microsoft stock) is not a big deal to our government leaders because of all the money that state and federal representatives hope to acquire from a major shake up of Microsoft, and because their corporate benefactors (IBM, SUN, AOL/TimeWarner, et. al) will benefit from a coup in obtaining Microsoft's intellectual property. ENRON is a big deal, because so many government leaders had there hands involved in that organization in so many ways. Microsoft is, on the other hand, not a big deal to the government and needs to be done away with, because rather than spend a lot of time throwing money at congressional leaders and lobbying congress, Microsoft went about it's business. Microsoft did do and still does an excellent job of finding the best and the brightest talent to become one of the best marketing and technology companies in the world. If you really want to find out about competition, then why don't you go out and compare a Microsoft solution, to that of one of it's competitors (IBM, SUN, AOL/TimeWarner, Linux or other OS/Application variants) and evaluate on all facets (up front costs, consulting needs, ongoing support, etc), and you will see that if more draconian remedies are pushed upon Microsoft that the high prices already charged by these Microsoft competitors will do everything except become more competitive.

Thank you for your time and consideration!

David J. Renner

Subject: Proposed Microsoft settlement: woefully insufficient

Dear Justice Department,

As a software innovator and holder of several software patents, I have first hand knowledge of how extremely brutal, unfair and bullying Microsoft is to others in the industry. I was involved for five years in negotiation, arbitration and potential legal action against Microsoft which only caused Microsoft to spend incredible resources to deny me and Humanic Systems any just and due compensation for our innovative work.

In my opinion, as President of Humanic Systems, a company that was (above) abused by Microsoft regarding our intellectual property for significant components of Microsoft Outlook, the proposed remedy is extremely inadequate:

1. It does not provide substantial redress for the prior losses caused by MS on others

2. Secrecy provisions undermind the ability to obtain API information and will systematically be used by MS, in my opinion, to continue its monopoly stranglehold

3. There are no structural remedies, and, without those, the ''fascist'' mindset of Ballmer and Gates will continue to dominate the thinking of each and every employee

4. Microsoft's stated opinions about various forms of open software, being a ''cancer'' undermines the ability for consumers to get the maximum benefit for the least cost This position, alone, demonstrates that they want ''all the marbles'' and it is a ''winner take all'' game Consider, for example, a PBS documentary about extreme competition as taught within the Gates family as Mr. Gates grew up This person does not know the word cooperation, and, without extremely directive measures, will never show cooperation to the rest of the software industry that is slowly dying under his ruthless hand.

Subject: Microsoft settlement

To Whom It May Concern,

I hope Microsoft does not get off with a warning or a fine. Warnings have been disregarded in the past. And a fine will only be earned back by higher prices on its products. I think for Microsoft to curtail its illegal domination there have to be specific, strict instructions as to what it may and may not do. Windows XP is even more bundled with Microsoft products than previous versions. How did that happen; why was that product allowed to be shipped? Microsoft does not play well with others and must be severely restricted in its drive to curtail and bully competition, ignore industry standards and push through its own proprietary standards and hamper innovation.

Sincerely,
Rick Balian —

Subject: Microsoft Settlement

In my opinion, Microsoft's proposed settlement to the law suit is a fair solution to ending this long, ongoing fight by competitors to try to bring Microsoft its knees. The willingness of nine states to accept the settlement clearly demonstrates that it is fair and reasonable. But nothing will ever be enough ''punishment'' for those states who want to damage Microsoft.

I urge the DOJ to recommend acceptance of the settlement proposal. Allow Microsoft, along with its new awareness of business practices, to continue building great software and services for users around the world.

RE: Microsoft Settlement

Dear Attorney General Ashcroft:

I am sending this public comment via email to record my support for settlement of the court case against Microsoft Corporation. I seek your continuing support in the effort to persuade the judge that the settlement will be in the better public interest of the United States than the alternative of costly and unfocused, continued litigation.

The settlement, whatever its effects on Microsoft Corporation, will be quite beneficial to the community that uses personal computers, PC makers will be able to re-configure the desktop package of programs that come with Microsoft?? Windows, or even to combine making PCs with operating systems from Microsoft and other software makers, with the ending of exclusive distribution and promotion terms in contracts, These and other changes will bring greater flexibility and opportunity for experimentation to the PC world, If Microsoft wants to continue to lead the industry it will have to come up with new and better innovations faster than it has in the past.

Please continue to support the settlement. Thank you.

Respectfully yours,
Michele Adams Pizzitola

To: ''microsoft.atr(a)usdoj.gov''
Date: 1/28/02 3:22pm
Subject: personal opinion of MS settlement

To whom it may concern.

I am very concerned regarding a quick and non-remedying settlement against Microsoft. I feel as thought I am a pet of this particular corporation ... I am only allowed to have what they will allow me to have. Not only are my software choices very limited, but even some of those competing choices are taken away from me because of the reasons which found Microsoft guilty of being an illegal monopoly.

One thing I do not understand is why Microsoft has not been sued by corporations using their software. There are many software ''bugs'' in their past software—Office 95, 97 2000, etc. Windows 95, 98, 98 second edition, millennium, etc. If I am buying a license to use software, and not the software itself, it stands to reason that I would expect the licensor to keep fixing the ''bugs'' in software for a specified amount of time; and that new releases are just software with new features.

However, there are many unresolved software ''bugs'' which are never fixed. With no competing software, my only recourse is to buy a new license for a different version of software. This may be an expensive remedy which I should not have to afford.

Also, I have heard that major resellers MUST sell Microsoft software on their computers. From Dell, Gateway, etc I can not get a computer only. I must purchase an operating system. But, on a previous computer that will no longer be used, I already paid for an operating system. If that computer is no longer to be used, or to be used with Linux, Unix, FreeBSD, Be, or some other ''ground roots'' operating system, why must I pay again for a software license when one is already freely available for use?

I believe I have been wronged. I have been duped out of my hard-earned money. I insist that this will not happen again! I want the party found guilty by a jury to be considered guilty by the judicial system!

Dear Mr. Ashcroft:

I support the settlement between your office and Microsoft in the ongoing antitrust trial. I believe that Microsoft has the right to free enterprise, and the terms it will comply with to end the case are fair to its competitors. Microsoft's concessions in the settlement will ensure that their rivals have more opportunities to gain market share. Making new program removal features available in Windows XP and giving computer makers new freedoms to integrate non-Microsoft programs into Windows will ensure that other companies who make good products will have a greater chance of distributing them to the public.

Please settle the Microsoft case, and be mindful of their right to innovate and reach as many people as possible with their products.

Sincerely,
Linda J. O'Neill -Puls

From: Gary Robson
To: Microsoft ATR
Date: 1/28/02 3:22pm
Subject: Microsoft Settlement

I believe that the findings in the Microsoft antitrust case were accurate and reasonably stated, but that the remedies do not go far enough to prevent recurrence or to compensate consumers and competitors for the damage done by Microsoft.

When I first began using computers with Microsoft operating systems, the OS represented around 1% of the total cost of the computer (an IBM PC with MS-DOS). Now, I can buy a computer for under $1,000 and a copy of MS Windows will cost over $100. They've gone from 1% to 10%. The vast amounts of profit Microsoft is raking in from their operating systems monopoly is funding advertising, price cutting, and other methods of invading other profit centers, including not only middleware, but video games, the ISP/ASP market (through MSN), and many less visible incursions through acquisitions and partnerships.

Breaking up Microsoft is the only realistic solution. ———

Under the Tunney Act, I wish to comment on the proposed Microsoft settlement. In my opinion, the Proposed Final Judgement (PFJ) does not protect the interests of the American public, and does not address the anti-competitive practices Microsoft was found guilty of. In particlular, I would like to make the following points:

The PFJ doesn't take into account Windows-compatible competing operating systems The PFJ Contains Misleading and Overly Narrow Definitions and Provisions The PFJ Fails to Prohibit Anticompetitive License Terms currently used by Microsoft The PFJ Fails to Prohibit Intentional Incompatibilities Historically Used by Microsoft The PFJ Fails to Prohibit Anticompetitive Practices Towards OEMs The PFJ as currently written appears to lack an effective enforcement mechanism As a professional working in the Computer Software industry, I have personally observed the effect Microsofts monopoly power has had. It has stifled innovation, blocked investment in promising competitive technologies, and severely distorted the efficiency of the software marketplace. Today, no one knows what the economic value of a PC operating system is, or a web browser, or an email client. Microsofts monopoly has blocked the free flow of information and capital that is essential to a healthy market. The decision by the Justice Department to capitulate to Microsoft is a gross injustice to the average consumer of computer software.

In summary, the Proposed Final Judgment, as written, allows and encourages significant anticompetitive practices to continue, would delay the emergence of competing Windows-compatible operating systems, and is therefore not in the public interest. It should not be adopted without substantial revision to address these problems.

Subject: Microsoft Settlement

My Opinion/Vote: Settlement needs to be completed and minimal penalties, if any, need to assessed and allow Microsoft freedom to be innovative, creative and competitive and survive in the world competitive economy and free market. At the rate the legal proceeding are going, throwing this case is completely an option.

I am pro-settlement with Microsoft, DoJ and the nine states. The issues, who and why's are not reflective of the general populating and I am convinced this is being driven by Sun, IBM and AOL/Netscape and several other competitors who lack product creativity and success. After all the legal battles and information about harming consumers, at the end, you ask the general population and consumers thru the Tunney Act. If this was really truly driven by the consumers, I am pretty sure we would be hearing from them more then Sun, IBM, and AOL/Netscape funded legal battles.

Settlement: Microsoft, economy, consumers and innovative productivity has suffered enough. There should minimal penalties against Microsoft and many of the practices in question are no longer in place or even applicable. Companies need to be innovative, creative and competitive to survive in the world economy and free market.

Issues:

*These legal fees are costing the US and Microsoft many dollars. I see where Microsoft took a finical cost, $660 Million dollars battling these legal issues, but where/what are the funds fueling the DoJ and nine states and the other previous other nine states? My income, state and local tax dollars and maybe some selective corporate sponsorship? I would challenge opposing corporate sponsorship in the court of law on a case slated on behalf of the people.

*Other legal issues related to suing Microsoft i.e. the Class-Action Suit http://www.microsoft.com/presspass/Press/2002/Jan02/01–11ClassActionDe cisionPR.asp and the resent AOL/Netscape suit http://www.microsoft.com/freedomtoinnovate/info/news—01—22—02.asp *Where has the end consumer been harmed by Microsoft IE browser, in the scope of this case? For that matter Microsoft's technology harming consumers? And one should look back in history and see where technology has come from and improved consumers, productivity and world wide economy.

Other 100 Class-Act Suite, and suggested settlement:

''Under the proposed settlement, Microsoft had agreed to provide more than $1 billion in cash, training, support and software to help make computer technology more accessible to public schools serving nearly 7 million of America's most economically disadvantaged children.'' Would have helped those schools and prepared those students for the current real world computing skills. But no, Apple/Mac's has the loin-share of that market and go figure they are training students on non-Microsoft technology in preparation their profitable careers.

AOL/Netscape Suit:

Who killed Netscape? Well, AOL purchased Netscape for $10 billion dollars in the midst of the DoJ trial, even after hearing concrete evidence that IE's success in the market was based on merit, not market share. And in the middle of a so called browser war, sound like a poor business decision gone bad and now want the sue.

Dear Ms. Heese:

I applaud the leadership displayed by the Department of Justice and the nine Attorneys General for developing the proposed Microsoft settlement agreement that balances the protection of consumer interests and the competitive process. I believe that this settlement will preserve Microsoft's ability to innovate and engage in normal procompetitive activities, critical during our nation's current economic recession. At the same time, the settlement is a win for consumers, with its broad scope of prohibitions and obligations imposed on Microsoft. It will certainly require substantial changes in the way that Microsoft does business. It imposes significant costs on the company and entails an unprecedented degree of oversight. Furthermore, the agreement strikes an appropriate balance within the technology industry, providing opportunities and protections for firms

seeking to compete while allowing Microsoft to continue to innovate and bring new technologies to market.

This reasonable settlement will help consumers, the industry, and the economy to move forward.

Very truly yours,
Tim Pawlenty

From: Miles C
To: Microsoft ATR
Date: 1/28/02 3:26pm
Subject: opposed to settlement

From what I have read in the majority of trade publications is that the consensus is that this is not a settlement that will significantly benefit anyone other than Microsoft.

I hope that 9 states pursuing a separate path is enough to at least give whomever might be in charge of this case that it this case is strongly questionable. I would put forth the suggestion that attorney generals in 9 states are also experts in the matters of law, so even though 9 states have gone along with it the matter has some serious issues. As near as I can tell, Microsoft is and will remain a monopoly. They make the rules for their OS. They will also use unfairly their considerable resources to enter in and dominate any aspect of the software industry because there does not exist another corporation who can print money like they can. The idea of leveraging a monopoly is something that I don't think was adequately explored.

I think that they have adopted the old Royal philosophy of don't explain and don't apologize as much as possible. It works, most people will go away if you deny anything long enough. They have added to it with significant amounts of money in contributions making the party line that much more difficult to dispute.

At this juncture, they seem to be trying to make new inroads into people's lives such that they will control large portions of commerce with the Internet by holding much of the information used for marketing and purchasing. If the Department of Justice can have its case split so cleanly at this juncture how much less of a chance will there be an answer in the future when no doubt the political pressure will likely be even greater because of greater profit?

I truly doubt that they are significantly changed from their earlier tactics simply because those tactics worked and now no longer are necessary rather than they are facing any punitive measures. There will remain the fact that no one can develop for their platform as easily as they can. They have the source code and expertise in developing it that automatically gives them an advantage in experience.

I honestly feel as though I was sold out as a consumer. I don't doubt that any company that is developing in a field that MS looks at as potentially profitable feels even worse knowing that they will be acquired or destroyed as a force in that market through no special ability of MS other than not having that market niche fund its development. Office will help pay for Money, which will help pay for Age of Empires, for instance. Please reconsider this settlement. I truly believe that a diversified software industry will be much better for us than a gigantic corporation kept healthy through government intervention on its behalf.

Sincerely,
Miles Cannon

MTC–00028442

From: Bill Keough
To: Microsoft ATR
Date: 1/28/02 3:28pm
Subject: Microsoft Settlement

The recent history of antitrust has been a jihad by the Department of Justice against a pantheon of American industry. Antitrust cases against IBM, Intel and Microsoft seemed to have been designed to wreck the high tech industry. Al-Qaida could not have designed a more devious program to destroy the U.S. economy. Hyperbole? The current recession was started or at least given a boost by the tepped up legal action against Microsoft and the consequent fall of it's stock. Hundreds of billions of dollars have been lost.

This suit has unleashed a mob of whining moochers angling for a chunk of cash or control of Microsoft. If this lawsuit is upheld it will result in the virtual destruction of the company, maybe not at once, but surely in a drawn out death by fragmentation and bankruptcy. No more operating systems, no more Web browsers, no more games, no more office software, no more jobs, no more nothing. Contrast the way Microsoft does business with the way the Post Office, a real monopoly, does business. Can Microsoft prevent the entry of competitors into its realm of business? No it can't, but the Post Office routinely does this the only way possible: by the use of force or the threat of force. There is no other way to bar competition than to resort to force. Entry in a field of business however does not ensure success. Your competitors do not have to make allowances for your weaknesses by tailoring their business practices so you can survive. Everything is permitted except force or fraud. As Bill Gates has said many times, no one has been forced to do business with them. If their partners do not like the terms Microsoft sets they are always free to leave. Microsoft should not be compelled to open up its products to competitors. Windows and Internet Explorer are their property to dispose of as they see fit.

This is the essence of the case, or lack of a case, against Microsoft. Envious competitors complain about Microsoft's business practices, which they themselves routinely use. On a personal level, I started with the Prodigy browser and then switched to AOL. Finally when I bought a new computer I ended up with Internet Explorer. I never had any trouble switching browsers and from a business point of view it would not make sense to impede the installation of new software. After all what would be the point of an operating system that sabotaged certain programs? That Microsoft includes an internet browser with windows does not mean you have to use it. Competing browsers on CDs are so numerous they are regarded as junk mail. The Department of Justice case against Microsoft is not just senseless but in a recession and a time of war it is doubly destructive. Reason and justice dictate that this case should be dismissed.

To Whom It May Concern:

Many others have eloquently voiced their opposition to the proposed settlement. I cannot hope to express the same concerns as well in a brief email.

I am against the proposed settlement because I do not feel it goes far enough in restricting the anti-competitive practices that currently allow Microsoft to maintain a monopoly position in the desktop operating systems market. Further examples of these practices are evident in software releases subsequent to the court findings, further

justifying the need for strong measures that cannot be circumvented by Microsoft's interpretations of loose wording.

After all the legal battles and information about harming consumers, at the end, you ask the general population and consumers thru the Tunney Act. If this was really truly driven by the consumers, I am pretty sure we would be hearing from them more then Sun, IBM, and AOL/Netscape funded legal battles.

Dear District Court Judge:

I am writing to you to as I am frustrated with the prosecution of Microsoft. I am the Information Systems manager for our office and deal with Computers and Servers daily. Streamlining computer software and hardware can be the most difficult, time consuming and costly expense for our company.

Compatibility and support are key. I appreciate that Microsoft has helped immensely with this task. We don't need this process mucked up by government intervention. I resent that the government does not believe that I can decide for myself which software/hardware is useful to me. I can't believe our government views Microsoft as a threat, when after all it is Microsoft that has brought the industry to where it is....on real earnings, not ''puffed-up'' .com hype. Don't forget the bubble bursting for the .communists and all of their venture capital. Those bringing suit are not individual consumers, but Microsoft's unsuccessful competitors. Failed businesses must not be allowed to set the rules for the markets in which they failed.

Protecting some businesses from others is a dangerous policy. I want to see an America where success is embraced, not punished and throttled! Bill Gates is a self-made man who has brought America, the world, to new levels of progress. Microsoft has a fundamental right to its property, and it is the governments job to protect this right, not to take it away. Microsoft, should be lauded and left alone to continue to develop and prosper so that, we the people, can too.

Subject: Microsoft Settlement

Dear Sirs,

This is a follow-up to my e-mail from 11am this morning. My earlier letter was intended for those handling the civil anti-trust suit against Microsoft. This additional letter is in regards to the federal anti-trust case. As a citizen of the United States of America, and an employee in the High-Tech sector of our nations economy, I feel compelled to write and voice my disagreement with the proposed federal anti-trust settlement with Microsoft.

For the past two decades, I have watched again and again as Microsoft leverages its monopoly position to wipe out what were once healthy high-tech markets. While only a few of these cases have seen a courtroom, and while some would disagree about whether Microsoft's dominance in these instances has provided more pluses or minuses for the end customer, one thing is painfully clear: Microsoft has now been caught red-handed, showing the very worst of intentions, as they abused their monopoly position to destroy competition and seize control of the web browser market. What's more, Microsoft has shown in court, in the press, and in the marketplace, that they do not recognize their mistakes in this area. They are simply not capable of the kind of introspection, conscience and respect required to regulate themselves as a result of the findings of this case. As we have seen throughout this long ordeal, Microsoft shows an arrogant disrespect for the letter and spirit of the law; sometimes manipulating technical evidence, other times violating the temporary restrictions placed against them, all showing a clear pattern that they are truly unrepentant in their actions. The currently proposed settlement, which is basically that ''we won't do it again'' is laughable under the existing circumstances. I urge the Justice Department, The Court, The Judge, anyone else involved, to reject the currently proposed federal case settlement, which is merely a slap on the wrist (like so many slaps Microsoft has ignored before) and insist on pursuing truly punitive, active remedies against this company which is so wreckless in the marketplace and so disrespectful of the courts and of the American people.

Short of breaking up the company (which I still think is justified) certainly there should be, at the very least, some hefty fines applied against Microsoft, and perhaps even a loss of property rights (creating an open source library for) the various technology pieces Microsoft has used for monopolistic anti-competitive leverage, such as Microsoft Office, Microsoft Internet Explorer, Windows 95/98/NT, and so on. For us to hesitate on doing this because Microsoft is a ''flagship'' for the industry, or because their products are now such established, fundamental tools in our marketplace, really shows how entrenched and uncontrollable Microsoft truly is.

Again, despite arguments of past or future behavior, at least in this case the findings are clear. Microsoft has been caught abusing its monopoly position in the worst of ways, to the intentional detriment of the browser market. Microsoft has shown that it cannot self-regulate, and that it usurps the court and the will of the people at every opportunity. There has to be a more severe consequence for such destructive actions and intent.

Thank you for your consideration in this matter,

David E. Jorgensen

Dear Mr. Ashcroft:

I am a proponent of free enterprise and believe that the government's interference with Microsoft hover the last three years has been appalling. How can our nation and economy grow if politicians and lawmakers keep attacking business?

The antitrust lawsuit has been ridiculous and now that a settlement has occurred I see that Microsoft is being forced to grant broad new rights to computer makers to configure Windows so that competitors can more easily promote their own products. They are also forcing Microsoft to disclose for use by competitors interfaces that are internal to Windows operating system products.

The terms of the settlement seem aimed at nothing more than to give competition an edge it did not have before. Nevertheless, your office has to finalize the settlement. Our economy cannot afford further litigation against Microsoft. I hope your office does what it can to deter the states still eager to sue.

Sincerely,
Gail Williams

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

In relation to my objection to the final settlement in the MS case, I want to point out several loopholes attributed to the Proposed Final Judgment.

I am not in agreement to the oversight committee proposed by the PFJ. With in the confines of the settlement this committee must closely monitor and screen all activities by MS. This close scrutiny insures MS complies with all restrictions entailed in the agreement.

A three man compliance team will oversee and insure that Microsoft comply with the stated rules and regulations. Yet, this three-man oversight committee will be composed of the following: one appointee from the Justice Department, one appointee from Microsoft, and another appointee chosen by the two existing members. In turn, Microsoft will control half of the oversight team.

Also, in the likelihood of any enforcement proceeding, all findings by the oversight committee will not be allowed into court. The sole purpose of the committee is to inform the Justice Department of all infractions by Microsoft. Subsequently the Justice Depart will launch its own investigation into the matter and commence litigation to halt all infractions. When all is said and done, the oversight committee is just window dressing, who will not strictly oversee Microsofts business moves?

In my opinion, the Proposed Final Judgment does not provide appropriate restrictions against Microsoft. What reassurance do we have against Microsofts illegal and illicit activities? I can assure you that the Proposed Final Judgment does not effectively nor sufficiently address the question. Subsequently, I again submit my objection to the final settlement in the Microsoft case.

Sincerely,
Doray Tualla

I am writing to you today, giving official notice of my objection to the current DOJ anti trust settlement with Microsoft.

As a small business owner and software developer I strongly urge you to reconsider your settlement. Microsoft is a successful company not because their products are superior in quality, but because Mr. Gates and his associates are excellent salesman.

These salesman are selling the United States government into a shitty deal. For years, Microsoft's operating system alone grew to monopolistic power because of exclusive agreements with hardware vendors that eliminated any chance other competitors in that market had. The emergence of the Internet and the browser led to a weak but understandable argument that Microsoft intended to use ''brute force'' in the business world to eliminate its competitor.

While I am all for the American way, and all for free trade and freedom of commerce, I believe along with many intelligent, educated professionals that the American way is now threatened by this settlement. This settlement will bind the United States government to a monopoly that should not exist, a monopoly that already hinders free trade and creativity. Being Microsoft Certified myself, I will leave you with this thought; Microsoft builds software for the lazy IT employee. While many people may be employed as IT professionals, these IT people are short minded and lacking pertinent knowledge. The arrogance this combination breeds; stupid people making good money, establishes security risks.

At this point in time, the last thing the United States government needs is arrogant uneducated individuals at the helm of all the critical data in this country.

Dear Mr. Ashcroft:

We wanted to write to you today to express our dismay over the Microsoft antitrust dispute. As Americans, we feel that this suit is contrary to the very ideals of free trade and capitalism that we treasure in this nation. It is our opinion that punishing a company or an individual for demonstrating the very cleverness and ingenuity upon which we have built this nation is un-American.

Americans are unlike any other people in the world. It is our goal to become a success; to become something more than our fathers and grandfathers were; to start with nothing more than a good idea and a diligent work ethic and end up a success. This is the American dream, and it is this dream that is under attack in this suit.

This litigation is not a question of whether or not Microsoft violated antitrust laws. It is a question of whether or not we, as Americans, have the right to become successful without the interference of the government. We are pleased that this heinous suit has finally reached a conclusion that is satisfactory to all of the parties involved. However, it is our fondest wish that none of this unpleasant litigation had begun in the first place. Please keep the government out of the private sector.

Thank you.
Sincerely,
Don Crohan

Subject: Microsoft Settlement

Good Afternoon,

I certainly hope that you finally reach a settlement in this case and let one of the finest entities in America get on with business. Throughout my school years and all my years in busines, I have never received greater value and more productive tools than Microsoft software. MS Word and MS Excel are the envy of the software world as is the MS Windows operating system in all its versions. I am sure that all Microsoft's competitors are jealous; however, they should not be allowed to use the courts t achieve that which they cannot achieve through innovation. Sam Walton never resorted to the courts to beat out Sears, J.C Penny, K-Mart and the now defunct Ward's. He used innovation and fair pricing and we all get better value for that. WalMart is now the largest corporation in the world.

Judge Penfield Jackson was so biased in his handling of this case that he should be removed from the bench. I thought that the federal courts operated at a much higher standard but am sorry to say they all don't.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I oppose the proposed resolution in the MS case, better know as the Proposed Final Judgment. Over and above the usual economic risks presented by an unchecked monopolist—rising prices and monochromatic innovation the nations computer infrastructure will be increasingly vulnerable to attack if a single software system predominates.

Obviously I am referring to Microsoft. Suppose that 80 or 90percent of the world's grain supply came from a single variety of corns. We would be faced with the unacceptable risk that some single disease might wipe out an enormous portion of our food supply. In the same respects translate that example over to the Microsoft issue. Having only one kind of operating system or one kind of browser would make it terribly easier for saboteurs to bring the entire Internet to its knees. For one entity, such as Microsoft, to control 80 to 90 percent of the market for PC operating systems, Internet browsers, e-mail readers, and office productivity software is clearly a significant security risk. To then allow that monopoly to actively attempt to drive out its remaining competition would hardly be in the public interest. Diversity is the key in producing economic prosperity and improving the society as a whole. The PFJ goes against allowing diversity to flourish. Therefore I object to the Propose Final

Judgment.

Sincerely,

Washington, DC 20530–0001
Randolph S. Kahle
6161 N Canon del Pajaro
Tucson, AZ 85750
28-January-2002

Dear Ms. Hesse:

I have worked in the computer industry for over 25 years. During that time I have worked as a developer, a marketing/business strategist, and as a consultant to large and small companies. I have a degree from Rice University in software and hardware design and an MBA from the Amos Tuck School of Business Administration at Dartmouth College.

My work experience includes Hewlett-Packard as well as six years as a marketing and business strategist at Microsoft working on database and developer products. I have seen Microsoft from both the inside and now, for the last ten years, from the outside.

As I am not an attorney, I cannot speak to the legal specifics of the Proposed Final Settlement, however, I am qualified to speak to the practical implications of the terms in the computer industry as well as other industries and markets into which Microsoft may enter.

COMMENTS IN GENERAL

As the computer industry moves towards a future, fully-distributed, computing environment, it is vital to have an environment which fosters and rewards innovation. While it may seem a mature industry, we are still only at the early stages. To date, there have been several waves of general innovation and consolidation. Each wave brings cost reductions, creative ideas, whole new companies and new technologies. After a wave, there has been consolidation around standards and then the next wave appears. These waves could be named the ''mainframe era'', the ''minicomputer era'', and the ''personal computer era''. We are now leaving the ''personal computer era'' and entering a new one centered on distributed computing and information, the ''distributed computing era''. As each era transitioned to the next, the companies and products of each successive wave accommodated the past, while providing new innovations. IBM anchored the mainframe era, Digital and Hewlett-Packard emerged during the minicomputer era, and Microsoft, Dell, Gateway, and others emerged during the personal computer era.

What is different about the current transition, is that a single company, Microsoft, is attempting to leverage their monopolistic power created in the personal computer era and their position in the industry to define and control the next era.

COMMENTS ON CULTURE

I worked at Microsoft before Windows was a monopoly. What I observed was a culture fixated on domination at all costs. While Microsoft was growing, these actions and activities were not illegal. After becoming a monopoly, they clearly are (and were found to be so by the courts). What is important to note is that these illegal behaviors stem from the culture of the company.

Because of this strong culture, I do not believe that any external monitoring of internal operations would ever be successful (e.g. the ''TC'' as proposed). Microsoft managers are simply too smart, experienced, and aggressive to ever agree to submitting to external pressures. This comes from the top, Bill Gates himself. In my experience, I have never encountered a discussion in which anyone at Microsoft ever thought that they were in the wrong. This would never occur to anyone. This is a cultural factor, an arrogance of doing no wrong. With this culture, it seems extremely unlikely that Microsoft would be able to self-monitor or even work with an external auditing agency.

REMEDIES

My first choice for a remedy is to break Microsoft up into smaller competing entities. The reason for this is to attempt to reshuffle the organization so that there could be cultural and behavioral change. I petition the court to explore this remedy as the best way to combat future violations by Microsoft.

If the court does not pursue a break-up of Microsoft, then I strongly agree with many others, that there must be changes to and additional provisions added to the Proposal Final Settlement. For example, I fully support, and have sign Dan Kegel's open letter (http://www.kegel.com/remedy/letter.html).

OPENNESS AND TRANSPARENCY

My second choice for a remedy is to force openness and transparency in Microsoft's technology. Distributed computing systems are very complex and can be very subtle. To help the court, many other petitioners have listed specific technology disclosures that will help create openness. I will add that, in a general way, if Microsoft's technologies can be viewed by the industry and the market as *components* rather than as a *whole*, then a good balance may be struck between Microsoft's ability to innovate, and the industry's ability to compete and develop both complementary technology as well as competing technology. The tricky question is this: ''Where are the boundaries between the components?''

A simple answer can be found by focusing on and leveraging the up- coming pressures that will be felt as the distributed computing era arrives. The answer I propose is simple, easily monitored and enforced:

* Force Microsoft to fully disclose all wire-level (binary) protocols used between independent computing devices. (This include .Net protocols, SMB/NBT protocols for file sharing, and others)

* Force Microsoft to disclose the APIs which they expect other components to use as they access the wire-level protocols.

* Force Microsoft to fully disclose all file formats used to store persistent information.

The reason these are good remedies relies on the following:

* The future direction of computing is toward small, distributed computing devices. The economic and technological pressures will force the definition of boundaries between distributed components. This will be a constant pressure to

* increase* disclosure over time.

* It is easier to monitor and audit compliance at these boundaries compared to other more abstract and more easily re-defined boundaries. (Microsoft is a master at redefining boundaries for their own benefit).

* These disclosures provide significant value to competitors and innovators.

However, I must also point out that this is only a first step. This describes the technological boundaries and requirements. The Settlement must also address the legal issues such as Microsoft's attempt to prevent open-source software from running on Windows, and other licensing and cross-tie issues. I will leave these issues to the legal experts.

Violation of the Settlement must bring with it a powerful and costly punishment. I propose that if Microsoft violates the provisions of the Settlement that they be forced to place any software or system found to be in violation or associated with a violation into the general domain through an open-source license. This, more than any financial penalty, would be a real deterrent.

Regards,

Randolph S. Kahle

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

The settlement with Microsoft is in the best interests of the public and the economy. It not only will restore fair competition but also prevent future antitrust violations. But most importantly, the agreement will allow the technology industry to move forward with developing new products, rather than further burdening it with government lawsuits. The settlement has imposed many restrictions on Microsoft. For example, Microsoft has agreed not to enter into any agreements with any third party to promote any Windows technology exclusively. Additionally, Microsoft has agreed to a technical committee that will monitor the company's compliance with the settlement. Furthermore, Microsoft has agreed to design future versions of Windows to make it easier for computer makers and consumers to promote non-Microsoft software within Windows. Clearly, these changes will benefit both consumers and the economy.

The most impressive part of this settlement is that it includes matters that were not even at issue in the lawsuit. Enough is enough. Let's stop wasting money and time on unnecessary litigation.

Sincerely,
Judith Quandt

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I oppose the Proposed Final Judgment in relations to the Microsoft case. As one can plainly see, Microsoft continues to violate business practices. The Proposed Final Judgment does not punish Microsoft for its past violations to the anti-trust laws. Based on supporting evidence found by the Court of Appeals, Microsoft is guilty of breaking several anti-trust laws. Under the final settlement, Microsoft is permitted to retain most if not all profits gained through their illicit activities. Subsequently, the PFJ will not compensate parties injured or harmed through Microsofts egregious misdeeds. In addition, the PFJ will not take into account all Microsoft gains made through its illegal maneuverings. With all due respect, the final settlement is basically acknowledging the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? I can assure you that the message is clear and simple. The PFJ encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. With all due respect your honor, I am outraged at such a preposterous proposal that only helps Microsoft to remain intact and continue with its unethical practices. In conclusion I submit to you my objection to this Proposed Final Judgment.

From: Norwood Catron
To: Microsoft ATR
Date: 1/28/02 3:45pm
Subject: Microsoft Settlement

I am an IT professional, specializing in providing Microsoft solutions for small to mid-size businesses. I've worked in the field for four years now, and have used Microsoft operating systems and applications for fifteen years. I've invested considerable time and financial resources in becoming an expert with Microsoft products and have obtained several Microsoft specific certifications. My continued livelihood will continue to depend on Microsoft's dominance in the market.

Having said that, I feel strongly that the currently negotiated settlement does not do enough to punish Microsoft for past anticompetitive behavior or to prevent such behavior in the future. I don't believe that a break up of the company is a solution. The lines between application and operating system are quickly disappearing. Future technologies will continue to blur those lines. But I feel that Microsoft has used strict contracts with OEM's as well as unnecessary integration of applications into the OS (Internet Explorer in Windows 95/98/ME/2000 and XP, and now Windows Media Player in XP) to hinder consumer choice and competition.

In addition to the solutions already proposed, Microsoft should be forced to open the source code to ALL operating system API's, and quite possibly the entire OS. This would allow competing application developers to successfully create applications that work correctly with Microsoft operating systems. I feel strongly that the inaccessibility of the API information was one of the reasons Netscape, Corel, Novell and other application providers have had such a difficult time distributing bug free software.

Microsoft should also be strictly monitored in terms of its contracts with OEM's and other providers. Currently, if a consumer purchases a new PC from a manufacturer, it is quite literally impossible for the consumer to get one without a Microsoft OS. And if a consumer is successful at such an endeavor, that consumer can not be properly reimbursed from the OEM or Microsoft for the Microsoft software costs that are automatically incorporated into the cost of the PC. It is imperative that the federal government return the operating system and application market to a more stable playing field. As well it is important that Microsoft make reparations for past wrongs. Please reconsider the current settlement, and come up with more appropriate and harsher consequences. Microsoft must not get off with just a slap of the wrist.

Dear Mr. Ashcroft:

I am frustrated that, despite all efforts to serve justice, problems continue to arise in the Microsoft antitrust case. Now, even as a settlement is pending in the federal courts, Microsoft's opponents are seeking to overturn the settlement and bring additional litigation against Microsoft. This is highly inappropriate. Microsoft has done nothing to warrant such vicious persecution except be

successful. The litigants who seek to overturn the settlement have no altruistic aims—they only want to squeeze all the profit they can out of Microsoft.

After six months of supervised negotiations, Microsoft and the Department of Justice were able to reach a settlement in the antitrust case. Microsoft's opponents claim the settlement is too lenient and that Microsoft has merely received a slap on the wrist, but such is not the case. Some of the terms agreed to in the settlement extend to products and policies that were not found to be unlawful by the Court of Appeals; Microsoft has agreed to these terms in the interest of wrapping up the case. I agree that it is time to settle and move on, and I do not think the settlement is in any way unfair. For example, Microsoft has agreed to license the Windows operating system to twenty of the largest computer makers on identical terms and conditions, including price. Additionally, Microsoft will refrain in future from retaliating against anyone who produces software that directly competes with Microsoft technology.

I do not believe that additional action is necessary on the federal level. Microsoft has paid its debt to society, and it is time to let this go. I ask you to support the settlement in its entirety.

Sincerely,

Dear Sir or Madam—

Regarding the settlement of the antitrust case with Microsoft— Microsoft's unethical and anticompetitive business practices must be stopped. There must be an injunction or other legal device, or Microsoft must be split into separate business entities in order to restore competition. Microsoft's operating system must be unbundled from its internet browser and other software so that the consumer and free market will determine the best products and foster healthy competition.

I have purchased several software packages such as spreadsheet, word processing, project scheduling that I greatly preferred over the Microsoft products; however, they are no longer available for update due to the unfair competition from Microsoft. I have been personally hurt by Microsoft in that I am forced to use inferior, crash prone software.

Thank you for your consideration.

Subject: Microsoft Settlement
Renata B. Hesse
Antitrust Division
U.S. Department of Justice

I'm writing this to you because I'm gravely concerned over the settlement between our DOJ and Microsoft. There is no teeth to the settlement. It places too much trust in a company that is not trustworthy and has proven as such over its entire history. All that it will do is enhance Microsoft's grip on the desktop market and allow it to expand and also destroy other areas. Already the signs are everywhere that with every step in Microsoft's control and destruction of our computing industry, innovation has crawled to a near stop. When I say innovation, I am referring to the true meaning of the word and not another mad-twist meaning from Microsoft when they use ''innovate'' as part of their questionable ad campaign.

I am a user of Linux. Lately, I've noticed that Microsoft has increasingly tried to squeeze out non-windows platforms by their usual dirty tactics. It used to be that I could access my hotmail account. Now I'm forced to have a Passport account. Passport is a Microsoft product and Microsoft refuses to support a Linux version of Passport. Remember the debacle with MSN.com not allowing any non Internet Explorer browsers to visit their site? While on the subject of Internet Explorer; who on earth wants to view their file directory as a webpage (like in the Windows operating system)? This is the result of you allowing Microsoft to tie-in their browser and falsely claim that it's an integral part of Windows. It is not necessary and anyone with a slight understanding of computers should know that... except for some reason the DOJ.

As part of the settlement you Microsoft must be forced to sell a version of Windows without all the predatory tie-ins. And they must be forced to port all their applications to other operating systems. Those ported applications must be of equal quality and functionality. Typically, when Microsoft ports their software to another platform (Mac), that software is usually a crippled version of the windows original. They can claim that Windows is superior and thus providing more features but any software engineer would say otherwise. Then Microsoft must provide all the necessary specifications for 3rd party software vendors so as not to give Microsoft another area of unfair advantage.

Another point to bring up is the myth that Microsoft is good for our economy. Is it? I don't think so. How can Microsoft justify charging hundreds of dollars for an operating system that is no better than its previous version? The cost of manufacturing is nearly zero. But yet, everyone PC owner including businesses are strong-armed into buying this poor excuse for an upgrade. Those businesses are then forced to pass on that cost to the consumer. The cost amounts to a heavy burden on our national economy. Then Microsoft uses this money not to truly innovate and create more secure software, but to use their legal monetary might to crush the competition. Thus putting more people out of jobs. This is bad for our economy.

So please do not let Microsoft escape unscathed with yet another blatant violation of the law. Just look around you. The software landscape is nearly bare in the Windows market as far as ''genetic'' diversity. Without strong restrictions on their business tactics, we will be left with a very weakened engineering base as the world will continue to truly innovate. Having our schools teach Microsoft products instead of real software engineering will amount to suicide of the knowledge base. Then we'll have to answer to our children and grandchildren when they ask why we have to import quality software from Asia and Europe. And, why we had such a lead in that field and chose to allow one company (Microsoft) to sabotage everything we've worked for. Do the right thing now before it's too late and we lose everything.

Sincerely,
Bob Peterson

Dear Judge Kollar-Kotally,

I do not approve of the Proposed Final Judgment in the MS case. First of all every one know the U.S. Court of Appeals ruled unanimously that Microsoft had clearly violated anti-trust laws. It was understood as well as established that the government was in the process of developing a plan the accomplished the following: abolish the illegal monopoly implemented by Microsoft, deny MS the fruits of its past violations, and last but not least prevent further anti-competitive activity or behavior by MS. To my bewilderment, I cannot yet fathom how it is possible the Department of Justice would agree to such an egregious settlement that for the most part goes against all objectives stated previously in the MS case. Logically this proposal does not accomplish what the U.S Court of Appeals set forth. Therefore I am submitting my disapproval of the Proposed Final Judgment in the Microsoft Case.

I am writing to let you know that in my opinion the proposed settlement between Microsoft and the Department of Justice is a travesty. Microsoft's predatory behavior represents a profound threat to the health not only of the technology sector, in which I work, but of US industry as a whole, and of the United States itself.

If Microsoft can dictate its terms to the US government, who is it that really governs?

I urge you to reinstate the eminently fitting decision of Justice Jackson, and break the company up so as to separate the ownership of the operating system from that of the desktop applications.

Subject: Microsoft Settlement

Dear Person,

I have been employed by Netscape Communications for nearly five years as a software developer and I've been in the Information Technology field for over 20 years. Microsoft should not be allowed to destroy companies at their will, whenever they feel threatened by new technologies or decide to expand into a new market. Obviously, they can put any company into near bankruptcy, by using the revenue from the monopoly OS business to fund development and give away competing products. Allowing that behavior to continue will dramatically slow the growth rate of new technologies by giving the perception that the profits from those very difficult efforts can easily be taken away by the likes of Microsoft. Anything short of severe punishment will just signal that its ok to steal market share and destroy businesses as a tactic of growing your business. If that were allowed, then any business that has more money than another business can destroy it by simply building a competing product and giving it away until you've put them out of business. Is that the kind of business environment that we are trying to promote in this country? This is a great opportunity to show all businesses that integrity and fairness is a requirement to do business in the United States. That the people of the United States will not allow unfair market take-overs by giving away products to destroy companies. We could now show investors that their investments in new technologies will be protected from the predatory practices of companies like Microsoft.

This is not the time to allow ''politics as usual'' and hinder the investment in new technologies by showing that once you begin selling your new idea, any larger company can develop a similar product and give it away until your bankrupt. If you wonder where all the investment is in Silicon Valley startups, just think about the signal that we've given investors through the Microsoft trial. Who would want to invest in building new products knowing that if your successful your business will be stolen from you by any wealthy company that has the inclination.

Thanks,
Andy Warner

RE: Comments on the Microsoft Proposed Settlement Agreement

Dear Ms. Hesse:

The Prince William Regional Chamber of Commerce is writing this letter to express its support for the settlement reached by the U.S. Department of Justice, nine state attorneys general and Microsoft in the long-running antitrust lawsuit initiated by the federal government.

The Region's Chamber is critically aware of how important it is to our national economy that all businesses be able to ''get back to business.'' There were many knowledgeable people guided by an internationally recognized mediator to reach the Microsoft settlement. We believe that additional litigation, following on the heels of many years of costly legal proceedings and on the subsequent work of those in mediation would serve only to prolong the negative impact on our economy of the Microsoft litigation.

Therefore, the Prince William Regional Chamber of Commerce, an organization of more than 800 businesses in the Prince William area, respectfully encourages the U.S. Department of Justice to urge the Courts to adopt the agreement with all due speed so that business and our national—and even international—economy can move forward again with certainty.

Sincerely,
Carol A. Kalbfleisch

Though I am not an attorney, I have followed this case from the beginning and am appalled that Justice could consider accepting such a settlement. It does not address the criminal wrongdoing described in the Finding of Fact, nor the Findings of Law, almost all of which were upheld by the Appeals Court. More critically, there is neither punishment nor adequate means in place to prevent Microsoft's current market dominance from being leveraged into new ventures. The control mechanisms (''three person team'') is a joke, and the ''exceptions'' provide, as some have described it, ''loopholes on loopholes''. I can only hope that Judge Kottelly has the sense to reject this proposal for failing the test of ''public interest''.

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I wanted to make my opinion count. In turn, I object to the Proposed Final Judgment in the MS case. As history will prove, Microsoft continues to violate business practices. The Proposed Final Judgment in a sense, does not deny Microsoft its past violations and illegal acts. As one can see, every court, which has been involved with the case, has found Microsoft guilty of breaking the anti-trust laws. However, under the proposed final settlement, Microsoft, surprisingly enough, will be permitted to retain most if not all profits gained through their illicit activities.

Subsequently, the PFJ will not compensate parties injured or harmed through Microsofts egregious misdeeds. In addition, the PFJ will not take into account all Microsoft gains made through its illegal maneuverings. With all due respect, the final settlement is basically acknowledging the acceptance of Microsofts anti-competitive behavior. What kind of message does this send out to the public? I can assure you that the message is clear and simple. The Proposed Final Judgment encourages big corporations to engage in monopolistic and predatory conduct, which in turn is detrimental to the technology industry at large. I am angered at a proposal that only helps Microsoft to remain intact. Therefore I submit my objection to this Proposed Final Judgment.

Kind Regards,

Cookie Trulssen

From: donb@gasullivan.com@inetgw
To: Microsoft ATR
Date: 1/28/02 3:54pm
Subject: Microsoft Settlement

With all that has been said, I will be brief and to the point:

(1) Microsoft has been a great partner to our firm, G. A. Sullivan, and has been instrumental in helping us grow dramatically during the last decade. Among the honors we have received, Greg Sullivan, our founder, was named the 1999 U.S. Small Business Administration National Small Business Person of the Year. The success we have enjoyed has often been due to our strong partnership with Microsoft.

(2) Competition is alive and well in our industry. In the operating system marketplace, for example, IBM has thrown its considerable clout behind Linux and is aggressively advertising this fact. During the recent National Football League NFC Championship, they ran advertisements using basketball players as a metaphor for computer industry products and forces. For example, the ?opposing team? included players named ?Hacker?, ?Virus?, and ?Downtime?. ?Linux? was characterized as an incredibly talented player who would play for ?almost nothing? because ?he loves the game?. It remains to be seen how effective this ad campaign will be, but IDC predicts that Linux's market share will increase to 41% by 2005.

(3) While Microsoft does have some advantages in its daily business operations, advantages that we believe they have earned through hard work, it also still faces formidable obstacles and some important disadvantages. For example, as Microsoft attempts to sell its operating systems and platforms to corporate America, in the largest corporations (sometimes called the Enterprise marketplace) they are often viewed with condescension as a ?desktop? vendor selling personal productivity tools, computer mice, and games. They continue to build a channel of partners to help provide the necessary services to install, configure, and support their offerings in large corporations, but face stiff competition from IBM Global Services, often an entrenched competitor of huge proportions. Other large service organizations are also most often working against, rather than for, Microsoft.

(4) In many key areas of new research and growth (e.g. Personal Digital Assistants (PDAs), instant messaging, and highly scalable clustering for scientific purposes), Microsoft is a distant second or third place competitor to other firms and technologies (e.g. Palm, AOL, and Beowulf). To summarize our opinion?in almost every case Microsoft has been a tough but fair competitor in the marketplace. In the areas their practices were found anti-competitive, the remedies that have already been recommended are sufficient.

Microsoft has been a great partner to our firm, and we do our best every day to help ensure their success. Contrary to what many of Microsoft's competitors state, we find the marketplace to be a VERY competitive place, and hope that a more comprehensive ?remedy? is not enacted.

From: Jeff Fabijanic
To: Microsoft ATR
Date: 1/28/02 3:55pm
Subject: Microsoft Settlement.

To whom it may concern:

I am writing you today to express my concern and oppostition to the Proposed Final Judgement in the United States v. Microsoft antitrust case. I believe this settlement is counter to the best interests of the American people, harmful to our economy, and clearly inadequate given the findings of fact in the trial.

As a professional computer user and technology developer for the past 15 years (over twenty five if you consider my student years in high school and then MIT), I have watched as Microsoft has used any number of unethical and anti-competitive strategies to attain and maintain dominance at the expense of other companies, competing software platforms and consumers such as myself. In this respect, I am satisfied with the findings of fact in the case, as they confirm this viewpoint.

However, as upset as I am with Microsoft's past behaviours, I am extremely concerned that these same types of behavior are prevented in the future. Given the findings of fact, any judgement should demand strict measures which address not only the practices the company has engaged in previously, but which should also prevent them from engaging in other monopolistic practices in the future. I do not think that the Proposed Judgement is strong enough to serve this function.

As I read the Proposed Judgement, many—perhaps most—of the remedies will be ineffective against a company such as Microsoft which is determined to circumvent them. That Microsoft will work to bypass the original intent of the Judgement is clear for both technical and business practices—even during the course of the trial and settlement negotiations it has continued to use tactics that should be blocked by a solid agreement.

In fact just this month Bill Gates declared ''security'' to be the future direction of Microsoft's focus. Of course, under the

Proposed Judgement anything related to security need not be disclosed even if such would otherwise be mandatory. Under a strict reading, if Microsoft adds even basic security interfaces to its APIs then *none* of those APIs would need to be disclosed and there would be no penalty for not disclosing them. And to add insult to injury, the settlement as written actually seems to codify some of Microsoft's predatory practices. For example, although the settlement forces Microsoft to share its APIs with certain competitors, it also would force those who use these APIs to share all their finished code with Microsoft. As a result, Microsoft would see these companies'' code trade secrets and have the oportunity to replicate or circumvent them.

Another example—a requirement for receiving documentation for those APIs is that any organization needing it must meet *Microsoft-developed* standards of business viability; ''non-businesses'' (eg small or non-profit companies, and individual developers) probably won't qualify and so access to those APIs will simply not be available to them. Similarly, the clause requiring that Microsoft's competitors be allowed to place their own icons on the PC desktops only applies to companies which have already sold more than a million copies of their software in the U.S. So the very companies who most need a competitive advantage can not, in this case, receive it.

There are numerous other problems or oversights in the Proposed Judgement. However, for the sake of brevity, I will limit my comments to this last statement—I feel that the Proposed Final Judgement is deeply flawed and needs to be substantially revised to remove these flaws. Microsoft deserves more than a wrist-slap for the destructive abuse of its monopoly power, and all of us, including Microsoft and its investors, need to be protected against future abuses.

Sincerely Yours,
Jeff Fabijanic

Subject: Microsoft Settlement

Department of Justice:

I am writing to comment on the proposed settlement with Microsoft. I believe that the settlement is fair for both Microsoft and consumers. Microsoft deserved a penalty for their behavior and the penalty is harsh enough for Microsoft to learn their lesson.

Microsoft's competitors continue to fund lobbying efforts to overturn the settlement and inflict harsher penalties. The settlement is for the consumers, not competitors who find their best way to compete is fund lawsuits against Microsoft. An antitrust remedy should be designed to protect consumers rather than advance the interests of competitors.

The Department of Justice must stand-by the settlement, and not allow competitor-funded lobbying efforts to sway them. In no way do the competitors (i.e. AOL, Sun Microsystems, Oracle) have the consumer rights in mind when they continue to pour money into lobbying efforts. They want to create harsher penalties on Microsoft so they may be better equipped to compete. If they did have the consumers in mind they would be pouring money into research and development to compete with Microsoft in the marketplace.

It's time to end this with the proposed settlement and all these companies should get back to what they do best...create innovative products for consumers.

Subject: Microsoft settlement

Dear DOJ,

Due to the various continuing suits against Microsoft, I am forced to exit Microsoft Explorer (the company's browser and entrance to the internet) and bring up AmericaOnLine to read and send email. My other choice would have been, again, to close Microsoft Explorer and to bring up Microsoft Outlook Express which, as you well know, is split off from Microsoft Explorer. But isn't it ironic; AOL is suing Microsoft over its overweening powers, yet I can use AOL for both purposes: to receive and send email AND TO USE THE INTERNET but I CANNOT use Microsoft Explorer to use both services. Just who IS the monopolist here?

And last I looked on the tv screen, AOL, which also has a pretty good control of the NYC cable market, is spending zillions on advertising its AOL Time Warner direct cable hookup. And doesn't AOL have control of some magazines? and some TV stations? and some books? and some records? Excuse me, while I fall down the rabbit hole, said Alice. As a stockholder of Microsoft, Sun Micro and others and fortunate seller of AOL (at breakeven) and as user of Apple, Microsft Word etc and AOL since 1985, AND attempted user of Netscape which has been largely defunct since being taken over by AOL, I would find the not so sly tactics of the AOL/Sun etc gang who use stockholder monies to launch extensive and expensive litigation (which then becomes their raison d'Atre) laughable if it weren't so harmful to consumers, stockholders and profitably run businesses. It isn't just off balance sheet limited partnership that drain assets.

My support for Microsoft is based on many years of using their products and services which have always worked smoothly, reliably and efficiently which is, after all, what I pay for. As a stockholder I find Microsoft reports earnings in a conservative manner and maintains a strong balance sheet both of which indicate the company tends to its business and is not wasting stockholder assets. Everytime the market sneezes I don't feel as though I am going to lose my entire investment in Microsoft as I might with others. If the interest is the consumer and the stockholder, Microsoft will win hands down. If not, we'll see just how fair the US markets really are.

Subject: Microsoft settlement

The govenment, my government should make sure they understand that the consumer is not harmed by Microsoft it's products are cheaper than and better ever. Is Microsoft not allowed to compete, it should be allowed to compete and those cry babies Sun, Oracle and AOL will just have to make better products rather than lobby with governments about a competior—Microsoft. They are trying the exact same thing in Europe and I hope our legislators see through this smoke screen and see the facts Microsoft has superior products and the market proves that.

I feel the government should not pursure any further actions against Microsoft. I believe the terms-which have met or gone beyond the findings of the Court of Appeals ruling-are reasonable and fair to all parties involved. This settlement represents the best opportunity for Microsoft and the industry to move forward. However, the settlement is not guaranteed until after the review ends and the District Court determines whether the terms are indeed in the public interest.

Subject: Microsoft Settlement

Appropriate injunctive relief in an antitrust case should: (1) end the unlawful conduct; (2) ''avoid a recurrence of the violation'' and others like it; and (3) undo its anticompetitive consequences. See Nat'l Soc'y of Prof'l Eng'rs v. United States, 435 U.S. 679, 697 (1978); United States v. E.I. du Pont de Nemours & Co., 366 U.S. 316, 326 (1961); Int'l Salt Co. v. United States, 332 U.S. 392, 401 (1947); United States v. Microsoft Corp., 253 F.3d 34, 103, 107 (DC Cir. 2001) The proposed settlment fails utterly to achieve these goals. Rather, it is another opportunity for Microsoft to litigate the definitions of the settlement, rather than participate fairly in the market. A settlement which leaves Microsoft free to hide features and functions of its operating system behind license restrictions and nondisclosure agreements, and then to use these functions to advantage its own applications development process and products is inadequate. The source code of Microsoft's operating system must be published and made available at nondiscriminatory rates to all users in order to prevent future misuse of this substantial advantage by Microsoft. The source code to Microsoft's Office products must be auctioned to vendors wishing to compete with Microsoft, whether on the Windows platform or elsewhere in order to redress the violations that use of these hidden functions by Microsoft has created. Microsoft must create an independent, not-for-profit entity, transfer title to its Internet Explorer code to that entity, and pay royalties for each copy of IE to that entity, which should then use the proceeds to fund development of software products which function across multiple platforms in order to open up the application development arena to non-Microsoft products.

Subject: Microsoft settlement
52 Pennsylvania Avenue
Massapequa, NY 11758
January 27, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft: The antitrust suit against Microsoft has gone on for long enough. I believe that this suit is just trying to gore the fat cat just because it is fat. If Time Warner packages Netscape with AOL, then what is the harm with Microsoft packaging Explorer with Windows? This suit's contradicting demands are having a detrimental consequence on the nation's financial situation.

The settlement that was reached between Microsoft and the Justice Department will be beneficial in reviving consumer confidence. Microsoft has agreed to license its Windows operating system to 20 of the largest computer makers on identical terms and conditions. The settlement instructs Microsoft to also make all future versions of its Windows to be compatible with non-Microsoft software.

The settlement may seem to challenge the free-market, but it is vital to settle the case to help provide assistance in revitalizing the economy.

Sincerely,
Frank Zepf

Your Honor,

After reading and listening to the mass of information being presented to the general consumer regarding a potential miscarriage of justice, it would appear to me that I may have a rather unpopular opinion. I'd like explain my thoughts, but before I do...I need to clarify that I do NOT work for, recieve monys from, nor do I get any special benefits from either party in doing so.

We've seen what Apple computer tried to do in the past, by making everything they make propriatory. The average working person can't afford the equipment, let alone the software that works ONLY on their system. Tandy corporation (Radio Shack) tried to do the same thing, and nearly sunk them financially. ....because of Microsoft. Seems to me that if a competitor can't come up with a competitive system, ad a competivitve cost...they cry monopoly. If any legal decision favors these flag carrying towncriers of ''healthy competition''.....the ONLY ones that will benefit from it, will be them!

I don't know if I'm adequately articulating my position, but I just feel if 10,000 people can easily afford to buy a computer, and use software that's readily available, it's better for those 10,000 people than if say only 1,500 could afford to pay the EXTREMELY high prices of a system made by Apple or Sun technologies. It's true the profit to Apple and/or Sun is considerably higher from these 1,500 than the 10,000 working class like myself, but in my opinion...through all the smoke and mirrors...that's what this is REALLY all about. $$$$$$ Yes...monopoly CAN be a bad thing, but the only thing Microsoft is guilty of is providing an easy to use product at a low cost. Something the others just can't seem to do.

Go with your instincts, and stick with ''Of the People, By the People.....and FOR the people''. It's an old system...but it still works.

Thanks for your time,
Steve Shockley

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am sending you this brief message to simply say I favor a swift settlement of the Microsoft anti-trust case. This case has gone on long enough. After four years of litigation, appellate hearings and constant clamor the parties have a fair and workable settlement proposal, endorsed by the court, your department, Microsoft and the majority of state complainants. The proposal should be ratified and the case closed.

The settlement requires Microsoft to radically alter its business practices and its philosophy. Microsoft will now be required to configure its Windows platforms in a manner that readily accept non-Windows software. The company will be required to license its Windows systems to major computer Manufacturers on uniform terms. Microsoft has agreed not to use retaliatory practices against manufacturers whose products compete against its product. It has promised generally to abjure any predatory or anti-competitive market practices. It has agreed, as I said above, to adopt a whole new market philosophy that encourages not just competition, but its competitors. Surely such concessions are sufficient consideration for an end to this lawsuit.

Please support this agreement and help bring this case to a close.

Sincerely,
Donald Barlow

From: Alan Q. Thompson
To: Microsoft ATR
Date: 1/28/02 4:02pm
Subject: Microsoft Settlement

My name is Alan K. Thompson. I live in Riverdale, MD, am a US citizen, and am 37 years old. I feel that the proposed DOJ settlement with Microsoft is a travesty of justice. The Sherman anti-trust act was created to prevent the sort of illegal extension and protection of monopoly for which Microsoft has been found guilty. Microsoft has demonstrated in the past that it will use every arguably legal means to avoid restrictions on its actions, and the proposed settlement will allow it too much room. A much more structurally enforced remedy, such as that proposed by Judge Jackson in the original conviction or proposed by the ''dissenting states'' in early December 2001, is necessary to restore competition to this vital segment of the economy.

Thank you.

Dear Mr. Ashcroft,

As a retiree who has been following this Microsoft antitrust case, I must admit I was disappointed that this case was even brought to court. There are so many other companies with a high market share like Cisco and Oracle. No one pursued those companies. Microsoft has been great for the economy, for the shareholders, and for technology. What are the ramifications for this country, if litigation were to continue another four years? Would Microsoft be able to survive? They are already vulnerable, now that they've agreed to disclose portions of their source codes in their operating system to the competition.

Microsoft has been more than cooperative in resolving this matter and agreed to terms well beyond what is expected in any antitrust case. That ought to be enough.

Let's stop the litigation so the government can focus on more pertinent issues. Not only is it good for the company, but for the economy as well. Thanks for your consideration in this matter.

Sincerely,

Earl Ramsey

Subject: Microsoft Settlement
Renata B. Hesse
Antitrust Division
United States Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001

Dear Ms. Hesse,

I am very concerned that the proposed Microsoft settlement is not in the public interest. My fear as a computer user is that the all important freedom of choice which distinguishes our democracy will be further eroded. I appreciate your attention and hope you will include the following in your considerations.

My objections include the following points: 1) The settlement leaves the Microsoft monopoly intact. It is vague and unenforceable. It leaves Microsoft with numerous opportunities to exempt itself from crucial provisions.

2) The proposed settlement ignores the all-important applications barrier to entry which must be reduced or eliminated. Any settlement or order needs to provide ways for consumers to run any of the 70,000 existing Windows applications on any other operating system.

3) Consumers need a la carte competition and choice so they, not Microsoft, decide what products are on their computers. The settlement must provide ways for any combination of non-Microsoft operating systems, applications, and software components to run properly with Microsoft products.

4) The remedies proposed by the Plaintiff Litigating States are in the public interest and absolutely necessary, but they are not sufficient without the remedies mentioned above.

5. The court must hold public proceedings under the Tunney Act, and these proceedings must give citizens and consumer groups an equal opportunity to participate, along with Microsoft's competitors and customers.

Respectfully,

Mary Beth Brangan

MTC–00028494

From: Dave McGinley
To: Microsoft ATR
Date: 1/28/02 4:04pm
Subject: Microsoft Settlement

Respectfully submitted:

I oppose any settlement with Microsoft. I consider Microsoft's tactics to be monopolistic, unfair to competition, and predatory. Consider,

I was an Apple computer user from the late ''70s. Apple computer is no longer a viable option do primarily to Microsoft. The original MS Office came out on the Macintosh. When Apple begin to compete with Microsoft (late 80's), the Office programs suddenly were no longer supported on the Apple Platform and then when again supported MS Word was interpeted causing painfully slow execution (early 90's). Finally, when Apple capitulated to MS, a new fully functional release was made late 90's. I was a Netscape Navigator user. After running in to so many e-sites that would not support Netscape I was forced to change to Internet Explorer. I was a Eudora e-mail user. Again I was forced to change to Outlook Express for compatibility.

Lastly, when using an Apple Postscript printer, mysteriously, MS Office products would encounter errors printing. Research by my programmer showed MS had ''added'' a Postscript command of their own, thus preventing and Apple Standard Postscript command from executing without errors. The bottom line, if MS wants the market they have the financial and technical capability to drive any competitor from the market. Watch what happens with XBox vs Playstation and Ninetendo.

HELP.

Attorney General John Ashcroft
U.S. Justice Department
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am in support of the Microsoft antitrust settlement. It is clearly a compromise for both parties involved.

This is, out of the possible options, one of the more reasonable choices. Restrictions have been set upon Microsoft by the government under the terms of this settlement. These include contractual restrictions on the promotion of Windows technology, relationship with software developers and design obligations.

Please support this settlement. It is important that the technology industry concentrates on business now. The terms will mean a new wave of innovation, promoted by increased competition. I would appreciate it if the folks in Washington spent the taxpayers'' money in more efficient ways.

Subject: microsoft settlement

Dear Judge,

I am(just) a personal user of computers and software since 1982. I have not read all the legal docs, but have followed the rise of the personal compuger industry for about two decades. Microsoft has produced good products and bad products. The culture of Microsoft,(like the culture of Enron) is unhealthy: Before the death of Lotus 123, the Microsoft mantra was''DOS isn't done ''til Lotus won't run.'' The ''winner take all, damn the ethics'' attitude of MS might be tolerable if there were real competition in the operating system(OS) market. But there is no competition. No admission of guilt, no repentance. ''Innovation'' to Microsft is finding new ways to squeeze dollars out if the public. Microsoft will *always* use its OS and browser monopoly to maintain and extend it's illegal monopolies.

If It's a monopoly, it must be regulated. But when has Microsft ever followed a judges'' order or an anti-trust law it doesn't like? Better, separate the OS/Browser business from the rest of Microsoft. THEN use a couple billion of MS illegal profits to fund at least two open source OS alternatives, like Lindows. (using all MS internal tech data) IF there is real competition in the OS market, the public can choose to use or not to use MS products on their merits, not because the OS/Browser demands it.*

We don't want the Chinese Communists creating a Linux future for the Intel/AMD* PC do we?

Bruce Guenard
san jose ca

* There are no good analogies to the power the OS has over the consumer. What if GM were the only car maker in earth and it sold a car, but licensed the key? The key controlled the gas and brake and would only work properly if the car contained GM manufactured products. The car crashes a lot, but really crashes if not using GM tires, gas, oil, batteries etc. And the key quits working after 5 years. Break a key, out of luck. Just buy a new car and license the key

Car costs $19,999.00. Key licences for $1,990.00 for driving in the city, $2,990.00 to go to the suburbs or out of state. (relative pricing of home vs prof versions.) If your spouse or kids want a key, they must buy a license, too.

** With AMD battling Intel in the CPU market, hardware prices drop, with real choice. With the Microsoft OS Monopoly, forced upgrade prices rise. Let there be the end of software monopolies!! (pardon my spelling)

Subject: Microsoft Settlement

I find the DOJ proposed settlement with Microsoft to be a disgrace! Microsoft after snookering the original preparer of PC DOS was handed a monopoly by IBM. They have exploited that monopoly in a number of illegal ways. After being found guilty, they are now being rewarded by the DOJ with such weak ''punishment'' and unenforceable behavior restrictions, that Microsoft can now declare victory and continue on their merry way. Considering the relationship between Microsoft and the Bush administration, the money and the Ballmer visit to VP Cheney, one might have expected the DOJ to recuse itself.

This is an ''honorable'' administration—value is given for value received!

MTC–00028499

From: Benjamin Curtis
To: Microsoft ATR
Date: 1/28/02 4:05pm
Subject: Microsoft Settlement

Please consider this email a vote for not allowing the proposed settlement to stand. Microsoft has previously ignored and/or violated previous decrees, and have continued to exhibit predatory business practices to both establish and maintain their monopoly in the technology sector. The current proposed settlement does not go far enough to ensure that competition will be restored to the marketplace, and is not in the consumer's interest.

Microsoft has used various means to eliminate any and all threats of competition, including hiring away critical employees of competing companies (Borland), eliminating a profitable market for a software segment (Netscape), and integration of new products with current market-dominating products (Microsoft Word vs. Word Perfect). An oversight committee trying to enforce disputable sections of the settlement will simply be no match against both the entrenched competition-killing culture of Microsoft and the cadre of attorneys used to support that culture's goals. Instead, more drastic measures, such as those proposed by the nine dissenting states, should be put in place to help restore the competition that Microsoft has so effectively eliminated.

There are certain details of the proposed settlement that would seriously weaken the settlement if it were to be implemented as it currently drafted. For example, very little consideration is given to competition that may come from non-profit-oriented organizations such as the developers of the SAMBA project. This project's main goal is to provide software to allow users of other operating systems to provide file-sharing services in a network including Microsoft Windows clients. SAMBA's developers have had to continually adapt to Microsoft's changing of APIs and protocols to achieve this goal. The provisions in the current settlement proposal for releasing of API information simply are not stringent enough to be effective, as they don't address in enough either sharing APIs with non-profit groups or the timeliness of those transfers of information. SAMBA has been the only effective competition to Microsoft when it comes to file-sharing in dominantly Microsoft Windows environments, and this settlement does little to encourage that competition. Granted, this is only one case of a weakness in the proposal, and the settlement is not intended to benefit any one specific entity, but this is an example of how there are significant weaknesses in the settlement's ability to help restore competition and to be in the public interest.

In summary, this proposed settlement is not in the public interest for many reasons—many of which have been well documented elsewhere. Please do not allow the best interests of consumers to be forgotten. Please do not endorse this settlement. Thank you.

Sincerely,
Benjamin Curtis

Subject: Microsoft Settlement

To the Justice Department:

I am deeply disturbed by the prosecution of the Microsoft Company and Microsoft Chair Bill Gates. With Microsoft products, I have had the option of using other manufacturer's software and was often supplied at hardware purchase with software like Lotus and Claris and browsers from Mosaic to Netscape. I have received immeasurable benefit from the features of Microsoft products and they continue to be my preference. The reason I say this is that I very much resent the prosecution's contention that I am some kind of helpless consumer that can't even pick which software suits my purpose. And I don't believe the Justice department has the right to tell me what kind of deals I can make with my supplier. The court's job is not to protect one business from another, but to arbitrate contracts and protect individual and property rights (businesses are owned by individuals). Microsoft products are not a threat to anyone. As I remember, this case didn't start with consumers like me feeling ripped-off, or even with a violation of any contract between Microsoft business partners. It started with Microsoft's unsuccessful competitors! Since when do competition's losers get to sue? I want to live in a country where anyone with enough on the ball, putting in sufficient effort, can be a self-made-man like Bill Gates. That is the American Dream. It is a fundamental right! I want to know that my country is there to protect my right to my property, not to worry that if I succeed that my own country will take it away from me and turn it over to my competitors.

Sincerely,
Mary Bachmann

Subject: Microsoft Settlement
January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to you to express my support for the settlement reached between Microsoft and the Department of Justice. Consumer confidence in tech stocks has dwindled as the federal case has dragged on. Since the US District Court entered its judgement against Microsoft on April 3, 2000, we have witnessed a historic decline in investor confidence in the technology industry. The technology-heavy Nasdaq Composite stock index, which managed to get as high as 4504 that day, now rests comfortably below 2000 representing a loss of 56%.

Now we are in a recession. Massive layoffs are announced every week. Once mighty companies are folding. I believe it is time to put this issue to rest and enact the settlement.

Microsoft has made many concessions throughout this process. They have agreed to disclose the protocols of their windows system. This means that Microsoft will be required to make its proprietary information available to competitors. I wonder if those companies will have to share their proprietary data with Microsoft? It seems to me we should be rewarding innovative companies not penalizing them, or slicing them up, and feeding them to the competition.

I can remember when DOJ disassembled AT&T. As a result, my local telephone service is now far less reliable and much more expensive. I can?t even get anyone to answer the phone at the phone company to address a problem with my bill!

Finally, I would like to state that the enactment of the settlement will benefit the technology industries. Microsoft has done its

share to resolve the issue. Please enact the settlement reached in November.

Sincerely,

Troy Harkey

WHAT.

This is the penalty in the main DoJ suit after MS lost the appeal. The supression of Netscape's browser is the primary issue, but loss of BeOS is as bad.

HARM.

The MS IE bowser has been a main entry point for viruses, and its extensions have harmed the www. Tim Berners-Lee (who DID invent the Web) dislikes the damage propietary MS extensions has done. His goal was equality of operation across platforms.

MS has harmed Opera, Netscape by GIVING IE away. MS has harmed Carl Kipp by corrupting sites and starving the publisher of my preferred browser: NetScape Communicator! This is written on NetScape's e-mail program!

REMEDY?

I request forcing MS to be split (the original penalty) or source code opened without the ''security'' exemption. MS's recent ''$1 Billion'' settlement proposal for another suit is typically self-serving. They account their $10 MS Office package cost as ''$600'' retail AND hook students in the education market.

This is like letting the tobacco companies pay their fines in cartons of cigarettes!

US Judge Judge Colleen Kollar-Kotelly is going to look at OUR public comment on the remedy/penalty now that Microscoff has been confirmed

GUILTY!

Letting Microsoft off easily leads to:

World ''Dumb-in-Nation''!

Carl Kipp

Columbus, OH, 43202

In Unauthorized Windos 95, Andrew Schulman (wizard & editor) has many quotes from the DoJ vs MS [''settled'' out of court, 1994!] including his own congressional testimony. One was from a MS VP who said ''...my job is to see that Microsoft gets a fair share of the application market. I define that as 100%.'' Perfidy.

This case is an outgrowth of that one. MS agreed to not bundle the browser, did it anyway and claimed it was built-in. A lie, as testimony showed. I own 98Lite a program which merely uninstalls the IE browser.

Drug on the market.

MS's recent ''$1 Billion'' settlement proposal for another suit is typically self-serving. They account their $10 MS Office package cost as ''$600'' retail AND hook students in the education market. This is like letting the tobacco companies pay their fines in cartons of cigarettes!

Or the Carlos Lehder, of Medellin cartel pay fines in cocaine packets!

Judge T.P. Jackson did compare MS to a dealership.

Damage to Society.

Microscoff is bad for innovation. [See Caldera's suit for damage to DR-DOS. See Borland.].

Microsloth is bad for programmers. [You don't program, you use MFC objects. Dumb.]

Microstuff is bad for IT. [No one understands their proprietary stuff. Even MS! See IIS buffer over run. See the FBI warns MS about security. See Universal P'nP holes] Microscruff is bad for ZDNet, a media company. [Users have given up understanding. ZD loses readers looking for enlightenment.

They are since under new management.] ZDNet editor Kingman said ''No single company, not even Microsoft, is the enemy.'' WRONG. MS=Dumbination The GATES to Dumb-in-Nation!

They are already vulnerable, now that they've agreed to disclose portions of their source codes in their operating system to the competition. Microsoft has been more than cooperative in resolving this matter and agreed to terms well beyond what is expected in any antitrust case. That ought to be enough.

IF MERGEFIELD PARA2 But clever people like me who talk loudly in restaurants, see this as a deliberate ambiguity. A plea for justice in a mechanized society.

Let's stop the litigation so the government can focus on more pertinent issues. Not only is it good for the company, but for the economy as well. Thanks for your consideration in this matter.

IF MERGEFIELD PARA5 But is suspense, as Hitchcock states, in the box. No, there isn't room, the ambiguity's put on weight.

Sincerely,

Ellen M. Ramsey

I think the settlement proposal is NOT good enough:

The technical comittee should give written report to the public, and answer questions from the public as much as they can.

The time of remedy should allow growing of competition, therefore 5 years are not enough, it should be a least 10 years.

Thanks you.

Dear Mr. Ashcroft:

I am a professor at a technical college, and work as an IT consultant. I acknowledge that there are legitimate reasons that brought about this case three years ago, but Microsoft become powerful not by being a predatory attackers, but by making excellent products. This case should not punish Microsoft for being the industry leader, but should rule that exclusionary practices should be changed. The concerns that give merit to the case have been addressed with the introduction of new Microsoft software, and that provisions are in place under the agreement that will ensure competition in the market.

The concerns of independent vendors, computer makers, and software engineers all have been taken into account to produce licensing and development changes within Microsoft software. Protocol has been set up to ensure that Microsoft remains a responsible industry leader by forming oversight committees and reevaluating future lawsuit guidelines. I do not understand what more can be done at the federal level. This case has already had an impact on the industry and the economy, and the effects of Microsoft being broken up would be devastating. The loss of standardization and operability would halt innovation, and might jeopardize our country's position as the world leader in technology development. We must resolve this case, and the sooner, the better. The necessary steps have been taken to foster competition, and would like to see the settlement given a chance to prove itself.

Sincerely,
Richard Martin

Subject: Please Settle Microsoft Suit
January 26, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am very adamant the lawsuit against Microsoft is unwarranted and should never have started in the first place.

I believe it was politically motivated by significant contributions of Netscape to the Democratic party. Further the suit, I believe has contributed to the down turn in the economy.

I fully suport for settlement that the DOJ has proposed. If Microsoft deems this settlement fair then I will support Microsoft's decision to comply. If you ask me, the lawsuit has only helped to strengthen Microsoft as a company rather than fulfill the intentions of the opposition—to tear the company apart.

Microsoft's willingness to comply should be some indication of the caliber company we are dealing with—a company that possesses true leadership. One of the signs of a great company is the willingness to concede when it is evident that alternative choices are limited. I don't the think the concessions on Microsoft's part where as much an admission of guilt as it is Microsoft sincere desire to get back to what they do best—innovate!

If the remaining opposition were to truly look closely at this case they would see that Microsoft has not gotten of easily as they have implied in the past. Microsoft will have to basically strip themselves of their competitiveness by allowing significant access to their internal interfaces and intellectual property.

Microsoft's efforts to comply, the disastrous effects on the economy, the vast of amounts of tax payer dollars spent should be plenty of reason to bring a speedy end to this case. I hope you hear the plea of the public and wrap up this matter.

Sincerely,
Frederick Savalli

From: Justin Lower
To: Microsoft ATR
Date: 1/28/02 4:08pm
Subject: Microsoft Settlement

To Whom It May Concern:

As a long time BeOS (Be Inc. Operating System) user I cannot say how disappointed I am in what remedy's have been discussed to deal with Microsoft's monopoly. These remedies are for me, the consumer, yet I have no doubt that when all is said and done that Microsoft will still be a monopoly, that I will remain to have a very, very limited choice of operating systems to use. (I don't consider Linux, BSD, etc to be valid choices—few companies have been able to provide a easy, usable operating system that does not require a degree in Computer Science to feel one is in control.) Apple and Be Inc. are the only choices I had apart from Windows in the last 5 years or more. Now, with the BeOS ''dead'', largely due to Microsoft's illegal bootloader license forcing system vendors to ignore Be Inc. or ,worse, to force a dual boot system to ignore the BeOS partition unless ''activated'' (see what Hitachi had to do to ship a system with BeOS preinstalled) I have little choice but to move to the Macintosh platform.

Remedy? There are plenty of methods where Microsoft could be forced to pay for illegal activities and possibly save the BeOS platform. They could be forced (with Palm's understanding) to purchase the BeOS/BeIA source code— forced to pay community developers to remove all third party code and release it to the public as open source. I sure that other options are available—ones that might be more realistic, but the fact remains—if the settlement does not result in the renewed development of the BeOS then I will have considered it a failure.

January 28, 2002,

Dear Ms Hesse,

I have been trying to understand the intricacies of the proposed settlement. I am very concerned that the final outcome does not promote a free market, and therefore allows Microsoft to continue monopolistic activities. It is best for the American consumers that viable alternatives to Microsoft have the opportunity to compete freely.

I have a friend that has published several detailed and well-argued points about the basic unfairness of the proposed settlement. Please do not let the free market be hijacked by Microsoft's lawyers. We must have access to code, alternative to both operating systems and application interfaces must be allowed to exist, and we should not let this proposed settlement go through the way it is currently written.

Please reference http://www.kegel.com/remedy/letter.html for more details on the specific changes that will help make this a much better settlement.

Thank you very much for your time.

Subject: Microsoft Settlement

Dear Ms. Hesse,

I would like to express Consumer Alert's support for acceptance of the Proposed Final Judgment to resolve the antitrust case against Microsoft. Consumer Alert, founded in 1977, is a non-profit, non-partisan consumer group with individual members in all 50 states. In addition, Consumer Alert is the founder and coordinator of the National Consumer Coalition (NCC). The NCC is an on-going coalition made up of 23 non-profit organizations, with those groups'' members numbering over 3 million.

In today's uncertain economic climate, it is in the best interests of consumers to have the issues settled and to bring to an end litigation that could further stymie our economic recovery. The agreement is needed to ''provide a prompt, certain and effective remedy for consumers.'' The technology sector and its resurgence could be vital to renewed economic growth, not only in the U.S. but in the world economy.

The remedies provided in the settlement are far-reaching and address the business practices that the court found to be anti-competitive. Offered by the U.S. Department of Justice, the proposed settlement was endorsed by nine State Attorneys General. The settlement could bring an end to litigation that has created an uncertain and disruptive climate.

With this settlement, consumers likely will continue to benefit from the products and services offered by firms that operate in dynamic and rapidly changing markets and are innovative in their distribution systems. Those who would seek further redress would try to shape the markets of today into a narrow and static mold of competition—one that would threaten consumer welfare. Satisfying the demands of competitors, at the expense of consumers, should not be the principal factor governing the resolution of this antitrust suit.

Throughout the three-year litigation process, no evidence of consumer harm was offered. Instead, it appeared that competitors wanted the legal system to help them with their business plans. Some of those who are pressing for further restrictions may claim that those are needed to protect consumers from anti-competitive practices. Yet consumers are the ones who benefit from creative institutional and technological change and are far more likely to be injured by political restrictions on such change, especially when such restrictions favor competitors.

Obstructing the agreement is likely to have widespread unintended consequences that could disrupt the continuation of these consumer benefits.

Consumers are benefiting from intense competition that has ?democratized? access to technology in the past decade. Not least of these are dramatically lower prices, ease of use for even the untutored, and the continuous unveiling of innovative products and services. Even during the past three years while this case was being litigated, technological advances continued unabated, many offered by Microsoft, but others portending new possibilities in information technology and new alignments.

Consumers are the ones who benefit from the vibrant competition that exists. They are the ones who would suffer from further antitrust action or draconian remedies that attempt to delineate how competition should evolve. The nature and speed of institutional and technological change is misunderstood. Today, no one can predict the future of IT—who the players will be and who are the likely winners and losers. Those who would use antitrust policy to mold their view of the future are likely to create impediments to innovation. Predicting where systems will go in the future is a task for markets and ultimately the customers in those markets—consumers.

Sincerely,
Frances B. Smith

January 25, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I believe that the Department of Justice was justified in filing this lawsuit against Microsoft. I support the settlement that the Justice Department has proposed and think that any other action, is just Microsoft's competitors looking for judicial remedies for what they can't obtain the free market!

As far as the nine remaining states action, there has been no loss to consumers as a part of Microsoft's actions. Microsoft sells in volume and at non monopolist prices. Just look at what its competitors charge for an operating system, Sun and Apple. In fact, it is Microsoft's products that have been the biggest contributor to productivity gains in the US economy in the last five years.

I hope that the settlement will be sustained during this public comment period, and that there will be no further federal action against Microsoft, or any other American company.

Sincerely,
John Ilgen

Subject: Microsoft Settlement

I think the proposed Microsoft settlement is a gross miscarriage of justice. Microsoft is a convicted monopolist, and such a heinous one that the only possible competition is the decentralized, guerilla Linux movement that arose at the grassroots level in the face of Microsoft's anticompetitive tactics. In other words, Microsoft is such an abusive monopoly, that many of the world's most technically proficient volunteered their time and effort to provide an alternative, because any for-profit organization that tried would be run into the ground.

People care about this case. This won't be swept under the rug; it will be remembered in future elections.

Sincerely,
Anthony D. Niesz

Subject: Microsoft Settlement

I have been following the most recent case against Microsoft with considerable interest. Whatever objections may have been raised about the objectivity of the original judge, his conclusions about Microsoft's anti-competitive conduct were based on such persuasive evidence that no one outside Redmond has bothered to question it.

He found that Microsoft's conduct was so consistently and pervasively corrupt in it's anti-competitive conduct, that there was no hope of reform without the most dramatic intervention. I agree with him that the company should be broken up, so that the operating system and the applications are developed and sold by separate companies. Short of that, it is obvious that the only effective way for the Government to prevent renewal of the abuses would be to establish a very comprehensive set of guidelines and strictures, with oversight sufficient to enforce them in the rapid and far-flung operation of the business.

I recently signed the petition on this matter which has been circulated by Dan Kegel. I endorsed that petition because it does such a thorough job of identifying ways in which the proposed settlement misses the target. Please heed those warnings.

The defenders of Microsoft originally argued that the Government could not hope to understand and supervise such a dynamic technology. Then the Government prosecutors successfully demonstrated impressive mastery of the issues, sweeping the defense aside in one master stroke after another. Wouldn't it be ironic if the new Administration threw away what the previous Administration had accomplished by formulating a settlement which was based on such a naive and simplistic approach to

the problem. Now that Enron is hanging around the new Administration's neck, does it want to add a sweetheart deal with Microsoft?

RE: Microsoft Settlement

The Microsoft trial was a waste of taxpayers'' money and a significant disincentive to investors. While both Microsoft and the plaintiffs may be happy with the settlement, the truth is that the plaintiffs should never have filed this action to begin with.

We have seen government sponsored lawsuits against the tobacco industry, against Microsoft, and now fully expect to see lawsuits against the fast food industry. While private parties should always have the freedom to use our courts, the rise in government sponsored lawsuits is a danger to our great country.

This case should be ended as soon as possible, so I am in support of this settlement only to expedite the process.

I have attached the following opinion piece from one of my associates.

Please consider it a part of my official comment.

Cooper Gets It Right on Microsoft

By Dom Armentano and ROY CORDATO

''I have concluded that this settlement with Microsoft is in the best interest of North Carolina consumers.'' With this statement Atty. Gen. Roy Cooper announced that North Carolina, along with eight other states, has joined the U.S. Department of Justice in reaching a settlement in its antitrust lawsuit against Microsoft. Cooper should be commended for deciding to scrap this ill-conceived and ultimately anticonsumer lawsuit brought by his predecessor, now Gov. Mike Easley.

The Microsoft antitrust case, as brought by both the Reno and Easley Justice Departments, was a mistake from the start. The fatal flaw was that the Reno-Easley argument against Microsoft was essentially a legal brief for Microsoft1s disgruntled competitors who simply could not compete. Antitrust laws prohibit restraints of trade and higher prices, yet Microsoft was prosecuted for the opposite behavior?for rapid innovation, increasing production, and lowering prices. Indeed, Microsoft was being prosecuted not because of its monopolist behavior but because it was being too competitive.

Like most antitrust suits since passage of the Sherman Act in 1890, the Microsoft case was not about protecting competition but protecting competitors.

Postsettlement complaints by some of Microsoft1s competition bear this out. In urging the states to continue their war on Microsoft, Real Network1s Kelly Jo MacArthur said the settlement was a ''reward, not a remedy.'' Scott McNealy, CEO of Sun Microsystems, quipped that ''I can1t retire now?I can1t leave the world to anarchy.'' From McNealy1s perspective the world of falling software prices and innovative new products stimulated by Microsoft1s presence in the market is anarchy. Apparently ''order'' is the pre-Microsoft world where consumers paid up to $1,000 for word processing and spreadsheet programs and internet users had to fork over about $100 to use Netscape.

True competition always looks anarchic to those who can1t compete. Microsoft should be praised for refusing to cave in to ludicrous demands from self-styled ''trustbusters'' like Janet Reno and Mike Easley that it unbundle its web browser from its Windows operating system (appeasing Netscape) or that the company be split into three separate pieces. Instead, it courageously fought the government for years to arrive at what amounts to a legal draw and a victory for consumers.

Ultimately the government got almost nothing, and consumers are better off for it. Under the consent decree, Microsoft is prohibited from engaging in exclusive dealing arrangements with original equipment manufacturers (OEMs), access providers, and suppliers, a practice it had all but abandoned anyway. Further, Microsoft is required to share its applications program interface code and allow all OEMs that license its Windows operating system more freedom to display non-Microsoft software applications. Again, Microsoft was already moving in the direction of what they call ''shared sources.'' Finally, Microsoft must charge OEMs published rates and offer them uniform discounts.

But Microsoft is left entirely free to determine its own prices and discounts and change them at any time. This is crucial because it is Microsoft1s aggressive pricing strategies that have made the consumer software market as competitive as it is.

Finally, Microsoft is a clear winner on the issue that first sparked the lawsuit: the tying of its Web browser to its operating system. Not only is that bit of efficient bundling now perfectly legal but more importantly, there are no specific restrictions on any future bundling of applications with operating systems going forward. This is the most important innovational development to come out of the settlement and it1s strongly pro-Microsoft and proconsumer.

It was never in the interest of North Carolina consumers to be part of this witch-hunt. Nearly all antitrust suits are brought or instigated by competitors and are blatantly anticonsumer. Antitrust has a long history of prosecuting aggressively competitive companies that have innovated rapidly and lowered prices to consumers; this includes such famous cases as Standard Oil and IBM. Consumers and businessmen need free, open markets and they need protection from force and fraud, but they don1t need antitrust laws that hamper innovation and harm society. Three cheers for Cooper in his decision to settle the state1s suit against Microsoft, and solid brickbats to Easley for bringing it in the first place.

Dom Armentano is professor emeritus in economics at the University of Hartford and author of ''Antitrust and Monopoly (Independent Institute, 1998) and Antitrust: The Case for Repeal (Mises Institute, 1999)''. Roy Cordato is vice president for research and resident scholar at the John Locke Foundation in Raleigh.

Subject: Microsoft Settlement

Dear District Court Judge:

I am writing to you to as I am frustrated with the prosecution of Microsoft.

I am the Information Systems manager for our office and deal with Computers and Servers daily. Streamlining computer software and hardware can be the most difficult, time consuming and costly expense for our company.

Compatibility and support are key. I appreciate that Microsoft has helped immensely with this task. We don't need this process mucked up by government intervention. I resent that the government does not believe that I can decide for myself which software/hardware is useful to me. I can't believe our government views Microsoft as a threat, when after all it is Microsoft that has brought the industry to where it is....on real earnings, not ''puffed-up'' .com hype. Don't forget the bubble bursting for the .communists and all of their venture capital. Those bringing suit are not individual consumers, but Microsoft's unsuccessful competitors.

Failed businesses must not be allowed to set the rules for the markets in which they failed. Protecting some businesses from others is a dangerous policy. I want to see an America where success is embraced, not punished and throttled! Bill Gates is a self-made man who has brought America, the world, to new levels of progress. Microsoft has a fundamental right to its property, and it is the governments job to protect this right, not to take it away. Microsoft, should be lauded and left alone to continue to develop and prosper so that, we the people, can too.

Attorney Hesse:

Please accept the proposed settlement of the Microsoft antitrust suit.

It has been four years since this case was first brought and I fail to see what we have gained. I strongly believe our government must consider the financial impact this case has had and the benefits our economy will gain if it is settled quickly.

This lawsuit has had a very damaging effect on the technology markets. It was not that long ago that we all looked forward to the continued growth of the ''New Economy'' that revolved around the computer industry. Unfortunately, the DOJ's antitrust suit can be closely associated with the downfall of the NASDAQ. We can never forget that when the courts announced that breaking up Microsoft was the correct path to take, all technology stocks dropped.

We have finally reached a point in this case that all parties have come together to negotiate a settlement. There can be no doubt that real compromises were made by Microsoft to put this case behind it. The best example of this is that Microsoft agreed to the establishment of an independent committee to monitor its actions.

Please accept this fair settlement.

Sincerely,

Ken Wingert

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Attorney General Ashcroft:

When the federal government decided to pursue Microsoft in an antitrust suit three years ago, the intention was to determine if Microsoft exercised unfair market advantage in the software industry. The result that the plaintiffs (including the government) in the suit did not consider was the harm to other businesses in the technology industry created by the lawsuit.

Unlike other software companies, Microsoft has an open platform that allows many manufacturers of computer software and hardware to be profitable due in part to the enormous investment Microsoft placed in creating the Windows operating system. Being involved in the video industry, I do a great deal of work with computers. The truth is, creating the highly complex codes that are needed to support the programs used in business these days can only be done by a company that has vast economic resources and technical expertise. By harming Microsoft, the lawsuit is harming companies that are dependent on its software for their livelihoods.

Thanks to the extremely low price of the Windows operating system, computers and technology have found the widespread use that benefits all of us. For this and many other reasons, I am in support of this settlement.

Sincerely,
John Kopp

Subject: Microsoft Settlement

Dear Sir or Madam:

I am writing to express my disapproval over the proposed Microsoft Settlement.

I believe this deal is a sellout to Microsoft. Consumers get no real benefits and Microsoft goes unpunished for their antitrust behavior. We have no reason to spend millions of taxpayer dollars pursuing this case, only to hand out such lenient penalties when the facts are on the government's side. Microsoft is and continues to be a monopoly.

I urge you to reconsider the terms of the deal so that real progress can be made to restore competition in the marketplace.

Sincerely,
Benjamin Kuo

Attorney General John Ashcroft
US Department of Justice
Washington, DC 20530–0001

Dear Attorney General Ashcroft:

I am writing in support of Microsoft's antitrust settlement with your Department of Justice. I think it is very reasonable. You should do your utmost to have it approved by the Court.

It is unfortunate that Microsoft's competitors had to resort to exploiting our legal system as their only way of staying in business. In the settlement Microsoft agrees to license its Windows operating system products to the 20 largest computer makers (who collectively account for the great majority of PC sales) on identical terms and conditions, including price (subject to reasonable volume discounts for computer makers who ship large volumes of Windows). Microsoft will make available to its competitors, on reasonable and non-discriminatory terms, any protocols implemented in Windows'' operating system products that are used to interoperate with any Microsoft server operating system. Microsoft will not to enter into any agreements obligating any third party to distribute or promote any Windows technology exclusively or in a fixed percentage.

In addition to the above, it appears that some of our ''REPRESENTATIVES—?'' in Washington are being ''Politically Correct'' and favor those companies that support them There are also'' State Officials'' trying to enhance their position and will do what they can to disrupt Microsoft. Microsoft has given its competitors the opportunity to stay afloat. American consumers have always benefited form Microsoft's innovations.

Sincerely,
John W. Dettre

Dear Ms. Hesse,

In my following of the Justice Departments antitrust action against Microsoft I am compelled to write this letter in of support of Microsoft and what I feel is an unjust prosecution of a company.

First—is bigness a crime? If it is you should take action against the Federal Government and several Sate Governments.

Second—is offering a software package at a lower price than any one else can produce a comparable product a crime?

Third—Microsoft has brought utility and time savings to small business and computer users that is unprecedented in its impact on our nations economy. Microsoft Software's contribution to productivity of individuals and business in the 17 years since they opened their doors has to be one of the major contributions of the 20th Century.

If our economy has produced the greatest standard of living in history it is because of the free enterprise system. This was made possible by the laws and the thinking of our Founding Fathers laid down in the Constitution and Bill of Rights. Our Country cannot maintain it's world leadership in freedom and free enterprise with a twisting of justice such as this case against Microsoft.

Yours truly,

From: David Richard Larochelle
To: Microsoft ATR
Date: 1/28/02 4:24pm
Subject: Microsoft Settlement

I am writing to inform you of my opposition to the proposed settlement in the Microsoft case. As a researcher and a member of the security community I am extremely dismayed by the previsions of the settlement

which allow Microsoft not to disclose details of their software which they deem to be security related.

For over 20 years it has been a widely accepted in the security community that ''security through obscurity'' does not work. Keeping the details of software secret does not make it more secure. Time and again it has been shown that malicious users are still able to find and exploit security holes in software even if the details of the software are not disclosed.

I am extremely distressed that these prevision of the settlement disregard the accepted views of the security community. They will do little or nothing to increase security and provide Microsoft with a giant loop hole to avoid releasing software.

David Larochelle

Washington DC 20530

My name is Leon H. Carrington, I am a citizen of the United States and I am herewith submitting my comments regarding the Proposed Final Judgement in Civil Action No. 98–1232, United States of America v. Microsoft Corporation.

The government has breached its duty to the public by offering the Revised Proposed Final Judgement (Final Judgement) as a Final Judgement and settlement in the case United States v. Microsoft Corporation. The remedy proposed is not effective for correcting or eliminating the violations alleged in the Complaint (Civil Action No. 98–1232 (CKK)). The remedy proposed would create more harm to the public than the damage alleged due to the fact that the proposed remedy would ignore serious allegations and behavior found by the United States District Court for the District of Columbia and the United States Court of Appeals for the District of Columbia, to be in violation of the Sherman Act; and it would confer upon Microsoft powers and authority the market does not allow it to possess currently. Thus, the proposed remedy would not be in the public interest and would be disastrous for many third parties, while greatly benefitting Microsoft.. If the remedy proposed includes both the Final Judgement and the Competitive Impact Statement, the proposal is wholly inconsistent with the Complaint and its allegations due to the fact that the Competitive Impact Statement is not even consistent with the Final Judgement which in turn is not responsive to the Complaint.

Specifically, the most glaring and perverse inconsistency is the base of nearly all damage rendering the Final Judgement inadequate and insulting. That inconsistency is the fact that the Complaint is substantially built on the definition of an operating system. The Competitive Impact Statement defines an operating system in a manner wholly consistent with the Complaint. The Competitive Impact Statement definition is in Section III ''Description Of The Practices Giving Rise To The Alleged Violations'', subsection B ''Factual Background'', subsection 1 ''Microsoft's Operating System Monopoly''. The Complaint definition is in Section IV ''The Relevant Markets'', subsection A ''The PC Operating System Market''. Astonishingly, in this very subsection the Complaint states truthfully, that ''No other product duplicates or fully substitutes for the operating system.'' Yet the Complaint incorrectly states in Section IV ''The Relevant Markets'', that ''There are two relevant markets. The market for personal computer operating systems, and the market for Internet browsers.'' This is foolish, indeed. There are two relevant markets. The market for personal computer operating systems, and the market for applications which includes Internet browsers. Note also that the District Court found and the Appeals Court agreed, that Microsoft illegally tied its Explorer browser into Windows in a nonremovable way while excluding rivals, in 1 violation of section 2 of the Sherman Act. The illegal tie-in also injured certain other application developers developing under Windows, who may not have been involved with browsers..

Notwithstanding, the Complaint makes reference to ''Microsoft's Windows operating system'' in section III subsection C. The Complaint refers often to ''Microsoft's Windows operating system monopoly''. That an operating system enables virtual software unification of the hardware computer components and resources, exposing them, and thus facilitates use of those resources and comnponents by users (consumers) and applications, is a perfectly acceptable and commonly understood definition of an operating system. However the Final Judgement creates a new class of product called a Microsoft Operating System Product (my emphasis) This new class, according to the Final Judgement, includes Windows 2000 Profession, Windows XP Home and Professional, and their successors. The Final Judgement further states in the definition of the term ''Microsoft Operating System Product'', that the code comprising the same ''shall be determined by Microsoft in its sole discretion.'' (Section VI—Definitions) We are lost. In spite of the fact that the Competitive Impact Statement recognizes what an operating system is, it confers upon the above listed Microsoft operating systems the designation ''Microsoft Operating System Product''. The new class and the reliance on Middleware by the Final Judgement and the Competitive Impact Statement, permits Microsoft to evade due penalties for established violations and further abuse their operating system monopoly by expanding their ''tie-in'' policy and rendering harmed ISV's among others, to the status of market irrelevance. This is a position Microsoft does not currrently enjoy. Allowing Microsoft to define what an operating system is (through their monopoly control and now U.S. Justice Department assistance) eliminates the threat of Middleware and applications which may compete with Microsoft applications. Indeed, applications not yet conceived can be preempted until Microsoft ''discovers'' them and adds them to their monopoly.

For such cause, many people recognize that breaking up Microsoft is the best first step in correction of alleged and established abuse. Recognizing and enforcing the legitimate (in this case) separation of operating system and applications is the best way to eliminate the basis by which Microsoft's abuse of its monopoly operating system caused damage and continues to do so. Separating the operating system would encourage its owner to make public all features provided by the underlying hardware manufacturers. It would further encourage competion between hardware

component manufacturers which manufacturers are as much victimized by Microsoft's abuse of its monopoly operating system as consumers and ISVs by virtue of the fact that hardware components'' interfaces must suit the Microsoft vision or be excluded. This why so many computer software game manufacturers continued to develop for DOS well into the late 1990%: the Windows interface denied them full access to the functionality that enabled them to distinguish themselves and satisfy their customers. No other vertical software market had a customer base that would allow it or the underlying hardware verticle market to ''rebel''. We are missing many new innovations.

Evading the operating system definition eliminates or surely deteriorates the possibility of illegal tie-ins. All potential beneficiaries of just and reasonable corrections that would have been established by faithfully addressing the allegations of the also semi-adequate Complaint, are instead further damaged or untreated (left damaged) by the Final Judgement. In the Complaint Section I subsection 5 it is stated that''Microsoft's conduct includes agreements tying other Microsoft software products to Microsoft's Windows operating system;...'' The effects of these tie-ins are well known but not part of the allegations of the Complaint. A Microsoft application with hidden interfaces (tie- ins) to the operating system has a chilling effect on the development of competitive products and prevents those few who may discover this interface from remaining competitive because of course, the hidden interface may be changed upon upgrade of Microsoft's application or operating system, 2 and the former interface removed, thus ''breaking'' the competitors application and causing consumers to spend more money unnecessarily. This situation also allows Microsoft to occasionally appear to be competing on the merits of their offering when such is not the case. Promoting middleware as is done in the Complaint, the Final Judgement, and the Competitive Impact Statement, does nothing to alleviate this problem. As stated in the Complaint and noted above, ''No other product duplicates or fully substitutes for the operating system.'' Indeed, middleware is just another application, however useful. Denying ISVs and consumers the benefits afforded them by a legitimately marketed bona-fide operating system as opposed to an ''Operating System Product'' can not be in the public interest, and is not responsive to the Complaint, including prior court judgements.

When the ''Nimda'' computer virus appeared last year, I was amazed at how it performed its activities. I was more astonished when it occurred to me that I was reading about functionality only a person familiar with Microsoft applications programming would understand. What astonished me was the fact that this and many other common viruses could not occur if Microsoft applications were not tied in to the operating system. Operating system vulnerabilities are policed, as it were, by the entire computing community. Application vulnerabilities are not so well noted, because applications other than middleware do not generally offer much exposure to the programming consumer, and competition keeps them distributed, not concentrated through the entire PC universe. This is not the case with Microsoft applications. Commonly used Microsoft applications are part of the ''programmers toolkit'' for Windows developers. If they were not, the anticompetitive position they occupy would be more blatant as only Microsoft could interoperate with them, using the exposed underlying functionality. On the other hand, having these products so fully integrated into the operating system and each other while exposed and enjoying the proliferation obtained from Microsoft's illegal use of its monopoly operating system, facilitates more and more clever exploits by hackers. The most common viruses affecting consumers have used the victims own Microsoft applications. It is not so easy to wreak havoc in other operating system environments where there are no externally programmable, ubiquitous applications which applications are fully integrated into the operating system via hidden APIs or interfaces. Strangely enough, in the Linux community, where essentially nothing is hidden, applications of this power could exist and remain secure because the open source community polices its environment jointly and severally. Interesting... someone can break Microsoft products but only Microsoft can fix them. Who pays? Thus we have another nasty by-product of the ''tie-in'' problem. It would be eliminated or greatly reduced with a return to application development competition based on an operating system exposed on a non- discriminatory basis.

It would thus be disastrous for ISVs and consumers alike if Microsoft had authority to regulate security issues for operating system and applications alike. That power is also effectively granted by the Final Judgement where security APIs and documentation are to regulated directly or indirectly by Microsoft, the antithesis of security in consumer and commercial computing.

That the Final Judgement creates a new class called Microsoft Operating System Product, is reprehensible, clearly evading the issues addressed by the complaint. That ISVs who know how to use computing facilities as well as and better than Microsoft should be relegated to the use of middleware for protection from abuse and for development is not contemplated by the Complaint or Court findings; is unjustly discriminatory, and not in the public interest; denying the public the expected benefits of many new applications which may or may not use, or be middleware; yet must have the access to the same APIs and documentation as any other entity in the computing arena. Indeed, many of the best among us study hardware documentation for software development, 3 and vice versa. Shall the United States Justice Department and Microsoft alter this historic landscape of a market in the interest of anyone other than Microsoft?

The Competitive Impact Statement seeks to limit the competition that competes against Microsoft and others in selected markets, by requiring that ISVs must be of a certain size in the market and have had that position over a particular period of time in order to obtain API disclosure relief under Section III.D of the Final Judgement; further enabling Microsoft to evade Complaint allegations and even Sherman Act violations it has been found guilty of. This is the case because again, some small mind has not yet learned that computing facilities are continually reused by bright agile minds. Interfaces used for middleware in one mind are perfect and necessary for another application in the mind of another party. This reuseability is the inherent nature of computer software and even the smallest computer hardware components. The various underlying markets must not be constrained by this taking on behalf of Microsoft. The limited vision of Bill Gates'' nightmares and appetites are not the proper perspective to use to correct the abuses of Microsoft's monopoly operating system.

The Competitive Impact Statement states in defining a Non-Microsoft Middleware Product, that such a product must have ''at least one million copies distributed in the U.S. within the previous year'' (my emphasis) .It further states that this requirement ''is intended to avoid Microsoft's affirmative obligations—including the API disclosure required by Section III.D .... being triggered by minor or even nonexistent products that have not established a competitive potential in the market and that might even be unknown to Microsoft development personnel.'' (my emphasis) This is preposterous! This constitutes unjust and unlawful restraint of trade and unjust discrimination. The Final Judgement does not restrict ISVs to a size or type insofar as their right to obtain the benefit of relief under Section III.D is concerned. If such were the case, the U.S. and Microsoft have decided who has the fight to compete where in the computing market which as stated above, consists of many integrated and simultaneously distinct and competing markets. This carving of the competing development community, to the benefit of Microsoft, is ironically, the exact opposite of what should be carved. Neither the U.S. nor Microsoft has the fight to determine what merely new, useful, and innovative products may be created using any functionality of a legitimate operating system. Is this why the evasion technique deployed is to call an operating system an operating system product instead of an operating system?

How dare this decree suggest that Microsoft development personnel should be aware of what all or any others are doing in development. Microsoft development personnel can not provide consumers a finished product after any number of beta tests, nor can they secure the products they make. The Revised Proposed Final Judgement and related Competitive Impact Statement are a stench in the nostrils of intelligent, informed consumers. Unless a settlement can resolve the issues raised herein, Microsoft should be broken into at least two separate pieces: operating systems and applications.

Respectfully Submitted,

Leon H. Carrington,
STB Practitioner

Subject: Microsoft settlement- further evidence

I have further indication that Microsoft continues to exercise monopolistic behavior such that the only solution is to break it into separate companies.

I recently purchased a subscription to MSDN (a service of Microsoft that includes their software on CD or DVD).

I went to install Win/XP. They had not supplied me with a product code for XP, and such a code is required in order to be able to install the product I had paid for.

It turns out that in order to get a product code, I must register an Email address with Microsoft[1]. Further, I must use Microsoft Passport[2] in order to get a product code. The product I'm installing has no relation to Email or Passport.

[1] I should not need an Email address to install something that is not an Email application. Last time Microsoft got my Email address, it took me nearly a year plus a letter to the gripe line at Infoworld to get them to stop spamming me.

[2] Microsoft Passport requires that:

1. You trust them to hold the required information about you.

2. You accept cookies, which has privacy implications

3. You use an approved browser. Microsoft rejected the browser I tried to use. —

Subject: Microsoft Settlement

The following is my comment about the proposed Microsoft Settlement under the Tunney Act:

First, let me state that I agree completely with Dan Kegel's comments abot the issues at http://www.kegel.com/remedy/remedy2.html. He has done a great job summarizing the many problems with the proposed settlement. In particular, however, I feel that the public will be harmed most by the fact that the proposed settlement doesn't account for any potential Open-Source competition. It allows Microsoft to decide which entities it's required to share documentation with, and has too many exceptions for Microsoft to use as reasons for not documenting their protocols and API's. Given that Microsoft has a documented history of refusing to cooperate, this portion of the settlement is not very helpful at all in restoring competition, and interoperability of protocols and data is absolutely required for any real competition to exist.

The settlement is not in the public interest, for the many many reasons listed above.

Sincerely,
Karl J. Smith

From: Dean (038) Danielle Fulcer
To: Microsoft ATR
Date: 1/28/02 4:27pm
Subject: Microsoft Settlement

I am in favor of this settlement. Microsoft has already changed many of its business practices that were shown to be in violation of the antitrust laws. These antitrust laws were meant from the beggining to protect consumers, not simply allow competitors who refuse to innovate and meet customer needs stay in business. Microsoft has taken incredible risks by investing in technology R&D when many other businesses would rather just keep the status quo.

It's time to move on. Accept this settlement. Protect innovation while monitoring Microsoft for compliance. Do not stifle Microsoft's sucees. THAT would hurt consumers, not Microsoft coming out with major new versions of their software that itegrate key features every couple of years. Could you imagine buying a computer from a manufacturer that was not allowed to integrate a CD-RW drive, or a DVD, or for that matter a laptop without a monitor? This is analagous to what Microsoft has done, integrate key user needs into a single product. Please do not force me as a cosumer to shop for each of my operating system needs individually. That would hurt me in terms of time and money.

Sincerely,
Dean Fulcer

Dear Mr. Ashcroft:

I am writing to express my approval of the settlement reached between the Justice Department and Microsoft.

As I understand the settlement, Microsoft has agreed to modify its Windows operating systems to allow for the use of non-Microsoft programs and services within Windows. The amount of additional consumer choice brought about by this concession could be very significant.

In addition, Microsoft has agreed to eliminate many of its more restrictive covenants from its agreements with licensees and distributors. I believe that this agreement will also provide additional consumer choice after a period of time.

I know that you will agree that you have more pressing problems on your agenda right now. Please take advantage of this opportunity, settle the case, and move on. Thank you for your attention.

Sincerely,
Beverly Offutt

re. Deficiencies in Microsoft settlement.

Pursuant to the Tunney Act, I am filing these comments on the proposed resolution of United States, et al. v. Microsoft.

My Perspective, Experience, and Interest

I believe this case is tremendously important. As personal computers and the Internet have become increasingly important to our everyday lives, so too has the landscape of the technology markets become increasingly important. Not only will the outcome of this case impact the fortunes of a host of technology companies, but it will also affect how I and millions of others communicate with our friends and family, what choices we have for online services such as digital photography, and of course how much we and businesses spend on technology infrastructure.

Once the government decided not to seek a structural remedy, it necessarily embarked

on a course of regulation. Regulation only works when the conduct prohibitions truly restrain anti-competitive behavior, and create a genuine opportunity for innovators to enter the market and compete in it based on their merits. Unfortunately, the Proposed Final Judgement (PFJ) presented by the Department of Justice and several states fails on all counts.

Its results will be only a mild, temporary modification to Microsoft's well-documented behavior, with no lasting or significant effect on competition. Microsoft will retain its monopoly and every incentive to maintain it through any means not specifically prohibited by the PFJ. Consumers will continue to be deprived of the innovations and other benefits of a truly competitive market, in part because innovators will be deprived of the opportunity and incentive to challenge Microsoft's monopoly as it expands and evolves. Most importantly, America's technology industry will stagnate, as ever fewer competitors see any value in entering markets dominated by Microsoft.

While I believe that many if not most Americans will be affected by the disposition of this case, I have a particular interest in it as a long-time technology consumer, entrepreneur, and enthusiast. Since 1980, I have used personal computers nearly every day, first as a hobby, then for school, and later for my career in the technology industry. In the early 1990s, I managed a small but pioneering desktop publishing department for a large advertising agency. Later, I joined a groundbreaking multimedia company that produced CD-ROMs for both Macintosh and Windows-based computers.

Most recently, I was a partner in a successful Internet development firm, which designs and produces web sites and other interactive media for corporate clients. Having sold my share of that business, I currently consult for other companies in the technology industry.

Definitions Are Critical: the Devil Is in the Details

1. Most provisions of the PFJ depend on the definition of ''Microsoft Middleware.'' Accordingly, we should expect this term to be well-defined, with clear boundaries and unquestionable meaning. Unfortunately, the reality is that it is vaguely defined, in language that grants Microsoft itself much control over what software it, and therefore the PFJ, governs.

1.1.

Definition: According to the PFJ (PFJ VI.J), ''Microsoft Middleware'' is any software which:

.* is distributed separately from the operating system,

.* controls the user interface of the Microsoft Middleware,

.* provides substantially similar functionality as a Microsoft Middleware Product, and

. is trademarked.

1.2.

Definition gives Microsoft control. So Microsoft, which has long stated its goal of incorporating browsing and other middleware functions into its operating system products, can exclude code from the Microsoft Middleware definition simply by not distributing it separately from the operating system, or even just by not trademarking it. Microsoft therefore will have enormous latitude in determining which new operating system features will be governed by the PFJ.

Clarity Is Essential to Compliance and Public Confidence.

The PFJ consists largely of vague prohibitions hobbled by numerous qualifiers and exemptions.

For instance:

Limited replacement of Microsoft Middleware.

2.1. The PFJ requires Microsoft to enable users and OEMs to specify that Non-Microsoft Middleware be used in place of Microsoft Middleware (PFJ, III.H.2). This is a welcome change because it had previously been difficult to replace Microsoft's Internet Explorer (IE) without facing ''considerable uncertainty and confusion'' when IE would nonetheless unexpectedly be invoked under certain circumstances (Findings,] 171).

2.1.1. Exemption for Microsoft servers. Unfortunately, Microsoft is exempt from this requirement when the Middleware Product would be invoked ''solely for use in interoperating with a server maintained by Microsoft'' (PFJ III.H). This may exempt Microsoft's current move into network services (''.NET'') from the judgement, inasmuch as such services communicate with Microsoft-owned servers. Microsoft considers .NET to be the next phase of the Internet, at last offering 'real'' applications and services. The first .NET service, Microsoft Passport, aims at becoming a cornerstone of Internet shopping and authentication transactions, and stores its data exclusively on Microsoft-owned servers.

2.1.2. Exemption for proprietary technologies. Another exemption allows Microsoft to launch its own middleware when the Non-Microsoft Middleware ''fails to implement a reasonable technical requirement'' (PFJ III H 3). Microsoft will be able to capitalize on this loophole simply by emphasizing proprietary technologies not supported by Non- Microsoft Middleware. To the extent that Microsoft can implement features using proprietary technologies, it will better be able to exclude Non-Microsoft Middleware. A truly pro-competitive PFJ would encourage Microsoft to use open industry standards.

OEM Distribution Channel Opened, But For Whom?

2.2. The PFJ requires Microsoft to allow OEMs to customize the user's desktop by installing icons for Non-Microsoft Middleware and other products (PFJ, III.C.1). This is important to the PFJ because Microsoft has in the past excluded Netscape and other competitors from the valuable OEM distribution channel, often by contractually limiting an OEM's ability to customize the desktop. In addition, Microsoft has used its control over the valuable desktop real-estate as an incentive to get IAPs such as AOL to support Microsoft Middleware instead of competing products.

2.2.1. OEMs lack incentive. Unfortunately, because Microsoft's Internet Explorer is now the market leader, there is today little consumer demand for alternatives to Microsoft Middleware. This makes it unlikely that an OEM would see much gain, if any, in installing Non-Microsoft Middleware. Such distribution may benefit the middleware developers, but would not greatly benefit the OEM.

2.2.2. Customizations will be short-lived. This prohibition remains in effect only for a 14-day window starting after the end user first turns on his or her PC. Thereafter, Microsoft is free to re-arrange the desktop as it sees fit, including automatic removal of any non-Microsoft icons, e.g. by operating system features such as the ''Clean Desktop Wizard'' built-in to Windows XP (PFJ, III.H.3). So, any Non-Microsoft Middleware developers who do manage to secure OEM distribution could well see their products wiped off the desktop after a short two weeks.

2.2.3. Likely results. These limitations beg the question: will any OEMs risk irritating Microsoft for such minor benefits? If they do, will the results truly be increased competition in the middleware market?

General Rule on Sharing APIs.

2.3. The PFJ requires Microsoft to share APIs used by Microsoft Middleware with ISVs, et al. (PFJ III.D). In its Findings of Fact, the District Court found that Microsoft had repeatedly withheld such information from ISVs, or used its disclosure as an incentive for 'friendlier'' behavior, in an effort to preserve the applications barrier to entry (Findings,] 84, 90, 91). Because ISVs depend on such information to develop software for a given platform, withholding APIs can limit or destroy an ISV's ability to create competitive products. Therefore full API disclosure should be considered a basic condition for any kind of effective competition.

2.3.1. Only APIs necessary to mimic Microsoft's products will be disclosed. Unfortunately, the PFJ requires Microsoft to share only those operating system APIs used by Microsoft Middleware. This is a limited set of APIs, of use only to those ISVs who want to develop middleware products similar to Microsoft's. It does little to help ISVs offer features or innovations not already offered by Microsoft's products. Since ISVs typically must provide innovations to gain market share against an entrenched market leader, this requirement is unlikely to promote competition in the middleware market.

2.3.2. Many APIs may be withheld on dubious 'security'' grounds. The PFJ allows Microsoft to exclude any APIs the disclosure of which ''would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems'' (PFJ III.I. 1).

. This is a surprising exemption because few security professionals believe API disclosure could weaken any well-designed security system. Indeed, the complete source code (a level of disclosure far greater than simple APIs) is publicly available for several operating systems and security-related products that are widely considered to be more secure than Windows (e.g. the Linux operating system).

. Yet the inclusion of this exemption implies that there in fact are such APIs

whose disclosure could compromise security, and thereby opens the door for Microsoft to make claims about which ones they are. There is no basis for the Competitive Impact Statement's (''CIS'') optimism that security-related exemptions will be limited to ''keys and tokens'' (CIS, IV.B.5) of particular installations. Nothing in the PFJ's language so limits the exemptable APIs, and such entities aren't generally visible at the API level, anyhow.

. With Microsoft's current push into network services (under the .NET moniker), we can expect privacy and security features to be suffused throughout the code, increasing the number of APIs Microsoft will try to exempt from disclosure. Indeed, Microsoft has just this month announced that privacy and security will henceforth be its main priorities. 1

1 Associated Press, ''Microsoft Announces Strategy Shift'', D. Ian Hopper and Ted Bridis, January 17, 2002.

Inadequate Enforcement

3. The task of detecting whether Microsoft has violated these and other provisions falls to a three- person ''Technical Compliance'' committee (the ''TC''). This committee will have access to the source code and tools used to create Microsoft's products, as well as access to the relevant Microsoft staff (PFJ IV.B.8). In theory, the TC's oversight will prevent Microsoft from using technical strategies to camouflage non-compliance, for instance by wrongly claiming that some important API should not be disclosed for security reasons. While such oversight may in fact be helpful, the TC is an inadequate, inefficient and non-transparent attempt to ensure enforcement of a Judgement that otherwise relies on voluntary compliance and enforces few penalties for transgressions.

3.1. Severe employment restrictions threaten the TC's performance. The PFJ includes employment restrictions which will dramatically narrow the pool of TC candidates—first, to those experts not currently working for Microsoft or a competitor, and then to those remaining candidates willing to forego any such employment for two years after serving on the TC. In so doing, it excludes nearly all of those experts in operating systems design and programming whom the TC most needs, since it will be very difficult to find any such experts not currently working for, and with no intention of working for, Microsoft or a competitor. As a professional in this field, I cannot imagine why a highly competent independent minded computer scientist would wish to serve on the TC under these circumstances.

3.2- The TC will be buried under a mountain of technical data. Even if well staffed, the committee will have all enormously difficult task from a technical standpoint. Inasmuch as deciphering computer source code can be difficult even for the code's author, much less a new reader, and inasmuch as Windows XP alone consists of some 45 million lines of code 2, this committee will have an enormously difficult task. Even with a large support staff, it is hard to imagine this committee effectively analyzing Microsoft's source code and fully investigating allegations of non-compliance.

3.3. The TC cannot ensure timely remedies. Further, because the committee is prohibited from public comment (PFJ, IV.B.10), it will be unable to confirm any ISV's suspicions about Microsoft's compliance, nor could it force a timely remedy. Its only recourse will instead be to notify Microsoft and the Plaintiffs and to suggest a possible remedy. Therefore, an ISV suspecting Microsoft of non-compliance will not receive an immediate remedy, but must instead rely on a bureaucracy whose natural tendency will be not to pursue minor infractions. While such infractions may indeed be minor in the scope of the overall judgement, they would assuredly be of great importance to the ISV.

3.4. The TC's findings may not be presented to the Court or the public. Under the PFJ, the TC may not testify in any matter relating to the Final Judgement, nor may its work product and recommendations be submitted to the Court (PFJ, IV.D.4.d). Similarly, the TC is prohibited from public comment (PFJ, IV.B.10). Thus, even if the TC's exclusive access to source code should produce evidence of deception and non-compliance by Microsoft, this evidence will not be presented to the Court. 2

BusinessWeek, ''Windows XP: a Firewall for All'', Alex Salkever, June 12, 2001.

. In theory, the TC will report to the Plaintiffs, who may in turn report such non-compliance to the Court, and produce evidence of it via other means. This may well happen in the case of massive or severe non-compliance. However, what happens to the small ISV who suspects Microsoft of non-compliance, e.g. by not disclosing some necessary API? Such an injured party may report its concerns to the TC, and then hope that the TC is able to verify its claims, and further is able to convince the Plaintiffs to go to court on their behalf. During this bureaucratic pursuit, the ISV's business may suffer irreparable harm, or even vanish altogether (as has very nearly happened to Netscape). Were such ISVs to have access to Microsoft's source code, perhaps in a secure facility, they could investigate such concerns themselves, directly and immediately. Indeed, API disclosure would not be an issue in the first place.

. The point here is that the nature of the TC is as the first step in a bureaucracy whose natural instinct will be to pursue only the most serious transgressions. In the context of a rapidly changing technology industry, this is a serious weakness in the PFJ.

3.5. PFJ places enormous weight on third TC member. The PFJ proposes that the Plaintiffs appoint one member of the TC, Microsoft appoint a second, and then these two members themselves choose a third (PFJ IV.B.3). This structure places enormous responsibility on the third member, who can be expected to decide any disagreement between Microsoft's representative and the Plaintiffs'', especially in the context of the Voluntary Dispute Resolution process in IV.D. It is unclear whether the TC reports to the Plaintiffs only as a single unit, or whether a dissenter's view also gets submitted to the Plaintiffs. A better structure would at the very least make it crystal clear that any single member of the TC may report, to the Plaintiffs.

Also, creating such a fulcrum position in the TC makes this third seat much less attractive and harder to fill, and injects an element of politics into the TC that will distract from its technical mission and smooth functioning. Because the TC is not a decisional body, but simply a means to keep a watchful eye on Microsoft's compliance, it is unclear why Microsoft should have representation here at all. All of the TC's members should be appointed by the Plaintiffs, perhaps with the DOJ appointing one member, the States appointing a second member, and the Plaintiffs collectively appointing the third.

3.6. Catch-22. Given the enormity of the TC's tasks, the limits on its powers and enforcement abilities, and the severe employment restrictions surrounding service in the TC (IV.B.2), it is clear that any candidate for the TC willing to accept the job is almost certainly too inexperienced to be legitimately qualified for it. In Today's Market, More is Needed.

4. In perhaps its broadest weakness, the PFJ fails to recognize that the circumstances of the original case were unique, and that circumstances today are very different. The Internet's rapid public acceptance around 1994–1995 took many established computer-industry firms by surprise, and radically changed the personal computer market. The basic reasons users wanted to own personal computers changed dramatically within less than two years. Two companies in particular, Netscape and Sun Microsystems, were able to aggressively exploit the new technologies and to take advantage of Microsoft's slow response to the burgeoning consumer demand. As a result, they were able to present a serious threat to the applications barrier to entry that has long protected Microsoft's monopoly in Intel-compatible operating systems.

4.1. No longer any consumer demand for non-Microsoft Middleware. But that window of opportunity is long closed. The Internet is an established part of the personal computer market. Microsoft's Internet Explorer is the dominant browser. There no longer is any great consumer demand for alternative browsers. Netscape no longer exists as an independent company, and development of the Netscape browser occurs at a fraction of its former pace. Even the CIS acknowledges that Microsoft has ''perhaps extinguished altogether the process by which these two middleware technologies [Java and the Netscape browser] could have facilitated the introduction of competition into the market for Intel-compatible personal computer operating systems'' (CIS, III.B.3).

4.2. Cannot resuscitate existing middleware competitors. Nothing in the PFJ can or will restore these competitors to their former strength. There is no way to rekindle the massive consumer demand, then left unserviced by Microsoft, that gave these companies their initial momentum.

4.3. Hoping for another thousand-year flood. Still, the CIS claims the PFJ will ''restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings'' (CIS, II). Given that Microsoft now dominates the browser market and retains its operating

systems monopoly, and given that the PFJ allows Microsoft to support its browser market share by tying the browser to the operating system, this claim seems to rest on the optimistic hope that some new disruptive technology will appear, will be ignored by Microsoft, and will create massive consumer demand for some non-Microsoft Middleware. Without such an event, the PFJ merely establishes rules for a game that has no players.

Unconditional Surrender

5. Finally, in a bizarre and extreme limitation, the PFJ will expire in only five years—regardless of whether or not Microsoft retains its operating systems monopoly (PFJ, V.A). The DOJ must believe that not only is the PFJ an effective remedy, but that it will be so effective that Microsoft will be reduced to a shadow of its former self and must be unshackled in just five years (seven, if the Plaintiffs seek and receive the maximum extension permitted by the PFJ). Unfortunately, this clause is so careless that it will release Microsoft no matter the circumstances—that is, even if Microsoft retains or even strengthens its monopoly power. The message that the PFJ sends is ''we'll try this for five years, and then we're giving up.'' Any judgement should remain in effect until the Court finds that Microsoft no longer holds a monopoly in Intel-compatible operating systems. It makes little sense to release Microsoft until competition has re-entered the market and Microsoft may no longer commit the illegal acts described by the Court's Findings of Fact.

Alternatives

This PFJ illustrates the difficulty in devising effective conduct remedies for complex software cases such as this, especially where the defendant retains its monopoly power and the incentive to expand and maintain it by any method not prohibited by the PFJ. Vague technical definitions and even apparently narrow exemptions can be exploited by the monopolist to maintain its ill-gotten gains. It would be vastly preferable to create the proper structural conditions for competition by decoupling parts of the monopolist enterprise. Without a structural remedy, it is imperative that the definitions and prohibitions in the Final Judgement be as clear and comprehensive as possible, so as to fully restrict the anti-competitive behavior that has been denying consumers choice, innovation and fair market pricing. There are a number of specific changes that ought to be made to the PFJ:

. Any judgement should remain in effect until Microsoft no longer holds a monopoly in Intel- compatible operating systems. Starting in 5 years, the Court should annually review

Microsoft's position in the Intel-compatible operating systems market. Should it find that Microsoft no longer exercises monopoly power in that market, and therefore cannot commit the illegal acts described in the Court's Findings of Fact, it could release Microsoft from the terms of the judgement.

.* The TC should be appointed entirely by the Plaintiffs, perhaps with the DOJ appointing one member, the States appointing a second member, and the Plaintiffs collectively appointing the third.

.* Definitions such as that of ''Microsoft Middleware'' should be tightened considerably, and the PFJ reworked to minimize its reliance on such narrow categories.

. Microsoft should be required to make the full source-code for its Intel-compatible operating systems available for viewing by ISVs et al.. This will allow ISVs to better develop competitive products, and will allow the ISVs themselves to monitor Microsoft's compliance with the judgement's other technical requirements, instead of relying on an inefficient, overworked TC.

.* If the Court decides against requiring source-code sharing, it should at a minimum require the disclosure of all operating system APIs used by any Microsoft products (i.e. not just those APIs used by Microsoft Middleware). A blanket disclosure requirement such as this will close those existing loopholes whereby Microsoft might withhold critical information from ISVs whose products threaten its operating system monopoly.

.* Exemptions permitting various proscribed behaviors under certain circumstances should, as a whole, be stricken.

.* Finally, the judgment should include real consequences for non-compliance, such as further conduct prohibitions, financial penalties, or further disclosure requirements. The PFJ currently provides only a possible Court-imposed two-year extension of its rather toothless provisions.

Conclusion I hope that the PFJ is modified by the DOJ or the Court, and that what seems to be a great opportunity for antitrust law to make a difference for tomorrow's entrepreneurs and consumers is not lost in a fog of complexity. The technology may be complex and changing, but the underlying competitive issues are fundamental. I take both comfort and concern from the fact that I am clearly not alone in expressing these concerns. As the Financial Times editorialized:

...It would be wrong for the states, or the judge, to reject this settlement merely because it is not sufficiently punitive. The test is whether the proposal provides enough protection for the public and for Microsoft's competitors. As it stands, it does not meet this test. Though a continued trial would be expensive and distracting, it would be better than an unsatisfactory settlement. This proposal should be rejected..

(Financial Times, ''Micro-too-soft'', November 5, 2001)

I believe that the PFJ, if accepted by the Court in its current form, will lead to clear and irreparable harm to consumers and to the United States'' technology industry. So pervasive has technology become that the technology industry is an obviously critical component of the American economy.

Even BusinessWeek, itself no anti-capitalist Microsoft critic, recognized the broad implications of the resolution of this case:

... [T]he Justice Dept.'s weak censure of Microsoft for its serious monopolistic practices could cost the U.S. mightily in the years ahead. The great strengths of the American economy are its openness, its competitiveness, and its innovativeness. Monopoly is the enemy of all three.

(BusinessWeek, ''Slapping Microsoft's Wrist'', November 19, 200!) Based on my experience, I do not find the PFJ to be in the ''public interest'', which is the standard that the DOJ and the Court are subject to under the Tunney Act.

Respectfully submitted,
Jonathan Gifford

Subject: Microsoft anit-trust settlement

I feel the settlement does not punish Microsoft for their wrong doings. Note that I did not say ''punish enough'', because I do not feel they are being punished at all. The agreement calls for oversight, not puninishment, and a large donation to schools. Neither of these will force Microsoft into changing its behaviour nor will they help create a more competitve environment. I, as a software developer, feel that any business I start would be threatened if I develop technology like Java that threatens their Monopoly.

I've heard some of Secretary Ashcroft's comments about the settlement and at least part of his reasoning is that it would be good for the economy. In the short term, this may be true, but the downturn in the economy and the war on terrorism will pass, and we will be left with a very non-competitive environment with one company dominating both the operating system and the applications area. This potentially has global ramifications. As you may be aware, some European countries and China are looking elsewhere for their technology. They are concerned about their own security and having only one company to provide the bulk of their productivity, security etc. This will only serve to create markets outside of the US. The Justice Department's current settlement may solve short term problems, but will only serve to isolate the American software vendors, unless you act now to reduce and/or restrict the Microsoft monopoly.

Thank you

As an individual and user of the Microsoft Operating System and bundled software I have appreciated the ease of having it all in one package. I believe that most individual consumers would agree. The government broke up Ma Bell and now there are many larger businesses. All it did was to make prices rise. A business should be allowed to produce their product without governmental restraint unless it in some way will do physical harm to a person.

To those of us who are retired and hold stock in these companies such as Microsoft, the ongoing dispute over who is right has only served to hurt the stockholders. Let's get this suit over with once and for all and let

Microsoft get back to doing what they do best ? innovate!

Thank you for your time,

Gordon Fox

Subject: Microsoft Settlement

The U.S. government, via the USAF, trained me to use and repair computers over 30 years ago. One of the first things I learned was that there are two kinds of software: operating system software and application software.

The operating system software, such as Windows, controls how the computer functions, whether it be one with an Intel Pentium or another manufacturer's CPU chip. Application software consists of programs that use the computer to perform tasks, such as word processing, money management, or browsing the internet. By Microsoft controlling the operating system market for PCs, they have unfairly competed in the marketplace for years.

By allowing Microsoft to continue to modify its operating system and add application software to it, you are allowing Microsoft to retain their monopoly and unfair advantage.

Microsoft will continue to stifle competition by using its unfair advantage. Consider that Netscape, who developed the network browser, has had to practically give its software away. In 2–3 years, why will anyone want to buy RealPlayer software when Microsoft will have imbedded their media player software in the operating system?

The only way to settle this issue fairly for all concerned is to split Microsoft into two companies. By requiring Microsoft to form a company that produces only operating systems, you will not only make the marketplace more fair for all application software companies, you will force Microsoft to make the best operating system they can.

And, yes, the world needs a better operating system, not just the operating system Microsoft allows consumers to buy. I want an operating system that will efficiently use the software I want to install, not an operating system that is loaded with applications I might not want. By requiring Microsoft to form a company that produces only application software, you will place Microsoft into a position where the quality of their software determines whether they succeed, not because they can use their operating system to an unfair advantage. Splitting Microsoft into two companies would give application software companies a fair chance to succeed. Real and fair competition will return and innovation will drive the market.

In the last 20 years, Microsoft has earned billions of dollars in profits, often at the expense of other companies. Consider Netscape who has had to give away their product. Consider Novell who had the best networking software available, but fell because Microsoft put networking software in their NT operating system. There are dozens, if not hundreds, more.

The settlement that has been negotiated is laughable. It does not change anything. Microsoft will continue with their current way of doing business. And innovation and competition will continue to be stifled.

Respectfully,

Larry Lininger

Subject: Microsoft Settlement

As a United States citizen and experienced computer professional who has at times been compelled to work with Microsoft products,I would like to express my opposition to the settlement that has been proposed for the USDOJ's antitrust lawsuit against Microsoft. I feel that the terms of the settlement as currently specified are weighted far too heavily in favor of Microsoft, and that they will do nothing to prevent Microsoft from continuing abuse its monopoly position to stifle competition and lock customers into its products. The terms also significantly underestimate the lengths to which Microsoft has shown it swilling to go to root out loopholes in any agreements it enters into and exploit them in such a way that any intended restrictions on its behavior are effectively neutralized. I also feel that the terms will do literally nothing to ease the market barrier to entry for new products, particularly open-source products such as the Linux operating system, which may happen directly compete with Microsoft's offerings.

There are a number of problems with the settlement which other shave outlined and on which I will not go into further details.However, I am dismayed by the extent to which the proposed settlement focuses almost completely on attempting to restrict Microsoft's behavior on the Windows desktop and middleware platforms, to the virtual exclusion of server platforms and other operating system products that are offered or soon to be offered Microsoft. In particular, the name ''Windows'' is mentioned 56times in the document, yet no mention is made of the embedded operating system market or of Microsoft's explicitly stated intention to replace the Windows desktop and server platform with the .NET initiative. Furthermore, the definitions of ''operating system,'' ''personal computer,'' ''Microsoft Platform Software,'' and''Windows Operating System Product'' refer entirely to desktop operating systems intended for use by a single user at a time.

This loophole would have the effect of rendering Section III.A moot in its entirety should Microsoft attempt to retaliate against an OEM that is attempting to market a competing Server Platform on its products. Additionally, the proposed settlement does nothing to preclude Microsoft from dropping the Windows Brand name altogether and continuing their customer lock-in,competition-stifling and monopoly-extending behavior on a similar but differently named platform.

Dan Kegel has done an excellent analysis which may be found online at (http://www.kegel.com/remedy/remedy2.html). Mr.Kegel's site also contains links to several other very compelling analyses. Due to the flaws which I and others have pointed out,the settlement as it is currently written does not serve the public interest and should not be accepted without considerable revisions to ensure that the market is not tilted unfairly inMicrosoft's favor.

Thank you for your time and for considering my point of view.

Sincerely,

Enough is enough. Let's end the legal assaults on Microsoft.

Microsoft has done more for the consumer than anybody else in the industry.

Without Microsoft's excellent leadership and ongoing product improvements we would not be where we are today. Are we about to go back in time?

Let the Free Enterprise System function the way it should and give Microsoft a chance to once again put 100% of it's efforts to making better products for the benefit of consumers.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing you today to express my opinion in regards to the settlement that was reached in November between Microsoft and the government. I support this settlement and believe it is a fair and sufficient agreement to end the three-year antitrust dispute.

This settlement contains provisions that will foster competition. Microsoft has agreed to share more information with other companies and is willing to follow procedures to make it easier for companies to compete. Under this agreement, Microsoft must design future versions of Windows to make it easier to install non-Microsoft

software. Microsoft has also agreed to license its Windows operating system products to the 20 largest computer makers on identical terms and conditions, including price. Microsoft will be monitored for compliance by a technical committee established by order of the settlement.

This settlement will serve in the best public interest. Microsoft has contributed so much to our society that stifling this company will only serve to negatively impact the public. Please support this settlement. Thank you for your time.

Sincerely,

John Jackson

Subject: Microsoft Settlement
Renata B. Hesse
Antitrust Division
U.S. Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001
Re.: Microsoft Settlement

Dear Ms. Hesse:

In response to the request for comments in USDOJ vs Microsoft in accordance with the Tunney Act I ask that such settlement be rejected. Having read the Revised Proposed Final Judgment between USDOJ and Microsoft, and having read the alternate proposed settlement by the nine states and DC, and having understood that the purpose of the Tunney Act to solicit feedback from US citizens affected by the outcome of a final judgment is to make sure that any such final judgment is in the best interest of the consumer, let me start by asking three questions:

1. Now that Microsoft has been at the center of antitrust controversy forever, starting when Novell sued Microsoft culminating in a consent decree in 1994, is it not in the best interest of the consumer and our country as a whole to find a solution that will keep Microsoft out of the courts, at least for a while?

2. Can the USDOJ vs Microsoft settlement proposal be in the best interest of the consumer if the agreement cannot be clearly understood even by the fairly educated person with a fairly good understanding of law that I am?

3. Can the USDOJ vs Microsoft settlement proposal be in the best interest of the consumer if the agreement ignores that, because Microsoft's marginal cost is effectively zero, remedies, that might have been effective for a predatory competitor that *does* have real marginal costs, are totally ineffective here?

What I, as the president of a company and as a consumer seek is simply an environment in which I can buy at a fair price what has become as ubiquitous a product as typewriters once were. In this case, however, this ubiquitous product is without the traditional competitive market place price pressures that go with ubiquitous products. Therefore prices for those Microsoft products that have replaced our typewriters are about four times higher then a competitive market would allow.

The solution, the remedy, that USDOJ and Microsoft offer to solve the issue of Microsoft having been found guilty of anti-trust violations gives me very little comfort, if any, that such a competitively priced market will develop as a result of that agreement. As a matter of fact, if the agreement is allowed to become final, Microsoft will be emboldened to eliminate some of the loopholes that have allowed sophisticated buyers to avoid the so-called Microsoft tax, the fact that the consumer pays for Microsoft products when s(he) buys a PC, whether s(he) needs those Microsoft products or not.

On the other hand, the alternative settlement agreement proposed by the nine states and DC appears to offer a solution that *does* create a competitive environment where it now counts most, the desktop.

Rather than addressing the various aspects of the USDOJ vs Microsoft proposal further, I will just address one issue, the clause in the alternate proposal that Microsoft establish three competitors for its MS-Office product through an auctioning process.

The real sticky problem in trying to find a good solution to *this* anti-trust case lies in the fact that, although an individual or a company may want to switch to a competitor's OS, the huge investment in training and learning MS-Office products, such as MS-Word and and MS-Excel, effectively discourages or even prevents such a switch.

If one draws an analogy between the oft cited Standard Oil anti-trust case, Microsoft has managed to bring about a situation where 90% (including Apple's 5%) of the desktop software can only run on MS-Windows gasoline. Forcing Microsoft to sell off gas stations under those circumstances is obviously not a remedy. However, by forcing Microsoft to auction off three copies of MS-Office, complete with formulas and technical assistance for ten years, competitors can develop desktops that people already know and like but which desktops run on the gasoline of those competitors.

Forcing Microsoft to just share the formula for the gas is an inadequate remedy, not only because, in the eyes of its competitors and a significant segment of the hightech industry, the quality of Microsoft gas is not very good, but also because of the time delay to build a refinery capable of producing that special gasoline.

The solution that the nine states and DC are proposing is therefore an analogy to a Standard Oil case that is even more threatening to the consumer because, in this case, Microsoft also owns the factory that makes the special cars that more than 90% of the people are using now and which cars only run on Microsoft's own special gasoline. Forcing Microsoft to become the non-exclusive manufacturer of those proprietary MS-Office cars is therefore a brilliant remedy on the part of the nine states and DC as well as a meaningful punishment for Microsoft because it is neither a cash punishment not a punishment that will hobble the company.

Competition for the dollars that consumers will spend to buy MS-Office is not only a desirable end to this anti-trust case, by having an MS-Office version that effective runs on OSes like Linux and Unix, this solution will also lead to a more lasting end to this energy sapping Microsoft antitrust hassle. By punishing Microsoft fairly for its proven illegal behavior, the government in effect discourages other illegal behavior, such as cracking, by large groups of people who feel justified to take the law into their own hands if their government fails to afford its consumers protection from a monopolist under the law.

Unless our government punishes Microsoft fairly for its illegal behavior, our government in effect creates an atmosphere in which lawlessness can blossom.

Restated in simple terms, it is my belief that it is in the best interest of the consumers and our country that the court reject the proposed USDOJ vs Microsoft final judgment and instead adopt the remedies in the proposed final judgment of the nine states and DC as the final judgment.

Sincerely,

Henry B. Keultjes

Subject: Microsoft Settlement

I fully support the proposed settlement between Microsoft and the DOJ. Despite months of testimony and years of legal wrangling, no one has ever given any significant evidence of any consumer harm as a result of Microsoft's actions and behaviors.

Microsoft's Windows operating system including the Internet Explorer browser is far and away the most user friendly, functional, and highest value operating system available. By building the browser functionality into the operating system (both as a user-level feature like IE and as the MSHTML components for ISVs to use), Microsoft has provided a level of functionality far beyond anything any other vendor has delivered.

I think settling this case is the best way for the software industry to move forward,

competing in the market instead of in the courts.

Sincerely,
Bruce Morgan

Dear DOJ:

Please impose penalties on Microsoft that will encourage new competition in operating systems. The current de facto monopoly results in the price gouging that is apparent in Microsoft's extremely high profit margins.

Sincerely yours,
Fred Rone

Dear Ms. Hesse:

Accompanying are public comments regarding the proposed Microsoft settlement submitted for consideration pursuant to the Tunney Act proceedings before the District Court for the District of Columbia.

I am not a lawyer, computer professional, or Microsoft competitor. I use personal computers to perform business ''office'' functions and am concerned by how unwieldy and unreliable Windows has become as new ''features'' I do not want or use are incorporated. I also use Linux and find it better than Windows for my needs. However, few of the specialized applications programs I need for my work (in addition to general purpose ''office'' applications) are available for that platform without custom programming or adaptation so using Windows is a practical necessity. Microsoft products are priced considerably higher than their functional equivalents by other publishers, a phenomenon I attribute to Microsoft's monopoly pricing power that the instant Tunney Act proceedings are intended to curb in the public interest while not losing the benefits of vigorous innovation in computer and communications technology.

You have my permission to publish these comments and to make whatever use of them in the Tunney Act proceedings you see fit. I hope these comments will be helpful to the Court.

Respectfully submitted,

Is the Microsoft Settlement in the Public Interest?

The settlement negotiated between Microsoft and the Justice Department and several of the plaintiff States appears to rest on the dubious proposition that the public interest is synonymous with the summation of private interests. Secondly, while the settlement arguably addresses the ''middleware'' problem that was the focus of much attention in the trial, it is weak, if not completely ineffectual, with respect to the equally important prevention of Microsoft's apparent extension of its operating system monopoly to the most widely used business applications software programs. These observations are amplified below.

While the Sherman Act provides for a private right of action seeking trebling of private damages suffered from monopolization, its strong feature was declaring monopoly and monopolization to be detrimental to the general public interest beyond the summation of losses to identifiable private parties who might sue. These days, in a case such as this, the loss to the general public interest might be seen as a stifling and channeling of innovation into forms approved by the monopolist, a hard-to-predict and quantify loss to an undefined and disparate ''public.'' This is the putative loss the Sherman Act is intended to mitigate through the Tunney Act proceedings. The Justice Department observed in its Competitive Impact Statement that the Court does not have the authority to write a different settlement that it might prefer and that what might emerge from further proceedings, and when, in the event the Court rejects the settlement as not in the public interest is indeterminate. It is also the case that several plaintiff States have not agreed to the instant settlement, though they could yet do so, suggesting that any final resolution with respect to their continuing action would need to be integrated, or made compatible, with this negotiated settlement in the event this settlement is accepted by the Court, if the public interest is not to be undermined by a patchwork of remedies applied to one monopolist by various parties. Moreover, it must also be observed that if this settlement is approved for all the practical reasons noted by the Justice Department, it is also nearly a foregone conclusion that another, more far-reaching governmental antitrust action against Microsoft is practically precluded during the five years duration of this consent decree, even if the consent decree were manifestly not working adequately. In the fast moving field of computers, software, communications, entertainment, and their conjunction—of possibly great value to at least some members of the public—five years is a long time. Lastly, it must be noted that Microsoft is likely to be the landmark case in applying antitrust law and principles to fast moving, high-technology businesses so it is important to get a sound foundation in place for future reference and consideration.

The Court found at trial, and the Court of Appeals affirmed, that Microsoft has a monopoly in its Windows operating system for Intel-compatible personal computers (without any finding that its Windows monopoly is either per se unlawful or unlawfully obtained) and that Microsoft had reinforced and extended its monopoly by a variety of business practices that the instant remedy is intended to rectify. Indeed, the trial Court asserted at some length that computer operating systems may be a natural monopoly in that: (a) the customer generally is buying the computer for the functionality provided by their chosen application programs, (b) OEMS have an over-riding need to sell a machine that works with their hardware and the unknown customer's application programs, (c) software publishers find it easier and more economical to write for only one operating system rather than for several platforms, and (d) most customers want the operating system that works with the most readily available standard software so as to be protected with respect to future needs not fully foreseeable now.

The Court's Findings of Fact noted that while most consumers might have no objection to a ''free'' internet browser bolted into their Windows operating system, many business customers might prefer not to make it easy for their employees to browse the Internet if their duties do not require it. More generally, there may be a broader divergence of what features, capabilities, and level of ''pre-integration'' is wanted and valued by household consumers and by business (office) customers for personal computers, and possibly by other significant identifiable market segments for personal computers. Whether or not the new features may be in some sense ''free'' of extra charge, they manifestly take up more memory, disk space, and other computer resources, none of which are free, and may be more prone to ''bugs'', security holes, and incompatibilities

unrelated to the features a particular user actually wants, needs, values, and in purchasing a personal computer system.

Much of the trial was taken up with ''middleware'', in particular internet browsers and the Java programming language, as both were seen as actually—or at least potentially—offering a new standard set of applications programming interfaces (''hooks'') for other, unrelated application programs of possibly less market penetration potential, while the ''middleware'' itself is more susceptible of being made compatible with non-Windows operating systems (or even native code interfaces) on the machine hardware side. Others can comment more perceptively on how effectively the settlement addresses that problem through its proposed Technical Committee. Though not as thoroughly addressed at trial, Microsoft appears to have extended its Windows monopoly into the large business applications software market (e.g., word processing, spread-sheets, small databases) through the same kinds of business practices as were found unlawful with respect to ''middleware.'' That is, when word processing, spreadsheets, and databases were observed to be applications that were inducing businesses (including government, non-profit, etc., ''office'' environments) to buy computers to put on nearly every employee's desk, Microsoft first tried to program such applications themselves, then if unsuccessful, buy up a third-rate contender in the field, threaten the first-rate contender that if they didn't sell out Microsoft would not make new API ''hook'' information available to them on a competitively timely basis, and apparently design special, undisclosed ''hooks'' into Windows that would make Microsoft's own applications software run better, faster, and/or more reliably than competitors'' products, such compatibility providing great marketing advantage (and commanding higher market prices) over rival applications program publishers whose products might be functional superior to Microsoft's offerings in consumers'' perceptions. Microsoft thereby eventually established a monopoly for these widely used, and lucrative, ''business'' application programs. Whether the Technical Committee approach proposed works for ''middleware'', where there are likely to be only a few, very sophisticated ''middleware'' developers, it is likely to be much less successful in providing relief to general software and applications developers and publishers, who are less likely to have the depth of programming expertise of a middleware developer, or to be able to make a good case for requesting new API ''hooks'' of Microsoft's Windows that might be helpful to their new application, yet that might have the potential to become the new ''next big thing.'' (That adaptability for new or special needs is one of the great virtues of open-source operating systems like Linux as one can add new API hooks as needed and push them into the operating system when the application program loads. Microsoft, of course, is unalterably opposed to open-source software as an expropriation of their intellectual property. While that may be their legitimately chosen business strategy, it leaves them open to antitrust charges if they exercise monopoly power in pursuing such a strategy.)

In summary, the Court should carefully consider whether the negotiated settlement decree will fully and reasonably protect the public from stifling and channeling of innovation in personal computers, aside from its direct effects on competitive private parties. In particular, the Court should inquire carefully into whether the Technical Committee approach underlying the proposed consent decree, particularly with respect to general applications developers/publishers as distinguished from ''middleware'' developers is sufficient to protect the public interest in this fast moving field.

Dear Ms. Hesse,

Pursuant to the Tunney Act, please accept these comments in support of the proposed settlement in the case of U.S. v. Microsoft. The Mackinac Center for Public Policy is an independent, non-profit research and educational institute dedicated to consumer choice and economic growth. Having closely followed the Microsoft case, we have concluded that consumers have largely benefited from the company's innovative products and services. In particular, the bundling of software applications has greatly enhanced consumer capability and convenience. In the absence of evidence of harm to consumers, it is in the public interest to end this protracted litigation. A settlement of the matter would allow Microsoft to focus its attention once again on producing useful products while also halting the enormous waste of taxpayers'' dollars on punishing private-sector success.

There is no question that Microsoft has proved to be an aggressive competitor. But there is no evidence of either a shortage of software products or rising prices. Indeed, the software market has grown tremendously in recent years while product prices have fallen dramatically. It thus appears that this case was largely provoked by rivals intent on gaining a competitive advantage through government force. The unjustified nature of the antitrust complaint does not warrant further punishment.

Thank you for the opportunity for comment.

A FINAL JUDGMENT MUST CORRECT THE VIOLATION OF THE LAW

THE MICROSOFT-DOJ PROPOSED FINAL JUDGMENT IS NOT IN THE PUBLIC INTEREST

We find the Microsoft-Department of Justice final judgment proposal to be fundamentally flawed. It is as an entirely inadequate remedy to the sustained, egregious, illegal conduct engaged in by Microsoft to thwart competition in the software industry and protect and enhance its own monopolies. Because it fails to protect consumers, it fails to serve the public interest. It should be rejected by the District Court.

FEDERAL LAW REQUIRES PUBLIC COMMENT. THE COURT SHOULD REVIEW ALL COMMENTS

Federal antitrust law (Tunney Act, 15 U.S.C. § 16) requires the Department of Justice to ''receive and consider'' comments related to the proposed Microsoft-DOJ resolution currently under review by Judge Colleen Kollar-Kotelly of the U.S. District Court for the District of Columbia. Judge Kollar-Kotelly has ordered the Justice Department to provide to her by February 27 its response to comments received. The Tunney Act requires Judge Kollar-Kotelly, in turn, to determine whether the Microsoft-DOJ proposal is in the ''public interest'' To make that determination, she may —to our mind must— consider the competitive impact of the proposal, including:

* termination of alleged violations and prevention of future monopolization,

* provisions for enforcement and modification,

* duration or relief sought,

* anticipated effects of alternative remedies actually considered, and

* any other considerations bearing upon the adequacy of such judgment.

Under the Tunney Act, Judge Kollar-Kotelly is also given the option of reviewing the original comments provided to the Department of Justice, rather than just the DOJ's response to them. We believe that Judge Kollar-Kotelly should endeavor to read all comments submitted in this highly contentious and landmark case. We believe that the Department of Justice is institutionally disposed to give inadequate consideration to comments such as these critical to a resolution that it, along with Microsoft, has proposed.

Our comments demonstrate that determining whether the DO J-Microsoft proposal is in the public interest should be a fairly straight forward exercise. The proposal fails to terminate the antitrust violations of which Microsoft has been found guilty (at trial and on appeal). Its enforcement provisions are weak at best. It restricts Microsoft behavior for a much-too-short period of time. Myriad other problems, discussed below as well as in detailed analysis attached to these comments prepared by the Consumer Federation of America and Consumers, encumber and eviscerate an otherwise vague and loophole-fiddled settlement proposal. Finally, a strong, workable alternative remedy, advanced by the state attorneys general who continue to aggressively pursue the case, already has been submitted to the Court for review. Unlike the Microsoft-DOJ proposal, that alternative would protect consumers and the public interest. With such numerous and obvious shortcomings, the District Court should reject the Microsoft-DOJ proposal in short order.

THE PUBLIC INTEREST TEST REQUIRES THAT FINAL JUDGMENT PROTECTS CONSUMERS

We insist on such an outcome on behalf of our constituencies, who are America's average consumers. Our groups have worked on basic consumer pocketbook issues across the nation for decades, and our membership numbers in the tens of millions. We believe that the public interest in this case is properly understood to include the harms that average consumers have experienced due to Microsoft's illegally anti-competitive activities. Individual consumers ultimately paid the price of Microsoft's past abuses of monopoly power, directly and indirectly, and they will pay for a continuation of the Microsoft monopoly. Any remedy endorsed by the Court needs to benefit consumers by restoring competition in those segments of the software industry that Microsoft has monopolized or is in danger of monopolizing. We acknowledge that, considering Microsoft's long-standing unfair business practices and deeply entrenched monopoly, such a task will not be easy. It is because of these same factors, however, that it is necessary.

THE SOFTWARE INDUSTRY IS RIPE FOR COMPETITION AND DOES NOT LEND ITSELF NATURALLY TO MONOPOLY

We begin by rejecting claims that the software industry is prone to natural monopoly.

Were that the case, Microsoft would not have had to engage in its systematically anti-competitive practices to maintain and extend its monopolies. The trial record and reams of trade press accounts bear testimony to the unnatural acts embraced by Microsoft to create and protect its monopoly power over the years. These include leveraging the Windows operating system, slowing or stopping its own deployment cycle, denying access to application interfaces, threatening to deny access to its operating system, threatening to stop developing software for competing platforms, bloating the operating system with unnecessary functionality, hiding prices in whole computer configurations, compelling computer manufacturers (original equipment manufacturers, or OEMs) to use its browser, reaching pacts with other companies to deny the use of alternative browsers, and on and on. Though the Department of Justice at least appears to agree in principle that monopoly in the software industry is neither natural nor desirable, in practice its proposal—prepared jointly with Microsoft allows for the continuation, if not exacerbation, of Microsoft market power.

In our view, the software industry is ripe for competition. Competition would yield an explosion of innovation and consumer convenience. Consumers care about applications, not about operating systems. Furthermore, most consumers are inclined to invest time and money in functional applications that they reasonably feel will endure, be supported, and work compatibility with other programs and their hardware. Independent vendors are interested, therefore, in creating products that match consumer expectations.

With the entrenched Microsoft monopoly, independent developers confront an applications barrier—Microsoft has such a significant lock on the computer platform and on applications used, that many developers are dissuaded from producing new products. Should the Microsoft monopoly be broken down, developers would look to create compatible, consumer-friendly products. In fact, that is what Netscape and Sun attempted to do with Navigator and Java—create software, known as ''middleware'' because they insert themselves between the operating system and applications running on top of the middleware. Because Netscape/Java was compatible across systems, it threatened Microsoft. Microsoft's reaction was to launch an illegal campaign to crush Netscape and undermine Java.

Because Microsoft illegally undertook to prevent competition, consumers were left with products that did not honestly earn their place in the marketplace. Microsoft products have not been disciplined for price and quality by competitors because of the company's anti-competitive practices. Remove the monopoly, and an avalanche of competition —aiming towards operable standards, innovative products, and better pricing— will be unleashed. Such developments would provide undeniable benefit to consumers. The software market will support, and therefore the public interest demands, actual competition within and between markets.

THE CHALLENGE BEFORE THE COURT

MICROSOFT'S DEEP-ROOTED ANTI-COMPETITIVE BUSINESS MODEL

Detailing Microsoft's anti-competitive business model is a nearly interminable task, though it was accomplished well by the District Court in its Findings of Fact, virtually all of which were upheld on appeal. The analysis attached by Consumer Federation of America and Consumers Union describe at length the depths to which Microsoft would sink to prop up its operating system monopoly, and to conquer other markets, such as for the browser and business productivity suites. The list of corporate victims is long, and includes not just Netscape and Sun, but also IBM, Intel, and Apple. Figure 1, below, summarizes in simple terms the barriers to competition that Microsoft has repeatedly erected. We reiterate that the Department of Justice and the Court should not lose sight of the fact that such practices ultimately negatively impact individual consumers, in the forms of higher prices, reduced choice, and inferior products and service.

CONSUMERS ARE HARMED BY MICROSOFT'S ABUSE OF MARKET POWER

Microsoft's widespread, unlawful practices, which the Microsoft-DOJ proposal fails to correct, harm consumers both qualitatively and monetarily. The harms are sufficiently great to require that the Court avoid a ''quick fix.'' It is much more important to devote a reasonable amount of time to get the final judgment right and protect consumers.

Microsoft's anticompetitive practices deny consumers choice. Microsoft strictly forces computer manufacturers to buy one bundle with all of its programs preloaded and biases the screen location, start sequences and default options. As a result, it becomes substantially difficult to choose non-Microsoft products. Products tailored to meet individual consumer needs (consumer friendly configurations, small bundles) are una vailable and eventually competing products disappear from the market. Further, by foreclosing the primary channels of

distribution with exclusive contracts and other deals, Microsoft forces consumers of non-Microsoft products to acquire them in time-consuming and inconvenient ways.

FIGURE 1: HOW MICROSOFT STOPS COMPETITION AND HARMS CONSUMERS CONSUMER

DENY CUSTOMER CHOICE Force bundles so OEMs won't install competing software Control the boot screen and desktop Restrict icons and add/remove buttons

CLOSE DOWN DISTRIBUTION<5>Exclusionary deals with Internet Access Providers. Prevent computer manufacturers from preinstalling non-Microsoft products Commingling code to make it hard to preinstall non-Microsoft products

UNDERMINE FUNCTIONALITY DEVELOPMENT AND PRODUCT SUPPORT Restrict functionality Prevent developers from focusing on non-Microsoft products Deceive developers into supporting proprietary products Undermine compatibility Prevent support for competing products

SOFTWARE DEVELOPER

In addition, Microsoft's practices impair quality and innovation. Because of Microsoft's leveraging of the operating system, superior products are delayed or driven from the marketplace. The District Court noted at least six instances in which Microsoft sought to delay the development of competing products. It noted as well several instances in which it delayed the delivery of its own products to accomplish an anti-competitive purpose. Resources are denied to and investment is chilled in competing products, slowing advances in technology and rendering some libraries of content obsolete. In addition, in several instances the Court found that Microsoft had undermined the ability of software applications or middleware to function properly with the Windows operating system. Thus, Microsoft has been quite willing to undermine the quality of its own and of competing products to preserve its market dominance.

In addition to qualitative harm, consumers have suffered monetary harm. The historical behavior of prices makes it possible to draw a direct line between competition and lower prices. Eliminating competition, as Microsoft has, results in higher prices. The fact that the excess price results from a failure to pass cost reductions through to consumers does not change the fact that consumers are overcharged. Nor does the fact that consumers do not pay for the software directly. In fact, there was a substantial increase in the price of Microsoft products in the 1990s that consumers paid in the price of the PCs they purchased. Of course, consumers do pay directly in the case of upgrades and for applications.

The centerpiece of Microsoft's pricing strategy has been to increase operating system prices while other components of the delivered PC bundle have fallen. Evidence at trial gave explicit estimates of the price of operating systems. The average preinstalled price is given as $19 in 1990 and over $49 in 1996. During that time span the average Microsoft revenue for preinstalled software rose from $25 to $62. Microsoft recognizes that it has been the beneficiary of volume growth created by the falling price of the PC, which masks its increasing prices. Thus, one of the key elements in Microsoft's business model is to bury its products in bundles. This hides the price from the public and allows Microsoft to hide behind the declining price of the total package.

The Consumer Federation of America has estimated that in the five years between the start of the anticompetitive attack on the browser in 1995 and the District Court finding of liability, Microsoft overcharged consumers by about $20 billion. The economic analysis of other experts suggests overcharges of as much as $30 billion.

In addition to direct monetary costs, indirect monetary costs of the Microsoft monopoly also present themselves. Though difficult to calculate, they are no less significant, and demand to be considered. Consumers, individual and corporate, have undoubtedly lost hundreds of millions of dollars due to such issues as training, rapid upgrade cycles, software crashes, bloated bundles, debugging, service, and hardware upgrades.

WINDOWS XP/.NET, LEFT UNCHECKED, ENHANCES AND EXPANDS THE MICROSOFT MONOPOLY

Microsoft's brazen disrespect for the antitrust laws is nowhere more readily apparent than in the design of its newest bundle of products (''Windows XP,'' and the ''.NET'' initiative, hereafter referred to as ''Windows XP/.NET'). The product is so blatantly at odds with the Court's ruling Microsoft must have designed it on the mistaken assumption that Microsoft would prevail in its appeal.

The extreme reliance of ''Windows XP/.NET'' on a huge bundle of entire applications and the continued reliance on contractual and technological bundling fly in the face of the Court's cautionary words. Windows XP and the .NET initiative are a bundle of services bolted together by technological links (code embedded in the operating system), contractual requirements, and marketing leverage.

The software, applications, and services that Microsoft has bundled cover all of the functionalities that are converging on the Internet, including communications, commerce, applications, and service. Today these Internet activities are vigorously competitive, just as the browser was before Microsoft launched its victorious attack against Netscape. In other words, the anticompetitive and illegal business practices Microsoft used to win the browser war are being extended to virtually every other application that consumers use. The bundle is built on commingled code, proprietary languages, and exclusive functionalities that are promoted by restrictive licenses, refusal to support competing applications, embedded links, and deceptive messages. A strong remedy, unlike the weak one proposed by Microsoft and the Justice Department, is needed before Microsoft becomes the monopolist of virtually all computer and Internet applications.

THE PROPOSED FINAL JUDGMENT FAILS TO PROTECT INDEPENDENT SOFTWARE DEVELOPERS, COMPUTER MANUFACTURERS, AND CONSUMERS

The history of the case and our analysis of the software industry show that in order for new software to have a fair chance to compete, the remedy must:

ù create an environment in which independent software vendors and alternative platform developers are free to develop products that compete with Windows and with other Microsoft products,

* free computer manufacturers to install these products without fear of retaliation, and

* enable consumers to choose among them with equal ease as with Microsoft products.

The Microsoft-Department of Justice settlement is an abysmal failure at all three levels. Under the proposed Microsoft-Department of Justice settlement, Microsoft will be undeterred from continuing its anticompetitive business practices.

INDEPENDENT SOFTWARE VENDORS GET LITTLE RELIEF UNDER THE MICROSOFT-DOJ PROPOSAL

Independent software vendors and competing platform developers will get little relief from Microsoft's continual practice of hiding and manipulating interfaces. Microsoft has the unreviewable ability under the proposed settlement to define Windows itself. It therefore controls whether and how independent software developers will be able to write programs that run on top of the operating system. The definitions of software products and functionalities and the decisions about how to configure applications programming interfaces (APIs) are left in the hands of Microsoft to an extreme extent. As a consequence, the company will be encouraged to embed critical technical specifications deeply into the operating system and thereby prevent independent software developers from seeing them. To the extent that Microsoft would actually be required to reveal anything, it would be so late in the product development cycle that independent software developers would never be able to catch up to Microsoft's favored developers.

Furthermore, the Court of Appeals recognized that the Microsoft monopoly is protected by a large barrier to entry, as many crucial applications are available only for Windows. The proposed settlement does nothing to eliminate this ''applications barrier to entry,'' such as by requiring the porting of Microsoft Office to other PC platforms. Rather than restore competition, the Microsoft-DOJ proposal all but legalizes Microsoft's previous anticompetitive strategy and institutionalizes the Windows monopoly.

COMPUTER MANUFACTURERS HAVE LITTLE ABILITY OR INCENTIVE TO INSTALL NON-MICROSOFT PRODUCTS UNDER THE PROPOSED FINAL JUDGMENT

The Microsoft-DOJ proposal does not shield computer manufacturers from Microsoft retaliation. The restriction on retaliation against computer manufacturers leaves so many loopholes that any OEM who actually offended Microsoft's wishes would be committing commercial suicide. Microsoft is given free reign to favor some, at the expense of others, through incentives and joint ventures. It is free to withhold access to its other two monopolies (the browser and

Microsoft Office) as an inducement to favor the applications that Microsoft is targeting at new markets, inviting a repeat of the fiasco in the browser wars. Retaliation in any way, shape, fit, form, or fashion should be illegal. Any adequate remedy, unlike the Microsoft-DOJ proposal, must include a prohibition on retaliation that specifically identifies price and non- price discrimination as well as applying to all monopoly products.

CONSUMER SOVEREIGNTY IS NOT RESTORED BY THE SETTLEMENT.

Because the proposed settlement requires no removal of applications, only the hiding of icons, Microsoft preserves the ability to neuter consumer choice. The boot screen and desktop remain entirely tilted against competition. Microsoft retains the ability to be the pervasive default option and is allowed to harass consumers who switch to non-Microsoft applications. Furthermore, it still gets to sweep third party applications off the desktop, forcing consumers to choose them over and over.

GIVEN MICROSOFT'S PAST BEHAVIOR, ENFORCEMENT MUST BE SWIFT WITH SUBSTANTIAL SANCTIONS FOR NON-COMPLIANCE, BUT THE PFJ PROVIDES NO SUCH MECHANISMS

After the District Court identifies remedies that can address these problems, it must enforce them swiftly and aggressively. Microsoft has shown —through a decade of investigations, consent decrees and litigation— that it will not easily be deterred from defending and extending its monopoly. Microsoft behaves as though it believes it has the right to do anything to eradicate competition. Every one of the illegal acts that led to the District Court findings of liability, unanimously upheld on appeal, took place after Microsoft signed its last consent decree.

With three monopolies to use against its potential competitors (the Windows operating system, the Internet Explorer browser, and Office in desktop applications), enforcement must be swift and sure, or competition will never have a chance to take root. The proposed settlement offers virtually nothing in this regard. The technical committee set up to (maybe) hear complaints can be easily tied up in knots by Microsoft because of the vague language that creates it. Because of the delay in its implementation, the crucial element of API disclosure will be in place for only four years. If Microsoft violates the settlement, nothing happens to the company, except that it must ''endure'' the annoyance of this weak settlement for an additional two years. Moreover, Virtually every specific measure of the proposed settlement is either fiddled with ambiguities or put under the sole discretion of Microsoft. In other words, Microsoft defines its own sanctions. The Department of Justice and the Court must not forget that independent software vendors were the targets of Microsoft's campaign and that the competitive process in the software market was its victim. When we review the question of whether the proposed settlement will lift the yoke of anticompetitive practices from this market, we find that it will not (see Figure 2). Under the proposed settlement, Microsoft preserves immense market power and discretion. The settlement cannot work to restore competition because independent software developers will not be freed to produce software products in a competitively neutral environment. As a result, consumers will continue to suffer at the hands of the Microsoft monopolies. The proposed settlement does not serve the public interest and must be rejected.

FIGURE 2: SOFTWARE COMPETITION WILL NOT BE RESTORED BECAUSE THE SETTLEMENT DOES NOT CREATE A LEVEL PLAYING FIELD FOR INDEPENDENT SOFTWARE VENDORS

DO I HAVE A FAIR CHANCE TO HAVE CONSUMERS USE MY PRODUCT?

Consumers have to choose my software twice to get my icon on the screen.

Consumers never have to choose Microsoft's; it's still the default.

Microsoft can sweep my icon off the system every 14 days.

WILL OEMs PUT MY PRODUCT ON THE PC?

Microsoft's code is guaranteed to be in every PC, only its icons are removed.

My code gets into only those PCs that I convince OEMs to install.

Microsoft can still give OEMs ''considerations'' to promote its product.

Microsoft can engage in Joint Ventures and prevent OEMs from using mine.

Microsoft can leverage its monopoly applications to keep my products out.

WHAT APIs DO I GET TO SEE?

Only APIs for products Microsoft has already developed.

Only APIs that Microsoft has decided not to move into the operating system.

Only APIs that Microsoft decides do not compromise its piracy, virus, licensing, digital rights management, encryption or authentication systems.

WHEN DO I GET TO SEE THE APIs?

Very late in the process, after Microsoft has had a huge head start in developing its products.

John Ashcroft, Attorney General
Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

Based on my background and experience in the technology industry, I think that the Microsoft antitrust case should be settled on the terms that are on the table now. Obviously, the terms could be tinkered with endlessly. Still, after three months of negotiate with the mediator appointed by the new federal judge on the case, the parties should have had ample opportunity to make the agreement as good as they could get it. The terms of the agreement will make it easier to work with Microsoft, which has been a stickler for holding to its legal fight from copyright and patent infringement, to driving a hard bargain in contract negotiations. For example, Microsoft has been insisting on exclusive marketing agreements, under which a personal computer, PC, building company must put Microsoft's Windows operating system on all of its computers or not receive the legal fight to use Windows at all. The other terms reflect the same opening up of Microsoft to enable its partners, rival and competitors an even greater participation in its overwhelming, and hard earned, success. This settlement will be good from computing, and good for America.

Thank you for your leadership on this issue.

Sincerely,
Michael Shaw

Subject: Microsoft Settlement

Greetings,

As an executive,engineer and inventor (20+ patents) I would like to provide the following comments as the final decisions are made concerning the Microsoft Settlement.

I have been a user of Microsoft Products since buying my first personal computer in about 1983. I have also been responsible for the coordination of information technology within my employer's organization. In submitting these comments, I am not claiming to represent the official position of my current employer, but only my personal views.

The standardization in file formats and software interfaces over the years has greatly improved the ability of people to communicate with each other both within organizations and between organizations. Much of this standardization has come because people selected Microsoft's Products instead of those of other vendors. Taken as a whole, Microsoft's solutions have been superior to those offered by other vendors. The network effect of many users using a common tool has driven the level of deployment of Microsoft's products.

Do not go beyond the current settlement and impair the ability of Microsoft's engineers and programmers to create new and improve their existing software. It should not be the the role of Government to be in the middle of a company's design efforts.

The current settlement takes sufficient steps to correct the commercial missteps which were made by the Microsoft team.

Sincerely,
Brian F. Greenwood

US Department Of Justice,

I'm writing to offer support for Microsoft's position in the current Antitrust scenario against them. I feel that the government should NOT take adverse action against Microsoft. The marketplace will do that if the company deserves it. Other parties against Microsoft in the business realm stand to gain financially against Microsoft if the software giant gets penalized. They would therefore offer tons of reasons why Microsoft should be penalized—of course.

Please leave business matters of this sort to the marketplace and consumers instead of lawyers eager for their fees and jealous business rivals holding daggers behind them.

Thank you.

On the Proposed Final Judgment in United States v. Microsoft

Contents

Introduction

As a software engineer with 20 years'' experience developing software for Unix, Windows, Macintosh, and Linux, I'd like to comment on the Proposed Final Judgment in United States v. Microsoft.

According to the Court of Appeals ruling, ''a remedies decree in an antitrust case must seek to 'unfetter a market from anticompetitive conduct', to terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future'' (section V.D., p. 99).

Attorney General John Ashcroft seems to agree; he called the proposed settlement ''strong and historic'', said that it would end ''Microsoft's unlawful conduct,'' and said ''With the proposed settlement being announced today, the Department of Justice has fully and completely addressed the anti-competitive conduct outlined by the Court of Appeals against Microsoft.''

Yet the Proposed Final Judgment allows many exclusionary practices to continue, and does not take any direct measures to reduce the Applications Barrier to Entry faced by new entrants to the market.

The Court of Appeals affirmed that Microsoft has a monopoly on Intel-compatible PC operating systems, and that the company's market position is protected by a substantial barrier to entry (p. 15). Furthermore, the Court of Appeals affirmed that Microsoft is liable under Sherman Act .7 2 for illegally maintaining its monopoly by imposing licensing restrictions on OEMs, IAPs (Internet Access Providers), ISVs (Independent Software Vendors), and Apple Computer, by requiring ISVs to switch to Microsoft's JVM (Java Virtual Machine), by deceiving Java developers, and by forcing Intel to drop support for cross-platform Java tools.

The fruits of Microsoft's statutory violation include a strengthened Applications Barrier to Entry and weakened competition in the Intel-compatible operating system market; thus the Final Judgment must find a direct way of reducing the Applications Barrier to Entry, and of increasing such competition.

In the following sections I outline the basic intent of the proposed final judgment, point out areas where the intent and the implementation appear to fall short, and propose amendments to the Proposed Final Judgment (or PFJ) to address these concerns.

Please note that this document is still evolving. Feedback is welcome; to comment on this document, please join the mailing list at groups.yahoo.com/group/ms-remedy, or email me directly at dank-ms@kegel.com.

Understanding the Proposed Final Judgment

In crafting the Final Judgment, the judge will face the following questions:

* How should terms like ''API'', ''Middleware'', and ''Windows OS'' be defined?

* How should the Final Judgment erode the Applications Barrier to Entry?

* How should the Final Judgment be enforced?

* What information needs to be released to ISVs to encourage competition, and under what terms?

* Which practices towards OEMs should be prohibited?

* Which practices towards ISVs should be prohibited?

* Which practices towards large users should be prohibited?

* Which practices towards end users should be prohibited?

Here is a very rough summary which paraphrases provisions III.A through III.J and VI. of the Proposed Final Judgment to give some idea of how the PFJ proposes to answer those questions:

PFJ Section III: Prohibited Conduct

A. Microsoft will not retaliate against OEMs who support competitors to Windows, Internet Explorer (IE), Microsoft Java (MJ), Windows Media Player (WMP), Windows Messenger (WM), or Outlook Express (OE).

B. Microsoft will publish the wholesale prices it charges the top 20 OEMs (Original Equipment Manufacturers) for Windows.

C. Microsoft will allow OEMs to customize the Windows menus, desktop, and boot sequence, and will allow the use of non-Microsoft bootloaders.

D. Microsoft will publish on MSDN (the Microsoft Developer Network) the APIs used by IE, MJ, WMP, WM, and OE, so that competing web browsers, media players, and

email clients can plug in properly to Windows.

E. Microsoft will license on reasonable terms the network protocols needed for non-Microsoft applications or operating systems to connect to Windows servers.

F. Microsoft will not force business partners to refrain from supporting competitors to Windows, IE, M J, WMP, WM, or OE.

G. (Roughly same as F above.)

H. Microsoft will let users and OEMs remove icons for IE, MJ, WMP, WM, and OE, and let them designate competing products to be used instead.

I. Microsoft will license on reasonable terms any intellectual property rights needed for other companies to take advantage of the terms of this settlement.

J. This agreement lets Microsoft keep secret anything having to do with security or copy protection.

PFJ Section VI: Definitions

A. ''API'' (Application Programming Interface) is defined as only the interfaces between Microsoft Middleware and Microsoft Windows, excluding Windows APIs used by other application programs.

K. ''Microsoft Middleware Product'' is defined as Internet Explorer (IE), Microsoft lava (MJ), Windows Media Player (WMP), Windows Messenger (WM), and Outlook Express (OE).

U. ''Windows Operating System Product'' is defined as Windows 2000 Professional, Windows XP Home, and Windows XP Professional.

The agreement can be summed up in one breath as follows: Microsoft agrees to compete somewhat less vigorously, and to let competitors interoperate with Windows in exchange for royalty payments.

Considering all of the above, one should read the detailed terms of the Proposed Final Judgment, and ask one final question:

* Is the Proposed Final Judgment in the public interest?

In the sections below, I'll look in more detail at how the PFJ deals with the above questions. How should terms like ''API'', ''Middleware, and ''Windows OS'' be defined?

The definitions of various terms in Part VI of the PFJ differ from the definitions in the Findings of Fact and in common usage, apparently to Microsoft's benefit. Here are some examples:

Definition A: ''API''

The Findings of Fact (? 2) define ''API'' to mean the interfaces between application programs and the operating system. However, the PFJ's Definition A defines it to mean only the interfaces between Microsoft Middleware and Microsoft Windows, excluding Windows APIs used by other application programs. For instance, the PFJ's definition of API might omit important APIs such as the Microsoft Installer APIs which are used by installer programs to install software on Windows.

Definition J: ''Microsoft Middleware''

The Findings of Fact (? 28) define ''middleware'' to mean application software that itself presents a set of APIs which allow users to write new applications without reference to the underlying operating system. Definition J defines it in a much more restrictive way, and allows Microsoft to exclude any software from being covered by the definition in two ways:

1. By changing product version numbers. For example, if the next version of Internet Explorer were named ''7.0.0'' instead of ''7'' or ''7.0'', it would not be deemed Microsoft Middleware by the PFJ.

2. By changing how Microsoft distributes Windows or its middleware. For example, if Microsoft introduced a version of Windows which was only available via the Windows Update service, then nothing in that version of Windows would be considered Microsoft Middleware, regardless of whether Microsoft added it initially or in a later update. This is analogous to the loophole in the 1995 consent decree that allowed Microsoft to bundle its browser by integrating it into the operating system.

Definition K: ''Microsoft Middleware Product''

Definition K defines ''Microsoft Middleware Product'' to mean essentially Internet Explorer (IE), Microsoft Java (MJ), Windows Media Player (WMP), Windows Messenger (WM), and Outlook Express (OE).

The inclusion of Microsoft Java and not Microsoft. NET is questionable; Microsoft has essentially designated Microsoft. NET and C# as the successors to Java, so on that basis one would expect Microsoft. NET to be included in the definition.

The inclusion of Outlook Express and not Outlook is questionable, as Outlook (different and more powerful than Outlook Express) is a more important product in business, and fits the definition of middleware better than Outlook Express.

The exclusion of Microsoft Office is questionable, as many components of Microsoft Office fit the Finding of Fact's definition of middleware. For instance, there is an active market in software written to run on top of Microsoft Outlook and Microsoft Word, and many applications are developed for Microsoft Access by people who have no knowledge of Windows APIs.

Definition U: ''Windows Operating System Product'' Microsoft's monopoly is on Intel-compatible operating systems. Yet the PFJ in definition U defines a ''Windows Operating System Product'' to mean only Windows 2000 Professional, Windows XP Home, Windows XP Professional, and their successors. This purposely excludes the Intel-compatible operating systems Windows XP Tablet PC Edition and Windows CE; many applications written to the Win32 APIs can run unchanged on Windows 2000, Windows XP Tablet PC Edition, and Windows CE, and with minor recompilation, can also be run on Pocket PC. Microsoft even proclaims at www.microsoft.com/windowsxp/tabletpc/tabletpcqanda.asp:

''The Tablet PC is the next-generation mobile business PC, and it will be available from leading computer makers in the second half of 2002. The Tablet PC runs the Microsoft Windows XP Tablet PC Edition and features the capabilities of current business laptops, including attached or detachable keyboards and the ability to run Windows-based applications.''

and

Pocket PC: Powered by Windows Microsoft is clearly pushing Windows XP Tablet PC Edition and Pocket PC in places (e.g. portable computers used by businessmen) currently served by Windows XP Home Edition, and thus appears to be trying to evade the Final Judgment's provisions. This is but one example of how Microsoft can evade the provisions of the Final Judgment by shifting its efforts away from the Operating Systems listed in Definition U and towards Windows XP Tablet Edition, Windows CE, Pocket PC, X-Box, or some other Microsoft Operating System that can run Windows applications.

How should the Final Judgment erode the Applications Barrier to Entry?

The PFJ tries to erode the Applications Barrier to Entry in two ways:

1. By forbidding retaliation against OEMs, ISVs, and IHVs who support or develop alternatives to Windows.

2. By taking various measures to ensure that Windows allows the use of non-Microsoft middleware. A third option not provided by the PFJ would be to make sure that Microsoft raises no artificial barriers against non-Microsoft operating systems which implement the APIs needed to run application programs written for Windows. The Findings of Fact (?52) considered the possibility that competing operating systems could implement the Windows APIs and thereby directly run software written for Windows as a way of circumventing the Applications Barrier to Entry. This is in fact the route being taken by the Linux operating system, which includes middleware (named WINE) that can run many Windows programs.

By not providing some aid for ISVs engaged in making Windows-compatible operating systems, the PFJ is missing a key opportunity to encourage competition in the Intel-compatible operating system market. Worse yet, the PFJ itself, in sections III.D. and III.E., restricts information released by those sections to be used ''for the sole purpose of interoperating with a Windows Operating System Product''. This prohibits ISVs from using the information for the purpose of writing operating systems that interoperate with Windows programs. How should the Final Judgment be enforced?

The PFJ as currently written appears to lack an effective enforcement mechanism. It does provide for the creation of a Technical Committee with investigative powers, but appears to leave all actual enforcement to the legal system.

What information needs to be released to ISVs to encourage competition, and under what terms? The PFJ provides for increased disclosure of technical information to ISVs, but these provisions are flawed in several ways:

1. The PFJ fails to require advance notice of technical requirements

Section III.H.3. of the PFJ requires vendors of competing middleware to meet ''reasonable technical requirements'' seven months before new releases of Windows, yet it does not require Microsoft to disclose those requirements in advance. This allows Microsoft to bypass all competing middleware simply by changing the requirements shortly before the deadline, and not informing ISVs.

2. API documentation is released too late to help ISVs Section III.D. of the PFJ requires

Microsoft to release via MSDN or similar means the documentation for the APIs used by Microsoft Middleware Products to interoperate with Windows; release would be required at the time of the final beta test of the covered middleware, and whenever a new version of Windows is sent to 150,000 beta testers. But this information would almost certainly not be released in time for competing middleware vendors to adapt their products to meet the requirements of section III.H.3, which states that competing middleware can be locked out if it fails to meet unspecified technical requirements seven months before the final beta test of a new version of Windows.

3. Many important APIs would remain undocumented

The PFJ's overly narrow definitions of ''Microsoft Middleware Product'' and ''API'' means that Section III.D.'s requirement to release information about Windows interfaces would not cover many important interfaces.

4. Unreasonable Restrictions are Placed on the Use of the Released Documentation

ISVs writing competing operating systems as outlined in Findings of Fact (?52) sometimes have difficulty understanding various undocumented Windows APIs. The information released under section III.D. of the PFJ would aid those ISVs—except that the PFJ disallows this use of the information. Worse yet, to avoid running afoul of the PFJ, ISVs might need to divide up their engineers into two groups: those who refer to MSDN and work on Windows-only applications; and those who cannot refer to MSDN because they work on applications which also run on non-Microsoft operating systems. This would constitute retaliation against ISVs who support competing operating systems.

5. File Formats Remain Undocumented

No part of the PFJ obligates Microsoft to release any information about file formats, even though undocumented Microsoft file formats form part of the Applications Barrier to Entry (see ''Findings of Fact'' ?20 and ? 39).

6. Patents covering the Windows APIs remain undisclosed

Section III.I of the PFJ requires Microsoft to offer to license certain intellectual property rights, but it does nothing to require Microsoft to clearly announce which of its many software patents protect the Windows APIs (cf. current practice at the World Wide Web Consortium, http://www.w3.org/TR/patent-practice). This leaves Windows-compatible operating systems in an uncertain state: are they, or are they not infringing on Microsoft software patents? This can scare away potential users, as illustrated by this report from Codeweavers, Inc.:

When selecting a method of porting a major application to Linux, one prospect of mine was comparing Wine [a competing implementation of some of the Windows APIs] and a toolkit called 'MainWin'. MainWin is made by Mainsoft, and Mainsoft licenses its software from Microsoft. However, this customer elected to go with the Mainsoft option instead. I was told that one of the key decision making factors was that Mainsoft representatives had stated that Microsoft had certain critical patents that Wine was violating. My customer could not risk crossing Microsoft, and declined to use Wine. I didn't even have a chance to determine which patents were supposedly violated; nor to disprove the validity of this claim.

The PFJ, by allowing this unclear legal situation to continue, is inhibiting the market acceptance of competing operating systems.

Which practices towards OEMs should be prohibited?

The PFJ prohibits certain behaviors by Microsoft towards OEMs, but curiously allows the following exclusionary practices:

Section III.A.2. allows Microsoft to retaliate against any OEM that ships Personal Computers containing a competing Operating System but no Microsoft operating system.

Section III.B. requires Microsoft to license Windows on uniform terms and at published prices to the top 20 OEMs, but says nothing about smaller OEMs. This leaves Microsoft free to retaliate against smaller OEMs, including important regional 'white box'' OEMs, if they offer competing products.

Section III.B. also allows Microsoft to offer unspecified Market Development Allowances—in effect, discounts—to OEMs. For instance, Microsoft could offer discounts on Windows to OEMs based on the number of copies of Microsoft Office or Pocket PC systems sold by that OEM. In effect, this allows Microsoft to leverage its monopoly on Intel-compatible operating systems to increase its market share in other areas, such as office software or ARM-compatible operating systems.

By allowing these practices, the PFJ is encouraging Microsoft to extend its monopoly in Intel-compatible operating systems, and to leverage it into new areas.

Which practices towards ISVs should be prohibited?

Sections III.F. and III.G. of the PFJ prohibit certain exclusionary licensing practices by Microsoft towards ISVs.

However, Microsoft uses other exclusionary licensing practices, none of which are mentioned in the PFJ.

Several of Microsoft's products'' licenses prohibit the products'' use with popular non-Microsoft middleware and operating systems. Two examples are given below.

1. Microsoft discriminates against ISVs who ship Open Source or Free Software applications

The Microsoft Windows Media Encoder 7.1 SDK EULA states ... you shall not distribute the REDISTRIBUTABLE COMPONENT in conjunction with any Publicly Available Software. ''Publicly Available Software'' means each of (i) any software that contains, or is derived in any manner (in whole or in part) from, any software that is distributed as free software, open source software (e.g. Linux) or similar licensing or distribution models ... Publicly Available Software includes, without limitation, software licensed or distributed under any of the following licenses or distribution models, or licenses or distribution models similar to any of the following: GNU's General Public License (GPL) or Lesser/Library GPL (LGPL); The Artistic License (e.g., PERL); the Mozilla Public License; the Netscape Public License; the Sun Community Source License (SCSL); ...

Many Windows APIs, including Media Encoder, are shipped by Microsoft as add-on SDKs with associated redistributable components. Applications that wish to use them must include the add-ons, even though they might later become a standard part of Windows.

Microsoft often provides those SDKs under End User License Agreements (EULAs) prohibiting their use with Open Source or Free Software applications. This harms ISVs who choose to distribute their applications under Open Source or Free Software licenses; they must hope that the enduser has a sufficiently up-to-date version of the addon API installed, which is often not the case.

Applications potentially harmed by this kind of EULA include the competing middleware product Netscape 6 and the competing office suite StarOffice; these EULAs thus can cause support problems for, and discourage the use of, competing middleware and office suites.

Additionally, since Open Source or Free Software applications tend to also run on non-Microsoft operating systems, any resulting loss of market share by Open Source or Free Software applications indirectly harms competing operating systems.

2. Microsoft discriminates against ISVs who target Windows-compatible competing Operating Systems The Microsoft Platform SDK, together with Microsoft Visual C++, is the primary toolkit used by ISVs to create Windows-compatible applications. The Microsoft Platform SDK EULA says:

''Distribution Terms. You may reproduce and distribute ... the Redistributable Components... provided that (a) you distribute the Redistributable Components only in conjunction with and as a part of your Application solely for use with a Microsoft Operating System Product...'' This makes it illegal to run many programs built with Visual C++ on Windows-compatible competing operating systems.

By allowing these exclusionary behaviors, the PFJ is contributing to the Applications Barrier to Entry faced by competing operating systems.

Which practices towards large users should be prohibited?

The PFJ places restrictions on how Microsoft licenses its products to OEMs, but not on how it licenses products to large users such as corporations, universities, or state and local governments, collectively referred to as 'enterprises'. Yet enterprise license agreements often resemble the per-processor licenses which were prohibited by the 1994 consent decree in the earlier US v. Microsoft antitrust case, in that a fee is charged for each desktop or portable computer which could run a Microsoft operating system, regardless of whether any Microsoft software is actually installed on the affected computer. These agreements are anticompetitive because they remove any financial incentive for individuals or departments to run non-Microsoft software.

Which practices towards end users should be prohibited?

Microsoft has used both restrictive licenses and intentional incompatibilities to discourage users from running Windows

applications on Windows-compatible competing operating systems. Two examples are given below.

1. Microsoft uses license terms which prohibit the use of Windows-compatible competing operating systems MSNBC (a subsidiary of Microsoft) offers software called NewsAlert. Its EULA states ''MSNBC Interactive grants you the right to install and use copies of the SOFTWARE PRODUCT on your computers running validly licensed copies of the operating system for which the SOFTWARE PRODUCT was designed [e.g., Microsoft Windows(r) 95; Microsoft Windows NT(r), Microsoft Windows 3.x, Macintosh, etc.] .... ''

Only the Windows version appears to be available for download. Users who run competing operating systems (such as Linux) which can run some Windows programs might wish to run the Windows version of NewsAlert, but the EULA prohibits this. MSNBC has a valid interest in prohibiting use of pirated copies of operating systems, but much narrower language could achieve the same protective effect with less anticompetitive impact. For instance, ''MSNBC Interactive grants you the fight to install and use copies of the SOFTWARE PRODUCT on your computers running validly licensed copies of Microsoft Windows or compatible operating system.''

2. Microsoft created intentional incompatibilities in Windows 3.1 to discourage the use of non-Microsoft operating systems

An episode from the 1996 Caldera v. Microsoft antitrust lawsuit illustrates how Microsoft has used technical means anticompetitively.

Microsoft's original operating system was called MS-DOS. Programs used the DOS API to call up the services of the operating system. Digital Research offered a competing operating system, DR–DOS, that also implemented the DOS API, and could run programs written for MS–DOS. Windows 3.1 and earlier were not operating systems per se, but rather middleware that used the DOS API to interoperate with the operating system.

Microsoft was concerned with the competitive threat posed by DR-DOS, and added code to beta copies of Windows 3. I so it would display spurious and misleading error messages when run on DR-DOS. Digital Research's successor company, Caldera, brought a private antitrust suit against Microsoft in 1996. (See the original complaint, and Caldera's consolidated response to Microsoft's motions for partial summary judgment.) The judge in the case ruled that ''Caldera has presented sufficient evidence that the incompatibilities alleged were part of an anticompetitive scheme by Microsoft.''

That case was settled out of court in 1999, and no court has fully explored the alleged conduct. The concern here is that, as competing operating systems emerge which are able to run Windows applications, Microsoft might try to sabotage Windows applications, middleware, and development tools so that they cannot run on non-Microsoft operating systems, just as they did earlier with Windows 3.1.

The PFJ as currently written does nothing to prohibit these kinds of restrictive licenses and intentional incompatibilities, and thus encourages Microsoft to use these techniques to enhance the Applications Barrier to Entry, and harming those consumers who use non-Microsoft operating systems and wish to use Microsoft applications software.

Is the Proposed Final Judgment in the public interest?

The problems identified above with the Proposed Final Judgment can be summarized as follows:

* The PFJ doesn't take into account Windows-compatible competing operating systems

o Microsoft increases the Applications Barrier to Entry by using restrictive license terms and intentional incompatibilities. Yet the PFJ fails to prohibit this, and even contributes to this part of the Applications Barrier to Entry.

* The PFJ Contains Misleading and Overly Narrow Definitions and Provisions

?? The PFJ supposedly makes Microsoft publish its secret APIs, but it defines ''API'' so narrowly that many important APIs are not covered.

?? The PFJ supposedly allows users to replace Microsoft Middleware with competing middleware, but it defines ''Microsoft Middleware'' so narrowly that the next version of Windows might not be covered at all.

?? The PFJ allows users to replace Microsoft Java with a competitor's product—but Microsoft is replacing Java with .NET. The PFJ should therefore allow users to replace Microsoft. NET with competing middleware.

?? The PFJ supposedly applies to ''Windows'', but it defines that term so narrowly that it doesn't cover Windows XP Tablet PC Edition, Windows CE, Pocket PC, or the X-Box—operating systems that all use the Win32 API and are advertised as being ''Windows Powered''.

?? The PFJ fails to require advance notice of technical requirements, allowing Microsoft to bypass all competing middleware simply by changing the requirements shortly before the deadline, and not informing ISVs.

?? The PFJ requires Microsoft to release API documentation to ISVs so they can create compatible middleware—but only after the deadline for the ISVs to demonstrate that their middleware is compatible.

?? The PFJ requires Microsoft to release API documentation—but prohibits competitors from using this documentation to help make their operating systems compatible with Windows.

?? The PFJ does not require Microsoft to release documentation about the format of Microsoft Office documents.

?? The PFJ does not require Microsoft to list which software patents protect the Windows APIs. This leaves Windows-compatible operating systems in an uncertain state: are they, or are they not infringing on Microsoft software patents? This can scare away potential users.

* The PFJ Fails to Prohibit Anticompetitive License Terms currently used by Microsoft

?? Microsoft currently uses restrictive licensing terms to keep Open Source or Free Software apps from running on Windows.

?? Microsoft currently uses restrictive licensing terms to keep Windows apps from running on competing operating systems.

?? Microsoft's enterprise license agreements (used by large companies, state governments, and universities) charge by the number of computers which could run a Microsoft operating system—even for computers running Linux. (Similar licenses to OEMs were once banned by the 1994 consent decree.)

* The PFJ Fails to Prohibit Intentional Incompatibilities Historically Used by Microsoft

?? Microsoft has in the past inserted intentional incompatibilities in its applications to keep them from running on competing operating systems.

* The PFJ Fails to Prohibit Anticompetitive Practices Towards OEMs

?? The PFJ allows Microsoft to retaliate against any OEM that ships Personal Computers containing a competing Operating System but no Microsoft operating system.

?? The PFJ allows Microsoft to discriminate against small OEMs—including regional 'white box'' OEMs which are historically the most willing to install competing operating systems—who ship competing software.

?? The PFJ allows Microsoft to offer discounts on Windows (MDAs) to OEMs based on criteria like sales of Microsoft Office or Pocket PC systems. This allows Microsoft to leverage its monopoly on Intel-compatible operating systems to increase its market share in other areas.

* The PFJ as currently written appears to lack an effective enforcement mechanism. Considering these problems, one must conclude that the Proposed Final Judgment as written allows and encourages significant anticompetitive practices to continue, and would delay the emergence of competing Windows-compatible operating systems.

Therefore, the Proposed Final Judgment is not in the public interest, and should not be adopted without addressing these issues.

Strengthening the PFJ

The above discussion shows that the PFJ does not satisfy the Court of Appeals'' mandate. Some of the plaintiff States have proposed an alternate settlement which fixes many of the problems identified above. The States'' proposal is quite different from the PFJ as a whole, but it contains many elements which are similar to elements of the PFJ, with small yet crucial changes.

In the sections below, I suggest amendments to the PFJ that attempt to resolve some of the demonstrated problems (time pressure has prevented anything like a complete list of amendments). When discussing amendments, PFJ text is shown indented; removed text in shown in [bracketed strikeout], and new text in bold italics.

Correcting the PFJ's definitions

Time constraints do not permit a complete list of needed changes. As an example, Definition U should be amended to read U. ''Windows Operating System Product'' means [the software code (as opposed to source code) distributed commercially by Microsoft for use with Personal Computers as Windows 2000 Professional, Windows XP Home, Windows XP Professional, and

successors to the foregoing, including the Personal Computer versions of the products currently code named ''Longhorn'' and ''Blackcomb'' and their successors, including upgrades, bug fixes, service packs, etc. The software code that comprises a Windows Operating System Product shall be determined by Microsoft in its sole discretion.] any software or firmware code distributed commercially by Microsoft that is capable of executing any nontrivial subset of the Win32 APIs, including without exclusion Windows 2000 Professional, Windows XP Home, Windows XP Professional, Windows XP Tablet PC Edition, Windows CE, PocketPC 2002, and successors to the foregoing, including the products currently code named ''Longhorn'' and ''Blackcomb'' and their successors, including upgrades, bug fixes, service packs, etc.

Release of Information

Because any new competitor in the Intel-compatible operating system market must be able to run Windows applications to have a chance in the market, and because Microsoft has traditionally used undocumented Windows APIs as part of the Applications Barrier to Entry, the Final Judgment should provide explicitly for a clear definition of what APIs a competing operating system must provide to run Windows applications.

The best way to do this is by submitting the API definitions to a standards body. This was done in 1994 for the Windows 3.1 APIs (see Sun's 1994 press release about WABI 2.0 and the Public Windows Initiative).

The result is Standard ECMA–234: Application Programming Interface for Windows (APIW), which provides standard definitions for an essential subset (four hundred and forty-four out of the roughly one thousand) of the Windows 3.1 APIs; it was rendered mostly obsolete by the switch to Windows 95. The Final Judgment should provide for the creation of something like ECMA–234 for the various modem versions of Windows.

Because Microsoft currently claims that it has intellectual property rights that protect the Windows APIs, but has never spelled out exactly which patents cover which APIs, the Final Judgment should force this to be spelled out.

To achieve the above goals, the PFJ should be modified as follows:

First, Sections III.D and III.E should be amended to remove the restriction on the use of the disclosed information:

... Microsoft shall disclose ... [for the sole purpose of interoperating with a Windows Operating System Product,] for the purpose of interoperating with a Windows Operating System Product or interoperating with application software written for Windows,

Second, a new section IV.E should be created as follows:

E. Establishment of a Windows API Standards Expert Group

1. Within 60 days of entry of this Final Judgment, the parties shall create and recommend to the Court for its appointment a six person Windows API Standards Expert Group (''WASEG'') to manage the creation, publication, and maintenance of a Windows APIs Standards Definition (''WASD'') and associated Windows APIs Standard Compliance Test Suite (''WASCTS''), and to guide the WASD through the process of being adopted by a standards body such as ECMA or the IEEE.

The WASD shall be a document, suitable for approval by a standards body such as ECMA or IEEE, which accurately defines the inputs, outputs, and behavior of each Windows API, and enumerates any Essential Claims.

The WASCTS shall be software source code which, when compiled and run, automatically tests an operating system for compliance with the WASD, and produces a list of APIs which fail to comply with the WASD. The test suite should run unattended; that is, it should be capable of running without human interaction or supervision.

2. Three of the WASEG members shall be experts in software design and programming, and three of the WASEG members shall be experts in intellectual property law. No WASEG member shall have a conflict of interest that could prevent him or her from performing his or her duties under this Final Judgment in a fair and unbiased manner. No WASEG member shall have entered into any non-disclosure agreement that is still in force with Microsoft or any competitor to Microsoft, nor shall she or he enter into such an agreement during her or his term on the WASEG. Without limitation to the foregoing, no WASEG member shall have been employed in any capacity by Microsoft or any competitor to Microsoft within the past year, nor shall he or she be so employed during his or her term on the WASEG.

3. Within seven days of entry of this Final Judgment, the Plaintiffs as a group shall select two software experts and two intellectual property law experts to be members of the WASEG, and Microsoft shall select one software expert and one intellectual property law expert to be members of the WASEG; the Plaintiffs shall then apply to the Court for appointment of the persons selected by the Plaintiffs and Microsoft pursuant to this section.

4. Each WASEG member shall serve for an initial term of 30 months. At the end of a WASEG member's initial 30-month term, the party that originally selected him or her may, in its sole discretion, either request re-appointment by the Court to a second 30-month term or replace the WASEG member in the same manner as provided for above.

5. If the United States or a majority of the Plaintiffs determine that a member of the WASEG has failed to act diligently and consistently with the purposes of this Final Judgment, or if a member of the WASEG resigns, or for any other reason ceases to serve in his or her capacity as a member of the WASEG, the person or persons that originally selected the WASEG member shall select a replacement member in the same manner as provided for above.

6. Promptly after appointment of the WASEG by the Court, the United States shall enter into a Windows API Expert Group services agreement (''WASEG Services Agreement'') with each WASEG member that grants the rights, powers and authorities necessary to permit the WASEG to perform its duties under this Final Judgment. Microsoft shall indemnify each WASEG member and hold him or her harmless against any losses, claims, damages, liabilities or expenses arising out of, or in connection with, the performance of the WASEG's duties, except to the extent that such liabilities, losses, damages, claims, or expenses result from misfeasance, gross negligence, willful or wanton acts, or bad faith by the WASEG member. The WASEG Services Agreements shall include the following:

a. The WASEG members shall serve, without bond or other security, at the cost and expense of Microsoft on such terms and conditions as the Plaintiffs approve, including the payment of reasonable fees and expenses.

b. The WASEG Services Agreement shall provide that each member of the WASEG shall comply with the limitations provided for in section IV.E.2. above.

7. Microsoft shall provide the WASEG with funds needed to procure office space, telephone, other office support facilities, consultants, or contractors required by the WASEG.

8. The WASEG shall not have direct access to any part of Microsoft's computer software source code that is not normally available to all ISVs. The WASEG shall not enter into any non-disclosure agreements with Microsoft or third parties. No implementations of any Windows APIs shall be written or published by the WASEG.

9. The WASEG shall have the following powers and duties:

a. The WASEG may require Microsoft to provide comprehensive answers to questions about Microsoft intellectual property claims.

b. The WASEG may require Microsoft to provide comprehensive answers to questions about the inputs, outputs, and functionality of any Windows

API; in particular, the WASEG may compel Microsoft to provide complete documentation for Windows APIs, including hitherto undocumented or poorly-documented Windows APIs.

c. The WASEG may engage, at the cost and expense of Microsoft, the services of outside consultants and contractors as required to fulfill the duties of the WASEG.

d. The WASEG shall establish a publicly available web she not owned or otherwise controlled by Microsoft, and will publish status reports and other information there at least as often as once per month. Documentation on the web site shall be made available subject to the terms of the GNU Free Documentation License; test suite source code made available on the web site shall be made available subject to the terms of the GNU General Public License.

e. The WASEG shall compile to the best of their ability a complete list of Windows APIs, including for each API the DLL name, entry point name, entry point ordinal number, return value type, and parameter types, as well as which versions of Windows it is supported by and an estimate of what percentage of Popular Windows Applications use it. The WASEG shall publish this list on the WASEG web site subject to the GNU Free Documentation License, according to the following schedule: Within 90 days after the WASEG is convened, the WASEG shall

publish this information for at least five hundred Windows APIs. On the 1st of each month thereafter, the WASEG shall publish this information for another five hundred Windows APIs. This shall continue until a complete list of Windows APIs is available on the web site. The WASEG shall update the list periodically to add previously unlisted Windows APIs. The WASEG shall periodically check the list for completeness by installing and running a representative sample of Popular Windows Applications and Microsoft Middleware while using tools such as Apius from Sarion Systems Research to watch the Windows APIs actually invoked by the product or its installer. The WASEG shall also set up a way for third parties to report Windows APIs which should be listed, and shall update its list of Windows APIs accordingly as appropriate.

f. The WASEG shall compile a complete list of Essential Claims, and an evaluation of which Windows APIs each Essential Claim covers. The WASEG shall publish this information on the WASEG web site subject to the GNU Free Documentation License, according to the following schedule:

Within 90 days after the WASEG publishes a portion of the list of Windows APIs on its web site, Microsoft shall deliver to the WASEG a list of the Essential Claims that cover the published Windows APIs. Within 90 days after the WASEG receives the list of Essential Claims, the WASEG shall publish its evaluation of which APIs those Essential Claims cover. This shall continue until such evaluations for all Essential Claims have been published on the WASEG web site.

g. The WASEG shall compile documentation for the list of Windows APIs defined above in section IV.E.9.e, including a complete description of the meanings of the return values and parameters, and the effects of the API. The documentation should be composed in a style similar to that used for the Single Unix Specification documentation (http://www.UNIX-systems.org/go/unix). Within 180 days after the WASEG is convened, and on the 1st of every month thereafter until complete, the WASEG will make available the currently completed portion of this documentation via its web site.

h. When the three documents described above—the list of Windows APIs, the list of Essential Claims and which Windows APIs they cover, and the documentation for the listed Windows APIs—is complete, the WASEG shall undertake to submit them to a standards body such as ECMA or the IEEE as a Draft WASD Document, and to make such enhancements and revisions as needed to gain the acceptance of that document as a standard.

i. The WASEG shall create a WASCTS, and publish it on the WASEG web site subject to the GNU General Public License, according to the following schedule: Within 180 days after the WASEG is convened, the WASEG shall publish test cases for at least one hundred Windows APIs. On the 1st of each month thereafter, the WASEG shall publish test cases for at least another one hundred Windows APIs. This shall continue until a complete WASCTS is available on the web site.

j. In the event that a planned update to Windows or any other Microsoft product is expected to result in the creation of new Windows APIs or Essential Claims, or WASEG's list of Windows APIs is updated, the WASEG shall create addenda to the WASD and WASCTS covering the new Windows APIs or Essential Claims, make them available via its web site, and undertake to submit them to the same standards body as above as an addendum to the standard.

Third, in section VI, Definition A should be amended to read

A. ''Application Programming Interfaces (APIs)'' means the interfaces, including any associated callback interfaces, that [Microsoft Middleware running on a Windows Operating System Product uses to call upon that Windows Operating System Product in order to obtain any services from that Windows Operating System Product.] Microsoft Middleware or Popular Windows Applications running or being installed on a Windows Operating System Product use to call upon that Windows Operating System Product or Microsoft Middleware in order to obtain any services from that Windows Operating System Product or Microsoft Middleware.

and two new definitions should be added:

V. ''Popular Windows Applications'' means the top 10 selling applications as reported by NPD Intelect Market Tracking in each of the categories

Business, Education, Finance, Games, Personal Productivity, and Reference, plus all Microsoft Middleware Products.

W. ''Essential Claims'' shall mean all claims in any patent or patent application, in any jurisdiction in the world, that Microsoft owns, or under which Microsoft has the right to grant licenses without obligation of payment or other consideration to an unrelated third party, that would necessarily be infringed by implementation of the Windows APIs Standard Definition by a competing Operating System. A claim is necessarily infringed hereunder only when it is not possible to avoid infringing it because there is no non-infringing alternative for implementing the required portion of the Windows APIs Standard Definition.

The following are expressly excluded from and shall not be deemed to constitute Essential Claims:

1. any claims other than as set forth above even if contained in the same patent as Essential Claims; and

2. claims which would be infringed only by portions of an implementation that are not required by the Windows APIs Standard Definition, or enabling technologies that may be necessary to make or use any product or portion thereof that complies with the Windows APIs Standard Definition but are not themselves expressly set forth in the Windows APIs Standard Definition (e.g., compiler technology, object-oriented technology, etc.) or the implementation of technology developed elsewhere and merely incorporated by reference in the body of the Windows APIs Standard Definition.

Prohibition of More Practices Toward OEMs

? III. A. 2. of the Proposed Final Judgment should be amended to read

2. shipping a Personal Computer that (a) includes both a Windows Operating System Product and a non-Microsoft Operating System, or (b) will boot with more than one Operating System, or (c) includes a non-Microsoft Operating System but no Windows Operating System Product; or...

Summary

This document demonstrates that there are so many problems with the PFJ that it is not in the public interest. It also illustrates how one might try to fix some of these problems.

On the Proposed Final Judgment in United States
v. Microsoft
Contents

Introduction

As a software engineer with 20 years'' experience developing software for Unix, Windows, Macintosh, and

Linux, I'd like to comment on the Proposed Final Judgment in United States v. Microsoft.

According to the Court of Appeals ruling, ''a remedies decree in an antitrust case must

seek to unfetter a market from anticompetitive conduct'', to terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future'' (section V.D., p. 99).

Attorney General John Ashcroft seems to agree; he called the proposed settlement ''strong and historic'', said that it would end ''Microsoft's unlawful conduct,'' and said ''With the proposed settlement being announced today, the Department of Justice has fully and completely addressed the anti-competitive conduct outlined by the Court of Appeals against Microsoft.''

Yet the Proposed Final Judgment allows many exclusionary practices to continue, and does not take any direct measures to reduce the Applications Barrier to Entry faced by new entrants to the market.

The Court of Appeals affirmed that Microsoft has a monopoly on Intel-compatible PC operating systems, and that the company's market position is protected by a substantial barrier to entry (p. 15). Furthermore, the Court of Appeals affirmed that Microsoft is liable under Sherman Act * 2 for illegally maintaining its monopoly by imposing licensing restrictions on OEMs, IAPs (Internet Access Providers), ISVs (Independent Software Vendors), and Apple Computer, by requiring ISVs to switch to Microsoft's JVM (Java Virtual Machine), by deceiving Java developers, and by forcing Intel to drop support for cross-platform Java tools.

The fruits of Microsoft's statutory violation include a strengthened Applications Barrier to Entry and weakened competition in the Intel-compatible operating system market; thus the Final Judgment must find a direct way of reducing the Applications Barrier to Entry, and of increasing such competition.

In the following sections I outline the basic intent of the proposed final judgment, point out areas where the intent and the implementation appear to fall short, and propose amendments to the Proposed Final Judgment (or PFJ) to address these concerns.

Please note that this document is still evolving. Feedback is welcome; to comment on this document, please join the mailing list at groups.yahoo.com/group/ms-remedy, or email me directly at dank-ms@kegel.com.

Understanding the Proposed Final Judgment

In crafting the Final Judgment, the judge will face the following questions:

* ù How should terms like ''API'', ''Middleware'', and ''Windows OS'' be defined?

* ù How should the Final Judgment erode the Applications Barrier to Entry?

* ù How should the Final Judgment be enforced?

* ù What information needs to be released to ISVs to encourage competition, and under what terms?

* ù Which practices towards OEMs should be prohibited?

* Which practices towards ISVs should be prohibited?

* Which practices towards large users should be prohibited?

* ù Which practices towards end users should be prohibited?

Here is a very rough summary which paraphrases provisions III.A through III.J and VI. of the Proposed Final Judgment to give some idea of how the PFJ proposes to answer those questions:

PFJ Section III: Prohibited Conduct

A. Microsoft will not retaliate against OEMs who support competitors to Windows, Internet Explorer (IE), Microsoft Java (MJ), Windows Media Player (WMP), Windows Messenger (WM), or Outlook Express (OE).

B. Microsoft will publish the wholesale prices it charges the top 20 OEMs (Original Equipment Manufacturers) for Windows.

C. Microsoft will allow OEMs to customize the Windows menus, desktop, and boot sequence, and will allow the use of non-Microsoft bootloaders.

D. Microsoft will publish on MSDN (the Microsoft Developer Network) the APIs used by IE, MJ, WMP, WM, and OE, so that competing web browsers, media players, and email clients can plug in properly to Windows.

E. Microsoft will license on reasonable terms the network protocols needed for non-Microsoft applications or operating systems to connect to Windows servers.

F. Microsoft will not force business partners to refrain from supporting competitors to Windows, IE, MJ, WMP, WM, or OE.

G. (Roughly same as F above.)

H. Microsoft will let users and OEMs remove icons for IE, MJ, WMP, WM, and OE, and let them designate competing products to be used instead.

I. Microsoft will license on reasonable terms any intellectual property rights needed for other companies to take advantage of the terms of this settlement.

J. This agreement lets Microsoft keep secret anything having to do with security or copy protection.

PFJ Section VI: Definitions

A. ''API'' (Application Programming Interface) is defined as only the interfaces between Microsoft Middleware and Microsoft Windows, excluding Windows APIs used by other application programs.

K. ''Microsoft Middleware Product'' is defined as Internet Explorer (IE), Microsoft Java (MJ), Windows Media Player (WMP), Windows Messenger (WM), and Outlook Express (OE).

U. ''Windows Operating System Product'' is defined as Windows 2000 Professional, Windows XP Home, and Windows XP Professional.

The agreement can be summed up in one breath as follows: Microsoft agrees to compete somewhat less vigorously, and to let competitors interoperate with Windows in exchange for royalty payments.

Considering all of the above, one should read the detailed terms of the Proposed Final Judgment, and ask one final question:

* ù Is the Proposed Final Judgment in the public interest?

In the sections below, I'll look in more detail at how the PFJ deals with the above questions. How should terms like ''API'', ''Middleware, and ''Windows OS'' be defined?

The definitions of various terms in Part VI of the PFJ differ from the definitions in the Findings of Fact and in common usage, apparently to Microsoft's benefit. Here are some examples:

Definition A: ''API''

The Findings of Fact (* 2) define ''API'' to mean the interfaces between application programs and the operating system. However, the PFJ's Definition A defines it to mean only the interfaces between Microsoft Middleware and Microsoft Windows, excluding Windows APIs used by otherapplication programs. For instance, the PFJ's definition of API might omit important APIs such as the Microsoft Installer APIs which are used by installer programs to install software on Windows.

Definition J: ''Microsoft Middleware''

The Findings of Fact (¶28) define ''middleware'' to mean application software that itself presents a set of APIs which allow users to write new applications without reference to the underlying operating system. Definition J defines it in a much more restrictive way, and allows Microsoft to exclude any software from being covered by the definition in two ways:

1. By changing product version numbers. For example, if the next version of Internet Explorer were named ''7.0.0'' instead of ''7'' or ''7.0'', it would not be deemed Microsoft Middleware by the PFJ.

2. By changing how Microsoft distributes Windows or its middleware. For example, if Microsoft introduced a version of Windows which was only available via the Windows Update service, then nothing in that version of Windows would be considered Microsoft Middleware, regardless of whether Microsoft added it initially or in a later update. This is analogous to the loophole in the 1995 consent decree that allowed Microsoft to bundle its browser by integrating it into the operating system.

Definition K: ''Microsoft Middleware Product''

Definition K defines ''Microsoft Middleware Product'' to mean essentially Internet Explorer (IE), Microsoft Java (MJ), Windows Media Player (WMP), Windows Messenger (WM), and Outlook Express (OE).

The inclusion of Microsoft Java and not Microsoft. NET is questionable; Microsoft has essentially designated Microsoft. NET and C# as the successors to Java, so on that basis one would expect Microsoft.NET to be included in the definition.

The inclusion of Outlook Express and not Outlook is questionable, as Outlook (different and more powerful than Outlook Express) is a more important product in business, and fits the definition of middleware better than Outlook Express. The exclusion of Microsoft Office is questionable, as many components of Microsoft Office fit the Finding of Fact's definition of middleware. For instance, there is an active market in software written to run on top of Microsoft Outlook and Microsoft Word, and many applications are developed for Microsoft Access by people who have no knowledge of Windows APIs.

Definition U: ''Windows Operating System Product''

Microsoft's monopoly is on Intel-compatible operating systems. Yet the PFJ in definition U defines a ''Windows Operating System Product'' to mean only Windows 2000 Professional, Windows XP Home,

Windows XP Professional, and their successors. This purposely excludes the Intel-compatible operating systems Windows XP Tablet PC Edition and Windows CE; many applications written to the Win32 APIs can run unchanged on Windows 2000, Windows XP Tablet PC Edition, and Windows CE, and with minor recompilation, can also be run on Pocket PC. Microsoft even proclaims at www.microsoft.com/windowsxp/tabletpc/tabletpcqanda.asp:

''The Tablet PC is the next-generation mobile business PC, and it will be available from leading computer makers in the second half of 2002. The Tablet PC runs the Microsoft Windows XP Tablet PC Edition and features the capabilities of current business laptops, including attached or detachable keyboards and the ability to run Windows-based applications.'' and

Pocket PC: Powered by Windows

Microsoft is clearly pushing Windows XP Tablet PC Edition and Pocket PC in places (e.g. portable computers used by businessmen) currently served by Windows XP Home Edition, and thus appears to be trying to evade the Final Judgment's provisions. This is but one example of how Microsoft can evade the provisions of the Final Judgment by shifting its efforts away from the Operating Systems listed in Definition U and towards Windows XP Tablet Edition, Windows CE, Pocket PC, X-Box, or some other Microsoft Operating System that can run Windows applications.

How should the Final Judgment erode the Applications Barrier to Entry?

The PFJ tries to erode the Applications Barrier to Entry in two ways:

1. By forbidding retaliation against OEMs, ISVs, and IHVs who support or develop alternatives to Windows.

2. By taking various measures to ensure that Windows allows the use of non-Microsoft middleware.

A third option not provided by the PFJ would be to make sure that Microsoft raises no artificial barriers against non-Microsoft operating systems which implement the APIs needed to run application programs written for Windows. The Findings of Fact (¶ 52) considered the possibility that competing operating systems could implement the Windows APIs and thereby directly run software written for Windows as a way of circumventing the Applications Barrier to Entry. This is in fact the route being taken by the Linux operating system, which includes middleware (named WINE) that can run many Windows programs.

By not providing some aid for ISVs engaged in making Windows-compatible operating systems, the PFJ is missing a key opportunity to encourage competition in the Intel-compatible operating system market. Worse yet, the PFJ itself, in sections III.D. and III.E., restricts information released by those sections to be used ''for the sole purpose of interoperating with a Windows Operating System Product''. This prohibits ISVs from using the information for the purpose of writing operating systems that interoperate with Windows programs.

How should the Final Judgment be enforced?

The PFJ as currently written appears to lack an effective enforcement mechanism. It does provide for the creation of a Technical Committee with investigative powers, but appears to leave all actual enforcement to the legal system.

What information needs to be released to ISVs to encourage competition, and under what terms?

The PFJ provides for increased disclosure of technical information to ISVs, but these provisions are flawed in several ways:

1. The PFJ fails to require advance notice of technical requirements Section III.H.3. of the PFJ requires vendors of competing middleware to meet ''reasonable technical requirements'' seven months before new releases of Windows, yet it does not require Microsoft to disclose those requirements in advance. This allows Microsoft to bypass all competing middleware simply by changing the requirements shortly before the deadline, and not informing ISVs.

2. API documentation is released too late to help ISVs Section III.D. of the PFJ requires Microsoft to release via MSDN or similar means the documentation for the APIs used by Microsoft Middleware Products to interoperate with Windows; release would be required at the time of the final beta test of the covered middleware, and whenever a new version of Windows is sent to 150,000 beta testers. But this information would almost certainly not be released in time for competing middleware vendors to adapt their products to meet the requirements of section III.H.3, which states that competing middleware can be locked out if it fails to meet unspecified technical requirements seven months before the final beta test of a new version of Windows.

3. Many important APIs would remain undocumented The PFJ's overly narrow definitions of ''Microsoft Middleware Product'' and ''API'' means that Section III.D.'s requirement to release information about Windows interfaces would not cover many important interfaces.

4. Unreasonable Restrictions are Placed on the Use of the Released Documentation ISVs writing competing operating systems as outlined in Findings of Fact (¶ 52) sometimes have difficulty understanding various undocumented Windows APIs. The information released under section III.D. of the PFJ would aid those ISVs—except that the PFJ disallows this use of the information. Worse yet, to avoid running afoul of the PFJ, ISVs might need to divide up their engineers into two groups: those who refer to MSDN and work on Windows-only applications; and those who cannot refer to MSDN because they work on applications which also run on non-Microsoft operating systems. This would constitute retaliation against ISVs who support competing operating systems.

5. File Formats Remain Undocumented

No part of the PFJ obligates Microsoft to release any information about file formats, even though undocumented Microsoft file formats form part of the Applications Barrier to Entry (see ''Findings of Fact'' * 20 and * 39).

6. Patents covering the Windows APIs remain undisclosed Section III.I of the PFJ requires Microsoft to offer to license certain intellectual property rights, but it does nothing to require Microsoft to clearly announce which of its many software patents protect the Windows APIs (cf. current practice at the World Wide Web Consortium, http://www.w3.org/TR/patent-practice). This leaves Windows-compatible operating systems in an uncertain state: are they, or are they not infringing on Microsoft software patents? This can scare away potential users, as illustrated by this report from Codeweavers, Inc.:

When selecting a method of porting a major application to Linux, one prospect of mine was comparing Wine [a competing implementation of some of the Windows APIs] and a toolkit called 'MainWin'. MainWin is made by Mainsoft, and Mainsoft licenses its software from Microsoft. However, this customer elected to go with the Mainsoft option instead. I was told that one of the key decision making factors was that Mainsoft representatives had stated that Microsoft had certain critical patents that Wine was violating. My customer could not risk crossing Microsoft, and declined to use Wine. I didn't even have a chance to determine which patents were supposedly violated; nor to disprove the validity of this claim.

The PFJ, by allowing this unclear legal situation to continue, is inhibiting the market acceptance of competing operating systems.

Which practices towards OEMs should be prohibited?

The PFJ prohibits certain behaviors by Microsoft towards OEMs, but curiously allows the following exclusionary practices:

Section III.A.2. allows Microsoft to retaliate against any OEM that ships Personal Computers containing a competing Operating System but no Microsoft operating system.

Section III.B. requires Microsoft to license Windows on uniform terms and at published prices to the top 20 OEMs, but says nothing about smaller OEMs. This leaves Microsoft free to retaliate against smaller OEMs, including important regional 'white box'' OEMs, if they offer competing products.

Section III.B. also allows Microsoft to offer unspecified Market Development Allowances— in effect, discounts—to OEMs. For instance, Microsoft could offer discounts on Windows to OEMs based on the number of copies of Microsoft Office or Pocket PC systems sold by that OEM. In effect, this allows Microsoft to leverage its monopoly on Intel-compatible operating systems to increase its market share in other areas, such as office software or ARM-compatible operating systems.

By allowing these practices, the PFJ is encouraging Microsoft to extend its monopoly in Intel-compatible operating systems, and to leverage it into new areas.

Which practices towards ISVs should be prohibited?

Sections III.F. and III.G. of the PFJ prohibit certain exclusionary licensing practices by Microsoft towards ISVs.

However, Microsoft uses other exclusionary licensing practices, none of which are mentioned in the PFJ.

Several of Microsoft's products'' licenses prohibit the products'' use with popular non-Microsoft middleware and operating systems. Two examples are given below.

1. Microsoft discriminates against ISVs who ship Open Source or Free Software applications

The Microsoft Windows Media Encoder 7.1 SDK EULA states

... you shall not distribute the REDISTRIBUTABLE COMPONENT in conjunction with any Publicly Available Software. ''Publicly Available Software'' means each of (i) any software that contains, or is derived in any manner (in whole or in part) from, any software that is distributed as free software, open source software (e.g. Linux) or similar licensing or distribution models ... Publicly Available Software includes, without limitation, software licensed or distributed under any of the following licenses or distribution models, or licenses or distribution models similar to any of the following: GNU's General Public License (GPL) or Lesser/Library GPL (LGPL); The Artistic License (e.g., PERL); the Mozilla Public License; the Netscape Public License; the Sun Community Source License (SCSL); ...

Many Windows APIs, including Media Encoder, are shipped by Microsoft as add-on SDKs with associated redistributable components. Applications that wish to use them must include the add-ons, even though they might later become a standard part of Windows. Microsoft often provides those SDKs under End User License Agreements (EULAs) prohibiting their use with Open Source or Free Software applications. This harms ISVs who choose to distribute their applications under Open Source or Free Software licenses; they must hope that the enduser has a sufficiently up-to-date version of the addon API installed, which is often not the case.

Applications potentially harmed by this kind of EULA include the competing middleware product Netscape 6 and the competing office suite StarOffice; these EULAs thus can cause support problems for, and discourage the use of, competing middleware and office suites. Additionally, since Open Source or Free Software applications tend to also run on non-Microsoft operating systems, any resulting loss of market share by Open Source or Free Software applications indirectly harms competing operating systems.

2. Microsoft discriminates against ISVs who target Windows-compatible competing Operating Systems

The Microsoft Platform SDK, together with Microsoft Visual C++, is the primary toolkit used by ISVs to create Windows-compatible applications. The Microsoft Platform SDK EULA says:

''Distribution Terms. You may reproduce and distribute ... the Redistributable Components... provided that (a) you distribute the Redistributable Components only in conjunction with and as a part of your Application solely for use with a Microsoft Operating System Product...''

This makes it illegal to run many programs built with Visual C++ on Windows-compatible competing operating systems.

By allowing these exclusionary behaviors, the PFJ is contributing to the Applications Barrier to Entry faced by competing operating systems.

Which practices towards large users should be prohibited?

The PFJ places restrictions on how Microsoft licenses its products to OEMs, but not on how it licenses products to large users such as corporations, universities, or state and local governments, collectively referred to as ''enterprises''. Yet enterprise license agreements often resemble the per-processor licenses which were prohibited by the 1994 consent decree in the earlier US v. Microsoft antitrust case, in that a fee is charged for each desktop or portable computer which could run a Microsoft operating system, regardless of whether any Microsoft software is actually installed on the affected computer. These agreements are anticompetitive because they remove any financial incentive for individuals or departments to run non-Microsoft software.

Which practices towards end users should be prohibited?

Microsoft has used both restrictive licenses and intentional incompatibilities to discourage users from running

Windows applications on Windows-compatible competing operating systems. Two examples are given below.

1. Microsoft uses license terms which prohibit the use of Windows-compatible competing operating systems

MSNBC (a subsidiary of Microsoft) offers software called NewsAlert. Its EULA states ''MSNBC Interactive grants you the right to install and use copies of the SOFTWARE PRODUCT on your computers running validly licensed copies of the operating system for which the SOFTWARE PRODUCT was designed [e.g., Microsoft Windows(r) 95; Microsoft Windows NT(r), Microsoft Windows 3.x, Macintosh, etc.] .... ''

Only the Windows version appears to be available for download. Users who run competing operating systems (such as Linux) which can run some Windows programs might wish to run the Windows version of NewsAlert, but the EULA prohibits this.

MSNBC has a valid interest in prohibiting use of pirated copies of operating systems, but much narrower language could achieve the same protective effect with less anticompetitive impact. For instance, ''MSNBC Interactive grants you the right to install and use copies of the SOFTWARE PRODUCT on your computers running validly licensed copies of Microsoft Windows or compatible operating system.''

2. Microsoft created intentional incompatibilities in Windows 3.1 to discourage the use of non-Microsoft operating systems

An episode from the 1996 Caldera v. Microsoft antitrust lawsuit illustrates how Microsoft has used technical means anticompetitively.

Microsoft's original operating system was called MS-DOS. Programs used the DOS API to call up the services of the operating system. Digital Research offered a competing operating system, DR-DOS, that also implemented the DOS API, and could run programs written for MS-DOS. Windows 3.1 and earlier were not operating systems per se, but rather middleware that used the DOS API to interoperate with the operating system. Microsoft was concerned with the competitive threat posed by DR-DOS, and added code to beta copies of Windows 3.1 so it would display spurious and misleading error messages when run on DR-DOS.

Digital Research's successor company, Caldera, brought a private antitrust suit against Microsoft in 1996. (See the original complaint, and Caldera's consolidated response to Microsoft's motions for partial summary— judgment.) The judge in the case ruled that

''Caldera has presented sufficient evidence that the incompatibilities alleged were part of an anticompetitive scheme by Microsoft.''

That case was settled out of court in 1999, and no court has fully explored the alleged conduct.

The concern here is that, as competing operating systems emerge which are able to run Windows applications, Microsoft might try to sabotage Windows applications, middleware, and development tools so that they cannot run on non-Microsoft operating systems, just as they did earlier with Windows 3.1.

The PFJ as currently written does nothing to prohibit these kinds of restrictive licenses and intentional incompatibilities, and thus encourages Microsoft to use these techniques to enhance the Applications Barrier to Entry, and harming those consumers who use non-Microsoft operating systems and wish to use Microsoft applications software.

Is the Proposed Final Judgment in the public interest?

The problems identified above with the Proposed Final Judgment can be summarized as follows:

* ù The PFJ doesn't take into account Windows-compatible competing operating systems

?? Microsoft increases the Applications Barrier to Entry— by using restrictive license terms and intentional incompatibilities. Yet the PFJ fails to prohibit this, and even contributes to this part of the Applications Barrier to Entry.

ù The PFJ Contains Misleading and Overly Narrow Definitions and Provisions

?? The PFJ supposedly makes Microsoft publish its secret APIs, but it defines ''API'' so narrowly that many important APIs are not covered.

?? The PFJ supposedly allows users to replace Microsoft Middleware with competing middleware, but it defines ''Microsoft Middleware'' so narrowly that the next version of Windows might not be covered at all.

?? The PFJ allows users to replace Microsoft Java with a competitor's product— but Microsoft is replacing Java with .NET. The PFJ should therefore allow users to replace Microsoft. NET with competing middleware.

?? The PFJ supposedly applies to ''Windows'', but it defines that term so narrowly that it doesn't cover Windows XP Tablet PC Edition, Windows CE, Pocket PC, or the X-Box— operating systems that all use the Win32 API and are advertised as being ''Windows Powered''.

?? The PFJ fails to require advance notice of technical requirements, allowing Microsoft to bypass all competing middleware simply by changing the requirements shortly before the deadline, and not informing ISVs.

?? The PFJ requires Microsoft to release API documentation to ISVs so they can create compatible middleware—but only after the deadline for the ISVs to demonstrate that their middleware is compatible.

?? The PFJ requires Microsoft to release API documentation—but prohibits competitors from using this documentation to help make their operating systems compatible with Windows.

?? The PFJ does not require Microsoft to release documentation about the format of Microsoft Office documents.

?? The PFJ does not require Microsoft to list which software patents protect the Windows APIs.

This leaves Windows-compatible operating systems in an uncertain state: are they, or are they not infringing on Microsoft software patents? This can scare away potential users.

* The PFJ Fails to Prohibit Anticompetitive License Terms currently used by Microsoft

?? Microsoft currently uses restrictive licensing terms to keep Open Source or Free Software apps from running on Windows.

?? Microsoft currently uses restrictive licensing terms to keep Windows apps from running on competing operating systems.

?? Microsoft's enterprise license agreements (used by large companies, state governments, and universities) charge by the number of computers which could run a Microsoft operating system— even for computers running Linux. (Similar licenses to OEMs were once banned by the 1994 consent decree.)

* The PFJ Fails to Prohibit Intentional Incompatibilities Historically Used by Microsoft

?? Microsoft has in the past inserted intentional incompatibilities in its applications to keep them from running on competing operating systems,

* ù The PFJ Fails to Prohibit Anticompetitive Practices Towards OEMs

?? The PFJ allows Microsoft to retaliate against any OEM that ships Personal Computers containing a competing Operating System but no Microsoft operating system.

?? The PFJ allows Microsoft to discriminate against small OEMs—including regional 'white box'' OEMs which are historically the most willing to install competing operating systems— who ship competing software.

?? The PFJ allows Microsoft to offer discounts on Windows (MDAs) to OEMs based on criteria like sales of Microsoft Office or Pocket PC systems. This allows Microsoft to leverage its monopoly on Intel-compatible operating systems to increase its market share in other areas.

* . The PFJ as currently written appears to lack an effective enforcement mechanism. Considering these problems, one must conclude that the Proposed Final Judgment as written allows and encourages significant anticompetitive practices to continue, and would delay the emergence of competing Windows-compatible operating systems. Therefore, the Proposed Final Judgment is not in the public interest, and should not be adopted without addressing these issues.

Strengthening the PFJ

The above discussion shows that the PFJ does not satisfy the Court of Appeals'' mandate. Some of the plaintiff States have proposed an alternate settlement which fixes many of the problems identified above. The States'' proposal is quite different from the PFJ as a whole, but it contains many elements which are similar to elements of the PFJ, with small yet crucial changes.

In the sections below, I suggest amendments to the PFJ that attempt to resolve some of the demonstrated problems (time pressure has prevented anything like a complete list of amendments). When discussing amendments, PFJ text is shown indented; removed text in [], and new text in bold italics.

Correcting the PFJ's definitions

Time constraints do not permit a complete list of needed changes. As an example, Definition U should be amended to read

U. ''Windows Operating System Product'' means [] any software or firmware code distributed commercially by Microsoft that is capable of executing any nontrivial subset of the Win32 APIs, including without exclusion Windows 2000 Professional, Windows XP Home, Windows XP Professional, Windows XP Tablet PC Edition, Windows CE, PocketPC 2002, and successors to the foregoing, including the products currently code named ''Longhorn'' and ''Blackcomb'' and their successors, including upgrades, bug fixes, service packs, etc.

Release of Information

Because any new competitor in the Intel-compatible operating system market must be able to run Windows applications to have a chance in the market, and because Microsoft has traditionally used undocumented Windows APIs as part of the Applications Barrier to Entry, the Final Judgment should provide explicitly for a clear definition of what APIs a competing operating system must provide to run Windows applications. The best way to do this is by submitting the API definitions to a standards body. This was done in 1994 for the Windows 3.1 APIs (see Sun's 1994 press release about WABI 2.0 and the Public Windows Initiative). The result is Standard ECMA-234: Application Programming Interface for Windows (APIW), which provides standard definitions for an essential subset (four hundred and fourty-four out of the roughly one thousand) of the Windows 3.1 APIs; it was rendered mostly obsolete by the switch to Windows 95. The Final Judgment should provide for the creation of something like ECMA-234 for the various modem versions of Windows.

Because Microsoft currently claims that it has intellectual property rights that protect the Windows APIs, but has never spelled out exactly which patents cover which APIs, the Final Judgment should force this to be spelled out.

To achieve the above goals, the PFJ should be modified as follows:

First, Sections III.D and III.E should be amended to remove the restriction on the use of the disclosed information:

... Microsoft shall disclose ... [], for the purpose of interoperating with a Windows Operating System Product or interoperating with application software written for Windows,

Second, a new section IV.E should be created as follows:

E. Establishment of a Windows API Standards Expert Group

1. Within 60 days of entry of this Final Judgment, the parties shall create and recommend to the Court for its appointment a six person Windows API Standards Expert Group (''WASEG'') to manage the creation, publication, and maintenance of a Windows APIs Standards Definition (''WASD'') and associated Windows APIs Standard Compliance Test Suite (''WASCTS''), and to guide the WASD through the process of being adopted by a standards body such as ECMA or the IEEE.

The WASD shall be a document, suitable for approval by a standards body such as ECMA or IEEE, which accurately defines the inputs, outputs, and behavior of each Windows API, and enumerates any Essential Claims. The WASCTS shah be software source code which, when compiled and run, automatically tests an operating system for compliance with the WASD, and produces a list of APIs which fail to comply with the WASD. The test suite should run unattended; that is, it should be capable of running without human interaction or supervision.

2. Three of the WASEG members shah be experts in software design and programming, and three of the WASEG members shall be experts in intellectual property law. No WASEG member shah have a conflict of interest that could prevent him or her from performing his or her duties under this Final Judgment in a fair and unbiased manner.

No WASEG member shah have entered into any non-disclosure agreement that is still in force with Microsoft or any competitor to Microsoft, nor shah she or he enter into such an agreement during her or his term on the WASEG. Without limitation to the foregoing, no WASEG member shah have been employed in any capacity by Microsoft or any competitor to Microsoft within the past year, nor shall he or she be so employed during his or her term on the WASEG.

3. Within seven days of entry of this Final Judgment, the Plaintiffs as a group shall select two software experts and two intellectual property law experts to be members of the WASEG, and Microsoft shall select one software expert and one intellectual property law expert to be members of the WASEG; the Plaintiffs shall then apply to the Court for appointment of the persons selected by the Plaintiffs and Microsoft pursuant to this section.

4. Each WASEG member shall serve for an initial term of 30 months. At the end of a WASEG member's initial 30-month term, the party that originally selected him or her may, in its sole discretion, either request re-appointment by the Court to a second 30-month term or replace the WASEG member in the same manner as provided for above.

5. If the United States or a majority of the Plaintiffs determine that a member of the WASEG has failed to act diligently and consistently with the purposes of this Final Judgment, or if a member of the WASEG resigns, or for any other reason ceases to serve in his or her capacity as a member of the WASEG, the person or persons that originally selected the WASEG member shall select a replacement member in the same manner as provided for above.

6. Promptly after appointment of the WASEG by the Court, the United States shall

enter into a Windows API Expert Group services agreement (''WASEG Services Agreement'') with each WASEG member that grants the rights, powers and authorities necessary to permit the WASEG to perform its duties under this Final Judgment. Microsoft shall indemnify each WASEG member and hold him or her harmless against any losses, claims, damages, liabilities or expenses arising out of, or in connection with, the performance of the WASEG's duties, except to the extent that such liabilities, losses, damages, claims, or expenses result from misfeasance, gross negligence, willful or wanton acts, or bad faith by the WASEG member. The WASEG Services Agreements shall include the following:

a. The WASEG members shall serve, without bond or other security, at the cost and expense of Microsoft on such terms and conditions as the Plaintiffs approve, including the payment of reasonable fees and expenses.

b. The WASEG Services Agreement shall provide that each member of the WASEG shall comply with the limitations provided for in section IV.E.2. above.

7. Microsoft shall provide the WASEG with funds needed to procure office space, telephone, other office support facilities, consultants, or contractors required by the WASEG.

8. The WASEG shall not have direct access to any part of Microsoft's computer software source code that is not normally available to all ISVs. The WASEG shall not enter into any non-disclosure agreements with Microsoft or third parties. No implementations of any Windows APIs shall be written or published by the WASEG.

9. The WASEG shall have the following powers and duties:

a. The WASEG may require Microsoft to provide comprehensive answers to questions about Microsoft intellectual property claims.

b. The WASEG may require Microsoft to provide comprehensive answers to questions about the inputs, outputs, and functionality of any Windows API; in particular, the WASEG may compel Microsoft to provide complete documentation for Windows APIs, including hitherto undocumented or poorly-documented Windows APIs.

c. The WASEG may engage, at the cost and expense of Microsoft, the services of outside consultants and contractors as required to fulfill the duties of the WASEG.

d. The WASEG shall establish a publicly available web site not owned or otherwise controlled by Microsoft, and will publish status reports and other information there at least as often as once per month. Documentation on the web site shall be made available subject to the terms of the GNU Free Documentation License; test suite source code made available on the web site shall be made available subject to the terms of the GNU General Public License.

e. The WASEG shall compile to the best of their ability a complete list of Windows APIs, including for each API the DLL name, entry point name, entry point ordinal number, return value type, and parameter types, as well as which versions of Windows it is supported by and an estimate of what percentage of Popular Windows Applications use it. The WASEG shall publish this list on the WASEG web site subject to the GNU Free Documentation License, according to the following schedule: Within 90 days after the WASEG is convened, the WASEG shall publish this information for at least five hundred Windows APIs. On the 1st of each month thereafter, the WASEG shall publish this information for another five hundred Windows APIs. This shall continue until a complete list of Windows APIs is available on the web site. The WASEG shall update the list periodically to add previously unlisted Windows APIs. The WASEG shall periodically check the list for completeness by installing and running a representative sample of Popular Windows Applications and Microsoft Middleware while using tools such as Apius from Sarion Systems Research to watch the Windows APIs actually invoked by the product or its installer. The WASEG shall also set up a way for third parties to report Windows APIs which should be listed, and shall update its list of Windows APIs accordingly as appropriate.

f. The WASEG shall compile a complete list of Essential Claims, and an evaluation of which Windows APIs each Essential Claim covers. The WASEG shall publish this information on the WASEG web site subject to the GNU Free Documentation License, according to the following schedule: Within 90 days after the WASEG publishes a portion of the list of Windows APIs on its web site, Microsoft shall deliver to the WASEG a list of the Essential Claims that cover the published Windows APIs. Within 90 days after the WASEG receives the list of Essential Claims, the WASEG shall publish its evaluation of which APIs those Essential Claims cover. This shall continue until such evaluations for all Essential Claims have been published on the WASEG web site.

g. The WASEG shall compile documentation for the list of Windows APIs defined above in section IV.E.9.e, including a complete description of the meanings of the return values and parameters, and the effects of the API. The documentation should be composed in a style similar to that used for the Single Unix Specification documentation (http://www.UNIX-systems.org/unix). Within 180 days after the WASEG is convened, and on the 1st of every month thereafter until complete, the WASEG will make available the currently completed portion of this documentation via its web site.

h. When the three documents described above—the list of Windows APIs, the list of Essential Claims and which Windows APIs they cover, and the documentation for the listed Windows APIs—is complete, the WASEG shall undertake to submit them to a standards body such as ECMA or the IEEE as a Draft WASD Document, and to make such enhancements and revisions as needed to gain the acceptance of that document as a standard.

i. The WASEG shall create a WASCTS, and publish it on the WASEG web site subject to the GNU General Public License, according to the following schedule: Within 180 days after the WASEG is convened, the WASEG shall publish test cases for at least one hundred Windows APIs. On the 1st of each month thereafter, the WASEG shall publish test cases for at least another one hundred Windows APIs. This shall continue until a complete WASCTS is available on the web site.

j. In the event that a planned update to Windows or any other Microsoft product is expected to result in the creation of new Windows APIs or Essential Claims, or WASEG's list of Windows APIs is updated, the WASEG shall create addenda to the WASD and WASCTS covering the new Windows APIs or Essential Claims, make them available via its web site, and undertake to submit them to the same standards body as above as an addendum to the standard.

Third, in section VI, Definition A should be amended to read

A. ''Application Programming Interfaces (APIs)'' means the interfaces, including any associated callback interfaces, that Microsoft Middleware or Popular Windows Applications running or being installed on a Windows Operating System Product use to call upon that Windows Operating System Product or Microsoft Middleware in order to obtain any services from that Windows Operating System Product or Microsoft Middleware. and two new definitions should be added:

V. ''Popular Windows Applications'' means the top 10 selling applications as reported by NPD Intelect Market Tracking in each of the categories Business, Education, Finance, Games, Personal Productivity, and Reference, plus all Microsoft Middleware Products.

W. ''Essential Claims'' shall mean all claims in any patent or patent application, in any jurisdiction in the world, that Microsoft owns, or under which Microsoft has the right to grant licenses without obligation of payment or other consideration to an unrelated third party, that would necessarily be infringed by implementation of the Windows APIs Standard Definition by a competing Operating System. A claim is necessarily infringed hereunder only when it is not possible to avoid infringing it because there is no non-infringing alternative for implementing the required portion of the Windows APIs Standard Definition.

The following are expressly excluded from and shall not be deemed to constitute Essential Claims:

1. any claims other than as set forth above even if contained in the same patent as Essential Claims; and

2. claims which would be infringed only by portions of an implementation that are not required by the Windows APIs Standard Definition, or enabling technologies that may be necessary to make or use any product or portion thereof that complies with the Windows APIs Standard Definition but are not themselves expressly set forth in the Windows APIs Standard Definition (e.g., compiler technology, object-oriented technology, etc.) or the implementation of technology developed elsewhere and merely incorporated by reference in the body of the Windows APIs Standard Definition.

Prohibition of More Practices Toward OEMs

§ III. A. 2. of the Proposed Final Judgment should be amended to read

2. shipping a Personal Computer that (a) includes both a Windows Operating System Product and a non-Microsoft Operating System, or (b) will boot with more than one Operating System, or (c) includes a non-Microsoft Operating System but no Windows Operating System Product; or ...

Summary

This document demonstrates that there are so many problems with the PFJ that it is not in the public interest.

It also illustrates how one might try to fix some of these problems.

Ms. Hesse,

Please find below a joint open letter signed by 2366 people from across the United States. I composed the open letter and offered to collect signatures by email as a simple way for people to express their views on the Proposed Final Judgment.

I certify that the following list of names was compiled from email sent to petition@kegel.com; that return email was used to provide some small degree of assurance that each submission came from a valid email address; and that I have verified to the best of my ability that all co-signers are US residents or citizens.

I am sending the document (http://www.kegel.com/remedy/remedy2.html) referenced in the joint open letter under separate cover as my personal Tunney Act comment.

Sincerely,
Dan Kegel

Washington, DC 20530–0001

Ms. Hesse,

Under the Tunney Act, we wish to comment on the proposed Microsoft settlement. We agree with the problems identified in Dan Kegel's analysis (on the Web at http://www.kegel.com/remedy/remedy2.html), namely:

* The PFJ doesn't take into account Windows-compatible competing operating systems

o Microsoft increases the Applications Barrier to Entry by using restrictive license terms and intentional incompatibilities. Yet the PFJ fails to prohibit this, and even contributes to this part of the Applications Barrier to Entry.

* The PFJ Contains Misleading and Overly Narrow Definitions and Provisions

o The PFJ supposedly makes Microsoft publish its secret APIs, but it defines ''API'' so narrowly that many important APIs are not covered.

. The PFJ supposedly allows users to replace Microsoft Middleware with competing middleware, but it defines ''Microsoft Middleware'' so narrowly that the next version of Windows might not be covered at all.

. The PFJ allows users to replace Microsoft Java with a competitor's product —but Microsoft is replacing Java with .NET. The PFJ should therefore allow users to replace Microsoft.NET with competing middleware.

. The PFJ supposedly applies to ''Windows'', but it defines that term so narrowly that it doesn't cover

Windows XP Tablet PC Edition, Windows CE, Pocket PC, or the X-Box—operating systems that all use the Win32 API and are advertised as being ''Windows Powered''.

. The PFJ fails to require advance notice of technical requirements, allowing Microsoft to bypass all competing middleware simply by changing the requirements shortly before the deadline, and not informing ISVs.

. The PFJ requires Microsoft to release API documentation to ISVs so they can create compatible middleware—but only after the deadline for the ISVs to demonstrate that their middleware is compatible.

. The PFJ requires Microsoft to release API documentation—but prohibits competitors from using this documentation to help make their operating systems compatible with Windows.

. The PFJ does not require Microsoft to release documentation about the format of Microsoft Office documents.

. The PFJ does not require Microsoft to list which software patents protect the Windows APIs. This leaves Windows-compatible operating systems in an uncertain state: are they, or are they not infringing on Microsoft software patents? This can scare away potential users.

* The PFJ Fails to Prohibit Anticompetitive License Terms currently used by Microsoft

. Microsoft currently uses restrictive licensing terms to keep Open Source and Free Software apps from running on Windows.

. Microsoft currently uses restrictive licensing terms to keep Windows apps from running on competing operating systems.

. Microsoft's enterprise license agreements (used by large companies, state governments, and universities) charge by the number of computers which could run a Microsoft operating system—even for computers running competing operating systems such as Linux! (Similar licenses to OEMs were once banned by the 1994 consent decree,)

* The PFJ Fails to Prohibit Intentional Incompatibilities Historically Used by Microsoft

. Microsoft has in the past inserted intentional incompatibilities in its applications to keep them from running on competing operating systems.

* The PFJ Fails to Prohibit Anticompetitive Practices Towards OEMs

. The PFJ allows Microsoft to retaliate against any OEM that ships Personal Computers containing a competing Operating System but no Microsoft operating system.

. The PFJ allows Microsoft to discriminate against small OEMs—including regional ''white box'' OEMs which are historically the most willing to install competing operating systems—who ship competing software.

. The PFJ allows Microsoft to offer discounts on Windows (MDAs) to OEMs based on criteria like sales of Microsoft office or Pocket PC systems. This allows Microsoft to leverage its monopoly on Intel-compatible operating systems to increase its market share in other areas.

* The PFJ as currently written appears to lack an effective enforcement mechanism. We also agree with the conclusion reached by that document, namely that the Proposed Final Judgment, as written, allows and encourages significant anticompetitive practices to continue, would delay the emergence of competing Windows-compatible operating systems, and is therefore not in the public interest.

It should not be adopted without substantial revision to address these problems.

Sincerely,

Andrew D. Hwang, Worcester, MA; Professor, College of the Holy Cross
Andrew Gray, Las Vegas, NV; Systems Administrator, University of Nevada
Andrew Helsley, Calabasas, CA; Student, University of California, Riverside
Andrew Hermetz, Dayton, Ohio; TechnoShaman, Humanadyne
Andrew Hon, Berkeley, California; Student, University of California Berkeley
Andrew James Alan Welty, Twentynine Palms, CA; n/a
Andrew J. Murren, Mendham, NJ; Partner, Omni-Tech Solutions
Andrew Klenzak, Atlanta, GA; Embedded Software Engineer, CIENA Corporation
Andrew Klopp, Denver, CO; HelpDesk Supervisor, Ultimate Electronics
Andrew Lenharth, Everett, WA; Information Technology Systems Specialist, State of Washington
Andrew Longton, Rockville, M/D; President, Metamark Corporation
Andrew Lubbers, Phoenix, AZ; Software Engineer, Helm Software
Andrew Lundberg, Baltimore, Maryland; Staff Engineer, Equinox Corporation
Andrew M. Page, Ithaca, NY; Media Assistant, Cornell University
Andrew O'Brien, Wyomissing, PA; Sattelite Communications Instructor, NATO
Andrew Park, Cleveland, Ohio; Systems Analyst, Federal Reserve Bank of Cleveland
Andrew Pavelchek, San Diego, CA; Sr. Electrical Engineer, Maxima Corporation
Andrew Pfiffer, Aloha, OR; Software Developer, Citizen of USA
Andrew Spencer, Salt Lake City, UT; Software Engineer, falling blue
Andrew S. Zbikowski, Minneapolis, MN; Information Technology Specalist, University of Minnesota Computer Science Dept
Andrew Valkanas, Chicago, IL; Student, NEIU
Andy Barclay, Concord, California; Solaris Systems Architect, Digital Island
Andy Catalano, College Place, WA; Student, Walla Walla College
Andy Chin, Los Angeles, CA; Student, University of California, Los Angeles
Andy Cristina, New Orleans, Louisiana; Student, University of New Orleans, Penta Corporation
Andy Mroczkowski, Philadelphia, PA; , Drexel University
Andy Wismar, Cleveland, Ohio; Internet Application Developer, Weatherhead School of Management
Angus Crome, Maryville, IL; Systems Administrator, n/a
Anthony Britton, Fairfax, Virginia; Network Engineer, N/A
Anthony Lastowka, Philadelphia, PA; NT/ W2K/Linux Administrator, University of Pennsylvania Medical School
Anthony L Borchers, Coconut Creek, Florida; Senior Engineer, PowerVision Corporation
Anthony McDowell, MS State University, MS; Student, Mississippi State University
Anthony Spears, Ames, Iowa; Software Developer, Universal Systems and Technologies (UNITECH)
Antone Roundy, Spanish Fork, UT; Manager, Mouken
Antonio Arredondo, San Jose, CA; Student, n/a
Ara Aroyan, Davis, California; CSE Student, UC Davis
Aric Stewart, Minneapolis, MN; Programmer, CodeWeavers

Ari Turetzky, Normal, IL; Development Team Lead, Illinois State University
Aron S. Spencer, Irvine, CA; Ph.D. Candidate: Graduate School of Management, UC Irvine
Arrigo Benedetti, Los Angeles, CA; Staff scientist, Caltech
Arthur Corliss, Anchorage, AK; Independent Programmer, n/a
Arthur Michaels, Parsippany, NJ; Software Engineer/Technologist, Lucent Technologies
Art Johnson, Los Angeles, California; Member lula.org, linuxatlax.org, CSC-SERC
Artur Kedzierski, Walnut, CA; Graduate Student, University of California
Ashley M. Kirchner, Boulder, Colorado; System Administrator, Photo Craft Laboratories, Inc.
Athur Abraham, Oakland, CA; Senior Software Engineer, A-Squared Systems Group
Attila Mate, New York, NY; Professor of Mathematics, Brooklyn College of CUNY
Audrey Lee, Princeton, New Jersey; Graduate Student (PhD program in Electrical Engineering), Princeton University
Aurangzeb M. Agha, San Francisco, CA; President and CEO, Missing Link Technology Partners
Austin Schutz, Portland, OR; Sr. Network Engineer, Global Crossing
Barak A. Pearlmutter, Albuquerque, N-M; Professor, University of New Mexico
Barrett Sylvies, Woodland Hills, CA; Field Service Technician, n/a
Barrington King, Washington, DC; Co-Founder, Wyrdwright
Barry E. Tolnas, Olympia, WA; Adjunct Faculty, The Evergreen State College
Barry Rountree, San Diego, CA; Software Engineer, Freelance
Barry Wilson, Beaverton, OR; Software Engineer, n/a
Baxter Michael Gilley, Chester, VA; Student, ECPI Technical College
B. Charles Reynolds, Seward, Alaska; Independant Business Owner, Unicity Network
Benjamin C. Kite, Santa Cruz, CA; n/a
Benjamin Cressey, Chapel Hill, NC; Systems Architect, n/a
Benjamin Gilbert, Pittsburgh, PA; Engineering student, Carnegie Mellon University
Benjamin J. Liberman, Santa Fe, NM; Programmer/Analyst, Accent Optical Technologies
Benjamin Moore, Marina del Rey, California; Programmer Analyst IV, USC Institute for Creative Technologies
Benjamin Morse, Somerville, Massachusetts; Student, MIT
Benjamin Moser, Floyds Knobs, Indiana; System Engineer, Kimball International
Benjamin R. Eastwood, Albany, CA; IT Manager, wilweb.com
Benjamin Russo, Herndon, Virginia; UNIX Systems Administrator, Currently Unemployed
Benjamin W Pearre, Cambridge, MA; Research Associate, MIT
Ben Messinger, Kennewick, WA; Network Systems Administrator, HFG
Bennett Neale, Santa Monica, California; Software Engineer, Edmunds.com
Ben Penning, San Diego, CA; Web Programmer, Einstein Industries
Ben Wilson, Louisville, KY; Systems Analyst/Designer, Corvus Digital Solutions
Beth A. Roe, Sarasota, Florida; Financial Controller & Consumer
Bevan C. Bennett, Pasadena, California; Manager of Information Technology, n/a
Bill Abbas, Sanford, FL; Senior Systems Architect, CRM Solutions
Bill Bennett, Gallatin, Tennessee; President, Double B Consulting
Bill Bisho, Colorado Springs, Colorado; V.P. Information Technology, H.I.S. Financial Services Corp.
Bill Brody, Troy, Michigan; Electrical Engineer, n/a
Bill Bryan, Paso Robles, California; Owner, Paralegal Services
Bill Cunningham, Sparks, NV; Technical Lead, Bally Gaming and Systems
Bill Denney, LaGrange, GA; College Student, Georgia Institute of Technology
Bill Ezell, Manchester, NH; Sr. Software Architect, Granite Systems
Bill Glover, Amarillo, TX; Enterprise Java Architect, n/a
Bill Huey, San Diego, CA; Software Engineer
Bill Jetzer, Madison, WI; Software Developer, SVA Consulting
Bill Sconce, Milford, NH; President, In Spec, Inc.
Bill Toole, New York, NY; self employed, n/a
Binu Parayil, Ocean, NJ; System Engineer, n/a
Blake Huber, Austin, TX; Director of Eng. Operations, Coremetrics
Blake Wesley Thomas, Chicago, Illinois; Student, Senior Tutor, CS, University of Chicago
Bob Alvarez, Chicago, IL; Human Factors Engineer/Software Engineer, bobalvarez.net
Bob Armstrong, Conway, MA; Consulting Engineer, Compaq
Bobby Hays, Lawrenceville, GA; Graphic Systems Developer, Network Communications, Inc.
Bob Dehnhardt, Reno, NV; n/a
Bob Hardy, Santa Clara, CA; UNIX Sysadmin, Sanmina-SCI Corp.
Bob Horvath, Arlington Heights, IL; Software Engineer, n/a
Bob Mileti, Torrington, CT; President, Trlby Innovative
Bob Nicksic, Chicago, IL; Technical Product Manager, Peter Martin Associates
Bob Pendleton, Round Rock, Texas; Owner, Gameprogrammer.com
Bob Stephan, Pebble Beach, California; Owner/Consultant, Moby Disk
Boyce Fullmer, Plano, TX; Systems Analyst, Flash Computers and Networks
Brad Baylor, Columbus, OH; Supervisor, Qwest
Bradford Carpenter, Camino, CA; Database Programmer, Construction NewsNet
Brad Garcia, Freedom, PA; Senior Software Engineer, n/a
Brad Harvell, Chandler, AZ; Senior Engineer, n/a
Bradley Greger, Los Angeles, CA; Neuroscientist, Caltech
Bradley J. Christensen, Berrien Springs, Michigan; Oracle Database Administrator, Andrews University
Bradley M. Alexander, Amissville, VA; Security Engineer, VeriSign (acting on my own accord...)
Bradley R. Stone, Columbus, Ohio; Graduate Student, The Ohio State University
Brad Midgley, Salt Lake, Utah; Developer, n/a
Brad Myers, Bridgeport, WV; Senior Systems Administrator, n/a
Brad O'Hearne, Irvine, CA; Software Engineer
Brad Showalter, Richmond, VA; Information Security Specialist, Federal Reserve Bank— Richmond
Brad Smith, Savannah, GA; Computer Engineering Major, Georgia Institute of Technology
Brandi Weed, Davis, CA; Consultant
Brandon Low, Chicago, Illinois; Graphics and Imaging Specialist, Copytec, Inc.
Brandon M. Reynolds, Akron, Ohio; Systems Engineer, Commercial Timesharing Inc. [http://www.comtime.com/]
Brandon Neill, Westminster, CO; Technical Support Engineer, Sun Microsystems
Brandon Stephens, Huntsville, AL; Network Security Administrator, CFD Research Corp
Brendan Billingsley, Boulder, Colorado; Student, University of Colorado at Boulder
Brendan Bouffler, New York, New York; Global Tech Support Manager, Proximity Corp
Brendan Byrd, Louisville, KY; Web Programmer, Resonator Software
Brent Bryan, Friday Harbor, Washington; Student, Yale University
Brent Chivers, Arlington, VA; Systems Administrator, Mitretek Systems
Brent Geske, Vancouver, WA; Software Engineer, self
Brent Laminack, Atlanta, GA; Director of e-commerce, Enweben, LLC.
Brent Pickert, Scottsdale, Arizona; Student, Arizona State University
Brett Barton, Dublin, OH; Pricing Coordinator, Ashland Distribution Company
Brett Carter, Portland, OR; Web Engineer, Kavi
Brett Coon, Milpitas, CA; Technical Director, n/a
Brett Johnson, Windsor, CO; Software Engineer, n/a
Brett Kislin, Pompano Beach, FL; Pres., Kislin Consulting
Brett Lorenzen, Alexandria, VA; Consultant and Developer, n/a
Brett Miller, Nashville, TN; Systems Administrator, n/a
Brett Peckinpaugh, Denver, Colorado; System Support Specialist, Avaya
Brett Presnell, Gainesville, Florida; Associate Professor, University of Florida
Brett Sanger, Williamsburg, VA; Web Programmer, n/a
Brett Schwarz, North Bend, WA; Lead Network Engineer, n/a
Brian Allemana, Chicago, IL; Web Developer/Consultant, n/a
Brian A. Redding, Champaign, IL; Software Engineer, n/a
Brian Beveridge, Oakland, CA; General Partner, Paradigm Three
Brian Casten, Elgin, IL; Student, Columbia College
Brian Chiko, Saratoga, California; VP Marketing, Vpacket Communications

Brian Cleverly, Sacramento, CA; ex Software Developer and now angry captive Microsft user., Anzam Yacht Refurbishing
Brian Davis, Beaverton, OR; Unix Systems Administrator, n/a
Brian Dellert, Prior Lake, MN; Software Developer, Independent Consultant
Brian DeRosa, Elk Grove Village, IL; Principal, The Net Squad
Brian D. Klar, Dayton, OH; VTC Engineer, OTS / WPAFB
Brian Fahrlander, Evansville, Indiana; Owner, Kamakiriad.com
Brian Feathers, Arlington, VA; Consultant, n/a
Brian Filipiak, Ypsilanti, MI; Grant Associate, Eastern Michigan University
Brian Grossman, Fort Collins, Colorado; President, SoftHome
Brian Hall, Colorado Springs, CO; Software Engineer, Northrop Grumman
Brian Hellman, Osceola, IN; IT manager, 1st Source Bank
Brian Horton, Pflugerville, TX; n/a
Brian J. Brondel, Springfield, MO; Student, Southwest Missouri State University
Brian Johnson, Durham, NC; IT Analyst, Duke University
Brian Kelly, Chicago, Illinois; Student, DePaul University
Brian Koppe, Buffalo Grove, IL; Undergraduate Student, DePaul University
Brian LaMere, San Diego, California; UNIX Sysadmin, Diversa
Brian Lau, Huntington Beach, CA; Software Engineer, Gordian Inc.
Brian Martin, Champaign, IL; Webmaster, Farm Credit Services
Brian Mason, Hinesburg, Vermont; Web Developer, Image Mason Design
Brian McFadden, Altamonte Springs, Florida; Device Driver Engineer, CDP
Brian M. Fisher, Chapel Hill, NC; Graduate Student in Nuclear Physics, University of North Carolina at Chapel Hill
Brian M. Schkerke, St. Louis, MO; Vice President Information Systems, NETCO
Brian Olsen, Aurora, Colorado; Senior Software Developer, Pixxures Inc.
Brian P. Bilbrey, Sunnyvale, CA; IT/Web/Consultant/Author, Orb Designs
Brian Redfern, Los Angeles, CA; Linux Programmer
Brian Reichert, Bethlehem, PA; Systems Engineer, n/a
Brian R. Furry, Hackettstown, New Jersey; Mathematics and Computer Science Teacher, Watchung Hills Regional High School
Brian R. Swan, Elgin, Illinois; internetwork Solutions Engineer, ThruPoint
Brian Strand, Oakland, California; CTO, Switch Management
Brian Teague, Houston, TX; Computer Science student, Rice University
Brian Templeton, Starkville, MS; Student, Mississippi State University
Brian T. Johnson, Bainbridge, GA; Electronics Calibration Specialist, USN
Brian Vincent, Breckenridge, CO; Telecom Engineer, Copper Mountain
Brian Weir, Cleveland, Ohio; student, Hiram College
Bridgette Ruggles, Waldwick, NJ; Computer Support/Web Designer, Cline
Brien Dieterle, Chandler, Arizona; Computer Technician, Maricopa Community Colleges
Brock Organ, Chapel Hill, NC; QA Engineer, Red Hat Inc
Bruce Armstrong, Orem, Utah; Software Quality Assurance Engineer, NTT/Verio (www.verio.net
Bruce Buckelew Oakland, CA; Director, Oakland Technnology Exchange—West
Bruce E. Birch San Diego, California; Information Systems Administrator, Biostruct
Bruce Hamilton Redondo Beach, CA; n/a
Bruce Horn, Mammoth Lakes, CA; Chief Technical Officer, Marketocracy, Inc.
Bruce McCready, Baltimore, FiD; Software Engineer, Advertising.com
Bruce McFarland, wilmington, DE; President, Absolute Systems Inc
Bruce Rakes, Atlanta, GA; CTO, Zmed
Bruce Rogovin, Cincinnati, Ohio; President, Bruce J. Rogovin DMD
Bruce Timberlake, Carlsbad, CA; Technology Engineer, Sun Microsystems
Bruce W. Calkins, Wales, MA; n/a
Bryan Carpenter, Loveland, CO; Software Development Engineer, Agilent Technologies
Bryan Durkee, Oshkosh, WI; NT Server Manager, Winnefox Library System
Bryan Housel, Philadelphia, PA; Software Engineer, CIM of Philadelphia
Bryan Newman, Seattle, WA; Programmer, n/a
Bryan Waterman, Monterey, CA; Lieutenant, DOD
Bryce Schober, Seattle, WA; Software Engineer, Dynon Development
Buckley Collum, Los Angeles, CA; Partner, MenaceFX
Buford Lemon, Midland, MI; Dr., A Big Chemical Company
Caleb Mardini, Bellevue, WA; Real Estate Coordinator, WhyNotOwn.com
Calvin Harrigan, Atlanta, Georgia; Software Engineer, n/a
Calvin S. Taylor Jr., Tigard, Oregon; President, Sandforge Engineering
Canyon Russell, Tulsa, Oklahoma; Consultant, n/a
Carl Alexander, Watertown, Massachusetts; Senior Systems and Network Administrator, Technical Education Research Center
Carl Christian Brink, Portland, OR; CTO, ONSITE! Technology
Carl Drake Jr, Chillicothe, OH; Commander USN(Ret)
Carl Friedberg, New York, NY; President and CEO, Comet and Company
Carlie J. Coats, Jr., Ph.D., Chapel Hill, NC; Mathematician/Analyst, MCNC-Environmental Modeling Center
Carl J. Youngdahl, Ph.D., Evanston, IL; Software/Content Developer, n/a
Carl Klutzke, Indianapolis, IN; Software Developer, Covance Inc.
Carl M. Holmberg, Kihei, HI; Systems Analyst, AFRL—Maui High Performance Computing center
Carl M. Keil, Portland, OR; Multimedia Producer, Portland Community College
Carl Mueller, Seattle, WA; Software Engineer, Nintendo
Carlos Eberhardt, White Bear Twp, MN; Consultant / Software Engineer, n/a
Carlos Santellanes, Montebello, California; Graphic Designer, Freelance
Carl Spangenberger, Wyoming, Michigan; Software Engineer, n/a
Carl Youngblood, Orem, Utah; Software Engineer, n/a
Caroline Lambert, Palo Alto, CA; IT Infrastructure Manager, Agilent Technologies
Carolyn Cooper, Princeton, NJ; Computer Science graduate student, Johns Hopkins University
Carroll Grigsby, Raleigh, NC; Retired, n/a
Cary Roys, Aurora, IL; Resnet Consultant, North Central College
Case Matthew Wiedner, Arlington Heights, Illinois; Network Administrator, American Telephone and Telegraph
Casey Gordon, Athens, Georgia; Web Administrator, College of Family & Consumer Sciences
Casey Hutchinson, Santa Cruz, CA; Network Administrator, Nadel Phelan, Inc.
Catherine Jenkins, Cambridge, MA; Student, MIT
C. Brandon Forehand, Pflugerville, TX; Software Developer, n/a
Cerrise Weiblen, Louisville, Colorado; Freelance XA, XA Business Services
Chadd Horanburg, Ferndale, MI; Security Engineer, Internet Security Systems
Chad Kavanaugh Bisk, Reston, Va; Senior Consultant, Braun Consulting
Chad Kay, Milwaukie, Oregon; n/a
Chad Margetts, West Jordan, Utah; Independent Consultant, Ron Allen Consulting Services
Chad Miller, Valdosta, GA; Developer, Debian
Chad Vogelsong, Carlisle, PA; Student, The Pennsylvania State University
Charles B. Cranston, Burtonsville, Maryland; Staff computer programmer, University of Maryland at College Park
Charles Borner, Lisle, IL; Owner, EvilNET.net
Charles D. Galler Jr., Houston, Tx; System Admin, C2C Fiber
Charles D. McJilton, Laporte, Colorado; System Administrator, JYM Information Systems LLC
Charles Durst, Arlington, MA; Senior Software Engineer, n/a
Charles E Chandler III, New Orleans, LA; Computer Technician, Computer Source, LLC.
Charles E Mason IV, Tallahassee, FL; Student, Florida State University
Charles E. Oesterle, Plymouth, Michigan; programmer, CEO Image Systems
Charles F. McKnight, Fayetteville, Arkansas; PC/LAN Specialist, Mercy Health Systems— NWA
Charles Forsythe, Dallas, TX; Enterprise Systems Consultant, Texas Home Health of America
Charles F. Wilkins, III, Houston, TX; Systems Analyst, Cullen College of Engineering
Charles Hasegawa, Mesa, Arizona; Software Engineer, Cottonwood Technology Group
Charles Hinson, King of Prussia, PA; Senior Engineer, Avercom
Charles Hopkins, Foothill Ranch, CA; Systems Analyst, Boeing Satellite Systems
Charles Hurlocker, Renton, WA; Retired Software Engineer
Charles Jenkins, Oak Ridge, Tennessee; Software Developer, n/a
Charles Kendrick, San Francisco, CA; Co-Founder and Chief Technology Officer, Isomorphic Software

Charles Kerr, Oklahoma City, OK; Senior Software Engineer, University of Oklahoma
Charles Krug Smart, Pittsburgh, Pennsylvania; Undergraduate Student, Carnegie Mellon University
Charles Kuske, New York, NY; Engineer, Metropolis DVD
Charles L. Hethcoat III, Houston, Texas; Concerned citizen, n/a
Charles Mattice, Stone Mountain, GA; Technical Director, Permite Corporation
Charles Mercer, Wichita, KS; Lead Analyst, Cessna Aircraft Company
Charles Noble Baker, Van Nuys, California; Systems Administrator, Solar Webb, INC
Charles ''Pat'' Kelley, Norcross, Georgia; Firmware Engineer, Enrev Power Solutions
Charles R. Fry, Sunnyvale, California; Computer Scientist, n/a
Charles Steinkuehler, Topeka, KS; Electronics Engineer, NewTek Partners; member, Linux
Router Project
Charles Wiltgen, San Diego, CA; Product Manager, PacketVideo
Charlie Eidem, Rohnert Park, California; Student, Sonoma State University
Charlie Kilian, Wamego, KS; Director of Software Development, Aphelion Studios
Charlie Zender, Irvine, CA; Professor of Earth System Science, University of California at Irvine
Chase Caster, Ames, IA; Student, Iowa State University
Chase Grund, Dayton, Ohio; Web Administrator, LOGTEC, Inc.
Chester Hoster, Dallas, TX; IT Network Engineer, n/a
Chip Hart, Burlington, VT; Director of Marketing, Physician's Computer Company (PCC)
Chip Witt, Santa Rosa, CA; Sr. Network Administrator, Westwave Communications, Inc.
Chris A. Miller, Omaha, NE; Application Architect, Withheld out of fear
Chris Armstrong, Sterling, VA; Product Engineer, America Online, Inc.
Chris Bare, Fort Lauderdale, FL; Technical Director, Metro Link Incorporated
Chris Barr, Wayland, MA; Software Engineer, Strider Software, Inc.
Chris Beattie, Columbia, South Carolina; System Administrator, Independent
Chris Bopp, Honolulu, HI; System Administrator, Travel Hawaii
Chris Carlin, Baton Rouge, Louisiana; Student, Texas A&M University
Chris Davis, Minneaplois, MN; Software Developer, KRS Software
Chris Dawson, Portland, Oregon; Software Engineer, Contractor
Chris Dos, Highlands Ranch, CO; President, Open Innovations
Chris Gamble, Grapvine, Texas; Developer, CPB Inc
Chris Gebhardt, State College, PA; Student of Computer Engineering, The Pennsylvania State University
Chris Hadley, Memphis, TN; System Engineer, Infuturo
Chris Hamilton, Anchorage, AK; IT Contractor, C&S Management Associates
Chris Harmon, Copley, Ohio; Student, University of Akron
Chris Holland, Costa Mesa, CA; Programmer, Contractor's Source Inc
Chris Hruska, Ithaca, NY; Graduate student, Cornell University
Chris Humphres, Durham, North Carolina; Software Engineer, n/a
Chris Lea, Los Angeles, CA; Senior Technologist, Lucid Designs
Chris Loendorf, Sacaton, Arizona; Project Director, Gila River Indian Community Cultural Resource
Chris March, Buffalo, NY; Network Administrator, Prep Incorporated
Chris Marckel, Minneapolis, Mn; QA analyst, IBMGS
Chris Mccraw, Denver, CO; unix consultant, independent
Chris McGraw, Clark, SD; Information Systems Operator/Maintainer, SDARNG
Chris Monson, Provo, UT; Chief Architect, Orangatango
Chris Rabkin, Naples, Florida; Internet Business Strategist, imageProjektions-DGL
Chris Scheller, Palmdale, CA; Presidnet/ Founder, Antelope Valley Linux Users Group
Chris Sexton, Raleigh, NC; Student, North Carolina State University
Chris Sutton, Seattle, WA; Software Engineer, iFloor.com
Chris Telfer, West Lafayette, Indiana; Graduate Student, Purdue University
Christian Greika, Atlanta, GA; Software Engineer, NCR Corporation
Christian H=F61tje, San Jose, Texas; Lead Developer, Rackspace Managed Hosting
Christian Schumann-Curtis, Denver, CO; R&D Manager, Pixxures
Christian Walker, San Francisco, California; Software Developer, Ubiquitos Information
Christine Eck, Columbia, FID; software engineer, n/a
Christopher A. Baumbauer, Lafayette, IN; student, Purdue University
Christopher A. Worth, Louisville, KY; Biomedical Engineer, Univ. of Louisville
Christopher Caldwell, Woburn, Massachusetts; Chief Engineer, Interliant Corporation
Christopher Corayer, Newton, MA; Network Engineer, ADE Corporation
Christopher Elmquist, St. Paul, MN; Software Engineer, Elmquist Microsystems
Christopher Fitch, Memphis, TN; Senior Software Engineer, n/a
Christopher Foley, Atlanta, Georgia; Systems Engineer, Stevens Communications
Christopher Holley, Durham, NC; Medical Student, Duke University Medical School
Christopher J. Armstrong, Clinton, Pennsylvania; Web Developer, NOVA Chemicals
Christopher J. Kucera, Green Bay, WI; Software Engineer, n/a
Christopher Mende, Colorado Springs, Colorado; Systems Engineer, Raviant Networks
Christopher Michael Werner, Brooklyn, New York; Student, SUNY Binghamton
Christopher N. Lawrence, Oxford, MS; Computer Systems Manager, University of Mississippi
Christopher O'Brien, Raleigh, North Carolina; Contracted Developer, CDI
Christopher Palow, Miami, Florida; Student Computer Engineering, Carnegie Mellon University
Christopher Park, Jacksonville, Florida; Software Developer, Independant
Christopher Plummer, Flemington, NJ; Lotus Notes Administrator, Independent Contractor
Christopher R. Wren, Cambridge, Massachusetts; Research Scientist, MERL
Christopher Sean Morrison, Aberdeen, FID; Senior Software Engineer, U.S. Army Research Laboratory
Christopher Smith, Los Angeles, California; Senior Technologist, Xdrive Technologies
Christopher S. Swingley, Fairbanks, Alaska; Computer / Network Manager, University of Alaska Fairbanks
Christopher Vargas, Arlington, VA; Web Publisher, HHMI
Christopher Wallace, Austin, TX; System Architect, Dell Computer Corporation
Christopher Weuve, Alexandria, VA; Senior Research Specialist, n/a
Christopher Wolske, Gaithersburg, MD; Consultant, n/a
Chris Turner, El Paso, TX; Graduate Student, UTEP
Chris Watson, Wellington, KS; President, Open Systems Inc.
Chris Wells, Lexington, KY; Software Engineer, rpcnet.com
Chris Williamson, Wilmore, KY; Instructional Technology Assistant, Asbury College
Chris Wingate, Fort Wayne, Indiana; Real Estate Investor, n/a
Chris Worley, SLC, UT; Programmer, Liberate Technologies
Chuck Messenger, Rochester, NY; Software engineer, self employed
Chuck Moss, Manassas, VA; President, Complete Network Solutions
C. J. Keist, Fort Collins, CO; UNIX admin, Colorado State University
Clark N. Quinn, Walnut Creek, CA; Executive Director, OtterSurf Labs
Claude Keswani, Boston, Massachusetts; Student, University of Massachusetts
Claudia Santoro, Somerville, MA; Systems Architect, Elm Square Technologies
Clay J. Claiborne, Jr., Los Angeles, California; President, Cosmos Engineering Company; Founder, lula.org
Clayton S. Chan, Irvine, CA; Computer Technician, n/a
Clif Cox, Eugene, OR; System administrator, OCFnet cliff Earle, Sunland, CA; n/a
Clifton Leonard, Oklahoma City, OK; Systems Engineer, CACI
C. Megan Larko, Laurel, FiD; Systems Administrator, NASA Goddard Space Flight Center
C. Michael McCallum, Elk Grove, CA; Associate Professor of Chemistry, University of the Pacific
Colin Dean, Volant, PA; Web Designer, Student, Freelance
Colin Kinlund, Bristol, Vermont; Student, The Red Cedar School
Colin Spencer, Norfolk, VA; Consultant, Independent
Colin Steele, Charlottesville, VA; n/a
Colleen Shannon, San Diego, California; Programmer/Analyst, CAIDA, San Diego Supercomputer Center, UCSD
Collin Anderson, Osceola, IN; Student, Penn High School
Conan Heiselt, Fremont, California; Systems Engineer, Kodak

Connor Smith, New York, NY; Computer Support, Cline Davis & Mann
Conrad Clark, Morgantown, WV; IT Consultant, Self Employed
Cory McKinstry, Austin, TX; Field Engineer, Northrop Grumman Information Technology
Coy T. Thorp, Vallejo, California; Network Systems Administrator, MDL Information Systems
Craig Butcher, Chelsea, Michigan; Foreman, University of Michigan Plant AC Shop
Craig I. Hagan, Seattle, Washington; Systems Engineer, n/a
Craig R. Campbell, Everett, WA; Software Engineeer, Fluke Networks
Craig Sparks, Overland Park, KS; Former CEO, NetGames USA (acquired by Microsoft)
Craig Van Degrift, Los Angeles, CA; President, Kanji-Flash Softworks
Craig Welch, Denver, Colorado; Systems Administrator, Consulting
Craig Znamierowski, Charlton, MA; Network Engineer, GweepCo
CR Jones, Walnut, MS; Systems Engineer, Consultant
C. Scott Ananian, Cambridge, MA; PhD student, Massachusetts Institute of Technology
Curt Cox, University City, MO; Programmer, n/a
Curt Holmer, Sterling, VA; Chief Consultant, CIHolmer Consulting Inc., http://www.ciholmer.com
Curtis Lisle, Orlando, FL; Visual Systems Scientist, SGI
Curtis R. Danner, Batavia, IL; Tech Specialist, Fermilab
Curtis Rey, Madison, Wisconsin; R.N.B.S.N., Saint Marys Hospital
Curtis Rushing, Lake St. Louis, MO; President, Rushing Consulting Inc.
Curtis Turner II, Central, South Carolina; Systems Administrator, Integrated Support Systems, Inc.
Curtis Wood, Corpus Christi, Texas; System Administrator/Architect, BlueDomino Hosting
Curt Jacobson, Kalispell, MT; n/a
Curt Pederson, Madison, Wisconsin; Software Engineer, Berbee
Cushing Whitney, Hoboken, NJ; Information Security Consultant, n/a
Cyril Bortolato, Campbell, CA; Staff Software Engineer, Adaptive Silicon
Dagny Haug, Minneapolis, MN; Associate Program Director, University of Minnesota
Dale Schoeck, Houston, TX; Concerned Citizen, Individual
Dallas Legan, Downey, California; Member, linuxatlax.org
Damian Cunniff, Harrington Park, NJ; Computer Science, Ramapo College of NJ
Damon A. Brown, Alexandria, VA; Consultant, Booz √ Allen √ Hamilton
Damon A. Schmidt, Brooklyn Center, PIN; PC Analyst/Intel Servers Support, Provell
Damon Cann, Port Jefferson, New York; Ph.D. Student, SUNY at Stony Brook
Damon Casantini, King of Prussia, PA; Computer Technician, n/a
Damon C. Richardson, St. Louis, MO; Software Developer, Express Scripts
Dana L. Parso, San Francisco, CA; Administrator, Santos & Urrutia
Dan Berger, Chino Hills, CA; Software Engineer, n/a
Dan Bidwa, Pittsburgh, Pennsylvania; Multimedia Technologist, Carnegie Mellon University
Dan Carrigan, Yellow Springs, OH; Librarian, Antioch College
Dan Devine, Seattle, Washington; n/a
Dane Johnson, Minneapolis, MN; Senior Systems Analyst, Supervalu
Danial Hinshaw, Honolulu, Hawaii; Electrician, Federal Employee
Danial Howard, Pocatello, ID; IT Programmer/Analyst, Idaho State University
Daniel Boudrot, Lewisville, TX; SW Engineer, ForeLogic, LLC
Daniel Bungert, State College, PA; Student, Pennsylvania State University
Daniel Bunn, Bedford, Virginia; Talent Scout / Artist, EB Muzik
Daniel E. Shown, St. Louis, MO; Administrative Secretary, Saint Louis University
Daniel Fuhr, Topeka, KS; Intern, Kansas Department of Health and Environment
Daniel Gryniewicz, Ann Arbor, Michigan; Software Engineer, Nexthop Technologies
Daniel Helfman, Los Angeles, California; Systems Administrator, Jim Henson's Creature Shop
Daniel Holdren, Albany, NY; System Administrator, SUNY Albany
Daniel Hong, Redwood City, CA; Unemployed Graduate, n/a
Daniel Kupka, Worcester, Massachusetts; PC Administrator, Framingham Heart Study
Daniel Lake, Portland, Oregon; Electrical Engineer, Mentor Graphics
Daniel Lee, San Mateo, CA; Senior Software Engineer, Entelos
Daniel Lipofsky, San Rafael, CA; Senior Software Engineer, n/a
Daniel Maas, Ithaca, NY; President, Maas Digital, LLC
Daniel Martinelli, Worcester, Massachusetts; Webmaster, Cancer Detection and Prevention
Daniel Paquette, Apalachin, NY; Software Engineer, n/a
Daniel Paul Veditz, Ben Lomond, California; Software Engineer, Netscape
Daniel Poston, Florence, SC; Computer Technician, N/A
Daniel R. Gowans, Fort Collins, Colorado; Design Engineer, Agilent Technologies
Daniel Rozinsky, Marlboro, New fork; President, Brainstorm Technology Associates
Daniel Stringfield, Wayne, NJ; Site Supervisor, Arsenal Digital Solutions
Daniel Stutzbach, Eugene, Oregon; Graduate Student, University of Oregon
Daniel T. Drea, Salem, CT; Owner, Daniel T. Drea P&H
Daniel W. Brown, Gloucester, MA; Senior Software Engineer, n/a
Daniel W. Drake, Apex, NC; Vice President, Oak Grove Software
Daniel Wolstenholme, Chandler, AZ; Software Engineer, Intel Corporation
Daniel Wright, Redwood City, California; President, ComputerX
Dan Marker, Kettering, OH; Technical Support Engineer, SGI
Dan Milstein, Boston, MA; Consultant, n/a
Dan Moore, Salt Lake City, Utah; Programmer, Sandstar Family Entertainment
Danny Espinoza, Washington, DC; Senior Software Engineer, emotion
Dan Reese, Spanish Fork, UT; Software Engineer, Clearstone Corporation
Dan Speers, Morristown, NJ; Editor, The Naturist Journal
Dan Trevino, San Antonio, TX; President, bluemagnet, llc
Dan Wilder, Seattle, WA; Tech Manager, Specialized Systems Consultants
Dan Wood, Alameda, CA; Founder, Karelia Software
Darcelle Bleau, Los Angeles, california; Research Analyst—IT, Major HMO
Darcy James Argue, Boston, MA; Musician, n/a
Darlene Wallach, San Jose, CA; Software Engineer, n/a
Daron D. Fraley, Plainfield, IN; IT Manager, DCM Indiana
Darren Hiebert, Madison, Alabama; Senior Software Engineer, XonTech
Darren Nguyen, San Mateo, CA; System Administrator, Talaris Inc.
Daryl Biberdorf, Carrollton, Texas; Database administrator, n/a
Dave Blankenship, Boise, Idaho; Senior Software Engineer, n/a
Dave Gardner, South Pasadena, CA; Network Administrator/Security Analyst, ExacTax Inc.
Dave Greene, Albany, NY; Technical Support, n/a
Dave Lyon, Sandy, Utah; Web Engineer, TeachStream
Dave Mallery, Ramah, NM; Editorial Director (retired), Professional Press
Dave Ruske, Sussex, WI; Sr. Software Engineer, Rockwell Software Inc.
Dave Seltzer, Rochester, N-Y; Network Software Engineer, n/a
Dave Serls, Littleton, CO; Software Engineer, n/a
Dave Wreski, Upper Saddle River, NJ; Director, Guardian Digital, Inc.
David A. Rogers, La Grange, Illinois; Senior Software Engineer, SPSS Inc.
David B. Caplinger, Omaha, NE; Information Technology Manager, Meridian, Inc.
David Beahm, Williamsport, PA; Programmer, Champion Parts
David Bechberger, Bozeman, MT; Hardware/Software Engineer, n/a
David Benfell, San Francisco, California; Systems Administrator, n/a
David Bilton, Colchester, CT; n/a
David Border, Bowling Green, Ohio; Assistant Professor, Bowling Green State University
David B. Peterson, Palo Alto, CA; Systems Administrator, n/a
David Buehler, Albuquerque, New Mexico; Graduate Student (Computer Science Ph.D. , University of New Mexico
David Castro-Diephouse, Philadelphia, PA; Software Engineer, Retek
David Chapman, Sonoma, CA; Software Tester, LucasArts Entertainment
David C. Hill, Centennial, Colorado; Consumer
David Christensen, Berkeley, CA; UC Berkeley
David C. Johanson, Gaithersbutg, MD; Aviation Physiologist, US Navy
David Clark, Simi Valley, CA; Software Engineer, Consultant

David Cotton, Santa Cruz, CA; Systems Administrator, vortex4.net
David C. Sloane, Boston, Massachusetts; Sr. Systems Admin., Vanderweil Facility Advisors
David Dahl, Chicago, IL; President, ddahl.com
David Daniel, Lyons, CO; Advisory Engineer, Storage Technology Corp.
David Diplock, San Diego, California; Software Engineer, Peregrine Systems
David Dittrich, Seattle, Washington; Member, The Honeynet Project
David D. Lewis, Chicago, IL; Independent Consultant
David Dolinar, Provo, Utah; Software Developer, n/a
Davide Libenzi, Beaverton, OR; Sr Software Engineer, NAI/McAfee
David Ford, Meriden, CT; Blue Labs Software
David F. Williams, Tulsa, Oklahoma; Network Administrator, Onbravo of Tulsa
David Gabler, Atascadero, CA; Network and Systems Security Engineer, n/a
David Gessel, Oakland, CA; Engineer, Black Rose Technology
David Goodwin, Sunnyvale, CA; Software Engineer, Tensilica
David Graser, Port Neches, Texas; Process Operator, Huntsman Corp.
David Greenberg, Highland Park, IL; President, David Data
David Hamilton, Nashville, Tennessee; Technical Consultant, n/a
David Hartwell Clements, Golden, CO; Math/CS Student, Colorado School of Mines
David Henning, Montgomery village, MD; Senior Security Engineer, CACI
David Hershberger, Pittsburgh, PA; Ph.D. student, Carnegie Mellon University
David HM Spector, Huntington, NY; President and CEO, DropZone Networks
David Hudson, Cerritos, CA; Technologist, The Capital Group, Inc.
David Hutchens III, Largo, FL; Operations Support Technician, n/a
David James Burneff, Columbus, Ohio; Developer, n/a
David J. Carlson, Farmington, Utah; Airline Pilot (Retired)
David Lance Smith, Newnan, Georgia; Owner/ CEO, smithSyndicate
David Lesher, Wheaton, MID; Engineer,
David L. Gantose, Cleveland, OH; Software Engineer, n/a
David L. Williams, San Diego, CA; Sr. Software Engineer, Stellcom
David Mandala, Phoenix AZ; President, THEM Productions
David Marsh, Palmdale, CA; Network Engineer, Medical Research Products
David May, Houston, TX; Senior Analyst, Dow Chemical
David McCuskey, Portland, Oregon; Owner, McCuskey Consulting
David Medinets, Ftanders, NJ; President, Eclectic Consulting
David Merrill, Byfield, MA; Software Engineering Consultant, Merrill SCM Consulting
David Mestel, St. Louis, Missouri; Systems Analyst, Free-Source.com
David M. Hull, Menlo Park, CA; Member of Technical Staff, TIBCO Software, Inc
David Minor, Reston, Virginia; System Architecht, Orbotech Inc.
David Morgan, Los Angeles, CA; Professor of CS, Santa Monica College, Los Angeles City College, UCLA Extension
David Neu, West Lafayette, Indiana; Computing Center Consultant, Purdue University
David Newman, Naperville, Illinois; Principle Software Engineer, Private Citizen
David Noonan, Atlanta, GA; Network Engineer, n/a
David O. Blanchard, Ph.D., Flagstaff, Arizona; Atmospheric Scientist, n/a
David O'Brien, Alameda, CA; Computer Engineer, Consultant
David Pearson, Walnut Creek, CA; Attorney, Law Offices of David S. Pearson
David Polenychko, Troy, Michigan; Network Administrator, ACE Controls
David Pool, Sunland, California; Software Developer, n/a
David R Dick, Nashua, NH; President, Software Innovations
David R. Roth, Portland, OR; Systems Analyst, Bureau of Labor and Industries, State of Oregon
David Rush (US Citizen/Expatriate), Dunlavin, Republic of Ireland; Principal Engineer,
AOL Technologies/Dublin
David Rysdam, Milford, NH; Software Engineer, n/a
David S. Goldberg, Belmont, MA; IT Manager, n/a
David Small, Kent, OH; Computer Science Major, Kent State University
David Smith, Kalamazoo, MI; Director of Development, Zooropa Design
David Smith, Morgantown, West Virginia; Systems and Network Administrator, West Virginia University
David Sowder, Cleburne, Texas; Systems Administrator, Southwestern Adventist University
David S. Roland, Denver, Colorado; President, Advanced Intelligent Networks Corporation
David Stair, Asheville, NC; College Student, Member, ACM
David Sullivan, Denver, CO; Associate Professor, MSCD
David Walker, Pescadero, Ca; QA Manager, Rocket Network
David White, Stockbridge, Georgia; Computer User, Private Individual
David Wiley, Ph.D., Logan, Utah; Assistant Professor, Utah State University
David Wilk, Gallup, NM; Systems Administrator, Community Internet Access
David Witherspoon, Salt Lake City, Utah; Algorithm Engineer, Idaho Technology
David W. Kennedy, Champaign, IL; Student, University of Illinois at Urbana-Champaign
David W. Thurston, Monroe, La.; Systems Administrator, CenturyTel
David Yates, Central, South Carolina; Devleopment Scientist, Perrigo Company
Dean Brettle, Gaithersburg, Maryland; Software Engineer, brettle.com
Deane Thomas, New York, NY; Senior Software Architect/Analyst, Goldman Sachs & Co.
Dean Jefferson, Madison, WI; Instructor, Madison Area Technical College
Deanna Cheung, Long Beach, CA; Director, Tara School
Deanna Thompson, Las Vegas, Nevada; System Adminitrator
Debbie Shrock, Spangle, WA; Girls'' Dean, Upper Columbia Academy
Deborah Tribble, Scottsdale, Arizona; housewife, n/a
Delbert Hart, Huntsville, Alabama; Assistant Professor, Computer Science Department, University of Alabama in Huntsville
Del Teel, Charlotte, NC; IT Architect / Engineer, IBM Corp
Denise Schilling, Big Bend, WI; Consumer, n/a
Dennis Cruise, Beaverton, Oregon; Developer, Professional Data Exchange
Dennis Jarecke, Kent, Ohio; Physicist, Kent State University
Dennis Jenkins, Milwaukee, Wisconsin; Alpha Geek, Universal Savings Bank
Derek Ramsey, Philadelphia, PA; Software Engineer, n/a
Derek Scott Young, Oklahoma City, Oklahoma; Lead Developer, Orcacom Worldnet
Derek Tarvin, Tulsa, OK; Manager, DecisionOne
Derek Warnick, Salt Lake City, UT; Software Engineer, 3M
Derek W. White, Las Vegas, Nevada; IT Student, Community College of Southern Nevada
Derick Siddoway, Salt Lake City, UT; Seriousdata Company, Systems Architect
D.Erickson, San Jose, CA; M.Dir., AdVenture Group
Devin Kyle Irby, Tivoli, New York; Video Installation Engineer (VIE), Ingest Digest
Dhaval Patel, Roselle Park, New Jersey; n/a
Diane F. Engles, Raleigh, NC; Software Developer, Rho, Inc.
Diane McSweeney, San Jose, CA; Webmaster, n/a
Diane M. Napolitano, Ossining, New York; Linux programmer, n/a
Diane Walter, Menlo Park, CA; Senior Research Engineer, SRI International
Dj Merrill, Lebanon, New Hampshire; Sr. Unix Systems Administrator, Dartmouth College
D. Mark Abrahams, Berkeley, CA; President and principal analyst, Abrahams-Rizzardi, Inc.
Dominic Eldridge, Sheridan, Michigan; Computer Lab Monitor, Montcalm Community College
Dominic Franchetti, San Mateo, CA; Software Engineer/Project Manager, eJiva
Donald Byrd, Bloomington, IN; Senior Scholar, Indiana University
Donald Grayson, Louisville, Kentucky; System Administrator, n/a
Donald J Bindner, Kirksville, MO; Asst Professor of Mathematics, Truman State Univ
Donald R. Clarke, Northport, New York; Staff Operations & Training Specialist, USAR
Donald R. Fairchild, Chesterfield, VA; CEO, Fairchild Software Inc.
Don Black, Newport Beach, CA; Director, Digital ChoreoGraphics
Don Holmgren, Batavia, IL; Computer Professional, Fermi National Accelerator Laboratory
Don J. Rude, Gaithersburg, Maryland; Owner/CTO, Steem

Don J Smith, Columbus, Ohio; Sr. Staff Software Engineer, n/a
Don Soegaard, Sutter, California; Industrial Engineer, entrepreneur
Dorab Patel, Santa Monica, California; President, Digicraft
Dorothea Salo, Madison, WI; n/a
Doug Alcorn, Kings Mills, Ohio; Independant Software Developer, Lathi.net
Doug Bryant, Charleston, SC; Software Engineer, Arthur D. Little
Doug Burks, Augusta, GA; Systems Administrator, n/a
Douglas James, West Jordan, UT; Chief Systems Administrator, I-Net Innovations
Douglas Lewan, Brick, NJ; Senior Software Engineer, Adir Technologies
Douglas Loss, South Williamsport, PA; Data Network Coordinator, Bloomsburg University
Douglas R. Glenn, Mauldin, SC; Enterprise Applications Analyst, KEMET Electronics Corp.
Douglas Rohrer, Cincinnati, Ohio; Chief Technology Officer, Safe@Work
Doug Matheson, Stockton, CA; Professor, University of the Pacific
Doug McBride, San Mateo, California; Software Developer, Liberate Technologies
Doug Raichle, Princeton, NJ; Member Technical Staff, Sarnoff Corp.
Doug Schafer, Agoura Hills, CA; Principal Hardware Engineer, Ixia Pow Hurst, Acworth, Georgia; System Support Specialist, Kennesaw State University
Dow McKeever, Valley Cottage, NY; Sound Designer, Sine Post Audio
Doyle Hopkins, Fort Collins, Colorado; Systen Engineer, LSI Logic
Drake wilson, Pittsburgh, PA; Student, University of Pittsburgh
Drew Poulin, Edmonds, WA; Translator, Sole Proprietor, TransCom Japan Dr. Kenneth R. Brownsberger, Boulder, CO; Software and Operations Scientist, University of Colorado—Boulder
Dr. Paul E. Black, Gaithersburg, MD; Computer Scientist, Member, Association for Computing Machinery (ACM)
Dr. Scott McCormick, Hamilton, OH; President, ESM Software
Dr Steve Otto, Portland, Oregon; CTO, TrueDisk Inc.
Dr. Thomas A. Cleland, Ithaca, NY; Research Associate, Cornell University
D. Scott Alexander; Warren, NJ; Chief Architect, Activium, Inc.
Duane Gustavus, Denton, Texas; UNIX Research Consultant, University of North Texas
Dudley Irish, Salt Lake City, Utah; IT Consultant, Ars Magna, Inc.
Duncan Murphy, Midway, KY; Consultant, Problem Solved!
Durwood Gene Bland, Jr., Cary, North Carolina; Software Consultant, Analysts International Corporation
Dusty Wright, westminster, CO; Content development, Sun Microsystems
Dwayne Parks, Fayetteville, AR; Software Engineer, Shinkoh Technologies Inc.
Dwight Briggs, Orange City, F1; Software Engineer, n/a
Dwight N Buchanan, San Jose, CA; Senior Programmer, IBM
Dwight Thornton, Reseda, Ca; Owner, Symple Engineering
Edan Dalton, Atlanta, GA; Research Assistant, Georgia Institute of Technology
Ed Chapman, Point Mugu, CA; Assistant Administrative Officer, US Navy
Eden Crane, Stockton, California; Network Administrator, Tonecontrol.net
Ed Hagerty, Addison, TX; Owner, General Knowledge Corporation
Ed Howland, St. Louis, MO; Independant Software Consultant, n/a
Ed Huott, Latham, NY; Consultant, SuperGeek Consolidated
Ed Leafe, Penfield, NY; Independent Consultant/ Developer, n/a
Edmond Temple, Piedmont, California; College Instructor, UC Berkeley Extension
Edmund Charles Lewis, Keene, Texas; Dir Administrative Computing, Southwestern Adventist University
Edmund Mitchell, Kingston, NY; Programmer/Analyst, Micro General Corporation
Ed O'Connor, Madison, New Jersey; Independent Software Developer, Rebol Scripting Community http://www.rebol.com
Ed Saipetch, Indianapolis, IN; Developer, Indianapolis Star
Edward Burton, Lewiston, Idaho; Proprietor and Mediator, Clearwater Peace (alternative dispute resolution)
Edward Byfield, New York, NY; Faculty, Parsons School of Design
Edward Figarsky, Holland, PA; Programmer, FASTNET Corporation
Edward F. Valeev, Atlanta, GA; Research Scientist, Georgia Institute of Technology
Edward Kaeufer, Blaine, WA; Software Engineer, CMPI
Edward Langenback, Cherokee Village, AR; Web designer / promoter, n/a
Edward Lentz, Conshohocken, Pa; Programmer/Analyst, Glaxo Smith Kline
Edward Resnick, Toronto, Ontario; Systems Engineer, Sun Microsystems, Inc.
Edward Schlunder, Mesa, Arizona; Software Engineer, SHEF Systems
Edward Simmonds, Glendale Heights, IL; Financial Systems Consultant, National Association of Realtors
Edward Smith, Cincinnati, OH; Windows Programmer/Consultant, n/a
Edward Starback, Troy, MI; Application Engineer, n/a
E John Swift, Aurora, CO; Technology Teacher, Castle Rock Middle School
Elaine Lindelef, Glendale, CA; Partner, Cognitivity
Elias Lutfallah, Chicago, IL; System Administrator/Programmer, Endeavor Information Systems
Elijah C. Menifee, Bethany, OK; Software Engineer, da Vinci Network Services
Elijah Wright, Athens, Ohio; Webmaster, http://stderr.org
Eliot Mason, Waunakee, WI; Lecturer, University of Wisconsin
Elizabeth Bonney, Cranford, NJ; Library and Information Science Graduate Student, Rutgers University
Elizabeth Edwards, Cambridge, MA; Software Engineer, n/a
Elizabeth Mieczkowski, New Orleans, LA; Web Developer, Medical Center
Elliot Abramowitz, Glendale, AZ; Student, Private Citizen
Elliot Jordan, Decorah, IA; Student, Luther College
Elliott Wilcoxon, Minneapolis, PIN; Student, University of Minnesota—Twin Cities
E. Matthew Schulz, Iowa City, Iowa; Statistician, ACT, Inc.
Emily Stambaugh, Chapel Hill, NC; Librarian, American Library Association
Eric A Bolden, Madison, WI; IPC, University of Wisconsin—Madison
Eric Albers, Jefferson, Maryland; CEO, Vertigo Simulations
Eric Anderson, Northfield, Minnesota; Software Engineer, Lockheed Martin
Eric Benedict, Madison, WI; Lecturer, Department of Electrical and Software Engineering
Eric D. Burgess, Farmers Branch, Texas; Senior Programmer, VarTec Telecom
Eric Fisher, Manilla, Indiana; Student, Novice Programmer
Eric Gold, Albuquerque, NM; Physician, University of New Mexico
Eric Hendrickson, Eden Prairie, Minnesota; Systems/Commerce Architect, Albedo Applications
Eric Hidle, Bryn Mawr, PA; Electrical Engineer, Honeywell International INC
Eric Howland, Madison, WI; Consultant and Programmer, n/a
Eric Irrgang, Austin TX; Computer Programmer, University of Texas at Austin
Eric Jergensen, Bethany, Oklahoma; President, da Vinci Network Services
Eric J. Gleske, Dover, NH; Television Producer/Director, Freelance
Eric Knudstrup, Saratoga, 95070; n/a
Eric Ludlum, New York City, New York; President, Core77
Eric Lundquist, Austin, Texas; President, The Robot Group, Inc
Eric McGough, Pleasanton, CA; CEO, Random Cube, Inc.
Eric Nedervold, Mountain View, CA; software engineer, self-employed
Eric Nichols, Marlborough, MA; Programmer/Analyst, Raybeam Solutions
Eric Roe, Sarasota, Florida; Chemical Engineer, n/a
Eric Smith, Williamsport, PA; Network Admin, Carole Hockman Designs Inc
Eric Spiegelberg, Savage, MN; Software Developer, n/a
Eric Stechmann, Shoreview, MN; Software Engineer, n/a
Eric Stierna, St. Petersburg, Florida; Software Engineer, IEEE Member
Eric Stoll, Rochester, NY; Software Engineer, n/a
Eric Weeks, Bountiful, Utah; Attorney, Weeks Law Firm
Eric williams, Pittsburgh, PA; PhD student, University of Pittsburgh
Erik Hanson, Fremont, CA; Software developer, Independent
Erik Hovland, La Crescenta, CA; Software Engineer, Jet Propulsion Laboratory and USCLUG member
Erik Vered, Indianapolis, Indiana; Consultant/Analyst, n/a
Ernest Fisch, Phoenix, Arizona; Retired
Ernest R. Smothers, Burke, VA; n/a
Esten N Porter, Clinton, MD; Systems Engineer, Galaxy Computer Services, Inc. http://www.gcsi.com
E. Trasel Rowland, M.D., Fort Pierce, Florida; n/a

Eugene Clement, Palm Springs, CA; Program manager, n/a
Eugene Lee, West Lafayette, Indiana; Department of Computer Science, Purdue University
Evan Anderson, Troy, OH; Software Engineer, Oxford Systems Integration
Evan Edwards, Palm Beach, FL; Vice President, Inforule Inc.
Evan Flink, Santa Rosa, CA; Owner, Electronic Warrior Computer Games
Evan Marshall, Rochester, MN; Systems Administrator, n/a
Fan Li Tai, Memphis, TN; Senior Data Protections Analyst, FedEx
Felix Finch, Dutch Flat, CA; Programmer, Scarecrow Repair
Felix Tan, Oakton, VA; Systems Developer, n/a
Fen Labalme, San Francisco, CA; Consultant, ACM
Fletcher Bartley Hubbard, Raleigh, NC; Software Developer, n/a
Fong Vang, Pleasanton, California; Systems Engineer, Zantaz
Ford Crews, Jackson, MS; Programmer, ERDC-VBG
Forde Prigot, Hoboken, NJ; Systems Analyst, Lehman Brothers
Forrest N Austin, San Francisco, CA; Sr Systems Administrator, Digitalpipe
Frances Felix, Winchester, VA; NOC Liaison Specialist, Covad Communications
Francine Taylor, Tigard, OR; Senior Programmer, Northwest Analytical
Frank DeRosa, Charlottesville, Virginia; Student, University of Virginia, Computer Science Department
Frank Goetz, Wheaton, IL; Computer Program Director, People's Resource Center
Frank J. Cameron, Beaverdale, PA; Student, University of Pittsburgh at Johnstown
Frank J. Iacovino Jr., Baltimore, Maryland; System Administrator, n/a
Frank Riha, Cleveland, Ohio; Senior Systems Consultant, KeyBank
Frank Skorupski, Nashua, New Hampshire; Account Support Engineer, n/a
Frank Tobin, Long Beach, NY; Software Developer, In-tel-tec (http://www.inteltec.com/)
Frans de Wet, Tallahassee, FL; Software Engineer, n/a
Fred Cheng, Los Angeles, CA; Student, UCLA
Frederick C. Smith, Stoneham, MA; Senior Applications Programmer/Analyst, n/a
Frederick Geier, Berkeley, California; VP, Geier & Geier Consulting
Frederick Haab, Atlanta, Georgia; Software Engineer, Turner Broadcasting System
Frederick Malouf, Mountain View, CA; Technical Lead, Glyphic Technology
Fred L. Drake, Jr., Reston, Virginia; Software Engineer, n/a
Fred Martin, Concord, MA; Educational Technology Designer, Gleason Research
Fumitaka Hayashi, Boston, MA; Research Fellow, Massachusetts General Hospital
Gabriel Freund, West Palm Beach, FL; Financial Analyst, Ocwen
Galen Seitz, Portland, Oregon; Senior Engineer, Seitz & Associates
Galen Stocking, Moreno Valley, CA; Student, California State University San Bernardino
Gareth J. Greenaway, Thousand Oaks, CA; President, Simi Conejo Linux Users Group
Garrick James, Seattle, WA; Network Security Engineer, Frank Russell Company
Garry Stahl, Dearborn, MI; Editor in Chief, DCG Computer club.
Garth Minette, San Jose, California; Member of Technical Staff, Verisity, Inc.
Gary Calvin, Los Angeles, California; Systems Administration Manager, Kenwood Americas Corporation
Gary D. Cupp, Jr., Harrisonburg, VA; Owner, HelpNet
Gary Downing, Menlo Park, CA; Technology Evangelist, Palm, Inc.
Gary Gordhamer, Waukesha, WI; OWNER / DBA, H&H Consulting Services, LLC
Gary Heller, Orlando, Florida; VP. Development & QA Manager, ImageSoft, a Fiserv Resource
Gary L. Withrow, Santa Cruz, California; Senior DP Programmer/Analyst and Oracle 8i DBA, County of Santa Cruz
Gary Peck, Berkeley, CA; Computer Science Student, University of California, Berkeley
Gary Schulte, Dallas, TX; Systems Analyst, Singular Software
Gavin Jefferies, San Francisco, CA; Consultant, Emptytree
Geff Underwood, Ames, Iowa; System Administrator, Iowa State University
Gene Schmidt, Scottsdale, AZ; Professor, Scottsdale Comm. College
Geng Yang, Austin, TX; Software Engineer, Ashley Laurent, Inc.
Geoff Hoyer, Oxford, MI; Software Engineer, Clarity
Geoffrey Bennett, Austin, Texas; Network Security, TICOM
Geoffrey Gerber, St. Paul, MN; Computer Consultant, n/a
Geoffrey H. Kuenning, Claremont, CA; Assistant Professor, Harvey Mudd College
Geoff Sanders, San Diego, CA; Systems Engineer, Self
George B. Czerw, Rancocas, NJ; Network Design & Administration Consultant, n/a
George Chong, Palo Alto, California; Systems Engineer, Quinstreet, Inc.
George Grayson, Chicago, IL; neuroscientist, Abbott Laboratories
George Hartogensis, Chicago, Illinois; Team Leader—Unix Systems Administration, Rush-Presbyterian St. Lukes Medical Center
George Rebovich, Acton, MA; Private Citizen, None
George Robinson II, San Clemente, Ca; n/a
George Seff, Arlington, VA; President, Limbic Systems
George Soler, San Francisco, CA; Software Developer, eRide Inc.
George Vamos, Studio City, California; Principal Engineer, Advanced Bionics Corporation
George Wagner, Sylvania, OH; President, Computers, Support, & Consulting
Gerald Perkins, Brentwood, Tennessee; Retired, n/a
Giles Hoover, Bradenton, Florida; Co-Owner, MacTampa (http://www.mactampa.com)
Gina Erickson, Camarillo, CA; Tech Support, VCNet, Inc.
Girard Jergensen, Edmond, OK; Software Engineer, n/a
Gita Sukthankar, Cambridge, MA; Member of Research Staff, Compaq Computer
Glen Canaday, Clearwater, FL; Support tech, BobCAD-CAM, Inc.
Glen McGraw, Greenville, SC; Consultant, n/a
Glen M Cornell, Grosse Pointe Park, MI; Software Engineer, Metro Link, Inc.
Glenn Focht, Ph.D., Gordonsville, TN; Owner, Focht Research
Glenn Hauman, Weehawken, NJ; President & Publisher, BiblioBytes
Glenn Holmer, Milwaukee, Wisconsin; Programmer/Analyst, Weyco Group, Inc.
Glenn Josefosky, Ferndale, MI; Sr. Software Engineer, CGN & Associates
Glenn Sokol, Philadelphia, PA; Student, Drexel University
Glenn Stone, Seattle, WA; Consultant, Gamma Delta Iota
Glenn Strauss, Manalapan, NJ; Founder, Glue Logic
Gordie Freedman, Palo Alto, CA; Principal Developer, Dotcast, Inc.
Gordon Fischer, Austin, Texas; Software Developer, Advent Networks
Gordon MacGinitie, Pittsburgh, PA; Sr. Hardware Engineer, retired
Gordon Marx, Charlottesville, VA; Student, University of Virginia
Gordon S. Bauer, Erie, PA; Computer Hardware Technician, Rentway
Govind Salinas, San Antonio, Texas; Software Developer, n/a
Graham Mitchell, Leander, TX; computer science teacher, Leander High School
Graham West, Chicago, Illinois; Game Programmer, Midway Games
Grant Goldade, Mandan, ND; ITD Computer Operator, ITD, ND
Greg Bailey, Salt Lake City, UT; Consultant, LXPRO.COM
Greg Barnes, Seattle, Washington; Software Engineer, UW
Greg Baugher, Hannibal, MO; PC and Network Support, Prince Manufacturing Company
Greg Briggs, Tacoma, Wa; ASPLU Student Government Senator, Pacific Lutheran University
Greg Foster, Columbus, OH; Senior Consultant, 3X Corporation
Gregg Rice, Toledo, OH; Computer Consultant, n/a
Greg Koch, Tampa, F1; Computer Consultant, PW Technology
Greg Kuchta, Fort Collins, CO; Design Engineer, LSI Logic
Greg Licon, San Francisco, CA; Network Administrator, Key Resources
Greg Lim, Atlanta, GA; Software Developer, InfiStar
Gregory A. Lund-Chaix, Portland, Oregon; Systems Administrator, State of Oregon
Gregory A. O'Neil, Glendale, N-Y; Systems Engineer, n/a
Gregory James Berkholtz, Portland, Oregon; Senior Systems Administrator and Information Security Specialist, Yoshida's Inc.
Gregory Kirkendall, Parker, CO; President and CEO, OpenEtools
Gregory Recine, Lyndhurst, NJ; Grad Student (Comp Physics), Stevens Institute of Technology
Gregory R. Warnes, Ph.D., Groton, CT; Statistician and Software Developer, n/a

Gregory R. Wold, Langhorne, PA; , n/a
Gregory Y. Tada, Salt Lake City, UT; Software Developer, IAS Design
Greg Roy, Norwell, MA; Software Quality Assurance Engineer, PentaSafe Security Technologies
Greg Steiert, Aloha, OR; Hardware Design Engineer, n/a
Greg von Beck, Mesa, AZ; Programmer/Analyst, TRW Automotive
Greg Willden, San Antonio, Texas; Research Engineer, Southwest Research Institute
Griffin Foster, Ramona, California; President, Tera256 Computer Club
G. Robert Mattix, Allen, Tx; Data Network Engineer, n/a
Guillermo Maturana, Ph.D., Berkeley, CA, CTO Andes Networks, Inc.
Guy Albertelli II, Ann Arbor, MI; Specialist in Educational Technology, Michigan State University
Guy Garrison, San Francisco, California; Motion Graphics Designer, Garrison Guybernetics
Guy Speier, La Crescent, MN; Sr. System Administrator, n/a
Gwen L. Veneskey, Pittsburgh, PA; Director of Marketing and Sales, Ounce of Prevention Software
Hal Black, Columbia, MD; Director, Software, n/a
Hal Bundy, Ottawa, Kansas; Librarian, Ottawa Library
Hal King, Knoxville, TN; Systems Programmer, University of Tennessee
Hal Vaughan, Richmond, VA; Owner, Threshold Digital
Hamlin R. Krewson, Ames, IA; Macintosh Support Tech, Beacon Microcenter
Hank Fisher, Arvada, Colorado; Software Engineer, Private Citizen
Hans Hazelton, Anchorage, AK; Sr. Network Technician, GCI
Hans Kugler, Tempe, AZ; software engineer, n/a
Hargun Khanna, San Jose, CA; Student, Archbishop Mitty High School
Harold L. Brooks, Urbana, IL; Network Administrator, Scitec
Harry Barrett, Canyon Country, Ca.; PC User (12 years), n/a
Harry G. Harbin, Woodinville, WA; Programmer/Analyst Contractor, Tmp.Wordwide/Washington Mutual
Harvey C. Scobie III, Manchester, NH; Technical Specialist, Kollsman
Harvey Lange, Toney, Alabama; Systems Analyst, n/a
Harvey Ussery, Hume, Virginia; Member, Northern Virginia Linux Users Group
Harvie Branscomb, Carbondale, CO; Owner, Charybdis
Heath Oderman, Suffolk, VA; Senior Consultant, netdecisions
Hector Vasquez, Edinburg, TX; Computer Specialist, The University of Texas-Pan American LAC Dept.
Heidi Miller, Los Gatos, CA; Technical Writer, Gatespace Inc.
Heidi Shanklin, Portland, OR; Apple Service Tech, Metro
H. Emery Ford, Kensington, MiD; Senior Programmer, CodeRyte
Henry Keultjes, Mansfield, OH USA; President, Microdyne Company
Herb DaSilva, Andover, MA; Senior Software Engineer, Adaptive Optics Associates
Herrick Goldman, Boston, MAss; Designer, Herrick Goldman Lighting Design
Hollie Schmidt, Lexington, Massachusetts; President, Lifting Mind Inc.
Holly Shaltz, Boyne City, MI; Freelance Web Designer, Shaltz Farm
Holly S. Robinson, Tamarac, FL; Technical Writer, Metro Link
Howard Allen Cohen, Holllywood, Florida; Attorney, Atkinson, Diner, Stone, Mankuta and Ploucha, P.A.
Howard E. Melton III, Sacramento, California; Registered Voter, Self Employed
H. W. Egdorf, Los Alamos, NM; Technical Staff Member, Los Alamos National Laboratory
H. william Welliver III, Mountain Top, PA; Systems Administrator, Fairchild Semiconductor
Ian Ballantyne, Vienna, ; Software Engineer and System Administrator, Schuster and Hwesta Gmbh
Ian Billington, Ester, AK; Student / Network Tech, University of Alaska Fairbanks
Ian Felton, Morgantown, West Virginia; n/a
Ian Hall-Beyer, Prairie Village, KS; Consultant
Ian McMahon, Atlanta, GA; Linux Software Engineer, e-VERIFILE.com
Ian Ragsdale, Austin, Texas; Software Engineer, SKYLIST
Ian Sterling, Memphis, TN; System Administrator, n/a igor Furlan, San Jose CA; IC Design Engineer, National Semiconductor
Ilan Rabinovitch, Encino, CA; n/a
Ilya Volynets, Belmont, CA; VP of Engineering, Total Knowledge
Imad Hussain, West Lafayette, IN; Student, Purdue University
Ismet Kursunoglu, MiD, Manhattan Beach, CA; Founder, linuxatlax.org
Ivan Kohler, San Francisco, CA; Developer, Debian
Jack Dunn, Omaha, Nebraska; Citizen, n/a
Jack Gott, Austin, Texas; Software Engineer, Compaq
Jack Green, San Francisco, CA; n/a
Jackie D. Smith, Imperial, Missouri; retired
Jack L Caldwell, Jr., Sugar Hill, GA; Member Technical Staff, Movaz Networks
Jack Lloyd, Baltimore, MD; System Administrator, Johns Hopkins University
Jack Park, Brownsville, CA; Independent Software Developer, Thinkalong Software
Jack Wenger, Madison, WI; IS Sytems Specialist, Wisconsin Department of Natural Resources
Jacob Gemmell, Juneau, Alaska; Network Specialist, Alaska Department of Labor & Workforce Development
Jake Robb, Grand Rapids, Michigan; Software Engineer, 43rd Parallel Technologies
James Adams, Denver, CO; Software Engineer, Agilent Technologies
James Altes, Washington, DC; Electronic Publishing Specialist, American Red Cross
James Ault, Albany, NY; Information Security Leader, Noble Consulting
James B. Bushman, Medina, Ohio; President, Bushman & Associates
James B. Evins, Alexandria, VA.; Electrical Engineer, n/a
James B. Greer, Memphis, TN; Concerned Citizen, Group Of Linux Users in Memphis
James B. Rimmer, San Diego, California; Software Engineer, CenterComm
James Damour, Albany, New York; Principle Consultant, Keane
James David McIninch, Ph.D., Burlington, MA; Computational Biologist, Cereon Genomics
James Dixon, Mannington, WV; n/a
James Domenico, San Francisco, CA; TECH, Self-employed
James E. Collins, Jr., Hinesburg, VT; V. P., Treasurer, Vermont BS
James E Flemer, Troy, NY; Student, Rensselaer Polytechnic Institute
James E. Powell, Englewood, CO; President, Silver Future Software
James Fitch, Napa, CA; Chief Deputy and System Administrator, Solano County Public Defender
James Flynn, Sunnyvale, California; Software Engineer, Self Employed
James Gallagher, Cypress, CA; Software Engineer, Boeing—C-17 Engineering Data Management
James Gettys, Carlisle, Massachusetts; Principal Member of Technical Staff, Compaq
James Giacchi, Warren, NJ; Personel, persinel
James Gregory Davidson, San Diego, California; Instructor, Learning Tree International
James Hardwick, Salt Lake City, Utah; Software Engineer, GE Medical Systems
James Hebert, Paradise, CA; Consultant, Self Employed
James Henderson, Salt Lake City, UT; Sr. Systems Engineer, n/a
James H. Kimura, Berkley, Michigan; End User, Private Citizen
James John Ewell III, Katy, Texas; CEO, Ewell Enterprises
James Kennedy, Topeka, Kansas; Progammmer/System Administrator, Standard Beverage Corporation
James Lamanna, Pasadena, CA; Student, California Institute of Technology
James Landon, Overland Park, Kansas; Senior Network Engineer, Sprint Corporation
,lames LasCola, Portland, OR; Systems Admin, Romar
James LewisMoss, Durham, NC; Developer, Linux Developers Group
James Lieb, Fremont, California; Software Consultant, Wild Open Source Inc.
James Lopez, Carrollton, Texas; Sales Manager, CompUSA
James L Osborn, Jr MSEE, Melbourne Beach, Florida; Senior Account Engineer, PacketVideo Corporation
James L. Sullivan, Fort Pierce, FL; Supervisor, Harbor Branch Oceanographic Institution
James Lucha, Moreno Valley, CA; Programmer/Analyst, San Bernardino Medical Group
James Mitchell Ullman, Statesboro, Georgia; Technical Support Specialist I, Georgia Southern University
James Moss, Gresham, Oregon; Creative Director, Personal Image Concepts
James M. Smith, St. Louis, MO; Manager, Technical Services, Intercon

James Myers Jr., Middletown, NY; Water Operator, Town of Goshen
James Newby, Carbondale, IL; Undergraduate, SIUC
James Patrick Miculka, Houston, Texas; Software Engineer, BMC Software
James Perkins, Beaverton, OR; Software Engineer, IEEE Associate Member
James Price, Atlanta, Georgia; System Administrator, n/a
James R. Hofmann, Naperville, IL; Senior Software Engineer, Ricardo Software
James Richard Tyrer, Green Valley, AZ; Consultant; Member, ACM
James R. Leu, Allison Park, PA; Independent Software Developer, n/a
James R. Maynard III, Fairmont, Minnesota; Senior Systems Engineer, Global MAINTECH Corporation
James Roberts, Birmingham, AL; Software Engineer, BankWare
James Rogers, Ridgecrest, CA; Software Engineer, NAWCWD
James Salsman, Mountain View, CA; Private Citizen, United States of America
James Sanford, Norwood, OH; Developer, Reynolds and Reynolds
James Shofstall, Carterville, Illinois; Owner, Select Synthetics
James Simons, Atascocita, Texas; Webmaster, International Webmasters Association
James Sterling Jr., McCrory, Arkansas; Computer Technician, Crabtree's Computer
James S. Wadell, Anchorage, Alaska; Systems Analyst, SAIC
James Wartell, Tucson, Az; Programmer, University of Arizona
James White, Laguna Hills, CA; Software Consultant, Pagesmiths
James W. Wiebmer, Petaluma, CA; Manager Systems Administration, Westwave Communications, Inc.
James Zach II, Frankton, IN; Electronics Technician, Smurfit-Stone Container
Jamie Dow, Newport Beach, CA; Student, University of California, Irvine
Jamie Lee Cho, North Bergen, New Jersey; Technical Architect, Zelo Technologies
Jamie Piperberg, Hamden, CT; Software Engineer, n/a
Jamie Yukes, Seattle, WA; Independent Consultant, TCN Communications
Jared Allar, Fargo, North Dakota; Student, North Dakota State University
Jared Curtis, Fresno, CA; Student, Fresno City College
Jared Robinson, Springville, UT; Software Engineer, Symantec Corporation
Jarred Fehr, Marietta, Georgia; PC Coordinator, Peachtree Business Products
J. Arruda, Santa Clara, CA; Corporate Alchemist, VA Software
Jason A. Dujardin-Terry, Spokane, WA; Computer Tech, Descriptive Imaging
Jason A. Tripp, Edenton, NC; Independent Software Developer, n/a
Jason Baietto, Boca Raton, Florida; Principal Engineer, Concurrent Computer Corporation
Jason Balicki, St. Louis, MO; Sr. Network Engineer, Alexander Systems
Jason Bergstrom, Portland, OR; System Administrator, Mentor Graphics
Jason Box, Binghamton, New York; Software Engineer, Self
Jason Cox, Irvine, Ca; IT Manager, E-Commerce Exchange
Jason Day, Atlanta, GA; Software Engineer,n/a
Jason Greene, Fairway, Kansas; Software Eng. IV, Sprint
Jason Guidry, Brackettville, Texas; Director of Bands, Brackett ISD
Jason Henriksen, Concord, CA; President, Hardy Henriksen Hughes Consulting, Inc.
Jason Howard, Oakdale, CA; Software Engineer, SpectSoft
Jason Jobe, Purcellville, VA; President, Datalore
Jason L. Shiffer, Vienna, VA; Senior Software Engineer, Zerotao.com
Jason McC. Smith, Chapel Hill, NC; PhD Candidate, Univ of North Carolina at Chapel Hill
Jason M. Crist, Lexington, Kentucky; New Media Specialist, Hart Media Services
Jason M. Felice, Cleveland, OH; Technology consultant and business owner, Cronosys
Jason Noble, Atlanta, Georgia; Software Engineer, n/a
Jason Penney, Dracut, MA; Software Engineer, n/a
Jason Pierce, Greensboro, NC; Computer Field Technician, Softwired Systems
Jason Purdy, Cary, NC; Chief Technology, Journalistic, Inc.
Jason Radecki, Porter, Indiana; Engineer, Local 150
Jason Reich, San Diego, CA; Software Engineer, Qualcomm, Inc.
Jason Rennie, Cambridge, MA; Graduate Student, Massachusetts Institute of Technology
Jason Samsa, Appleton, Wisconsin; Database Administrator, Airadigm Communications
Jason Scheirer, Riverside, California; Professional Student Intern, County of Riverside, CA
Jason Shonk, Montclair, NJ; Electronic Engineer, n/a
Jason Shupe, Pasadena, CA; System Engineer/Student, JPL/Cal Poly Pomona
Jason Stefanovich, Alexandria, VA; Software Test Analyst, US Government
Jason Titus, Brooklyn Park, MN; Consultant, Independent
Jason Waterman, Cambridge, MA; Research Scientist, MIT
Jason Westlake, Newnan, Georgia; Computer Technician, ICA Consulting
Jason Woolever, Sunnyvale, CA; Sr. R&D Engineer, Synopsys, Inc.
Jayan Moolayil, Chicago, IL; Senior Software Engineer, n/a
Jay Beale, Baltimore, MD; President, JJB Security Consulting
Jaye Mathisen, Medford, OR; Manager, Western Telephone Integrated Communications
Jay R. Walker, Valparaiso, IN; Application Developer, Golden Technologies, Inc.
Jay Sachs, North Adams, MA; Development Architect, Eziba.com
Jay Sulzberger, Yonkers, New York; Corresponding Secretary, LXNY, New York's Free Software Organization
Jay W. Luther, San Anselmo, CA; Attorney, Law Offices of Jay W. Luther
J.B. Nicholson-Owens, Champaign, Illinois; Consultant & Owner, Forest Field Consulting
J. Clifton Bullard, Memphis, TN; Programmer, US Postal Service
JC Pollman, Burke, Virginia; Major, US Army
J. David Eisenberg, San Jose, CA; Programmer/Teacher/Writer, n/a
Jeanne S. Glazer, Silver Spring, FID; Consultant, The Seva Group
Jean-Pierre, Ann Arbor, Michigan; student, University of Michigan
Jedediah Roach, Davis, California; Student, University of California, Davis
Jeff Adams, Kyle, TX; System Administrator, n/a
Jeff Brown, San Diego, CA; Graduate Student Researcher, UC San Diego
Jeff Carlson, Encino, CA; Systems Administrator, InfoUSA / www.easytel.net
Jeff Coffin, Nevada City, CA; Software Engineer, contractor for American Airlines
Jeff Couturier, Tampa, FL; Web Application Developer, ATT
Jeff Donner, Randolph, Massachusetts; Software Engineer, Scheduling Systems Inc
Jeff Greenman, Los Angeles, CA, Paralegal, General Counsel's Office, Los Angeles Community College District
Jeff Hayas, Boulder, Colorado; Senior Software Engineer, Storage Technology Corporation
Jeff Holcomb, Tucson, Arizona; Software Engineer, Red Hat
Jeff Hostetler, Jeffersonville, IN; President and Software Craftsman, Jeff Hostetler
Jeff Jackowski, Cary, North Carolina; Software Developer, n/a
Jeff Jennings, Boulder, CO; Advisory Firmware Engineer, Benchmark Storage Innovations
Jeff Lightfoot, Peoria, AZ; Systems Controller, US Air Force
Jeff Mayzurk, Los Angeles, CA; Vice President, Technology, E! Entertainment Television, Inc.
Jeff McKenna, Redmond, WA; President, McKenna Consulting Group
Jeffrey A. Ebert, Half Moon Bay, CA; Senior Logic Designer, Sonics, Inc.
Jeffrey A. Worth, Stoneham, MA; Senior Vice President/MIS Manager, Stoneham Savings Bank
Jeffrey Barger, Mason's Neck, Virginia; Systems Admin/Engineer, Maczilla Heavy Industries
Jeffrey Bridge, Houston, TX; Programmer, Thyme Technology
Jeffrey C. Albro, Duxbury, NA; Consultant, interaction-engineer.com
Jeffrey Dale Greenfield, Grand Rapids, MI; Systems Engineer, Calvin College
Jeffrey D. Kent, Austin, Tx; Stores Manager, Physics Dept.
Jeffrey Goff, Forest Heights, MD; Software Engineer, Blackboard Inc.
Jeffrey Johnson, Livermore, CA; Computer Scientist, Lawrence Livermore National Laboratory
Jeffrey K. Downey, Raleigh, NC; Editor, Triangle Sports Journal
Jeffrey L. Clark, Coon Rapids, MN; Principal Software Engineer, EDS PLM Solutions
Jeffrey L. Susanj, Florissant, MO; Member, ACM
Jeffrey Quinn, Nashville, TN; System Software Specialist, Vanderbilt University Medical Center

Jeffrey Rehbein, Water Valley, MS; Macintosh Games Developer, n/a
Jeffrey R Pitman, Hillsboro, OR; Software Engineer, Brooks Automation
Jeffrey S. Morgan, Cleveland, Ohio; Director of Technology, Bristol West Insurance
Jeffrey Wescott, San Francisco, California; Software Developer, n/a
Jeffrey Willis, Columbus, Ohio; Student, Ohio State University
Jeffrey Y. Sue, MD, Honolulu, HI; Diagnostic Radiologist, n/a
Jeff Rosowski, Las Vegas, NV; Network Systems Specialist, n/a
Jeffry Jones, Marietta, GA; Senior Internet Application Developer, weather.com
Jeff Shultz, Sacramento, CA; Partner, Sunfire Design and Consulting
Jeff Wandling, Fall City, WA; Software Development Engineer, RealNetworks
Jeff Wieland, West Lafayette, IN; Network Analyst/Engineer, Purdue University
Jef Spaleta, Princeton, NJ; Graduate Student, Princeton Plasma Physics Lab
Jemaleddin S. Cole, Glen Burnie, MD; Systems Analyst, Data Computer Corp. America
Jem Lewis, Seattle, WA; Software Engineer, n/a
Jennifer Bohmbach, Minneapolis, MN; Information Architect, Imaginet
Jennifer Mandel, Los Angeles, Ca; Computer Tech, freelance
Jeremiah Bachmann, Pittsburgh, PA; Software Engineer, n/a
Jeremiah Gilbert, Moriah, New York; Consultant, vtnetworks.net
Jeremiah Stanley, Arvada, CO; n/a
Jeremiah Trudeau, Tolland, CT; Graduate Student, University of Connecticut
Jeremy D. Foshee, Seneca, SC; Programmer/Systems Analyst, Integrated Support Systems, Inc.
Jeremy Green, Norman, OK; CTO, Digital Commerce Solutions
Jeremy Howes, Charlotte, NC; Product Mechanical Designer, Eurotherm Drives Inc
Jeremy Leader, Arcadia, CA; Software Developer, self employed
Jeremy McMillan, Chicago, IL; Unix System Administrator, Aon
Jeremy Noetzelman, Seattle, Washington; Senior Network Engineer, University of Washington
Jeremy Padfield, Dallas, TX; Design Verification Engineer, n/a
Jeremy Pastore, Bethlehem, PA; systems analyst, libra consulting corp.
Jeremy Petersen, Draper, Utah; Manager, TeachStream
Jeremy Schiffer, NYC, NY; Computer Security Administrator, Columbia University
Jeremy Stanley, Orem, UT; Software Engineer, LDS Missionary Training Center
Jeremy Walker, Southfiled, MI; Software Developer, i33
Jeremy White, Saint Paul, Minnesota; President & CEO, CodeWeavers, Inc.
Jerome D Krough, Laurel, Maryland; Chemist, n/a
Jerome Falatko, Reading, PA; Computer Systems Analyst, n/a
Jerry C. McGill, Ph.D., Crowley, Texas; Associate Professor, UNTHSC-FW
Jerry L. Neff, Fresno, CA; Programmer/Analyst, State Center Community College District
Jerzy Puchala, Alpharetta, Georgia; Senior Sftware Engineer, Still Current Development
Jeshua Smith, Madison, WI; Undergraduate Student, University of Wisconsin
Jesse Becker, Evanston, IL; Systems Administrator, n/a
Jesse Burson, Boston, MA; Manager of MIS, Adaptive Optics Associates
Jesse Donaldson, San Jose, CA; Senior Software Engineer, Palm, Inc.
Jesse Holden, Ukiah, CA; Web Designer / Computer Technician, Independent Contractor
Jessica Slason, Southington, CT; Microsoft Alternatives Hobbyist, n/a
J.F. Neveau II, Essexville, MI; Trooper, Michigan Dept. of State Police
Jill Ratkevic, Sunnyvale, Ca; Consultant, n/a
Jim Barnes, Bellevue, WA; Network Administrator, S&B Inc.
Jim Belant, Pulaski, Wisconsin; Electrical Engineer, System Engineer
Jim Bengtson, Nevada, Iowa; Sr. Programmer/Analyst, Ruan Transportation
Jim Bertin, Hysham, MT; Tech Coordinator, Hysham Public Schools
Jim Eikner, Austin, Texas; Network Administrator, n/a
Jim Gamble, Warrenton, VA; Software Engineer, n/a
Jim Matisi, Richardson, Texas; Sr. Middleware Administrator, CompUSA
Jim Miller, Cedar Rapids, IA; Chief of Software Infrastructure, i-OP
Jim Priest, Raleigh, North Carolina; CTO, ClickCulture
Jim Quinn, Shelton, CT; Desktop Systems Administrator, Getronics
Jim Roland, Irving, TX; Consultant, n/a
J. Kenneth Gentle, Lincoln University, PA; Software Architect, iMedium, Inc.
J Matte, Atlanta, GA; Application Programmer, Peachtree Business Products
J. Nathan Matias, Mount Joy, PA; Technologist, Allied Networks (www.allied.net)
JoAnna Minneci, Los Angeles, CA; Webmistress, On Target Design
Joe Howard, Puyallup, WA; Student, University of Puget Sound
Joe Kazura, Durham, NH; Information Technologist, University of New Hampshire
Joel F. Leland, Oceanside, Ca; Owner, http://www.moonstoneservices.com/
Joel Garringer, Tulsa, OK; Senior Web-Designer/Developer, Tek-Systems
Joel Harris, Indianapolis, IN; Consultant, Bravura Systems
Joel Kickbusch, Rockledge, FL; Lead Software Engineer, e-Security
Joel Miles, Maplewood, MN; IT Support Specialist, Science Museum of Minnesota
Joel Schneider, Bloomington, Minnesota; Software Developer, Effective Tech Services
Joe Marcotte, Honolulu, HI; Network Security/Firewall Administrator, n/a
Joe Naccarato, Wilmington, DE; Programmer, Dade Behring
Joe Provo, Needham, MA; Director, RCN Corporation
Joe Smith, Philadelphia, PA; biomedical research fellow, Thomas Jefferson University
Joe Weber, Louisville, CO; Senior Technologist, Cable Television Laboratories
John August, New Orleans, Louisiana; Analyst, Tulane University
John A. Varela, McLean, VA; Retired
John Beal II, Bend, OR; Network Engineer II, Orcom Solutions, Inc.
John Beamon, Baton Rouge, LA; Internet Systems Administrator, EATEL
John Bekas, Jr., Chicago, IL; Software Architect, Confirmative Technologies, Inc.
John Bryan, Austin, Texas; Programmer Analyst, Broadwing Communications
John Callaway, Santa Cruz, California; Software Engineer, visiComp
John Carpenter, Brookfield, WI; Software Engineer, Penta Technologies
John Clayton Long, Tallahassee, Florida; Programmer, Graphic Artist, Student, National High Magnetic Field Laboratory
John Clymer, Fairmont, MN; Software Engineer, Kahler Automation
John C Meuser, West Lafayette, Indiana; Student, Purdue University
John Crowley, Somerville, MA; Web Consultant, johncrowley.net
John D. Heintz, Austin, TX; Software Integrator, Isogen International, LLC.
John Diley, Gaithersburg, Maryland; n/a
John D. Mitchell, Moraga, CA; Citizen, USA
John Donaldson, Brattleboro, Vermont; Director, K2Kid:HyperMedia
John Edstrom, Newport, OR; Senior Programmer, NewSof Group
John E. Ivory, New Hartford, NY; President, Blue Vista Solutions
John Enters, Cedarburg, WI; Web and Database Developer, Sysnetweb
John Evans, Boston, Massachusetts; Computer Specialist, Association of Computing Machinery
John Ewart, San Bernardino, California; Software Developer, LANtrocity
John F Biggs II, Charlotte, North Carolina; Systems Admin, Wachovia
John F. Chamblee, Tucson, AZ; Graduate Research Associate, Center for Applied Spatial Analysis
John F. Houde, San Francisco, California; Assistant Research Neuroscientist, University of California
John Franks, Evanston, IL; Professor, Northwestern University
John G. Hasler, Elmwood, Wisconsin; Debian Developer
John Goodleaf, Seattle, Washington; Technology Coordinator, Immunex
John Grayless, San Antonio, Texas; IT Director, Gerloff Company, Inc.
John Guthrie, Washington, DC; Software Developer, American Institutes for Research
John Hall, Fairbanks, Alaska; Programmer, University of Alaska
John Hardin, Snohomish, Washington; Internal Systems Administrator, Apropos Retail Management Systems, Inc.
John Hatch, Dundas, MN; Computer User: Microsoft, Linux and Apple Products, n/a
John Heasley, Portland, Oregon; n/a
John Hohm, Oak Forest, IL; Software Developer, Applied Systems, Inc.
John Holcomb, Greenville, IL; n/a
John Holstein, Charleston, WV; Helpdesk/Support Coorinator, www.cotse.com

John H. Robinson, IV, San Diego, CA; Systems Administrator, University of California

John (Jack) Varga, Lafayette, Colorado; Data Systems/Software Architect, Independent

John J. Beach, Waterville, MN; Instructor, PC/LAN, IT Department, Brown College

John Karakash, Raleigh, NC; Senior Software Engineer, Lv17 Systems Inc.

John K. Edwards, Burke, VA; Vice President, Results Computing Corporation

John K. Herndon, Kansas City, Missouri; Student, DeVry

John K. Molnar, Atlanta, GA; Network Security Developer, Trellis Network Security

John Kroll, Milwaukee, Wisconsin; Systems Analyst, n/a

John Langley, Hollis, NH; Director of Platform Archtiecture, KANA Software

John L. Grzesiak, Derry, NH; Senior Analyst, The Learning Incentive

John Manning, Sterling, VA; President, electronworks, inc.

John McCain, Birmingham, Alabama; Systems Engineer, Layer3 Communications

John Medway, Austin, TX; Human Being, Human Race

John Meek, Dallas, Tx; Owner, Your IT Services

John Merryweather Cooper, College Place, Washington; Student/FreeBSD Maintainer, n/a

John M. Siino, Reno, NV; Sole-Proprietor, Advanced Engineering Services

John Napiorkowski, New York City, NY; Senior Programmer, Bristol Myers Squibb

John Oglesby, Snohomish, Washington; President, Data Index, Inc.

John Oliver, San Diego, CA; Systems Administrator, hosting.com

John Paquin, Freeland, Maryland; Senior Programmer, Breakaway Games

John P. Conner, Colorado Springs, CO; President, Empire Digital Instruments

John Peter Hermes, Waterloo, Illinois; DBA, Fleishman-Hillard

John Pierce, Palatine, IL; Consultant, n/a

John Pulliam, Frisco, Tx; Associate Technical Profesional, Halliburton Energy Services

John Quigley, Greenwich, Connecticut; Student, SUNY Maritime College

John Reyst, Royal Oak, Michigan; Owner, Net-Mechanics.com

John Rohrbaugh, Fort Collins, CO; Design Automation Engineer, Agilent Technologies

John Seals, Minneapolis, MN; Consultant, Solution Design Group

John Soliday, Marietta, GA; Systems Administrator, Self john Stillwagen, San Diego, CA; Database Administrator, La Jolla Institute for Allergy and Immunlogy

John Stoneham, Baltimore, MD; Associate Software Engineer, eOriginal, Inc.

John Stoner, Chicago, Illinois; Software Developer, Independent

John Sweeney, Satellite Beach, FL; Systems Administrator, SAIC

John Tebbutt, Frederick, MD; Computer Scientist, The National Institute of Standards and Technology

John Tobias, San Francisco, California; Sr. Network Engineer, Marin Networks Inc.

John Vann, Collegeville, PA; Web Developer, Kaloke Technologies

John Van Patten, Petoskey, Michigan; Violinist/Music Instructor, Self employed

John Viega, Warrenton, VA; CTO, Secure Software Solutions

John Vitek, Anderson, SC; Owner/President, Ideal Solutions

John V. Martinez, Atlanta, GA; Principal Software Engineer, Ciena

John Voigt, Terre Haute, Indiana; System Administrator, Valley Technology

John Walsh, Broomfield, CO; Java Architect, Sun Microsystems

John Wedoff, Somerville, MA; Software Developer, n/a

John Wendel, Monterey, CA; Computer Programmer, U.S. Navy

John Wenger, Ph.D., Redondo Beach, CA; Internet Consultant, Wenger Consulting

John W. Linville, Mebane, NC; Computer Engineer, LVL7 Systems, Inc.

John Wohlers, Somonauk, IL; Library Technology Assistant, Waubonsee community College

Jonathan Abbey, Austin, TX; Senior Operating System Specialist, The University of Texas at Austin

Jonathan Blocksom, Vienna, VA; President, GollyGee Software

Jonathan Booth, Urbana, IL; Graduate Student, UIUC

Jonathan Cameron, Chandler, Arizona; Software Engineer, Motorola

Jonathan D. Nolen, Santa Barbara, CA; Web Developer, n/a

Jonathan E. Greenberg, Ann Arbor, Michigan; Lead Consultant, Innovative Process Solutions

Jonathan Freiermuth, Rochester, NY; Lead Systems Engineer, VoiceWeb Corporation

Jonathan Hartley, Denver, CO; Senior Software Engineer, SchlumbergerSema

Jonathan Hart, Livermore, CA; Citizen, citizen

Jonathan Haskins, Los Angeles, CA; Web Designer, n/a

Jonathan Hill, Milwaukee, Wisconsin; Systems Administrator, Marshall & Ilsley Corporation

Jonathan Kamens, Brighton, MA; Senior Software Engineer, Curl Corporation

Jonathan Korman, San Francisco, CA; Principal designer, Cooper Interaction Design

Jonathan Lindstrom, St. Louis, MO; Senior MIS Specialist, Anheuser-Busch Companies

Jonathan McLin, Tempe, AZ; Chief Technology Officer, Cottonwood Technology Group

Jonathan M. Hamlow, Minneapolis, MN; Development Coordinator, Public Radio International

Jonathan Morris, Portland, Oregon; ASQ Certitified Software Quality Engineer, private citizen

Jonathan Newquist, Kearney, Nebraska; computer technician, n/a

Jonathan Niebling, Boston, Mass.; Flight Attendant, American Airlines

Jonathan Nizar, Baltimore, Maryland; Student, Johns Hopkins University

Jonathan Powers, Melbourne, FL; Digital Designer, Harris Corp.

Jonathan Troiano, Los Angeles, CA; IT Consultant, Freelance

Jonathan Walton, Newport Beach, CA; Design Engineer, Gordian

Jonathan Weeks, Seattle, WA; Director of Engineering, Performant

Jon Beckett Schreiber, Milwaukee, WI; IT Testing Analyst, Manpower

Jon Ciesla, Des Moines, IA; PC Systems Support, American Republic Insurance Company

Jon Hartwell, La Crescent, MN; Consultant, FIDS

Jon McClintock, El Cerrito, CA; Project Engineer, Blue Mug

Jordan Peterson, Watertown, WI; Network Administrator II, DeLaRue Cash Systems

Jorge Guerra, Miami, FL; Business Development Manager, Opera Software

Joseph A. Knapka, El Paso, TX; Sysems Engineer, TransCore Intelligent Traffic Systems, Inc.

Joseph Alek Piasecki, Danville, Illinois; Systems Administrator, Danville Holdings, Inc.

Joseph Buck, Campbell, CA; Principal Engineer, Synopsys

Joseph Cooper, Portland, Oregon; Programmer, Torment Interactive

Joseph Crowley III, Dedham, MA; Data Entry Specialist, Preferred Temporaries

Joseph Daniel Lyman, Tigard, OR; CIO, Exacura Professional Technologies

Joseph Esrey, Gainesville, FL; Student, Anthropology, University of Florida

Joseph Foley, Cambridge, MA; Senior Software Engineer, Akamai Technologies

Joseph J Collins, Middlesboro, Kentucky; Pharmacist, n/a

Joseph Kanowitz, Ridgefield, CT; Network Administrator, Individual

Joseph K. Fish, Raytown, Missouri; Programmer / Analyst, DataCapture Technologies

Joseph L. Hill, Hanover, NH; Unix Systems Manager, Dartmouth College

Joseph L. McCay, Manchester, NH; Software Engineer, n/a

Joseph Lubin, New York City, New York; Senior Software Engineer, emagine solutions

Joseph Majeske, Highland Park, NJ; VP Software, Sonorus, Inc.

Joseph Palmer, San Jose, CA; (Former) Director of Hardware Engineering, Be, Inc.

Joseph R. Justice, Alexandria, VA; Computer Programmer, self-employed

Joseph Rock, Ann Arbor, MI; Communications Engineer, NextHop Technologies Inc.

Joseph Shraibman, New York, NY; Director of Internet Operations, Xtenit Inc (http://www.xtenit.com)

Joseph Sloan, Fullerton, Ca; Systems Engineer, Mirai Consulting

Joseph Vandevander, Raleigh, North Carolina; System Administrator, n/a

Joseph W. Gibson, Pasadena, CA; Lead Software Engineer, n/a

Josep L. Guallar-Esteve, Chapel Hill, NC; QA Testing Engineer, Red Hat Inc. & member of IEEE Computer Society

Josh Bauguss, Albuquerque, New Mexico; Senior Programmer, Web-Galleries

Josh Douglas, Bedford, VA; Systems Administrator, Smyth Companies

Josh Jackson, Houston, TX; Founder, University of Houston Linux Users Group

Josh Mayers, Boston, MA; Network Engineer, n/a

Josh Prokop, Brewster, MA; Independent Softeware Developer, n/a

Josh Simon, Aurora, IL; Principal, Joshua S. Simon Consulting

Joshua Arnold, Austin, Texas; Systems Administrator, IronRhino

Joshua Bennett, Chicago, IL; Corporate Systems Technologist, ABN A mro
Joshua Crone, Baltimore, Maryland; Unix Systems Administrator, Advertising.Com
Joshua Fluty, Greenville, SC; Independent Programmer, n/a
Joshua Fritsch, Stamford, CT; Security Analyst, UnixGeeks.Org
Joshua Fryman, Bogart, GA; PhD Student and Researcher, Georgia Institute of Technology
Joshua Kayse, Smyrna, Georgia; Student, n/a
Joshua Keith, Malden, MA; n/a, n/a
Joshua Kirby, Little Rock, Arkansas; IT Specialist III, Southwest Power Pool
Joshua Levenson, Raleigh, NC; Premier ISV Partner Engineer, Red Hat
Joshua Smith, East Lansing, Michigan; Student, Michigan State University
Joshua Willingham, Phoenix, AZ; Technical Coordinator, Aries Technology, Inc.
Josh Varner, Bartlesville, Oklahoma; Programmer, Diversified Systems Resources
Josiah Royse, Lexington, KY; Technical Contractor, Analysts International
J. Scott Evans, Springfield, VA; Chief Technology Officer, Computational Physics, Inc.
J. Scott Jaderholm, Provo, Utah; Student, Brigham Young University
Juan Lang, San Jose, CA; software engineer, Cranite Systems
Judd Rogers, Austin, Texas; Product Developer, BMC Software
Judith Phillips, Atlanta, Georgia; Learning Products Engineer, HP
Jules Agee, Seattle, WA; System Administrator, Pacific Coast Feather Co.
Jules Siegel, Cancun, Quintana Roo; Writer and Graphic Designer, CafeCancun.com
Julia Christianson, Arlington, VA; Administrative Director, ICON Community Services
Julia Hart, NYC, NY; Student, Columbia University

MTC–00028573—0025

Julia Mackert, Galesburg, Illinois; PC Support Specialist, OSF
Julia Mason M.D., Waunakee, WI; Pediatrician, Physicians for Social Responsibility
Julie Szekely, Austin, Texas; Web Designer, Self-employed
Julio A. Cartaya, Atlantic Highlands, New Jersey; Systems Engineer, AT&T
Justin A. Faughn, College Station, TX; Student, Texas A&M University
Justin Anderson, Amherst, MA; Student, University of Massachusetts Amherst
Justin Ballou, Burlington, VT; EDI Project Manager, The Physician's Computer Company
Justin Dugger, Olathe, KS; Student, Kansas State University
Justin D. Whitney, Worcester, Massachusetts; n/a
Justin Fletcher, Murray, KY; Network Technician, Murray State University
Justin French, McPherson, KS; Student, n/a
Justin Georgeson, Plymouth, MN; Software Engineer, Optical Solutions Inc.
Justin Guerin, Colorado Springs, Colorado; Product Engineer, Atmel Corp.
Justin Hall, Cincinnati, OH; Network Administrator, The Sant Corporation
Justin Lee, Denver, CO; Senior Software Development Architect, Harland Financial Solutions
Justin Miller, Somerville, Massachusetts; Senior Software Architect, Oculus Technologies Corp.
Justin Wojdacki, Santa Clara, CA; Senior Engineer, Analog Devices
Kanayo Orji, East Lansing, MI; Student, n/a
Karen Mirande, Dufur, OR; Landscape, U.S. Citizen
Karl Bellve, PhD, Worcester, Massachusetts; Research Engineer, University of Massachusetts
Karl J. Smith, Portland, OR; Systems Engineer, n/a
Karl M. Hegbloom, Portland, Oregon; Developer and Consultant, The Debian Project
Karl S. Griffiths, Edwardsville, Illinois; Microcomputer Technician, I cannot disclose
Katherine Smith, San Jose, CA; Scientific Programmer, n/a
Kathleen L Smith, Seattle, WA; Retired, Seattle schools
Kathy Cook, Los Angeles, CA, Registered Psychologist, Didi Hirsch Community Mental Health Center
Kathy Evans, Antioch, TN; Web Designer, E.I.C.C.
Kathy I. Morgan, Tok, Alaska; just a US citizen who uses computers
Kaushik De, Arlington, TX; Professor, The University of Texas at Arlington
Keith Bierman, San Jose, CA; Software Developer, n/a
Keith Hays, Champaign, IL; Senior Support Engineer, Argus Systems Group
Keith H. Hayden, Dumont, NJ; Web Site Developer, powersolution.com
Keith Holland, Bowling Green, KY; Software Developer, Independent Consultant
Keith Keller, San Francisco, CA; System administrator, n/a
Keith K Gross, Madison, WI; Development support specialist, Wisconsin Department of Revenue
Keith Reed, Detroit, Michigan; UNIX/SAN Administrator, CareTech Solutions/Detroit Medical Center
Keith Wissing, Lititz, PA; Senior Software Engineer, IDenticard
Kelly Cordellos, Santa Rosa, CA; Apple Sales Consultant, Apple Computer
Kelly Hatcher, Austin, Texas; Senior Software Engineer, Vignette Corporation
Kelly Hickel, Minneapolis, MN; Senior Software Architect, n/a
Kelvin Kakugawa, Champaign, IL; Student, Self
Ken Bowman, Mt. Pleasant, SC; IT Manager, Quovadx
Ken Conrad, Dayton, OH; Network Analyst, Motoman, Inc.
Kendall Bailey, De Pere, WI; Software Engineer, Schneider National
Kendall whitlatch, Duvall, Washington; IT Consultant/Software Engineer, Grendel Industries
Ken Engel, Berkeley, CA; Software Engineer, member, Tau Beta Pi National Engineering Honor Society—tbp.org
Ken Fox, Ann Arbor, Michigan; Programmer, Ford Motor Company
Ken Horton, Indian Harbour Beach, FL; Developer, ImageLinks
Ken Kelley, Charlottesville, VA; Software Engineer, n/a
Ken Klavonic, Concord, NC; Systems Admin, Wachovia
Ken Kumayama, Glendale, Arizona; System Administrator, n/a
Ken Martin, Woodinville, WA; Software Engineer, n/a
Ken McKee, Hillsborough, NC; Analyst Programmer, Duke University Medical Center
Kenneth Badertscher, San Jose, CA; Technical Yahoo!, Yahoo! Personals
Kenneth Bromberg, Garden City, NY; College Lab Technician, City University of New York Graduate Center
Kenneth E McFarling, Portland, Oregon; Software Engineer, n/a
Kenneth Eschrich, Branford, CT; Student, Worcester Polytechnic Institute
Kenneth J. Hendrickson, Tucson, AZ; Principal Engineer, Raytheon Missile Systems
Kenneth J. Lund, Houston, Texas; Hardware Engineer IV COMPAQ
Kenneth M. De Tullio, Huntsville, AL; Programmer, BRC
Kenneth Miller, San Francisco, California; Associate Professor, University of California
Kenneth V. Cuvelier, Canby, OR; Computer Consultant, Becken Computer Services
Kenneth W. Cochran, Alexander City, Alabama; Consultant, Independant
Kenneth W. Melvin, East Bend, North Carolina; Citizen, United States of America
Kenn Murrah, Dallas, Texas; Webmaster, Ussery Printing
Ken Settle, Newport Beach, CA; Software Developer, TransMedia Productions, Inc.
Kent Benedict, Iowa City, Iowa; Systems Administrator, n/a
Kent Peterson, Charlottesville, Virginia; Senior Quality Assurance Analyst, n/a
Kent Pirkle, Atlanta, Georgia; Systems Administrator, n/a
Kent Schumacher, Minneapolis, MN; IS Manager, Structural Wood Corporation
Kermit Woodall, Glen Allen, VA; President, Nova Design
Kerry Crouse, Nashua, NH; Owner/Engineer, Crouse Consulting
Kevin A. Sesock, Stillwater, Oklahoma; Deskside Computer Support Specialist, Oklahoma State University
Kevin D. Clark, Nottingham, NH; Software Engineer, n/a
Kevin Dickson, Billerica, MA; Software Engineer, Raytheon
Kevin H. Devin, Bothell, WA; Systems Administrator, n/a
Kevin Hostelley, Cleveland, OH; Technology Master, KeyBank
Kevin Hutson, Austin, TX; Programmer, Insomniac's Lounge
Kevin J. Butler, Spanish Fork, Utah; Software Architect, Campus Pipeline
Kevin Martin, Tuxedo Park, NY; Owner, Brass Cannon Consulting
Kevin McFadden, McLean, VA; consultant, n/a
Kevin Michael Pansky, Cleveland, OH; Student, Northwestern University
Kevin Morgan, Los Angeles, CA; Consultant, Self-employed
Kevin Nelson, St. Louis, MO; Senior SMC Staff, Cybercon

Kevin O'Connor, Ardsley, NY; Systems Analyst, McGraw-Hill

Kevin O'Mahoney, Palo Alto, California; Senior Software / Hardware Engineer, n/a

Kevin Oster, Milpitas, CA; Software Engineer, Member, ACM

Kevin Rayhons, San Antonio, TX; Multimedia Specialist, Southwest Research Institute

Kevin Sonney, Pittsboro, NC; Programmer, webslingerZ, Inc

Kevin Swearingen, Saint Charles, Missouri; President, Reliable Group

Kevin White, Newbern, TN; Computer Support Technician, Collierville Municipal Government

Kevin Wright, Dallas, TX; Systems Technician, Neiman Marcus

Khouri Giordano, Melville, NY; Software Technology Researcher, Nikon

Kimberly A. Brosan, Irmo, SC; Library Media Specialist, Mid-Carolina High School

Kimberly Claffy, La Jolla, CA; associate research scientist, Principal Investigator, UCSD, CAIDA

Kimberly Menninga, Grand Rapids, Michigan; Research and Development Coordinator, The Composing Room of Michigan

Kip Gebhardt, San Francisco, CA; Software Engineer,n/a

Kip Manley, Portland, Oregon; Writer and designer, Freelancer

Konrad Nagel, Santa Cruz, CA; Application Manager, SZ Testsysteme

Kory Hamzeh, West Hills, CA; President, Avatar Consultants, Inc.

Krishna Sethuraman, Sunnyvale, CA; Programmer/Analyst, SGI

Kris Ktindworth, Urbana, Illinois; Database Administrator, Carle Clinic Association

Kristian Kvilekval, Santa Barbara, CA; Graduate Researcher, UC Santa Barbara

Kristine Sawyer, Castro Valley, California; Concerned Citizen

Kurt Andersen, Liberty Lake, Washington; Postmaster, Agilent Technologies

Kurt Anderson, Bangor, Maine; Info Security Assoc, Eastern Maine Healthcare

Kurt D. Starsinic, Brooklyn, NY; Senior Software Architect, WolfeTech Development

Kurt Overberg, San Francisco, CA; Analyst, KMDI Inc.

Kurt Schaeffer, Houston, TX; Technical Support Representative, Larson Software Technology

Kurt Yoder, McLean, VA; Network administrator, Sport & Health Clubs

K.V. Moffet, Lancaster, CA; Owner, Offworld Press

Kyle Davenport, Dallas, TX; SysAdmin, CompUSA

Kyle Hasselbacher, Elmhurst, IL; Programmer, n/a

Kyle Hoyt, Pinellas Park, FL; System Engineer, Raytheon

Kyle MacLea, Norwich, VT; Graduate Student, Dartmouth College

Kyle Mandli, Madison, Wisconsin; Software Engineer/Researcher, Mandli Communications

Kyle McDonald, Burlington, MA; System Engineer/Programmer, Sun Microsystems

Kyle Mesnard, Crystal Lake, IL; Student, University of Illinois

Kyle Wheeler, Cincinnati, Ohio; Student, Ohio University

Lamar Prosser, Charleston, SC; IT Coordinator for Ctr for Health Care Research, Med Univ of SC

Lance Dryden, Astoria, New York; Network Administrator, Modelwire

Lance Ivy, College Place, WA; Student, Walla Walla College

Lane Weast, Fort Myers, FL; Programmer Analyst I, Lee County Clerk of Court

Lanny Powers, Athens, Alabama; President, LANPOWERS Inc.

Larry Groebe, Dallas, TX; VP New Media, Insider Marketing

Larry Hammer, Williamsburg, Virginia; Network Administrator, Ecpi Technical College

Larry McVoy, San Francisco, CA; CEO, BitMover, Inc.

Larry Norris, Oklahoma City, OK; Director of Development, AFA eDirect

Larry Sendlosky, Leominster, MA; Consulting Software Engineer, Storigen Systems

Larry Smithmier, Cary, NC; Software Engineer, Oak Grove Software

Larry Staton Jr., Winter Park, Florida; Paralegal/Economist, Holihan Diaz

Larry Works, Charlottesville, Virginia; Network Engineer, n/a

Lars R. Damerow, Oakland, CA; Senior UNIX System Administrator, n/a

Laura Wick, San Diego, CA; Homemaker

Laurence Mills-Gahl, Chicago, IL; President, Webfarm, Inc.

Laurence Schorsch, Evanston, IL; Graduate Student, University of Chicago

Lawrence Alkoff, Austin, TX; retired, n/a

Lawrence Gohar, New York, NY; Sr. Server/Network Engineer, n/a

Lawrence M. Brinley, Greenfield, IN; President/CEO, SOHO Solutions

Lawrence R. Doolittle, Walnut Creek, California; Staff Engineer, Lawrence Berkeley National Laboratory

Lawson Whitney, Concord, North Carolina; Citizen, United States of America

Lee Adams, Lake Mary, Florida; BOFH, Synergy Southeast

Lee C Smith, Tyrone, GA; Regional Sales Mgr (Retiring), Plastican Inc

Lee Glenn, Des Moines, Iowa; Software Engineer, n/a

Lee Graba, Minneapolis, Minnesota; Principal Engineer, Honeywell, Inc.

Lee M. Bernbaum, Midwest City, OK; Programmer/Analyst, self-employed

Lee Wenzbauer, Chicago, IL; Senior Consultant, DanielGraphics

Lee Willoughby, Kansas City, MO; Web Developer, AP Network Services

Leif Sawyer, Anchorage, AK; Network Engineer, General Communication, Inc

Lei Zhang, Los Angeles, CA; Student, UCLA Linux Users Group

Len Frazier, McAllen, TX; Systems Manager, Rio Grande Valley Publishing

Leonard Park, Salem, MA; Sales Associate, Apple Computers

Leonard Schrieber, PhD, Fair Lawn, NJ; Senior Trading Systems Analyst, n/a

Leon D. Shaner, Dearborn, ; Internet Architect, Sun Microsystems, Inc.

Lewis Vincent, Melbourne, Vic; Manager, eDream Designs

Lex Mierop, Newbury Park, CA; Senior Software Engineer, Network Telephone Services

Linchuan Liu, Mountain View, California; Student, University of California at Berkeley

Linda Lawson, Phoenix, AZ; Flash Design and Production, n/a

Lindsay Pallickal, Elmsford, New York; Principle, Guidewalk LLC

Lion Templin, Minneapolis, Minnesota; Owner, LCR Systems

Lisa Applegate, Pekin, IL; Network/ Systems Administrator, Pekin School District 108

Lisa A Uber, Highland Park, New Jersey; Consultant/Project Manager, Starling

Lisa Corner, Princeton, WV; System/ Network Administrator, n/a

Lisa R. Bogue, Los Angeles, CA; System and Network Administrator, n/a

Lisa Werner Carr, Dallas, Texas; Senior Content Developer, imc2

Lou Glassy, Bozeman, Montana; Software Engineer, RightNow Technologies

Louis Canaiy, Fort Collins, Colorado; Systems Administrator, Engineering Network Services (Colorado State University)

Lou Miller, Washington, DC; Project Coordinator, Washington Metropolitan Area Transit Authority

Lucas McCauslin, Worcester, MA; Embedded Systems Engineer, Microwave Radio Communications

Luc Lapalme, Sudbury, Ontario; Software Developer, Accutron Instruments

Luke A. Kanies, Nashville, Tennessee; Infrastructure Architect, Caterpillar Financial

Luke Crawford, Rochester, NY; Web Programmer, R Brooks Associates

Lyle D. Vogtmann, Oak Harbor, WA; Pres., Whidbey Island Linux User Group

Lynn Yuan, West Covina, California; Executive Director, i2s Inc.

MacDonald Jackson, Corvallis, OR; CAD Engineer, Intel

Malcolm Gin, Columbia, Maryland; Systems Architect, Member, ACM

Marcel Valcarce, Hollywood, CA; Designer/ Director, Pacific Title and Art Studio

Marc Grubb, Roslindale, MA; Director, IS, Panache Editorial

Marcia Baczynski, Jersey City, NJ; Member, New York Linux Users Group

Marc Levine, Ukiah, California; Systems Analyst Programmer, County of Mendocino

Marcus B. Sellers, Homer City, PA; Masters Candidate Biology, Indiana University of Penna

Marcus I. Ryan, Ames, IA; Computer Engineer, Iowa Department of Transportation

Marcus Porter, Falls Church, VA; Systems Engineer, National Institutes of Health

Margaret Stephanie Leber CCP, Jeffersonville, PA; Chief Technical Officer, Matrisync

Mario Martinez, New York, NY; Systems Engineer, Thomson Financial

Marion Bates, Hanover, NH; Research Engineer, Institute for Security Technology Studies

Mark ''Adam'' Baum, Elk River, MN; Software Engineer, Lockheed Martin ATM

Mark Allshouse, Baltimore, Maryland; Student, Anne Arundel Community College

Mark A. Lytle, Houston, Texas; Network Analyst, Phillips Petroleum Co.

Mark Anderson, Chandler, Arizona; Component Engineer, Intel Corp.

Mark A. Thomas, Germantown, Maryland; Owner, Play by Electron Games

Mark Belnap, Pleasant Grove, UT; Software Developer, n/a
Mark C. Bradley, Eden Prairie, MN; Senior Software Engineer, n/a
Mark Clancy, Rochester, MN; Senior Analyst/Programmer, Mayo Clinic
Mark Ericksen, Omaha, Nebraska; Software Engineer, n/a
Mark Fasheh, Los Angeles, CA; Student, UCLA Linux Users Group
Mark Gray, Atlanta, GA; Computer Systems Analyst, n/a
Mark Greene, Concord, NH; Sr. Systems Engineer, Capital Region Health Care
Mark H. Bickford, Portland, ME; Programmer/Analyst, n/a
Mark Holbrook, Pocatello, Idaho; IS manager, AMI Semiconductor
Mark Horning, Aurora, CO; Unix Systems Administrator, IBM Global Services
Mark Jackson, Fort Collins, Colorado; Software Engineer, Shuffle Master
Mark Jacob, San Diego, CA; Software Engineer, Sony Computer Entertainment America
Mark Jaroski, San Francisco, California; Senior Software Engineer, World Health Organization
Mark J. Horn, Charlotte, NC; System/Network Administrator, n/a
Mark Juliano, Atlanta, GA; Unix Administrator, Autotrader.com
Mark King, Sun Valley, NV; Graphic Artist, n/a
Mark Kinzie, Baltimore, MD; Software Engineer, Johns Hopkins University
Mark Martin, Rochester, New York; Experience Designer, Element K
Mark Miller, Berkeley, CA; Student, Univ. of California
Mark Mynsted, Lewisville, TX; Senior Application Developer, n/a
Mark Nottage, Berkeley, CA; Systems Engineer, n/a
Mark Parker, Salt Lake City, Utah; Lead Web Developer, Medicity
Mark Plimley, San Jose, CA; President, Plimley Consulting
Mark R. Andrachek, Jr., Richmond, VA; Concerned Citizen, n/a
Mark R. Millsap, Potomac Falls, Virginia; Business Development Manager, Affiliated Information Resources, Inc.
Mark Rottler, Indianapolis, IN; Owner/President, SLM Industries LLC
Mark R. Ritschard, Loveland, CO; Director of Computing, Colorado State University
Mark Rushing, Seattle, WA; IT Consultant, Orbis Lumen
Mark Salisbury, Chelmsford, Ma; Senior Software Engineer, Salisbury and Salisbury Inc.
Mark Schafer, Defiance, ohio; student, NSCC
Mark Schweikle, Gilbert, Arizona; Student, Byte Rain Development Corporation
Mark Shepard, Dallas, TX; Software Engineer, Consultant
Mark Stevenson, Indianapolis, IN; Small businesss owner, n/a
Mark Stock, Ann Arbor, MI; PhD student, U of Michigan
Mark Stratman, Hoffman Estates, IL; Systems Administrator and Software Developer, EMC Capital Management
Mark Swayne, Portland, OR; Computer Programmer, n/a
Mark Symonds, Fountain Valley, CA; Systems Administrator, n/a
Mark Tucker, Clifton Park, NY; Unix Systems Consultant, n/a
Mark Wagner, Fremont, California; Database Administrator, IBM/CrossWorlds
Mark W. Alexander, Orlando, FL; Consumer, n/a
Mark Whiteford, BaltiMore, MD; Network Administrator, WW PCTechs
Mark wilson, Ithaca, NY; Student, Cornell University
Marlene Morley, Cleburne, Texas; Linux Administrator, Hypernet Communications
Marshall D. Lewis, Charlottesville, VA; Senior Programmer, ScholarOne Inc.
Martin Middleton, Bridgewater, MA; Release Engineer, n/a
Martin Slade, Pasadena, CA; Scientist, non-profit research lab
Marty Altman, Orlando, Florida; Senior Scientist, SAIC
Marty Paul Combs, San Francisco, CA; Systems Administrator, Techprose
Mary Pat McDonald, Phoenix, Arizona; Educator, Cartwright School District
Mary Peterson Hartzler, Alexandria, Virginia; self employed, n/a
Matt Curtis, American Fork, UT; Software Engineer, Clearst0ne Corporation
Matt Dew, Denver, CO; Hardware Engineer, SEAKR Engineering
Matt Graha
M, Lansing,
MI; QA/Testing Lead, Group InfoTech
Matt Hell
Man, Urbandale, Iowa; Network Security Analyst, Principal Financial Group
Matthew A.
Miller, Ahahei
M, California; Software Engineer, The van der Roest Group
Matthew Barr, New York, NY; Syste
Ms Ad
Ministrator, Barr Consulting
Matthew Bogosian, San Francisco, California; Software Engineer, Grand Central Communications
Matthew Bohnsack, Ames, Iowa; Software Developer, bohnsack.com
Matthew Caughron, Omaha, Nebraska; Co-Founder, Proteron LLC
Matthew Conway, Cambridge, Massachusetts; Senior Software Engineer, i2 Technolgies Inc.
Matthew C. Rees, Greenville, Rhode Island; Computer Programmer, n/a
Matthew Goheen, Rochester, NY; Consultant, MRRC Consulting Corp.
Matthew Hornyak, Pittsburgh, PA; CTO, rTheory
Matthew Hudson, Seattle, WA; Network Security Engineer, AT&T Wireless
Matthew Jenove, West New York, New Jersey; Software Engineer, n/a
Matthew J. Evans, Espanola, New Mexico; Owner/Operator, Oasis CyberCafe
Matthew Jones, Fort Wayne, Indiana; Macintosh computer lab Administrator, Taylor University Fort Wayne
Matthew J. Turk, Grand Rapids, Michigan; Student, Northwestern University (IL)
Matthew Kerr, Walnut Creek, CA; Student, Saint Mary's College of California
Matthew Luu, Santa Ana, CA; Helpdesk Administrator, Goodwill Industries of OC
Matthew Manor, Valley Stream, New York; President, Kingmanor Enterprises
Matthew McNeil, Pocatello, ID; Student, Idaho State University
Matthew Patton, Springfield, VA; Network Security Officer, VGS
Matthew Poor, Englewood, FL; Citizen, Venice Auction
Matthew Radway, Rapid City, SD; Student, South Dakota School of Mines and Technology
Matthew Ray, Austin, Texas; Software Developer, 360 Commerce
Matthew R Burack, Ames, IA; Software Developer, Computer Data Services
Matthew Reed, Seattle, Washington; Student, n/a
Matthew Ross, Ephrata, Washington; Founder, nineinchnerds.org
Matthew Sachs, Merrick, NY; Lead Developer and Project Manager, Zevils Software
Matthew Sexton, Kirkland, WA; Design Engineer, n/a
Matthew Strait, Oak Park, IL; Student, Carleton College
Matthew Toia, Washington Crossing, PA; Student, n/a
Matt Krabbenhoft, Austin, Texas; Graphic Designer, n/a
Matt Leonard, Denver, CO; Consultant, n/a
Matt Lewis, Sacramento, CA; Network Security Manager, WINfirst
Matt Oquist, Nashua, NH; Software Engineer, Compaq Computer Corporation
Matt Potosnak, New York, New York; Programmer, RiskMetrics Group
Matt Pujol, Fort Collins, Colorado; Electrical Engineer, IEEE
Matt Schmill, Amherst, MA; Research Assistant, University of Massachusetts
Matt Vanderveer, Charlottesville, VA; Systems Administrator, Boxer Learning
Matt Welsh, Berkeley, CA; Graduate student researcher, UC Berkeley Computer Science Division
Maureen Duffy, Troy, NY; Student, Rensselaer Polytechnic Institute
Maurice P., Buckfield, ME; Technology Manager, MSAD #39
Max Bell, Portland, Oregon; Senior Systems Analyst, Max Bell Consulting
Maxx Christopher Lobo, San Jose, CA; Network Architect, ArrayComm, Inc.
Mayer Ilovitz, New York, NY; AVP, Citibank
Melissa Grams, Appleton, WI; Systems Analyst, Airadigm Communications
Melissa Woo, Champaign, IL; Research Programmer, University of Illinois at Urbana-Champaign
Meredith Dixon, Mannington, WV; Webmaster, Raven Days
Meryl Newbern, New York, NY; Consultant, n/a
Micah Cox, Kingston, TN; Lead Programmer, Ethereal Software
Micah John Cowan, Mountain View, CA; Software Engineer, Transmeta Corporation
Michael A. DeLuca II, Hatboro, PA; Web Designer, Psidonia.org
Michael A. Jaskowiak, Centreville, VA; n/a
Michael Alatorre, Los Angeles, CA; EIS Liaison Analyst, Cedars-Sinai Health System

Michael A. McLean, Raleigh, NC; QA Testing Engineer, Red Hat Inc.
Michael Amster, Los Angeles, CA; Chief Technology Officer, WebEasy
Michael A. Raymond, Eagan, MN; Software Engineer, SGI
Michael A. Schupp, New York, NY; Senior Developer/Systems Architect, Crosslinks Systems
Michael Barnes, San Mateo, CA; Software Engineer, Cisco Systems
Michael Batchelder, Redwood City, CA; Software Engineer, Counterpane Internet Security, Inc.
Michael Battle, Phoenix, AZ; Software Engineer, Motorola Semiconductor Products Sector
Michael Bell, Pewaukee, WI; Programmer, n/a
Michael Blakeley, Foster City, CA; Internet consultant, self-employed
Michael Bolen, Mishawaka, Indiana; Field Enginner, Service Express, Inc.
Michael Bourgon, Fort Worth, TX; Database Administrator, n/a
Michael Brauwerman, Chevy Chase, FiD; Software Engineer, OPNET Technologies
Michael Buice, Chicago, Illinois; Graduate Student, University of Chicago
Michael Challis, Oklahoma City, OK; President, NeoDigita
Michael Charrier, Colorado Springs, Colorado; President, Charrier Consulting International
Michael Cope, Richmond, VA; Photographer, Michael Cope Photography
Michael Creighton, St. Louis, MO; Interactive Designer, Omni Creative Group
Michael C. Schultheiss, Indianapolis, IN; CEO / CIO, Amellus Enterprises, Ltd.
Michael D. Barry, Baltimore, FiD; Application Developer, n/a
Michael Desjardins, Gray, ME/ Computer Programmer, n/a
Michael Dill, San Jose, CA; Systems Administrator, Novellus Systems
Michael Dinsmore, Gaithersburg, MID; MacGenius, Apple
Michael E Brown, Pflugerville, TX; Software Engineer, Dell Computer Corp
Michael Fairchild, Ventura, CA; n/a
Michael Fair, Los Angeles; Member, linuxatlax.org
Michael F. Klein, Palo Alto, CA; Engineer and Domain Administrator, n/a
Michael Fox, Seattle, Washington; Software Engineer, Self
Michael Galloway, Lenoir City, TN; System Engineer, Oak Ridge National Lab
Michael Granger, Lakewood, CO; Architect, The FaerieMUD Consortium
Michael Guymon, New York, NY; Systems Architect, Igicom
Michael Hagedorn, Houston, Tx; Sr Software Engineer, Pentasafe, Inc
Michael Heyes, Fort Wayne, Indiana; Electrical Engineer, Lincoln Foodseervice Products
Michael Hnatko, Syracuse, NY; Student, Syracuse University
Michael Hollander, San Francisco, CA; Software Engineer, Intraspect Software
Michael Houda, Soquel, CA; Senior Engineering Technician, CSJ/DPW/D&C
Michael Hrubik, Norton, Ohio; Student, The University of Akron
Michael Isaac Jones, Columbus, Ohio; Computer Science Student, The Ohio State University
Michael Jennings, Portland, OR; Business Owner, Futurepower(R) Computer Systems
Michael J. Manning, London, Ohio; Software Engineer, n/a
Michael J Myers, Manchester, PA; Sr Applications Developer, PA State Employee's Retirement System
Michael J. O'Donnell, Chicago, Illinois; Professor in Computer Science, The University of Chicago
Michael Jones, Ruckersville, VA; Java Programmer, Boxerlearning
Michael J. Porter, Newark, DE; Senior Systems Programmer, University of Delaware
Michael King, Wheeling, Illinois; QA Software Tester, Zebra Technologies
Michael Klein, Hermosa Beach, CA; Chief Architect, Greatmark Software
Michael Komarnitsky, Boulder, CO; President, Komar Consulting Group
Michael Kriss, Naperville, Illinois; System Administrator, n/a
Michael L. Broggy, New York, NY; System Analyst, New York Times
Michael Lee, Phoenix, Arizona; Cell Biologist, Environomics Southwest
Michael Lewis, Fort Collins, Colorado; CEO, NicheStaffing
Michael Logue, Asheville, NC; Business Owner (Partner), Earth Guild
Michael Lucas, Saint clair Shores, MI; Consultant, Great Lakes Technologies Group
Michael McConnell, Edina, Minnesota; Chief Architect, http://info-sapient.sourceforge.net
Michael McCray, San Bernardino, CA; Computer Technician, San Bernardino Medical Group
Michael McGonagle, Chicago, Illinois; Owner, FoundSoundRealizations
Michael McHenry, Long Beach, CA; Consultant, Rossum Technologies
Michael Mirande, Dufur, OR; Videographer, Self
Michael Monasco, Minneapolis, Minnesota; President, Cycle Software Services
Michael Morrison, San Diego, Ca.; Software Engineer, Stonefly Networks
Michael O'Neill, Holden, MA; n/a
Michael O'Toole, San Jose, Ca; Engineering Director, n/a
Michael Owens, Santa Fe, New Mexico; Systems Analyst, State of New Mexico
Michael Parker, Los Angeles, CA; Software Architect, n/a
Michael Peay, Murrieta, CA; IT Manager, RedZone Interactive
Michael Percy, San Ramon, CA; Software Engineer, Portera Systems
Michael P McGill, Bethesda, MD; Director of Software Development, HealthASPex Inc.
Michael Poole, Reston, Virginia; Design Engineer, n/a
Michael Remski, Merrimack, NH; Principal Software Engineer, n/a
Michael R. Jinks, Chicago, Illinois; Unix Systems Administrator, James Franck Institute
Michael Roberts, Bloomington, Indiana; Owner, Vivtek http://www.vivtek.com
Michael Roman, Ithaca, NY; Sr Systems Analyst, Cornell University
Michael Sandford, Jacksonville, Florida; Student, University of North Florida
Michael Shiplett, Ann Arbor, MI; Senior Software Developer, Cisco Systems
Michael Sierchio, San Francisco, California; Information Security Consultant, Tenebras, LLC
Michael Skora, Ann Arbor, MI; Web Master, University of Michigan
Michael Spencer Jr., Council Bluffs, Iowa; Programmer/Analyst, Celebrity Personnel
Michael S. Scaramella, Esq., Cherry Hill, NJ; Senior Partner, Scaramelia & Hoofnagle
Michael Tesch, Minneapolis, MN; Software Engineer, Independent Contractor
Michael Tomkins, Kingman, AZ; Consultant, VMSupport
Michael T. Rankin, Walker Valley, NY; Software Support Manager, n/a
Michael T. Scheidler, Greentown, IN; Unix/NT System Administrator, Delphi Automotive Systems
Michael Warnock, San Francisco, California; Artificial Life Programmer, InOrbit Entertainment Inc.
Michael Westcoat, San Francisco, CA; Software Engineer, n/a
Michael Wimpee, Olympia, Washington; Student, Whitman College
Michael W. Shaffer, Palo Alto, California; Network and Security Administrator, Agilent Technologies
Michelangelo Grigni, Atlanta, GA; Associate Professor, Emory University
Michelle Arden, Palo Alto, CA; Consultant, Arden Consulting
Michelle Klein-Hass, Van Nuys, CA; Citizen of the United States of America, n/a
Mignon Belongie, Redwood City, CA; Software Engineer and co-founder, Digital Persona, Inc.
Mike Cathey, Collegedale, TN; Network Administrator, RTC Internet DBA Catt.com
Mike Dean, Cleveland, OH; Programmer, NBD, Inc.
Mike Doherty, Cleveland, OH; Self, Self
Mike Grello, Gaston, South Carolina; Principal Programmer, MaranaTha Software
Mike Heath, Provo, UT; Software Developer, Terrapin Technologies
Mike Hokenson, Green Bay, WI; Systems Admin, DCT Technologies
Mike Lundy, San Jose, CA; Founder, Leland High School Linux/BSD Club
Mike Schiller, Edgewater, MID; Electrical Engineer/Embedded Programmer, n/a
Mike Schiraldi, Ashburn, VA; Research Scientist, VeriSign
Mike Shupp, Los Angeles, California; grad student, Cal State University
Mike Simpson, Atlanta, Georgia; Senior Technical Architect, Abel Solutions
Mike Vondrasek, Fort Worth, TX; Senior Windows Engineer, CitiGroup
Mike Wexler, Santa Clara, CA; CTO, TIAS.COM
Mike Whitney, Austin, TX; Sr. Systems Analyst/Programmer, Motorola
Miles Pickering, San Francisco, CA; Owner, 4by6.com
Milind Rao, Atlanta, GA; Software Architect, Brickstream
Mingyan Bao, Fort Collins, CO; Software Engineer, n/a
Miron W. Neal III, Portland, OR; Instructor, Portland Community College

Mitch Lee, San Francisco, CA; Software Engineer, unemployed
M. Jamie Hejduk, Lexington Park, Maryland; Network Admin, www.memorabledvds.com
M. Lisa Colvin, Nederland, Colorado; Disabled, Concerned individual
M.L. McCauley, Dallas, Texas; President, Mtech Services
Molly Tomlinson, Somerville, MA; Consultant, PeaceGeeks
Mona T Magee, Tallahassee, Florida; State Worker, n/a
Morgan Collins, Yakima, WA; Owner, Morcant Software
Moses Lei, Falls Church, VA; Student, Thomas Jefferson High School for Science and Technology, Alexandria, VA
Mukesh Agrawal, Pittsburgh, PA; Graduate Student, Carnegie Mellon University
Nadia Pervez, Goleta, CA; Graduate Student, EE/CS, UCSB
Najati Imam, Lexington, Kentucky; Masters Student, University of Kentucky
Nancy Goroff Whitney, East Setauket, NY; Assistant Professor, SUNY Stony Brook
Nancy Lehrer, Thousand Oaks, CA; Software Architect, self employed
Nasser Salim, Albuquerque, New Mexico; Systems Administrator, Albuquerque High Performance Computing Center
Nate Fichthorn, Nokesville, Virginia; Student, n/a
Nate Sammons, Denver, CO; Senior Consultant, BEA Systems
Nathan Bargmann, Bremen, Kansas; Lead Electronics Technician, Class A, Union Pacific Railroad
Nathan Black, Madison, WI; Consultant
Nathan Clegg, San Diego, CA; Software Engineer, MUSICMATCH
Nathan Cohick, Quartz Hill, California; Design Engineer, (Advanced Bionics) Private Consultant
Nathan Currier, Los Alamos, NM; Graduate Research Assistant, University of California
Nathan Egge, Austin, TX; Software Developer, Trilogy Software
Nathan Feltch, Provo, UT; Software Analyst, Dentrix Dental Systems Inc.
Nathaniel Davis, Chicago, IL; Graphic Designer, The Creative Group
Nathaniel Gray, Pasadena, CA; Graduate Student, California Institute of Technology
Nathan Kunkee, Rolla, MO; Student, University of Missouri-Rolla
Nathan Myers, Placerville, CA; Software Engineer, n/a
Nathan Neulinger, Rolla, MO; Systems Administrator, University of Missouri—Rolla
Nathan O'Meara, Ravenna, OH; Student, SSCT
Nathan Paul Simons, Ridgecrest, California; Owner, Hard Core Hackers
Nathan Roach, San Antonio, Texas; Product Manager, small business
Nathan T. Spillson, Ann Arbor, Michigan; Principal, Innovative Process Solutions
Nathan W. Labadie, Detroit, MI; Sr. Security Specialist, Wayne State University
Neal J. Murphy, Orinda, CA; L.Ac., n/a
Neal Rauhauser, Omaha, Nebraska; Engineer, American Relay
Neal R. Haslam, Ashfield, PA; Telecommunications Engineer, electric utility
Neal Young, Cambridge, MA; Senior Research Scientist, n/a
Neeraj Tulsian, Austin, Texas; n/a
Neil D. Rosenthal, Schenectady, New York; Consultant, Applications Programming, James McGuinness & Associates, Inc.
Nell Drumm, Polk City, Iowa; Student, North Polk Community School District
Neil Getker, Cincinnati, OH; Network Administrator, HR ProFile
Neill Haggard, Cary, North Carolina; Consultant, Self employed
Nevin Lyne, Rochester, FiN; Sr Network Administramor, Gippy's Internet Solutions
Nicholas Allen, Columbus, OH; Computer Engineering Student, Ohio State University
Nicholas Bender, Norton, NA; Quantitative Analyst, n/a
Nicholas Jones, Chicago, IL; Unix Administrator/Network Tech, DuckSystems/SignalCorp
Nicholas Paulick, Oshkosh, WI; Mechanical Engineer, n/a
Nick Fankhauser, Liberty, IN; Programmer, Doxpop
Nick Grossman, New York, NY; Software Developer, n/a
Nick Ienatsch, Orinda, CA; Retired, State of California
Nick K. Aghazarian, Stockton, CA; Windows Software Engineer, n/a
Nick Scott, Arlington, VA; Engineer, Veritect
Nick Traxler, West Lafayette, Indiana; Student, Purdue University
Nick Wesselman, Milwaukee, WI; Consultant, Digital visions
Niels Provos, Ann Arbor, Michigan; Ph.D. candidate, CITI, University of Michigan
Nigel Gamble, Mountain View, CA; Operating System Software Engineer, Afara Websystems
Nigel Olding, Folsom, CA; Consultant, CDI
Nino R. Pereira, Springfield, VA; Sr. Scientist, Ecopulse
Nitin Borwankar, Oakland, CA; President and CEO, Borwankar Research Inc.
Noah Gibbs, Mountain View, CA; Software Engineer, Palm, Inc
Noel Holshouser, Plain Dealing, LA; Independent Consultant, n/a
Nolan Leake, San Francisco, CA; Software Engineer, Radik Software
Norbert Roma, Pittsburgh, PA; Research Scientist, n/a
Norman Yamada, New York, NY; Independent software developer, n/a
Ocie Mitchell, Pasadena, California; Software Engineer, Paracel
Oliver Azevedo Barnes, Brooklyn, NY; Web Developer, self-employed
Oliver Stacey, Berkeley, California; Software Engineer, n/a
Pablo Virgo, Middletown, Maryland; Student Tech Support, Earlham College
Pamela Eachus, Manchester, New Hampshire; IS Operations Analyst, Syndicated Services
Pamela Jasins, Ann Arbor, Michigan; GIS Technician, Washtenaw County Government
Paonia J. Ezrine, Chelmsford, MA; Sr. Unix Consultant, n/a
Partha Narasimhan, Santa Clara, CA; Network Architect, n/a
Pat Augustine, Jacksonville, FL; Systems Administrator, n/a
Patricia A. Rupe, Ormond Beach, FL; Senior Applications Analyst, n/a
Patrick B. Gardner, Aiken, South Carolina; Owner, Offdwall Computers
Patrick Corrigan, Tigard, Oregon; n/a
Patrick Finnegan, West Lafayette, IN; Student, Purdue University
Patrick Insko, Roscoe, Illinois; Principal, Insko Computer Consulting Group
Patrick J. LoPresti, Cambridge, NA; Founder, Curl Corporation
Patrick J. Santucci, Dayton, OH; Control Systems Programmer, MCSi
Patrick McDonald, Boston, MA; President, Heed Technology
Patrick McMahon, Newark, DE; Computer Information Technology Associate III, University of Delaware
Patrick Moon, Somerville, Massachusetts; Substitute Teacher, Somerville High School
Patrick Nichols, Norfolk, VA; Web Developer, n/a
Patrick Scannell, Fairbanks, AK; Network Manager, USFWS
Paul Belt, Franklin, MA; Networking Consultant, Self
Paul Blair, Bluffton, SC; Software Development Manager, Databuilt
Paul Bort, Euclid, Ohio; Systems Engineer, TMW Systems
Paul Bradley, Portland, Oregon; Technology Specialist, n/a
Paul Campbell, Seattle, WA; Tech Consultant, n/a
Paul Cantrell, St. Paul, MN; Software Engineer, Retek Inc.
Paul DeStefano, Beaverton, Oregon; Systems Analyist, n/a
Paul D. Robertson, Alexandria, Virginia; Director of Risk Assessment, n/a
Paul Eberle, New Prague, MN; Software Developer, BlueCross BlueShield of MN
Paul Felts, Ventura, CA; Network Administrator, CSF
Paul Forbes, Sunnyvale, CA; Network Engineer, Trimble
Paul G. Allen, El Cajon, CA; Engineering Consultant, Random Logic Consulting Services
Paul Gardner, Carlsbad, CA; Software Engineer, n/a
Paul G. Ennis, Chapel Hill, NC; Attorney at Law, n/a
Paul Herzog, Flanders, New Jersey; President, Gapware Systems
Paul H. Lewis, Aiken, South Carolina; Government Documents Librarian, University of S. Carolina—Aiken
Paul Hoehne, Reston, VA; Manager, T4 Consulting Group
Paul Howard, St. Joseph, Michigan; Sole Proprietor, Tomcat Robotics
Paul Keusemann, Savage, MN; Software Engineer, n/a
Paul Levitt, Brookline, MA; Space Systems Engineer, n/a
Paul Lorenz, Rochester, NY; Software Engineer, NetSetGo Inc.
Paul Lupa, Austin, TX; Sr. Systems Analyst, Motorola
Paul Lussier, Lunenburg, MA; Senior Network/Systems Administrator, Mission Critical Linux
Paul M. Dubuc, Columbus, OH; Software Engineer, CAS
Paul Miller, Kalamazoo, MI; Systems Analyst, Bary County Telephone

Paul Miller, Palm Bay, Fla.; Microsoft Support Tech, graphic-mac.com
Paul Notley, San Francisco, California; QA Engineer, Isomorphic Software
Paulo Raffaelli, San Francisco, CA; Principal Engineer, ImagiWorks, Inc.
Paul Rupe, Chapel Hill, NC; Software developer and computer hobbyist, n/a
Paul Schreiber, Cupertino, CA; Software Engineer, Apple Computer Inc.
Paul Stroud, Raleigh, NC; Software Engineer, IBM
Paul Walmsley, Boulder, Colorado; n/a
Paul Z. Myers, Morris, MN; Professor, University of Minnesota, Morris
Peter A. Schwenk, Newark, Delaware; CITA-3, Systems Administrator, University of Delaware
Peter Bakke, Portland, Oregon; Webmaster, Independent
Peter Benjamin, Santa Monica, CA; Consulting Scientist, n/a
Peter Boothe, Laguna Beach, CA; Software Developer, Gordian Inc.
Peter DeWeese, Fairfax, VA; Developer Support Engineer, webMethods
Peter F. Hollings, Atlanta, Georgia; Software Consultant, n/a
Peter Flugstad, Iowa City, Iowa; System Architect, Icon Labs
Peter Frischknecht, Clemson, SC; Net Admin, Empowering Solutions Inc
Peter Gephardt, Columbus, Ohio; Engineer, n/a
Peter Havens, Dever, CO; Senior Engineer, Level 3 Communications
Peter J Scordamaglia, Holiday, FL; Senior Systems Engineer/Developer, Pegasus TransTech
Peter Kasting, Santa Barbara, CA; Software Development Engineer, Green Hills Software, Inc.
Peter Luichinger, Fort Wayne, Indiana; Software Engineer, TEK Interactive Group
Peter Marreck, Greenwich, CT; Software Developer, FactSet
Peter Rinehart, Jupiter, FL; student of computer science, Cornell University
Peter Schneider, Nashville, TN; Software Engineer, n/a
Peter Tagtmeyer, Hamilton, NY; Librarian, Colgate University
Peter Vessenes, Cambridge, HA; President, Ybos Corp
Pete Smith, New Smyrna Beach, Florida; Electronics Technician, Bellsouth
Pete Toscano, Fairfax, VA; Systems Research Manager, n/a
Petre Scheie, St. Louis Park, MN; Unix System Administrator, Nextel Partners
Petr Vicherek, Richester Hills, MI; Software Engineer, Eaton Corporation
Phil Harris, Reston, Virginia; System Administrator, Cable & Wireless
Philip Brogden, Tijeras, New Mexico; Senior Engineer, CWS
Philip Brown, Lakewood, California; System Administrator, bolthole.com
Philip Budne, Arlington, MA; Consultant, n/a
Philip Hilton, Farmington, Maine; Student, University of Maine at Farmington
Philip Sagstetter, Littleton, Colorado; Software Developer, Lockheed Martin Corporation, Astronautics Company
Phillip Cox, Mesa, AZ; Network Engineer, Charles Schwab
Phillip Jones, Raleigh, NC; Java Devloper (Contractor), IBM
Phillip Karlsson, New York, NY; General Partner, Goats, LLC
Phillip Mocek, Seattle, WA; Software Engineer, Internap Network Services
Phillip Pollard, Lansdale, PA; Programmer, Diversified Consulting
Phil True, M.S., Eagan, MN; System Architect, n/a
P. Ryan Bergman, Des Moines, Iowa; Web Developer, GeoLearning
P. T. Kornman, Notasulga, AL; Dr., Central AL Comm College
P T Withington, Plymouth, MA; Software Journeyman, callitrope
Rachel Slatkin, Atlanta, Georgia; Electrical Engineer, n/a
Rafal Boni, Stoughton, MA; Software Engineer, n/a
Ralph Stanley, Austin, Texas; Probe Test Engineering, Motorola
Ramon R. Aviles, Montgomery, IL; Private citizen, n/a
Randall Campbell, Fort Collins, Colorado; Software Engineer, Hewlett-Packard
Randall J. Parr, Seattle, WA; owner, Temporal Arts
Randall W Smock, Arvada, Colorado; Hardware/Software Systems Engineer, Storagetek
Randolph H. Kramer, Bethlehem, Pa; Consultant, n/a
Randolph S. Kahle, Tucson, AZ; President, Kahle Associates, LLC
Randy Froc, Pepperell, MA; Software Engineer, Curl Corporation
Randy Tidd, McLean, VA; Software Engineer and Private Investor, (Self)
Raylynn Knight, Acworth, GA; Sr. Software Design Engineer, ChoicePoint
Ray McVay, Arlington, TX; Sr. Software Engineering Specialist, Northrop Grumman Information Technology
Raymond Ferguson, Madison, WI; NOC-Analyst, Berbee
Raymond Kocian, Ridgefield, CT; Research Scientist, Schlumberger-Doll Research
Raymond Leonard Haines, Columbus, Ohio; Support Analyst, OCLC
Ray Tayek, Lakewood, California; programmer, nanosoft
Rebecca Andrews, San Francisco, California; consultant, n/a
Rebecca Frankel, Boston, MA; Software Engineer, MIT Artificial Intelligence Lab
Rebecca Sobol, Boulder, Colorado; Editor, LWN.net
Red Lloyd, San Antonio, Texas; Senior System Administrator, Veridian
Rene Fromhold-Treu, Mountain View, CA; Consultant, Eike Consulting
Renu Bora, Los Angeles, California; CFO, Linux Public Broadcasting Network
Renwick Preston, Houston, Texas; Control Systems Specialist, S&B Engineers & Constructors, LTD
Reuben Partida, Pasadena, CA; Specialist, Verizon Advanced Services
Reuven Gevaryahu, Philadelphia, PA; Student, University of Pennsylvania
Rev. Nicholas R. Robbins, Bay City, MI; ,
Richard A. Eiken, Kansas City, Missouri; PC Consultant, Eiken Consulting
Richard A. Milewski, Sunnyvale, California; CTO, RamPage.Net
Richard Blumberg, Cincinnati, OH; Proprietor, Wm. Blake Fabricators
Richard Brennan, Lockport, New York; n/a
Richard Bullington-McGuire, Arlington, VA; Managing Partner, PKR Internet
Richard Clark, Warren, MI; Field Service Engineer, MBM Computer System Solutions
Richard Congdon, Rockport, MA; Senior Programmer, Harvard University
Richard Copeland, Marietta, Georgia; Senior Systems Engineer, n/a
Richard D. Cravens, Columbia, MO; , Independent Consultant
Richard Forno, Arlington, VA; Chief Technology Officer, Shadowlogic
Richard G. Misenheimer, Los Angeles, CA; Senior Engineering Consultant, n/a
Richard Harris, Pittsburgh, PA; Director of Technology, Anexinet
Richard Jason Armstrong, Phoenix, Arizona; Network Systems Engineer, Technica Corporation
Richard Johnson, Kansas City, MO; President, Northland Computer Services
Richard Kelsch, Lakeside, California; Owner, RK Internet Technologies
Richard Lesh, St. Peters, MO; President, Compass Genomics
Richard Linville, Spruce Pine, NC; Distance Education Technician, Mayland CC
Richard M. Atwater, Indianapolis, IN; Software Engineer, Charles E. Hill & Associates
Richard Moore, Newark, California; President, DACS Software, Inc.
Richard Murphy, Las Cruces, New Mexico; Mechanical Engineer, HTSI, NASA JSC White Sands Test Facility
Richard Nicoletti, Southborough, MA; Software Engineer, Millennium Pharmaceuticals
Richard Plevin, Brattleboro, Vermont; President, Richard Plevin and Associates
Richard Ross, Oxnard, CA; Lieutenant Commander, United States Navy
Richard Sawey, San Carlos, CA; Citizen, USA
Richard Schumer, San Francisco, California; Auditor, Curtis Hotel
Richard Tietjen, Guilford, CT; Publishing Technologist, McGraw-Hill
Richard W. Ernst, San Diego, CA; n/a
Richard W. Lipp, Overland Park, KS; Information Systems Manager, List & Clark Company
Richard Wynne, Raleigh, NC; System Administrator, AT&T
Rich Coe, Milwaukee, WI; Software Engineer, n/a
Rich Fuchs, Burlingame, CA; systems programmer, Research Libraries Group
Rich Gordley, Des Moines, Iowa; Lead Programmer, Diversified Software Technology
Rich Irvine, Minneapolis, Minnesota; SysAdmin/Senior Systems Consultant, ArchWing Innovatons LLC
Rick Bradley, Harlingen, Texas; CTO, EastCore
Rick Buford, Columbia, MO; System Administrator, CARFAX
Rick Frankel, New York, New York; President, cyberCode consulting inc
Rick Richardson, Wayzata, MN; Dad, Richardson Family

Rick Romero, Waukesha, WI; IT Manager, Valeo
Rick Thompson, Claremore, Oklahoma; Developer, aeonblue
Rick Wittstruck, Lincoln, NE; Computer Programmer, self-employed
Ricky Musci, Berkeley, California; Systems Administrator, The Nautilus Institute
Rik Farrow, Sedona, Arizona; Security Consultant
RL ''Bob'' Morgan, Seattle, WA; Senior Technology Architect, University of Washington
R.L.Dempsey, Carrollton, Texas; unemployed, concerned user
Roberta A. Kennedy, St. Augustine, FL; Applications Specialist, n/a
Robert A. Cooper, Katy, Texas; Individual
Robert A. Glenn, New York, NY; Private citizen
Robert A. Jacobs, Omaha, Nebraska; Computer Analyst, Northrup Grumman Information Technology
Robert A Salzman Jr., Beaverton, OR; Sr. Member of Technical Staff, Responsys
Robert Bercik, Washington DC; Student, Computer Science, Georgetown University
Robert Bingham, Westerville, OH; Student, Ohio State University

MTC–00028574

From: Brian Bender
To: Microsoft ATR
Date: 1/28/02 4:41pm
Subject: Microsoft Settlement

To Whom It May Concern,

As I understand the proposed settlement regarding the anti-trust trial against Microsoft, little if anything is done to correct the actions that have been found anti-competitive. The agreement simply prevents them from continuing. This hardly seems sufficient to deter a corporation from cheating its way into a dominant position. There should be, in my opinion, actual peanalties paid for past actions, so that there is a real disincentive to engaging in these practices in the future.

Consider this a ''no'' vote on the proposed settlement.

Thanks for your attention.

Sincerely,

Brian Bender

Pittsburgh, PA, USA

MTC–00028575

From: Lissa Levy
To: Microsoft ATR
Date: 1/28/02 4:41pm
Subject: Microsoft Settlement

I believe that the proposed settlement is a bad idea. It gives too much control to Microsoft without concern for the consumer.

Thanks,

Lissa Levy

Chapel Hill, NC

MTC–00028576

From: Ford, Jim
To: Microsoft ATR
Date: 1/28/02 4:41pm
Subject: Microsoft Settlement

To Whom It May Concern:

I am writing this last minute email to state my support for the Microsoft Settlement. I believe that this battle the DOJ has waged against Microsoft has been, at the least, misguided, and has threatened competition more than anything Microsoft itself has been accused of. I would also point out that most of the key players in this battle on the corporate side stand to gain greatly not because DOJ will eliminate a threat to their well-being, but because DOJ is beating down a competitor who has the pulse of the marketplace (which they often do not).

Let's get this travesty of litigation out of the way and move on to something important!

MTC–00028577

From: TSULLV@aol.com@inetgw
To: Microsoft ATR
Date: 1/28/02 4:42pm
Subject: Microsoft settlement

Sir:

I am but a lowly consumer and cannot afford 10,000 dollar an hour lawyers.

I have no way to file any briefs with any judges and would not even know how. I can tell you one thing. On my computer I cant even remove one small icon that has to do with the MSN network. I would not even begin to be able to come close to removing or using any other soft ware on my home PC. Now I know little of the law and have no way of sending this letter to the judge.

I can tell you one thing micro soft has monopolized my system and that's a fact.

Thank You

Thomas F. Sullivan

little guy consumer

From: Susan Kaltenbach
To: Microsoft ATR
Date: 1/28/02 4:43pm
Subject: Microsoft Settlement

To the Department of Justice (DOJ):

I would like to submit my comment on the issue of the Microsoft settlement.

I understand that complainants against the settlement state that it (a) Does not correct Microsoft's ''anti-competition'' errors, and (b) Having Microsoft donate $1B of hardware, software and training is wrong because it perpetuates Microsoft's domination of the operating system marketplace.

I cannot comment on topic (a) because I am not well educated on the complaints and resolutions of this large and complex case. But I can comment on topic (b).

I am an individual who cares deeply about getting more underrepresented school kids interested in the sciences, and I have expended effort and mentorship to try to facilitate this. (In Washington state, ''underrepresented'' means racial minorities and ''first generation'' college students—students who are the first in their family history to attend college. I personally am a ''first generation'' college student.) I've heard comments from those opposed to the $1B donation that these kids should receive Linux software, since it is ''free'' and ''open code,'' and would help loosen Microsoft's grip on the operating system's marketplace.

I want to make my message perfectly clear: These kids would be further ghettoized if the Linux proponents get their way. The Microsoft Windows software and applications model is used throughout the business world and is the dominant international software. To donate a fringe operating system like Linux would make these non-employable.

Not only is Linux useless in developing work skills for these kids, it is also extremely difficult to learn. Thus, only those who are supremely motivated—such as young boys already pursuing the maths and sciences—would make the effort to learn. The other, majority of students would avoid computing. And they would lack computer skills needed for them to succeed academically and professionally.

The present paradigm is to introduce kids to Windows or MacIntosh operating systems. Then, the kids move to more specialized operating systems as the need arises. Unix and Linux are often used by academics— not by the rest of the world.

I therefore respectfully submit that the settlement agreement is, on topic (b), completely fair and valuable to the nation as a whole.

Thank you for the opportunity to comment.

To Whom It May Concern:

Attached are my comments re. United States et al. v. Microsoft, pursuant to the Tunney Act.

I have attached two copies of the same document, one in Microsoft Word format; the other in Rich-Text Format. Either document should be readable on any modern PC using up-to-date software.

Thanks in advance,

JJ Gifford

re. Deficiencies in Microsoft settlement.

Pursuant to the Tunney Act, I am filing these comments on the proposed resolution of United States, et al. v. Microsoft.

My Perspective, Experience, and Interest

I believe this case is tremendously important. As personal computers and the Internet have become increasingly important to our everyday lives, so too has the landscape of the technology markets become increasingly important. Not only will the outcome of this case impact the fortunes of a host of technology companies, but it will also affect how I and millions of others communicate with our friends and family, what choices we have for online services such as digital photography, and of course how much we and businesses spend on technology infrastructure. Once the government decided not to seek a structural remedy, it necessarily embarked on a course

of regulation. Regulation only works when the conduct prohibitions truly restrain anti-competitive behavior, and create a genuine opportunity for innovators to enter the market and compete in it based on their merits. Unfortunately, the Proposed Final Judgement (PFJ) presented by the Department of Justice and several states fails on all counts.

Its results will be only a mild, temporary modification to Microsoft's well-documented behavior, with no lasting or significant effect on competition. Microsoft will retain its monopoly and every incentive to maintain it through any means not specifically prohibited by the PFJ. Consumers will continue to be deprived of the innovations and other benefits of a truly competitive market, in part because innovators will be deprived of the opportunity and incentive to challenge Microsoft's monopoly as it expands and evolves. Most importantly, America's technology industry will stagnate, as ever fewer competitors see any value in entering markets dominated by Microsoft.

While I believe that many if not most Americans will be affected by the disposition of this case, I have a particular interest in it as a long-time technology consumer, entrepreneur, and enthusiast. Since 1980, I have used personal computers nearly every day, first as a hobby, then for school, and later for my career in the technology industry. In the early 1990s, I managed a small but pioneering desktop publishing department for a large advertising agency. Later, I joined a groundbreaking multimedia company that produced CD-ROMs for both Macintosh and Windows-based computers.

Most recently, I was a partner in a successful Internet development firm, which designs and produces web sites and other interactive media for corporate clients. Having sold my share of that business, I currently consult for other companies in the technology industry.

Definitions Are Critical: the Devil Is in the Details

1. Most provisions of the PFJ depend on the definition of ''Microsoft Middleware.'' Accordingly, we should expect this term to be well-defined, with clear boundaries and unquestionable meaning. Unfortunately, the reality is that it is vaguely defined, in language that grants Microsoft itself much control over what software it, and therefore the PFJ, governs.

1.1. Definition: According to the PFJ (PFJ VI.J), ''Microsoft Middleware'' is any software which:

. is distributed separately from the operating system,

. controls the user interface of the Microsoft Middleware,

. provides substantially similar functionality as a Microsoft Middleware Product, and

. is trademarked.

1.2.

Definition gives Microsoft control. So Microsoft, which has long stated its goal of incorporating browsing and other middleware functions into its operating system products, can exclude code from the Microsoft Middleware definition simply by not distributing it separately from the operating system, or even just by not trademarking it. Microsoft therefore will have enormous latitude in determining which new operating system features will be governed by the PFJ.

Clarity Is Essential to Compliance and Public Confidence.

2. The PFJ consists largely of vague prohibitions hobbled by numerous qualifiers and exemptions.

For instance:

Limited replacement of Microsoft Middleware.

2.1. The PFJ requires Microsoft to enable users and OEMs to specify that Non-Microsoft Middleware be used in place of Microsoft Middleware (PFJ, III.H.2). This is a welcome change because it had previously been difficult to replace Microsoft's Internet Explorer (IE) without facing ''considerable uncertainty and confusion'' when IE would nonetheless unexpectedly be invoked under certain circumstances (Findings ¶ 171).

2.1.1. Exemption for Microsoft servers. Unfortunately, Microsoft is exempt from this requirement when the Middleware Product would be invoked ''solely for use in interoperating with a server maintained by Microsoft'' (PFJ III.H). This may exempt Microsoft's current move into network services (''.NET'') from the judgement, inasmuch as such services communicate with Microsoft-owned servers. Microsoft considers .NET to be the next phase of the Internet, at last offering ''real'' applications and services. The first .NET service, Microsoft Passport, aims at becoming a cornerstone of Internet shopping and authentication transactions, and stores its data exclusively on Microsoft-owned servers.

2.1.2. Exemption for proprietary technologies. Another exemption allows Microsoft to launch its own middleware when the Non-Microsoft Middleware ''fails to implement a reasonable technical requirement'' (PFJ III H 3). Microsoft will be able to capitalize on this loophole simply by emphasizing proprietary technologies not supported by Non- Microsoft Middleware. To the extent that Microsoft can implement features using proprietary technologies, it will better be able to exclude Non-Microsoft Middleware. A truly pro-competitive PFJ would encourage Microsoft to use open industry standards.

OEM Distribution Channel Opened, But For Whom?

2.2. The PFJ requires Microsoft to allow OEMs to customize the user's desktop by installing icons for Non-Microsoft Middleware and other products (PFJ, III.C.1). This is important to the PFJ because Microsoft has in the past excluded Netscape and other competitors from the valuable OEM distribution channel, often by contractually limiting an OEM's ability to customize the desktop. In addition, Microsoft has used its control over the valuable desktop real-estate as an incentive to get IAPs such as AOL to support Microsoft Middleware instead of competing products.

2.2.1. OEMs lack incentive. Unfortunately, because Microsoft's Internet Explorer is now the market leader, there is today little consumer demand for alternatives to Microsoft Middleware. This makes it unlikely that an OEM would see much gain, if any, in installing Non-Microsoft Middleware. Such distribution may benefit the middleware developers, but would not greatly benefit the OEM.

2.2.2. Customizations will be short-lived. This prohibition remains in effect only for a 14-day window starting after the end user first turns on his or her PC. Thereafter, Microsoft is free to re-arrange the desktop as it sees fit, including automatic removal of any non-Microsoft icons, e.g. by operating system features such as the ''Clean Desktop Wizard'' built-in to Windows XP (PFJ, III.H.3). So, any Non-Microsoft Middleware developers who do manage to secure OEM distribution could well see their products wiped off the desktop after a short two weeks.

2.2.3. Likely results. These limitations beg the question: will any OEMs risk irritating Microsoft for such minor benefits? If they do, will the results truly be increased competition in the middleware market?

General Rule on Sharing APIs.

2.3. The PFJ requires Microsoft to share APIs used by Microsoft Middleware with ISVs, et al. (PFJ III.D). In its Findings of Fact, the District Court found that Microsoft had repeatedly withheld such information from ISVs, or used its disclosure as an incentive for ''friendlier'' behavior, in an effort to preserve the applications barrier to entry (Findings, ¶ 84, 90, 91). Because ISVs depend on such information to develop software for a given platform, withholding APIs can limit or destroy an ISV's ability to create competitive products. Therefore full API disclosure should be considered a basic condition for any kind of effective competition.

2.3.1. Only APIs necessary to mimic Microsoft's products will be disclosed. Unfortunately, the PFJ requires Microsoft to share only those operating system APIs used by Microsoft Middleware. This is a limited set of APIs, of use only to those ISVs who want to develop middleware products similar to Microsoft's. It does little to help ISVs offer features or innovations not already offered by Microsoft's products. Since ISVs typically must provide innovations to gain market share against an entrenched market leader, this requirement is unlikely to promote competition in the middleware market.

2.3.2. Many APIs may be withheld on dubious ''security'' grounds. The PFJ allows Microsoft to exclude any APIs the disclosure of which ''would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems'' (PFJ III.J.1).

. This is a surprising exemption because few security professionals believe API disclosure could weaken any well-designed security system. Indeed, the complete source code (a level of disclosure far greater than simple APIs) is publicly available for several operating systems and security-related products that are widely considered to be more secure than Windows (e.g. the Linux operating system).

. Yet the inclusion of this exemption implies that there in fact are such APIs

whose disclosure could compromise security, and thereby opens the door for Microsoft to make claims about which ones they are. There is no basis for the Competitive Impact Statement's (''CIS'') optimism that security-related exemptions will be limited to ''keys and tokens'' (CIS, IV.B.5) of particular installations. Nothing in the PFJ's language so limits the exemptable APIs, and such entities aren't generally visible at the API level, anyhow.

. With Microsoft's current push into network services (under the .NET moniker), we can expect privacy and security features to be suffused throughout the code, increasing the number of APIs Microsoft will try to exempt from disclosure. Indeed, Microsoft has just this month announced that privacy and security will henceforth be its main priorities.1 Associated Press, ''Microsoft Announces Strategy Shift'', D. Ian Hopper and Ted Bridis, January 17, 2002.

Inadequate Enforcement

3. The task of detecting whether Microsoft has violated these and other provisions falls to a three- person ''Technical Compliance'' committee (the ''TC''). This committee will have access to the source code and tools used to create Microsoft's products, as well as access to the relevant Microsoft staff (PFJ IV.B.8). In theory, the TC's oversight will prevent Microsoft from using technical strategies to camouflage non-compliance, for instance by wrongly claiming that some important API should not be disclosed for security reasons. While such oversight may in fact be helpful, the TC is an inadequate, inefficient and non-transparent attempt to ensure enforcement of a Judgement that otherwise relies on voluntary compliance and enforces few penalties for transgressions.

3.1. Severe employment restrictions threaten the TC's performance. The PFJ includes employment restrictions which will dramatically narrow the pool of TC candidates—first, to those experts not currently working for Microsoft or a competitor, and then to those remaining candidates willing to forego any such employment for two years after serving on the TC. In so doing, it excludes nearly all of those experts in operating systems design and programming whom the TC most needs, since it will be very difficult to find any such experts not currently working for, and with no intention of working for, Microsoft or a competitor. As a professional in this field, I cannot imagine why a highly competent independent minded computer scientist would wish to serve on the TC under these circumstances.

3.2. The TC will be buried under a mountain of technical data. Even if well staffed, the committee will have an enormously difficult task from a technical standpoint. Inasmuch as deciphering computer source code can be difficult even for the code's author, much less a new reader, and inasmuch as Windows XP alone consists of some 45 million lines of code2, this committee will have an enormously difficult task. Even with a large support staff, it is hard to imagine this committee effectively analyzing Microsoft's source code and fully investigating allegations of non-compliance.

3.3. The TC cannot ensure timely remedies. Further, because the committee is prohibited from public comment (PFJ, IV.B.10), it will be unable to confirm any ISV's suspicions about Microsoft's compliance, nor could it force a timely remedy. Its only recourse will instead be to notify Microsoft and the Plaintiffs and to suggest a possible remedy. Therefore, an ISV suspecting Microsoft of non-compliance will not receive an immediate remedy, but must instead rely on a bureaucracy whose natural tendency will be not to pursue minor infractions. While such infractions may indeed be minor in the scope of the overall judgement, they would assuredly be of great importance to the ISV. 3.4.

The TC's findings may not be presented to the Court or the public. Under the PFJ, the TC may not testify in any matter relating to the Final Judgement, nor may its work product and recommendations be submitted to the Court (PFJ, IV.D.4.d). Similarly, the TC is prohibited from public comment (PFJ, IV.B. 10). Thus, even if the TC's exclusive access to source code should produce evidence of deception and non-compliance by Microsoft, this evidence will not be presented to the Court. 2 BusinessWeek, ''Windows XP: a Firewall for All'', Alex Salkever, June 12, 2001.

. In theory, the TC will report to the Plaintiffs, who may in turn report such non-compliance to the Court, and produce evidence of it via other means. This may well happen in the case of massive or severe non-compliance. However, what happens to the small ISV who suspects Microsoft of non-compliance, e.g. by not disclosing some necessary API? Such an injured party may report its concerns to the TC, and then hope that the TC is able to verify its claims, and further is able to convince the Plaintiffs to go to court on their behalf. During this bureaucratic pursuit, the ISV's business may suffer irreparable harm, or even vanish altogether (as has very nearly happened to Netscape). Were such ISVs to have access to Microsoft's source code, perhaps in a secure facility, they could investigate such concerns themselves, directly and immediately. Indeed, API disclosure would not be an issue in the first place.

. The point here is that the nature of the TC is as the first step in a bureaucracy whose natural instinct will be to pursue only the most serious transgressions. In the context of a rapidly changing technology industry, this is a serious weakness in the PFJ. 3.5. PFJ places enormous weight on third TC member. The PFJ proposes that the Plaintiffs appoint one member of the TC, Microsoft appoint a second, and then these two members themselves choose a third (PFJ IV.B.3). This structure places enormous responsibility on the third member, who can be expected to decide any disagreement between Microsoft's representative and the Plaintiffs'', especially in the context of the Voluntary Dispute Resolution process in IV.D. It is unclear whether the TC reports to the Plaintiffs only as a single unit, or whether a dissenter's view also gets submitted to the Plaintiffs. A better structure would at the very least make it crystal clear that any single member of the TC may report to the Plaintiffs.

Also, creating such a fulcrum position in the TC makes this third seat much less attractive and harder to fill, and injects an element of politics into the TC that will distract from its technical mission and smooth functioning. Because the TC is not a decisional body, but simply a means to keep a watchful eye on Microsoft's compliance, it is unclear why Microsoft should have representation here at all. All of the TC's members should be appointed by the Plaintiffs, perhaps with the DOJ appointing one member, the States appointing a second member, and the Plaintiffs collectively appointing the third. 3.6. Catch-22. Given the enormity of the TC's tasks, the limits on its powers and enforcement abilities, and the severe employment restrictions surrounding service in the TC (IV.B.2), it is clear that any candidate for the TC willing to accept the job is almost certainly too inexperienced to be legitimately qualified for it.

In Today's Market, More is Needed.

4. In perhaps its broadest weakness, the PFJ fails to recognize that the circumstances of the original case were unique, and that circumstances today are very different. The Internet's rapid public acceptance around 1994–1995 took many established computer-industry firms by surprise, and radically changed the personal computer market. The basic reasons users wanted to own personal computers changed dramatically within less than two years. Two companies in particular, Netscape and Sun Microsystems, were able to aggressively exploit the new technologies and to take advantage of Microsoft's slow response to the burgeoning consumer demand. As a result, they were able to present a serious threat to the applications barrier to entry that has long protected Microsoft's monopoly in Intel-compatible operating systems.

4.1. No longer any consumer demand for non-Microsoft Middleware. But that window of opportunity is long closed. The Internet is an established part of the personal computer market. Microsoft's Internet Explorer is the dominant browser. There no longer is any great consumer demand for alternative browsers. Netscape no longer exists as an independent company, and development of the Netscape browser occurs at a fraction of its former pace. Even the CIS acknowledges that Microsoft has ''perhaps extinguished altogether the process by which these two middleware technologies [Java and the Netscape browser] could have facilitated the introduction of competition into the market for Intel-compatible personal computer operating systems'' (CIS, III.B.3).

4.2. Cannot resuscitate existing middleware competitors. Nothing in the PFJ can or will restore these competitors to their former strength. There is no way to rekindle the massive consumer demand, then left unserviced by Microsoft, that gave these companies their initial momentum.

4.3. Hoping for another thousand-year flood. Still, the CIS claims the PFJ will ''restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings'' (CIS, II). Given that Microsoft now dominates the browser market and retains its operating systems monopoly, and given that the PFJ

allows Microsoft to support its browser market share by tying the browser to the operating system, this claim seems to rest on the optimistic hope that some new disruptive technology will appear, will be ignored by Microsoft, and will create massive consumer demand for some non-Microsoft Middleware. Without such an event, the PFJ merely establishes rules for a game that has no players.

Unconditional Surrender

Finally, in a bizarre and extreme limitation, the PFJ will expire in only five years—regardless of whether or not Microsoft retains its operating systems monopoly (PFJ, V.A). The DOJ must believe that not only is the PFJ an effective remedy, but that it will be so effective that Microsoft will be reduced to a shadow of its former self and must be unshackled in just five years (seven, if the Plaintiffs seek and receive the maximum extension permitted by the PFJ). Unfortunately, this clause is so careless that it will release Microsoft no matter the circumstances—that is, even if Microsoft retains or even strengthens its monopoly power. The message that the PFJ sends is ''we'll try this for five years, and then we're giving up.''

Any judgement should remain in effect until the Court finds that Microsoft no longer holds a monopoly in Intel-compatible operating systems. It makes little sense to release Microsoft until competition has re-entered the market and Microsoft may no longer commit the illegal acts described by the Court'' s Findings of Fact.

Alternatives

This PFJ illustrates the difficulty in devising effective conduct remedies for complex software cases such as this, especially where the defendant retains its monopoly power and the incentive to expand and maintain it by any method not prohibited by the PFJ. Vague technical definitions and even apparently narrow exemptions can be exploited by the monopolist to maintain its ill-gotten gains. It would be vastly preferable to create the proper structural conditions for competition by decoupling parts of the monopolist enterprise. Without a structural remedy, it is imperative that the definitions and prohibitions in the Final Judgement be as clear and comprehensive as possible, so as to fully restrict the anti-competitive behavior that has been denying consumers choice, innovation and fair market pricing. There are a number of specific changes that ought to be made to the PFJ:

. Any judgement should remain in effect until Microsoft no longer holds a monopoly in Intel- compatible operating systems. Starting in 5 years, the Court should annually review Microsoft's position in the Intel-compatible operating systems market. Should it find that Microsoft no longer exercises monopoly power in that market, and therefore cannot commit the illegal acts described in the Court's Findings of Fact, it could release Microsoft from the terms of the judgement.

. The TC should be appointed entirely by the Plaintiffs, perhaps with the DOJ appointing one member, the States appointing a second member, and the Plaintiffs collectively appointing the third.

. Definitions such as that of ''Microsoft Middleware'' should be tightened considerably, and the PFJ reworked to minimize its reliance on such narrow categories.

. Microsoft should be required to make the full source-code for its Intel-compatible operating systems available for viewing by ISVs et al.. This will allow ISVs to better develop competitive products, and will allow the ISVs themselves to monitor Microsoft's compliance with the judgement's other technical requirements, instead of relying on an inefficient, overworked TC.

. If the Court decides against requiring source-code sharing, it should at a minimum require the disclosure of all operating system APIs used by any Microsoft products (i.e. not just those APIs used by Microsoft Middleware). A blanket disclosure requirement such as this will close those existing loopholes whereby Microsoft might withhold critical information from ISVs whose products threaten its operating system monopoly.

. Exemptions permitting various proscribed behaviors under certain circumstances should, as a whole, be stricken. Finally, the judgment should include real consequences for non-compliance, such as further conduct prohibitions, financial penalties, or further disclosure requirements. The PFJ currently provides only a possible Court-imposed two-year extension of its rather toothless provisions.

Conclusion

I hope that the PFJ is modified by the DOJ or the Court, and that what seems to be a great opportunity for antitrust law to make a difference for tomorrow's entrepreneurs and consumers is not lost in a fog of complexity. The technology may be complex and changing, but the underlying competitive issues are fundamental. I take both comfort and concern from the fact that I am clearly not alone in expressing these concerns. As the Financial Times editorialized: ''. . .It would be wrong for the states, or the judge, to reject this settlement merely because it is not sufficiently punitive. The test is whether the proposal provides enough protection for the public and for Microsoft's competitors. As it stands, it does not meet this test. Though a continued trial would be expensive and distracting, it would be better than an unsatisfactory settlement. This proposal should be rejected..'' (Financial Times, ''Micro-too-soft'', November 5, 2001)

I believe that the PFJ, if accepted by the Court in its current form, will lead to clear and irreparable harm to consumers and to the United States'' technology industry. So pervasive has technology become that the technology industry is an obviously critical component of the American economy.

Even Business Week, itself no anti-capitalist Microsoft critic, recognized the broad implications of the resolution of this case: ''. . . [T]he Justice Dept.'s weak censure of Microsoft for its serious monopolistic practices could cost the U.S. mightily in the years ahead. The great strengths of the American economy are its openness, its competitiveness, and its innovativeness. Monopoly is the enemy of all three.'' (BusinessWeek, ''Slapping Microsoft's Wrist'', November 19, 2001)

Based on my experience, I do not find the PFJ to be in the ''public interest'', which is the standard that the DOJ and the Court are subject to under the Tunney Act.

Respectfully submitted,
Jonathan Gifford

Subject: Microsoft Settlement

Ms. Renata B. Hesse, Antitrust Division 601 D Street NW, Suite 1200 Washington, DC 20530–0001 Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough.

Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user.

This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

Sincerely,
Noreen Willig 7394 E. Brisa Drive

Re: MICROSOFT SETTLEMENT COMMENTS

Ms. Hesse:

I would like, if I may, to forgo adding any further efforts to muddy the law and, instead, just comment on the proposed settlement as a consumer who uses a PC computer. With all the drang and sturm already surrounding this case, the interests of the consumer can sometimes get lost in the legal crossfire.

Separate from the arcana of the law, there are two competing views that have been expressed to determine the consumer's interest, as regards the benevolence of the monopoly that Microsoft maintains over desktop operating systems, and against

which the proposed settlement ought to be judged.

The first, and most easy to understand, is the view ably championed by Microsoft. That points to the great advantages in convenience from having a single seller that, alone, can erect a seamless intra and inter connectivity among the various applications on one's own desktop and in electronic communications with different computer users using different platforms. Certainly the convenience factor has some merit and, I must confess, some of my computer-using colleagues with whom I discuss these issues second Mr. Gates'' feelings.

On the other hand, and less readily understood but eminently as vital, is the essential creative energy for dynamic change and future progress that only emanates from disorganization and chaos, both of which are, too often, swallowed in the maw of a monopoly, especially one, like here, that has been found to wantonly abuse its monopoly power. That is why I believe this excerpt from the Pulitzer Prize winning book, Guns, Germs and Steel, is so instructive for how to structure a remedy in this case, if you will indulge me in this short detour to an explanation of why civilizations expand and fall-

''Why did China lose its [technological] lead [over Europe]? Its falling behind is initially surprising because China enjoyed undoubted advantages . . .

''These advantages and head start enabled medieval China to lead the world in technology. The long list of its major technological firsts . . . In the early 15th century it sent treasure fleets, each consisting of hundreds of ships up to 400 feet long and with total crews of up to 28,000, across the Indian Ocean as far as the coast of Africa, decades before Columbus's three puny ships crossed the narrow Atlantic Ocean to the Americas'' east coast. Why didn't Chinese ships proceed around Africa's southern cape westward and colonize Europe, before Vasco da Gama's own three puny ships rounded the Cape of Good Hope eastward and launched Europe's colonization of East Asia? Why didn't Chinese ships cross the Pacific to colonize the America's west coast? Why, in brief, did China lose its technological lead to the formally so backwards Europe?

''The end of China's treasure fleets gives us a clue. Seven of those fleets sailed from China between A.D. 1405 and 1433. They were then suspended as a result of a typical aberration of local politics that could happen anywhere in the world: a power struggle between two factions at the Chinese court (the eunuchs and their opponents). The former faction had been identified with sending and captaining the fleets. Hence when the latter faction gained the upper hand in a power struggle, it stopped sending fleets, eventually dismantling the shipyards, and forbade oceangoing shipping . . . But in China . . . because the entire region was politically unified . . . [o]ne decision stopped fleets over the whole of China.

''Now contrast those events in China with what happened when fleets of exploration began to sail from politically fragmented Europe. Christopher Columbus, an Italian by birth, switched his allegiance to the duke of Anjou in France, then to the king of Portugal. When the latter refused his request for ships in which to explore westward, Columbus turned to the duke of Medina-Sedonia, who also refused, then to the count of Medina-Celi, who did likewise, and finally to the king and queen of Spain, who denied Columbus's first request but eventually granted his renewed appeal. Had Europe been united under one of the first three rulers, its colonization of the Americas might have been stillborn.'' Jared Diamond, Guns, Germs and Steel: the Fates of Human Societies, W.W.Norton & Co. (1999), at pp. 411–413 (emphasis added).

The same motivating forces that animate a civilization described by Mr. Diamond similarly infect those of companies, technologies and markets. Microsoft certainly has much to be proud of in prevailing over so many of its competitors. But innovation does not number high on that list.

Whether we think back to the first ''killer app,'' the spreadsheet, or the word processor, not to mention the mouse, the user-friendly WYSIWYG interface, the world wide web, media streaming, music sharing or almost anything else that has caught fire in the market, it was someone other than Microsoft who conceived and gave life to these ideas so critical to the realization of the full potential of computing. Furthermore, the fact that Microsoft exercised its monopoly power over the desktop to destroy so many of these inventors, depriving them of their just reward for their labors, is of great concern for an economy whose lifeblood literally depends upon the nourishment of innovation.

What Microsoft has added to the equation apart from technical refinements is, essentially, marketing—marketing with the unique power that arises not because it has developed the newest or best product for the consumer, but rather the dominance that derives from the illegal extension of its desktop operating system monopoly.

This is not a contentious statement. The company's executives openly acknowledge the fact, as in the Wall Street Journal profile that ran following Mr. Gates handing day-to-day control over to Mr. Ballmer two years ago at the height of this litigation. ''Mr. Ballmer's ascension signals— ''the shift in power at Microsoft from those with purely technical minds to those who can fuse technology with business sense and customer concerns. For example, Microsoft's consumer chief Rick Belluzzo, a longtime Hewlett-Packard Co. executive whom Mr. Ballmer recruited, says the success of Microsoft's Web efforts depend more on marketing than technology.'' David Bank, ''How Steve Ballmer Is Already Remaking Microsoft,'' Wall Street Journal (Jan. 17 ''00) (emphasis added).

Nor ought that statement to be surprising. It is in the essential nature of organization that, once primacy in some endeavor is achieved, every sinew in its corporeal body is marshaled toward the defense of the product at the source of its power, to be free of the unpleasantness of brutish competition, and to enjoy the quiet life of the monopolist.

Understandable though that may be for any monopoly, including Microsoft, this condition does not demarcate the consumer interest. Rather it is antithetical to it. Messy but vibrant competition is the only proven engine to maintain the pressure to constantly strive and to provide rewards for those who succeed.

Absent clear and enforceable constraints on the extension of Microsoft's desktop monopoly to the web and beyond, the future will be the worse for the dead weight of their monopoly. If the trial court's original structural remedy breaking up the operating system monopoly from applications and the web is off the table, then it is absolutely essential that the final judgment erect an impenetrable wall preventing Microsoft's conduct from extending its monopoly into the new frontiers that advanced computation have opened.

This includes a ban on bundling or otherwise tying the sale of its Windows operating system with any other software product whose essential purpose is to communicate to or from the world wide web or manipulate digitized sights and sounds, all of which are outside the OS market and none of which is mission critical for a desktop computer to operate. At the same time, Microsoft must also open all its evolving source code with complete documentation to competing developers so that they are given a fair opportunity to be the First to market for mid-ware with product that is seamlessly integrated into the operating system. Lastly, the defaults built into the operating system cannot steer the passive user to Microsoft's products, such as the Word folder that Outlook Explorer continues to steer me to when attaching fries such as this to email, impervious to my best efforts to change that default setting.

Mind you, none of this means that Microsoft ought to be stopped from marketing any product that they chose, so long as it is unbundled in its own shrink wrap to insure that they are forced to compete on a level playing field. Even if they had acquired their monopoly power on the desktop legally—and the trial court found otherwise—that tragedy would be inexcusably compounded in a black mark on the legal system were they now permitted to leverage that illegal monopoly into new markets and, in the process, slow the development of future opportunities on which America's leadership depends.

For all his accomplishments, Mr. Gates ought not to be heard to complain about the intervention of the anti-trust laws in his path to market power inasmuch as Microsoft only exists by virtue of the fact that the Justice Department had previously sued IBM for anti-trust violations, which at the time had a near monopoly in mainframe computers. The reason IBM visited young Mr. Gates that fateful day in 1979 in search of an outside party to provide an operating system for IBM's first personal computer was, by moving that product extension in someone else's hands, to throw the antitrust wolves off their traces, not because they had any capacity or desire to develop their own product in-house.

Now it is time for him to recognize that the sun which has shined on him is setting. For the immediate future, Microsoft can continue to enjoy monopoly rents on a mature business so long as it refrains from those acts

found unlawful that illegally sustain its monopoly, but it must leave future markets to be conquered only by those who fairly prevail on the field of competition.

It is in its dynamic economy that America has defined its greatness. In that achievement, however, lay the seeds of our own decline if we let ourselves become prey, as so many civilizations have before us, to subside into complacency, lured by the siren call of convenience and its hand maiden, the status quo.

With the future of economic growth so tied to the ability to multiply human productivity through advances in computation, it would be a tragedy of the first order to let that happen. This case creates the opportunity to seize a far better future than the convenient but far more limited one promised by Microsoft.

Sincerely,
Peter Anderson

Subject: Anti Trust settlement

Mr. Ashcroft,

Please read the attached letter regarding Microsoft. Thank you.

Regards,
James J Lennox

MTC–00028582—0001

James Lennox
19 Dellwood Drive
Florham Park, NJ 07932
January 28, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

The purpose of this letter is to go on record as a supporter of the settlement that Microsoft and the Department of Justice has reached. The antitrust suit against Microsoft has drained state and federal government funds, as well as Microsoft's; am relieved to see that it has ended.

A inordinate amount of money has been spent pursuing Microsoft, and this settlement finally allows an end to the litigation. The settlement was actually harder on Microsoft than I would have liked, but I am relieved to see an end to the dispute. In fact, Microsoft will be required under the agreement to supply its competitors with its intellectual property in the form of source code and design data, which makes up the internal structure of the Windows operating system. This does not seem fair to me, but if it ends the suit against Microsoft, I support it.

This settlement is fair enough, and I just hope that there will be no further litigation against Microsoft.

Sincerely,
James Lennox

I urge the Federal Government and those states involved in the settlement of the anti-trust case with Microsoft in November 2001 to continue with the process of settlement and see it through to its completion. I have read the terms of the settlement and the punishment of Microsoft is stern but fair for all involved. I and the other consumers who ultimately drive the economy will benefit from this settlement and that is of utmost importance today. It is time for the Federal Government the participating States and all those who seek to further delay this settlement to move on to other issues by allowing the completion of this settlement and ending the Microsoft anti-trust case once and for all.

The government has no business determining software/hardware combinations how technology can be improved how technology companies can form partnerships and how companies can manage their intellectual property. The market and consumers have already made that decision and make it every day in their purchasing choices. This settlement should be approved so that we can all move on to the business of innovation.

Because I am old (68) I remember the growth of computer technology and it has been great. Microsoft has led the way. But along the way there has been a lot complaining about the leadership. As I remember it would come from people who were experts. It seemed they had control of their world and didnt want it to change. But technology is about change and therefore what ever Microsoft did it made the present better and pushed us into the future. From my point of view we should stop all law suites aginst Microsoft and get on with business.

Throughout this process Microsoft and Bill Gates have shown no remorse or even signs that they have infringed on the rights of others in the marketplace. The current settlement is a sellout to Microsoft.

They concede nothing and give nothing. The day after this settlement concludes Microsoft will continue to bully and coerce smaller competitors protect their programs and deny what everyone thought that they were supposed to yield. Their lawyers will find protection in the samll print. Microsoft gained leadership through shrewd buisness alignments initially and afterward by borrowing technology from others. Did Microsoft introduce the mouse or pull down screens? No! If it wern t for other competition Microsoft would still have us using DOS. Microsoft has continuously introduced mediocre software and mediocre upgrades that crash and crash again. If they were building automobiles no one would buy a second one. Microsoft has dominated the personal computer software field with poor products soley because they have muscled every competitor into submission. The proposed settlment does nothing to stop this still arrogant corporation from continuing as it has in the past. Break up Microsoft!

Give the Nation an honest and fair playing field for all. Thanks !

I am shocked that the government has brought this case against Microsoft. Microsoft is an innovative company that does a lot for it s consumers. It s amazing that a small business can be successful with the tools Microsoft has developed. This case against Microsoft needs to be dropped. It s harming consumers and our economy to continue such a fight against a company that has done so much for the consumers and America! Please drop this case and move on. Settlement is needed to help the economy to move forward. I am so disappointed in the 9 states that are continuing the fight against Microsoft. They are obviously not listening to the American people since most of us do not want this to continue since Microsoft has done so much to help improve our lives. It s so obvious that the 9 states are being pushed to continue to fight Microsoft just for money and their power-hungry competitors that have not been able to develop products as well as Microsoft. As a consumer I choose which products I want to use. It s not forced upon me! Therefore I m not sure how I m being harmed. I choose what I want to use and I will continue to choose Microsoft. Please move forward and let things continue the way they are.

Dear Sirs I encourage you to complete and settle the Microsoft case as soon as possible in a manner that is the least intrusive of Microsoft. It is my opinion that this entire case is based not upon what is best for consumers as we enjoy the greatest technological advantage in the world here in the USA largely due to the contributions from Microsoft but based upon the desire of others as Larry Elison and Scott McNealey (Oracle & Sun Corporations) to themselves be # 1 in place of Microsoft. Both have openly and repeatedly said as much on many venues. It is time to close this case and move on. Best
Regards
Danny Chadwell

It is my belief that government has gone too far in it s pursuit/vendetta against Microsoft. When the public buys more goods from a certain company it is usually because that company had the foresight to see the needs of the public. Also the public has in essence cast it s vote by buying goods and services from Microsoft thereby showing it s trust and it s wish to continue a consumer/producer relationship with that company. It makes me wonder what is next on the government s agenda to attack and break up. This divide and conquer strategy taken by our government can next attack anything American. The people should beware and vote accordingly to be assured that those who intend to use big government against the public are not in a position to do so.

It seems to me to be more a matter of extortion than justice.The complaints were brought by competitors rather than consumers. The anti trust and monopoly laws were intended to protect consumers yet consumers are not for the most part the ones complaining.If Microsoft is a monopoly then how can there be competitors to bring about these complaints? It seems to be another case like that of the tobacco co.s of the government seeing a huge pile of cash that it can extort from a legal corporation operating in a legal manner producing a legal product being used in a legal manner.

My Opinion is that the government should stay out of technology and the web. They are currupting freedom of speech with every attack on the Internet & Microsoft. People shouldn t be prosocuted for doing good business and making good products. there hasn t been a company that is better at doing business OR making good software for consumers and business to use. Most Commerce on the internet is backed by microsoft servers and a technology that microsoft has made. That awesome advance (known as ACTIVE SERVER PAGES) in the internet is downplayed by one or more tiny little losers in the consumer market. Most people know and love windows its on something like 90% of consumers PCs.

Your alternatives are Macintosh or Linux. Both of these options are either too technical or too expensive. Windows is easy enough for most Non-Technical people to use and learn. Macintosh says they are the easiest but with most people they dont want a Macintosh because they look dumb or they are too expensive you choose why. Plus $1000 for a low end computer isn t desireable for me how about you!?

Your other option are linux and OS2 (all flavors) do you program C? I dont and im a database administrator enough said. Another person (or the government) might take the opposite view. Well they are soo good they are tring to take over all the companies that make technology. I don t believe they are tring to take over anything. I think that the consumers are making them. they are making products that are far better than any others.I don t work for microsoft nor do I believe in thier mission statements. But as a consumer in the technology field I believe in their products. So be it is I will continue to buy

Microsoft products reguardless of any government regulations%

I buy Microsoft products because I like them and I want them. The thought that Netscape or any other company is losing market share due to a monopoly is ridiculous. If I thought other products had merit I would buy them. The only reason Microsoft seems to have a monopoly is because their products are many times better than the competition! In my opinion the plaintiffs in this case are wasting my tax dollars.

I have been a consumer of Microsoft products since 1991. I have never felt disadvantaged by their pricing of their products. In fact my personal productivity has increased significantly every year as their products improved through innovations they incorporated into their software and services. I think the settlement is fair and it is time to end this costly legal battle. Our government has better battles to fight. I would urge the judge to pressure the remaining State s Attorney s to also settle the case and let s move on to more serious offenders than Microsoft which has helped make America the World leader in technology and software.

Our anti-trust laws should be modified to reflect the contemporary marketplace. Microsoft's competitors took advantage of antiquated laws to hurt the company that has provided unprecedented benefit to our society economy productivity as a nation and ability to comunicate globally. Free enterprise has prevailed. It is indeed the very size of Microsoft that enabled continuous reinvestment into improving it's products. The state of our present computing systems is now well ahead of where it might have been were Micrsoft restricted. Re-do the laws. Leave Microsoft alone. Tell the competitors to take their case to the market and not the courts.

To whom it may concern

I believe as a citizen of this free country the government does not have right to intervene with any company. The companies of the United States are like the citizens of the United States. They both have the freedom to excel. This is what makes America what it is. In the case regarding Microsoft I believe they have their right to excel. They company has brought us new technology has helped out the economy and had begin a new market. The comapny should not be punished. I believe the majority of the citizens of the United States are grateful for what Microsoft has done and what they will continue to do. Its a shame that my tax money is being used against a company that wanted to excel.

Thank you for this opportunity and your time.

Take Care

Dear Sir or Madam,

The proposed settlement does not go nearly far enough in stopping microsoft's egregious behavior. The company should be dealt with decisively. How many anti-trust suits do my tax dollars have to fund. You have a mandate to protect the consumer and competition. Microsoft has repeatedly shown contempt for our government and our people. If we are to fight terrorism around the world we should begin at home. This monopoly only inhibits the growth of our economy, It does not represent it. As a business manager I am forced into disadvantageous purchasing decisions as a direct result of microsoft breaking compliance with technologies before their life cycles are realized. We are forced to spend capital to replace equipment that is not broken just to remain on a platform that they support. You let the best remedy escape when you opposed the break up now you don't even have an enforceable doctrine. Please for all our sakes take stronger action. I just don't want to continue to buy lesser products because I have no choice.

Thank You
Richard Moore

This settlement is for the COMPETITORs NOT the consumer !!! I always thought a free market system would let the market decide. We are not a free market system when the government dictates the market especially when it has been obvious over the last 4 years of this lawsuit that the competitors are

using our own government to gain their own advantages. Not many consumers in the US today believe this lawsuit has anything to do with them. We all know it has to do with jealously and posturing by the competitition.

Please stop this nonsense and let consumers decide what is best for them. Our dollar speaks loudly in a free market system.

Though I do not believe that justice should be swayed by the majority's opinion for majority'ssake I provide my opinion here because the Microsoft case has been made open for public comment. The American government has taken Microsoft to task for being a productive innovative and successful company. The purpose of the government is to defend its peoples' individual rights these rights are impinged upon when force is used to undermine another's ability to think live or produce through free choice. Controls on legitimate spending contracts and productivity undermine civilized human behavior and only cause more controls. Microsoft has settled rather than fight the court system with its energy money and time. But the justice system is wrong. These laws should never have existed in America. There should be a complete separation between economy and state only cases of national security fraud and broken contract should be business matters of the court domain. To punish Microsoft for being so successful is the equivalent of punishing an individual for being good at living. I can only hope that the precedent set by the outcome of this case does not seek to completely undermine all that America stands for.

To Whom It May Concern:

I think the increasing frequency of computer viruses and denial of service attacks only serve to underscore how important competition is in the market place, and how poor quality and service can get in the face of a monopoly. Microsoft is knowingly producing shoddy products because they can force suppliers to comply with their demands. They use their size, market share and media assets to avoid competition, while their lawyers tie up what competition and complaints there are. I do not want to see them shut down, but I want real accountability to the public built into the remedy. Please help see to it that any proposed settlement has teeth, or do not settle.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to you to express my support for the settlement of the anti-trust lawsuit against Microsoft. The agreement that has been reached will not only help the economy, but it will ensure that in the future, anticompetitive corporate action will not be tolerated. Microsoft has not been let off lightly and the government has proven its point.

The biggest provision of the settlement is the fact that Microsoft will not attack other computer manufacturers who produce rival products. This will definitely open up the market to fair competition without fear of reprisal. I support Microsoft's position and also think that it is necessary for small business to flourish in partnership with larger companies. This settlement allows this to happen.

Three years is long enough for a case to continue. Microsoft has agreed to this settlement and now it is time for the government to respond in kind. Anticompetitive laws have benefited greatly from the result of this case and so have all sides concerned. Let Microsoft continue to develop software that benefits us all without the threat of further litigation hanging over the company. I urge you to accept this settlement. Thank you.

Sincerely,
Joanne Griffin

Subject: Microsoft Settlement.

Dear DOJ

The fact that this government has backed down from properly seeking a strong settlement from Microsoft, in view of the finding that it has promulgated monopolistic behavior is distressing. In my view, and that of MANY literate computer professionals, what Microsoft has wrought on the Country, World, and the Computer business at large is nothing more than a thinly -veiled attempt to create a monopolistic stranglehold on how we compute, and what we compute with.

If there needs be any further evidence about how ineffective Microsoft is at innovation, and how little they care about anything other than Market share, it would be this: Their Latest ''state of the art'' operating SYstem Windows XP, is so full of security breaches and bugs that it makes matters WORSE rather than better. And they KNOW it! In addition, they are patching these flaws so quickly and so often that it is virtually impossible for IT professional to maintain a stable computing environment in their businesses.

I, for one, CATEGORICALLY REFUSE to operate their software, and avoid using the Windows operating system completely. Many IT professional are now switching to UNIX, Mac OS X and LINUX as a stable alternative.

i wish that DOJ would SERIOUSLY REVIEW their proposed settlement (which has been watered down significantly since, coincidentally, a REPUBLICAN administratin took power) as it DOES NOT provide protection for the American Computing Public, and, in fact, lays the way clear for Microsoft to continue to promulgate Monopolistic control of the way we work—Iff you need more proof, look seriously as the .NET Strategy, and their abusive software upgrade ''purchase'' policies.

I am disappointed with DOJ being prepared to THROW AWAY the ONLY opportunity we have to remedy Microsoft's egregious business practices, and to properly punish them. Please do the right thing—since you won't break them up, at least LEVEL THE PLAYING FIELD so they can no longer usurp INNOVATION from third parties and call it WINDOWS. LOOK AT WHAT THEY DID TO NETSCAPE!!!! Mad, you're damn right I'm mad—I pay your salaries! Now please do the will of the people, NOT the will of the politicians. WE WANT THIS ABUSER PUNISHED!

My wife and I enjoy the quality and reliability of Microsoft products. We have used competitors products in the past and have found them to be inferior time and time again.

We think it would be in everyone's best interest to resolve the case. We may just be two individuals in the population but our opinion is that this drama has gone on too long as it is. The company that provides a superior product at a reasonable price should not be ''bashed'' just because it is preferred by the user.

Approximately fifteen years ago a competition issue arose with telephone companies and I have not experienced the same degree of satisfaction in telephone service since the breakup of AT&T. I would hate to see history repeat itself.

Maybe the time and monies used to prosecute Microsoft could be better used investigating the pricing and merger activities within the cable industry. At the consumer level these appear to be unfair, monopolistic, and not in the best interest of the public.

Subject: Microsoft Settlement

Good Afternoon,

As a professional with 20 plus years of computer technical experience and a decade-long owner of several successful computer service companies I feel that I have a relevant perspective on this case that should not be ignored. Important background to consider first is that I initially gained experience with Microsoft's competitor Apple, followed by various other competitor's systems. I was slow to move to Microsoft's products but eventually found that they offered superior products and support. As a developer in the computer business, they were far more responsive to my needs than Apple and delivered more cost effective solutions. Since then on countless projects, this has been the case and it is for no other reason then Microsoft's ability to offer better products and support with lower total-cost-of-ownership that they have my business.

This case was never created for or even by consumers but for the benefit of failed market competitors to Microsoft. It was presided over by a judge with a personal axe to grind who was incapable of understanding anything technical. The prosecution of Microsoft was an insult and the behavior of the court was worse. Microsoft's proposed settlement is more than fair and should be accepted.

Thank you for your time,
Sincerely,
Reid Flickinger

January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I was recently informed that the DOJ has asked for the public's opinion on the antitrust lawsuit against Microsoft. As I feel very strongly about this issue, I decided to take full advantage of this opportunity. I am an avid support of Microsoft and if this settlement brings closure to this three-year battle against them, then I support the settlement as well. In my opinion, this lawsuit as done nothing but attempt to tear down the IT industry leader. In the process, major damage has been done to this industry and the economy. It is time to bring closure to this case and I hope that you will make the necessary decision to ensure this.

I have a hard time understanding the reasons behind the States'' dissatisfaction with the settlement. The settlement seems fair and serves to ensure that future antitrust violations will not occur. Microsoft has even agreed to alter business practices that were not found to be unlawful, just so that this matter will close quickly. As for Microsoft competitors, they should be more than pleased that Microsoft has agreed to grant them much easier access to their company codes and interfaces. This is the first time that this has happened in an antitrust case. Additionally Microsoft will adhere to findings by a Technical Committee as it relates to compliance disputes.

I am confident that I am one of many people who feel the same way about this matter and hope that my comments and those of others will play heavily on your decision to wrap this matter up quickly. Thank you for taking the time to consider my thoughts on this matter.

Sincerely,
Albert Minoofar

Subject: Microsoft anti-trust settlement

Greetings—

I am a professor of computer science at the University of Colorado at Boulder. I am a lifelong Unix user, but my professional life has been significantly affected by the Microsoft monopoly, and I would like to make a few points about the settlement.

Microsoft has a long history of business practices that intentionally and effectively tie its users'' hands—in ways that benefit Microsoft, and that perpetuate and extend its monopoly. Their business practices are predatory, and their design choices have made it difficult for anyone to use any kind of competing software or format. This is true from the system level (e.g., the netscape lockout) to the social/practice level—for example, how hard it is to get a Microsoft email program to send email messages in anything but Microsoft-proprietary format.

This last example, which hits me many times every day, may seem petty, but it is really pernicious—in the way that my history classes taught me that the anti-trust act is intended to fix. I get email from a non-computer-scientist colleague, complete with a Word attachment. I email back, asking for a lingua franca format like pdf or ascii. My correspondent can't figure out how to do the translation, eventually gets frustrated, and castigates me for not ''getting with the program'' and using Microsoft. Since I use computers professionally, doing so is not an option; moreover, I know enough to not succumb to that kind of pressure. Neither of those things is true for most people, and the pressure propagates the Microsoft monopoly.

Encouraging an entire community of users to use a single set of proprietary software is not only a matter of monopoly. It is also a matter of security. Microsoft's email programs, for example, not only force their naive users to send Microsoft-format attachments, but also make those users vulnerable, because the defaults are set up so incoming attachments are automatically ingested. Moreover, those programs are full of security holes. This combination causes dozens of virus attacks to propagate around the world every year. My colleagues'' computers are routinely paralyzed during these events, but I have never—NEVER—been affected by a virus in my 20 years at MIT and Colorado.

It is well known in ecology that a diverse population is far more robust. The goal of Microsoft's direct and indirect pressure is a homogeneous population of computer users running Windows. A single smart hacker would be able to take down this entire country if they succeed.

File formats should be open, just like the design of a car interface —- the steering

wheel/accelerator layout, etc.—is open. Competitors should not be smothered using heavy handedness. (This is EXACTLY what catalyzed the suit that ended up in Sherman!) The open-source community, in particular, should be allowed to thrive, not squelched. Manufacturers should be able to install any OS that they can sell, without fear of retaliation. That kind of force is the very antithesis of the free and open market.

Sincerely,
Elizabeth Bradley

Subject: Settlement

Our government or any part thereof, should never be used as some sort of wrecking ball used against those entities which through superior strategy and innovation realize the maximum benefits of our capitalistic system. It is through such practices that the consumer realizes the greatest benefits of innovations at competitive market costs.

Therefore, it is a credit to our system of justice and fairness that the anti-trust case against Microsoft, encouraged and driven by those entities that choose to whine rather than compete, be concluded in this settlement rather than some heavy handed judgement by the DOJ against the Microsoft Corporation.

Thank You.

From: Jan Chesne
To: Microsoft ATR
Date: 1/28/02 4:50pm
Subject: Microsoft Settlement

The purpose of the settlement, I hope, is to restrain Microsoft's monopolistic tactics in the future. Allowing them to donate their software and compatible hardware to schools would be a step in the wrong direction, only furthering their monopoly. Anything to equalize the playing field would be helpful, e.g., let them purchase competitors'' products for the schools.

I believe MS should be required to make most of its products and Web services compatible with all other systems. Windows should be provided separately from other MS products (Outlook Express, etc.) so that hardware makers could include competing products and users could make easier choices.

Good luck.

V.
MICROSOFT CORP.,
Defendant
COMMENTS ON THE PROPOSED SETTLEMENT BY:
Citizens Against Government Waste
Thomas A. Schatz
President
1301 Connecticut Ave., NW—Suite 400
Washington, DC 20036
(202) 467–5300 FAX: (202) 467–4253

On behalf of the one million members and supporters of Citizens Against Government Waste (CAGW), I am providing comments on U.S. v. Microsoft pursuant to the Tunney Act. CAGW supports the settlement as being in the public interest and opposes further litigation in this case. Further expenditure of tax dollars and government resources on this case, which has stifled technology, innovation, and investment at a time when the economy is in recession and the nation is at war, would not benefit the American people.

CAGW is a nonprofit, nonpartisan organization founded in 1984 by J. Peter Grace and Jack Anderson following the report of President Reagan's Private Sector Survey on Cost Control, better known as the Grace Commission. Since its founding, CAGW has been researching, publicizing, and working to eliminate wasteful government spending. In particular, CAGW has exposed mismanagement of governmental resources in the technology sector, such as incompatible computer and accounting systems, as well as billions of dollars spent on hardware and software that simply did not work. On the basis of our 18 years of nationally recognized expertise representing the interests of American taxpayers, we are submitting our comments to you today.

On November 6, 2001, Microsoft, the Department of Justice (DO J) and nine states agreed to a Proposed Final Judgment (PFJ) in the lawsuit against the company. As the overriding element of the Tunney Act is whether an antitrust settlement is in the public interest, CAGW submits that the PFJ clearly meets this standard.

CAGW estimates that to date the Microsoft lawsuit has cost taxpayers more than $35 million. It has also hobbled one of America's premier high-tech engines of growth at a time when we need to jump-start our economy. The PFJ is fair to all sides in the case, including:

Microsoft, which will continue to be able to provide new software that integrates new products;

Competitors, who will have more access to the Windows platform to incorporate their products or make them compatible;

Software manufacturers, who will get back to the business of creating innovative products;

Consumers, who will have more choices among software products; and,

Investors, who will have stability in the marketplace.

Perhaps of greatest benefit to the American people, the settling states will avoid additional costs and now be able to focus their time and resources on matters of far greater significance. As noted by District Court Judge Colleen Kollar-Kotelly, who pushed for a settlement after the attacks of September 11, it is vital for the country to move on from this lawsuit. The parties worked extremely hard to reach this agreement, which has the benefit of taking effect immediately rather than months or years from now when all appeals from continuing the litigation would finally be exhausted. Furthermore, Microsoft, DOJ and the nine states have accepted the settlement as better than continued proceedings.

Specifically, Microsoft will not be broken up and will be able to continue to immolate and provide new software and products. Software developers and Internet service providers (ISPs), including competitors, will have unprecedented access to Microsoft's programming language and thus will be able to make Microsoft programs compatible with their own. Competitors also benefit from the provision that frees up computer manufacturers to disable or uninstall any Microsoft application or element of an operating system and install other programs. In addition, Microsoft cannot retaliate against computer manufactures, ISPs, or other software developers for using products

developed by Microsoft competitors. Plus, in an unprecedented enforcement clause, a technical committee will work out of Microsoft's headquarters for the next five years, at the company's expense, and monitor Microsoft's behavior and compliance with the settlement.

The settlement is compatible with the findings of the U.S. Court of Appeals for the District of Columbia, which substantially narrowed the scope of legal liability and instructed the U.S. District Court to created remedies that fit the ''drastically altered'' findings. As Assistant Attorney General for Antitrust Charles James said in testimony before the Senate in December:

Of the twenty anticompetitive acts the court of appeals reviewed, it reserved with respect to eight of the acts that the district court had sustained as elements of the monopoly maintenance claim. Additionally, the DC Circuit reversed the lower court's findings that Microsoft's ''course of conduct'' separately violated Section 2 of the Sherman Act. It reserved the district court's rulings on the attempted monopolization and tying claims, remanding the tying claim for further proceedings under a much more difficult rule of reason standard. And, or course, it vacated the district court's final judgment that set forth the break-up remedy and interim conduct remedies.

Acceptance of the PFJ would send a clear signal to the nine remaining states and the District of Columbia opposed to the settlement that their remedy is not appropriate given the findings of the court of appeals. The alternative proposed by the remaining plaintiffs appears to be based on the original district court decision, which is no longer relevant. Dragging the proceedings out further, with a new remedy hearing, a new district court decision, another appeal to the DC Circuit, an appeal to the Supreme Court, and remand back to the court of appeals and district may be in the interests of Microsoft's competitors, but it is not in the public interest.

Most importantly, this settlement is fair to the computer users and consumers of America, on whose behalf the lawsuit was allegedly filed. Consumers will be able to select a variety of pre-installed software on their computers. It will also be easier to substitute competitors'' products after purchase as well. The PFJ even covers issues and software that were not part of the original lawsuit, such as Windows XP, which will have to be modified to comply with the settlement.

Public opinion is squarely in favor of settlement. Voter Consumer Research conducted polls of 1,000 eligible voters in Utah and Kansas in November, 2001, and opposed further action by their state attorneys general following the settlement by a 6 to 1 margin. This is an even greater percentage than previous polls concluding, by a 2 to 1 margin, that the lawsuit brought by DOJ and the 19 states was a waste of tax dollars.

The Microsoft case was supposedly brought on behalf of American consumers, who have paid the price of litigation through their taxes. Investment portfolios have been substantially devalued during this battle, and now more than ever, the country needs the economic stability this settlement can provide. This settlement is in the public interest, and should be accepted without change.

Respectfully Submitted,
Thomas A. Schatz

In my opinion, the terms of the findings of the Court of Appeals ruling has been met by Microsoft who has not only met but gone beyond said findings. Microsoft has agreed that the terms are reasonable and fair to all parties involved. It's time to drop the matter and allow Microsoft, as well as the industry, to move forward. Please NEVER forget what MICROSOFT has done for the INDUSTRY.

Thank you for your attention to the foregoing.

Subject: Lack of Punishment

To whom it may concern,

I'm writing as a concerned citizen, and as a computer science major to express my feelings about the settlement reached between the United States Department of Justice and Microsoft. Like many others out there, I do not think that the settlement reached goes nearly far enough to punish Microsoft for it's illegal actions. Also, the settlement does not give anyone any real power to prevent any further antitrust issues from arising.

Microsoft was found guilty of numerous violations of antitrust law, and they are walking away pretty much unscathed. It feels like the US DOJ doesn't have the stamina to fight against a huge corporation, and therefore took the easy way out. This is not right. It is the government's job to find a remedy that is in the best interest of the citizens of the United States of America. We are the ones who were injured by Microsoft's anticompetive actions, and we want to make sure that will never happen again.

Thank you for your time, and I hope that this joke of a settlement is never agreed upon.

Subject: Microsoft Settlement

Dear Ladies and Gentlemen:

I would like to register my deep dissatisfaction with the settlement terms offered by the Justice Department to Microsoft. These terms are not in the public interest; rather, they seem to serve only the interest, not even of the shareholders, but of the executives of a few powerful corporations, including Microsoft.

I will not bother to repeat the observations of, for example, Consumers Union, but rather focus on one specific failure of the settlement: namely, to address the concerns of open-source software development.

Many the most important tools that I use in my work as a software developer are ''open-source'' software, including the GNU/Linux operating system. These are non-commercial products with many qualities that Microsoft products have never achieved, such freedom from crashes, support for networking with standard security protocols, compatibility between versions, and adaptability which make them ideally suited to software development. These products are developed largely on the volunteer work of thousands of developers; their quality stems directly from the openness and liberality of the copyright. Their low dollar cost does not reflect their value.

One of the greatest challenges in open-source software development is to implement interfaces to obfuscated, proprietary protocols that companies such as Microsoft develop to lock-out competitors. This point that was not lost on the Department of Justice only a year or two ago. Unfortunately, the terms of the settlement enable Microsoft to continue to use its monopoly power against open-source products, since many of the remedies that are supposed to prevent Microsoft from dominating by implementing proprietary protocols are conditioned on there being an economically viable corporation, rather than a more reasonable definition, perhaps in terms of the number of users represented.

This is a slap in the face to open-source developers, absolutely contrary to the public interest, which it is the Governments'' special responsibility to protect, and a failure to enforce the spirit of anti-trust law, which is to prevent mere market domination from stifling competition. There is no real wealth created by Microsoft's use of proprietary protocols; only a guarantee of its ability to stifle alternative platforms in the future.

Your Truly,
John Charles Roth

Subject: Microsoft Settlement

Greetings...

As a long time computer user (since ''82) and software developer (since ''85), I have been extremely bothered and dismayed at the methods that Microsoft has utilized in its business practices. However, because of the

combination of Microsoft's massive pocketbook and their ability to intimidate others within the industry, it seemed the the only relief from Microsoft's tactics lay with the anti-trust efforts of the US Govt and the various states. When Microsoft was found guilty of predatory monoplistic behavior, Judge Jackson's orginal solution was right on target for what was deserved and needed to remedy the actions of Microsoft.

After this valid punishment was overturned on a technicality, an settlement was proposed which does nothing but provide Microsoft with a slap on the wrist and a promise to ''go forth and sin no more''. This is the same ''punishment'' that Microsoft received in ''94.. after which they went out and obliterated Netscape from the Internet, held PC makers hostage to their demands for the desktop and threatened Apple Computer with actions that would have destroyed Apple unless Apple played the game the Microsoft way.

Microsoft has truly proven itself to be a company that cannot be trusted, despite all of Bill Gates'' ''aw-shucks'' mannerisms and speeches. This is a company that choses to not play by the rules or behave like a responsible corporate citizen. Just like with any other individual who continually operates outside the rules, the Federal and State governments MUST PUNISH Microsoft in a way that is comenserate with their crimes.

The proposed settlement does not in any way begin to match what the court documents clearly show that Microsoft deserves. It should be thrown out and a new plan devised that exacts from Microsoft the punishment it deserves.

Thank you.

Subject: Microsoft Settlement

Dear DOJ,

I strongly object to the proposed settlement with Microsoft. It is a gross and negligent miscarriage of justice.

I have some unique first-hand knowledge of the kind of financial damage that Microsoft has inflicted upon other companies. I know this because I was at the heart of the project at Compaq that resulted in Microsoft terminating Compaq's license to Windows.

Let me provide some background for you. I am the former product manager at Compaq Computer Corporation who was responsible for the Compaq/AOL deal in 1995. I worked for Rod Schrock, who was Vice President of the consumer division. You used several of my email messages in your case against Microsoft.

In 1995, I was placed in charge of defining Compaq's consumer online strategy. I proposed a relationship with America Online, one which was great for America Online, and even better for Compaq. It was worth HUNDREDS OF MILLIONS OF DOLLARS IN INCREMENTAL PROFIT to our business unit. The deal, in a nutshell, involved Compaq heavily promoting the AOL service, in exchange for AOL giving Compaq a significant ongoing revenue share.

Microsoft heard about this forming relationship. They contacted us and asked that we work with them instead of AOL, to promote their new online service code-named Marvel (now known as MSN, the Microsoft Network). We responded that we would be happy to work with them, but we would expect them to pay us in a similar fashion to how AOL was to pay us.

Their response? I'll paraphrase: We are Microsoft. We own the customer, not you, Compaq. You Compaq have three choices:

1) Do the deal with Microsoft. We will pay you NOTHING, but we'll have a closer relationship, with various intangible benefits (wink wink lower price on the OS, etc.)

2) Cancel the deal and do it with nobody. We are OK with that.

3) Do the deal with America Online. WARNING: IF YOU PURSUE THIS OPTION, WE WILL PUT YOU OUT OF BUSINESS.

Our team at Compaq reviewed the situation, and concluded that Microsoft must be bluffing. They couldn't do it, because it would be a blatant violation of anti-trust laws. We decided to proceed with the deal.

Shortly afterward, Microsoft sent us a letter telling us that we were in violation of their Windows License agreement, and we could no longer sell PCs with Windows installed. Our license to Windows was terminated. Since Microsoft Windows is the only viable operating system on the market, we were effectively shut down as a company. As Microsoft had threatened, THEY WERE PUTTING US OUT OF BUSINESS!!!

Needless to say, we ended up having to quickly appease Microsoft and redo the deal with AOL, dramatically watering it down and making it effectively into a nothing deal: no substantive benefit to AOL, no substantive benefit to Compaq.

If this kind of behavior is not a flagrant abuse of monopoly power, I don't know what is. Microsoft regularly wields this kind of abusive power. They have it, and they use it most aggressively. Speak with any of the myriad companies that have fallen victim to Microsoft's stranglehold. Their corpses litter the high-tech industry.

Just how powerful is Microsoft? Powerful enough to put just about any company out of business in short order if they were determined, including other huge powerful companies such as Intel. How would they accomplish such an impossible-sounding feat? Simply by making the following announcement: ''Microsoft today announces a strategic relationship with Advanced Micro Devices. Beginning with the next version of Windows, which will ship in six months, only new co-branded AMD/Microsoft processors will run Windows optimally. Legacy Intel processors will still run Windows, but only at 1/4 speed, and only for a limited time. Microsoft strongly encourages its customers to begin migrating to the AMD/Microsoft platform immediately, in preparation for the release of the exciting new Windows system.''

The proposed settlement does little or nothing to prevent this kind of behavior in the future. The absurd thing is, it actually gives Microsoft a government-sponsored leg-up to claim an additional monopoly in one of the rare markets that they don't currently own: the education market.

Microsoft (and some supporters) say that ''Microsoft is good for the U.S. economy... they are a brilliant high-tech success story for America ... don't punish successful companies.'' There is a half-truth in what they say, but their logic is flawed. By that line of thinking, Standard Oil would never have been broken up. In truth, Microsoft has not been a strong force for innovation. To the contrary, they have systematically stifled innovation. Their policy seems to be ''crush anything that Microsoft doesn't own and control''.

We will never know how much innovation and economic growth might have emerged from companies that fell victim to Microsoft's control ploys. However, we can guess by looking at one rare example where they failed. We know that Microsoft did not want the open Internet to happen, that instead they had a vision of a Microsoft-owned-and-controlled worldwide network (see early presentations on Microsoft's Marvel Project). In this case, for once, they did not move quickly enough to stop this emerging threat, and by the time they began their attack, they met a force so powerful that even they could not stop it. We now know just how much benefit the U.S. and the world have realized from the advent of the Internet. How many other promising technologies and markets has Microsoft successfully stopped? How much economic growth has been stunted by the Robber Baron of high-tech? The time has come to force Microsoft to play fair.

I would be glad to discuss this further with anyone from the DOJ. Please contact me at your earliest convenience.

Thank you,

Vaughn Rhodes

I find it interesting that now, after you made your decision, you permit comments on your to little to late actions.

While following this case not once did I see where it was mentioned all the third party software stolen by Microsoft and ''added'' to their Operating System. ICQ (now MS Message), MP3 (Winamp, MuchMusic, etc. and here they decided to lower the standard 128BPS), Java (They usurped the whole idea of java, making programs usable on ALL OSs, by changing the code so it wouldn't work on their own system). Internet Connection Sharing wasn't an MS idea, I bought that programming back in Win 95s day. Now its a feature? Another company product down the drain.

These are a few of many examples of Microsoft's brazen theft that seemed to be ignored, while they cry ''foul''.

And for punishment you are trying to give them a foothold in the Education market they ignored until Apple started showing it as a viable market? What about the businesses and programmers they put under?

Your punishment couldn't have been any better for Microsoft. Do you own stock?

Subject: Microsoft Settlement

I would like to take a moment to voice my objection to the propsed settlement in the Microsoft Anti-Trust case. I believe that the proposal is far too weak to have any meaningful effect on the marketplace.

In the past, Microsoft has demonstrated it's willingness to do whatever it sees fit in spite of the law, and to use it's billions to fend off any legal action until it is far too late to rectify the damage. I expect that if this settlement is accepted, it will be less than a year until Microsoft breaks the agreement in the pursuit of some competitor and creates another prolonged legal battle that will not be resolved until the competitor is long dead. And I expect that every last word in the agreement will be endlessly debated in court case after court case, as Microsoft forestalls any enforcement for years. Microsoft has shown little respect for the law to date (in terms of previous broken agreements, falsifying testimony related to IE and Windows, forging letters of support, etc). There is no reason to expect them to behave differently in the future.

Such outrages are funded by a public that has little choice but to pay Microsoft for it's products. I am writing this letter on a Linux machine that I bought with Windows 98. Despite the fact that I do not use MS products, I find that I am forced to buy them whenever I buy hardware. So long as MS can ''tax'' us this way, they can afford unlimited legal bills. I feel that any settlement that does not split up the company or prevent it from using Windows to enter new markets is doomed to fail.

Finally, I find it absurd that the DOJ won the first case, and essentially ''won'' the appeal (in that all the findings were upheld and only the remedy was vacated), and then suddenly turned about and proposed the weakest remedy imaginable (filled with all the legal loopholes MS could dream of). This smells heavily of politics. It seems very much as if the new DOJ lead by Mr Ashcroft is not interested in enforcing antitrust law or achieving justice for consumers, but is instead catering to the worst elements of the Republican party. Hopefully, the court will not accept this.

Sincerely,
Michael J Myers

Date: 1/28/02 4:53pm
Subject: Microsoft Settlement

Greetings,

I'd like to express my extreme personal and professional disappointment at what I deeply believe will be the almost total ineffectiveness of the proposed Microsoft antitrust settlement agreement.

You might just as well sentence a serial killer to probation, with the stern warning to not kill the victims again.

As a computer designer, I've had the opportunity to work with Microsoft since the late 1970's. I've watched them stifle technical innovation for almost a quarter century now. For nearly 25 years, regardless of their corporate size, they have consistently shown their only interest is maximizing their corporate profit by any means, legal or illegal.

Microsoft has indeed made a bunch of money for some people. So does dumping toxic waste into the environment. Why should Microsoft be treated differently than anyone else, simply because they've made a lot of money?

As a revealing exercise, consider how much human effort is wasted by Microsoft software each year. Assuming 100,000,000 PC's running MS software, and also assuming a week of unnecessary downtime each year (a conservative estimate), every year we have almost 2 million man-years of human life squandered—simply thrown away. This is technical innovation? This is business leadership? No, this is an appalling disregard for human life. And this tyrannical contempt for the lives of the people is made possible by Microsoft's monopoly. Our country was founded to defend the people from tyrants. And though the founding fathers of our country believed in market freedoms, they believed more in the power of our government to protect the public interest. That's why we have a federal government, and not a federal marketplace. Please, have the courage to create a settlement agreement that will actually protect the American people.

Millions of us are depending on you.

Sincerely,
Bruce McDiffett

Dear Mr. Ashcroft:

I am glad to see that the Microsoft case is coming to a close. I believe that you should settle the case pursuant to the terms of the agreement you reached with Microsoft in November 2001.

This settlement agreement provides you not only with the chance to bring a close to the federal government's case, but also to help the economy in the process.

Microsoft's agreement to discontinue a number of its more restrictive business practices should have a positive impact on the computer and software sector of the economy. The agreement to allow competition from non-Microsoft software within Windows is of particular importance because it could provide immediate opportunities for designers and developers of non-Microsoft software products.

I hope you approve the settlement and close this case as soon as the law allows. Thank you for your time.

From: Franziska Raedeker
To: Microsoft ATR
Date: 1/28/02 4:55pm
Subject: Microsoft Settlement

I want a fair choice of several options in computer applications.

1. The proposed settlement is not in the public interest. The settlement leaves the Microsoft monopoly intact. It is vague and unenforceable. It leaves Microsoft with numerous opportunities to exempt itself from crucial provisions.

2. The proposed settlement ignores the all-important applications barrier to entry which must be reduced or eliminated. Any settlement or order needs to provide ways for consumers to run any of the 70,000 existing Windows applications on any other operating system.

3. Consumers need a la carte competition and choice so they, not Microsoft, decide what products are on their computers. The settlement must provide ways for any combination of non-Microsoft operating systems, applications, and software components to run properly with Microsoft products.

4. The remedies proposed by the Plaintiff Litigating States are in the public interest and absolutely necessary, but they are not sufficient without the remedies mentioned above.

5. The court must hold public proceedings under the Tunney Act, and these proceedings must give citizens and consumer groups an equal opportunity to participate, along with Microsoft's competitors and customers.

Any company that dominates the vehicles by which companies achieve daily tasks and goals (while maintaining the illusion of open market participation, owns and controls the very same roads that facilitate those vital components of commerce AND maintains mafia-esque enforcement practices to insure as few vehicles from any and all rival competitors are equipped with the necessary technology and mechanisms to use those purported ''public'' roads constitutes the key issue in assessing the true injustice of monopolistic practices.

To my mind the appropriate analogy would be if Ford or GM suddenly decides to buy up all the major highways in the US and then equip those highways with exclusive features and benefits that can be only realized if you own their car. As a matter of fact, if your vehicle is not made by that dominant manufacturer, it just doesn't drive as well when it accesses those highways...it seems to go slower, has trouble with maneuvering and steering and the radio signal is weak or generates nothing but static. As a daily consumer of those highways, one becomes quickly convinced to buy a vehicle manufactured by the same company that is optimized for those highways by virtue of their exclusive ownership and that can also take exclusive advantage of any and all the extras and amenities that are not accessible to any other manufacturers'' vehicles.

Microsoft must be disavowed of their monopoly in being made to relinquish ownership either the Windows operating system or the right to develop and market the primary applications which are optimized to run within the Windows OS environment. Individually, each currently dominates their respective markets (solely by virtue of their combined ownership) and jointly present a total supremacy of the marketplace in both areas.

TABLE OF CONTENT§

INTEREST OF THE COMMENTER

The Computer & Communications Industry Association (''CCIA'') is an association of computer, communications, Internet and technology companies that range from small entrepreneurial firms to some of the largest members of the industry. CCIA's members include equipment manufacturers, software developers, providers of electronic commerce, networking, telecommunications and on-line services, resellers, systems integrators, and third-party vendors. Its member companies employ nearly one million persons and generate annual revenues exceeding $300 billion. CCIA's mission is to further the interests of its members, their customers, and the industry at large by serving as the leading industry advocate in promoting open, barrier-free competition in the offering of computer and communications products and services worldwide. CCIA's motto is ''Open Markets, Open Systems, Open Networks, and Full, Fair and Open Competition,'' and its website is at www.ccianet.org.

For nearly 30 years, CCIA has supported antitrust policy that ensures competition and a level playing field in the computer and communications industries. That involvement antedates the founding of Microsoft, much less its acquisition of its first monopoly and its refinement of anticompetitive techniques. CCIA supported the Tunney Act in the 1973 congressional hearings preceding the enactment of that legislation, and played active roles on the side of competition in other significant antitrust cases, including those against AT&T and IBM. Before participating as amicus curiae at the trial and appellate stages of the current Microsoft case, CCIA participated as a leading amicus curiae in the proceedings examining the last Microsoft consent decree in 1994-1995, both in the district court and in the court of appeals. As a consequence, CCIA and its members are intimately familiar with the shortcomings of that decree, and its failure to prevent or deter Microsoft from continuing on an anticompetitive course. Microsoft's conduct in the intervening years, including the period while this case has been litigated, has only sharpened CCIA's awareness of Microsoft's dedication to driving out competition from as many aspects of the computer-software and related industries as possible. Microsoft may repeat

its attempts to mischaracterize CCIA as a mere voice for competitors, but that innuendo cannot withstand scrutingy in light of the diversity of CCIA's membership now and over the years, combined with CCIA's 30 years of vigorous commitment to supporting openness and competition in the computer technology and communications industries. In hopes that a meaningful remedy in this case will prevent Microsoft from further expanding the scope of its monopoly, and with the certainty that the current Revised Proposed Final Judgment (''RPFJ'') falls far short of that task, CCIA submits this analysis of the RPFJ in conjunction with the economic analysis of Nobel laureate Joseph Stiglitz and his colleague Jason Furman, and the Declaration of Edward Roeder.

INTRODUCTION

The Tunney Act was designed to constrain the Department of Justice (''DOJ'') from entering into settlements that provided DOJ with an exit from an antitrust case but did not provide the public with a remedy commensurate with the defendant's antitrust violations. The Revised Proposed Final Judgment (RPFJ) in this case does not provide adequate relief for the extensive and thoroughly proven antitrust violations it purports to remedy.

Review of the RPFJ in this case should be especially searching because there can be no doubt about Microsoft's liability. For the first time in the history of the Tunney Act, the Court will review a proposed settlement reached after liability has been not only imposed, but unanimously affirmed on the government's most sweeping and economically significant theory. That clear-cut liability, and the voluminous Findings of Fact and trial record, place the Court in this case in a different position from courts reviewing pre-trial settlements.

Because there is no litigation risk on liability, the Court is uniquely situated to evaluate any asserted litigation risk as to remedy. Established principles of antitrust relief provide the Court in this case with concrete, recognized standards to ensure that the settlement serves the public interest in a way that courts reviewing pre-trial settlements cannot. Magnifying the need for close measurement of the RPFJ by objective principles is Microsoft's silence, in its filing under 15 U.S.C. § 16(g), about its effort to truncate this case by a lobbying campaign of unprecedented scope directed at the Executive and Legislative Branches alike—despite extensive public reports of that lobbying. Microsoft's effort to deny the obvious gives rise to an inference that it has something to hide.

The terms of the RPFJ provide the strongest reason for close scrutiny, because they cannot withstand analysis. The RPFJ would not provide a meaningful remedy for Microsoft's extensive campaign of exclusionary acts. That campaign suppressed the most serious threat to Microsoft's monopoly in the past decade, and not only prevented the erosion of the applications barrier to entry that insulates the monopoly, but increased the bar to new competition. The RPFJ ignores some of the most significant holdings of the court of appeals, however, including its separate imposition of liability for Microsoft's commingling of middleware code with the code for the Windows operating system.

More fundamentally, the RPFJ misses the point of Microsoft's illegal conduct, which was to prevent erosion of the applications barrier to entry by preventing middleware from attracting software developers to the middleware application programming interfaces (''APIs''). The RPFJ's basic premises, moreover, ignore the current economic and technical realities of the computer and software markets. In the seven years since Microsoft began the illegal conduct at issue in this case, Microsoft has strengthened its operating systems monopoly. The Internet browser, formerly a threat to that monopoly, has become an adjunct to it, with Microsoft's 91% share of that product adding further insulation to the operating systems monopoly. Microsoft's unadjudicated monopoly over personal productivity applications—a key to the applications barrier to entry in the operating systems market—likewise has grown in market share and market power.

But the RPFJ does not try to deprive Microsoft of any of the benefits of its illegal activity directed at the browser and other middleware. DOJ's remedial theory rests entirely on unidentified future middleware threats. In fact, there are no technologies today presenting a threat as intense as that presented by the Netscape browser and Java, and the duration of the RPFJ is so short that it almost certainly will expire before any significant new threats materialize.

Aside from some restrictions on commercial retaliation that at best might keep matters from getting worse, the RPFJ relies on two sets of putative obligations to achieve a more competitive market. But neither the provisions aimed at original equipment manufacturer (''OEM'') flexibility nor those addressing information disclosure requirements in fact require anything competitively meaningful. In large part, these provisions replicate Microsoft's current business practices respecting the disclosure of technical information and the configuration of end-user access to middleware products.

The OEM flexibility sections in RPFJ §§ III(C) and III(H) are literally superficial, principally addressing desktop icons rather than the middleware code itself, which contains the APIs relied on by software applications developers. Even if successful, the flexibility provisions would not affect the applications barrier to entry. Moreover, these provisions largely restate current business practices or provide OEMs with flexibility that both Microsoft and DOJ understand from experience will never be exercised. OEMs have little or no incentive to exercise their options; if they decline to do so, then the flexibility provisions will have no competitive consequences for the industry.

The RPFJ's information disclosure sections (§§ III(D) and III(E)) are so transparently insubstantial as to cast doubt on the entire proposal. The purported disclosure requirements trace back to definitions that are committed to Microsoft's control, are circular, or simply do not exist. Neither DOJ nor any other objective observer could have any idea precisely which APIs or protocols must be disclosed.

The RPFJ's provisions and definitions are so vague that only two practical results are possible. Either everyone will simply ignore the decree, which plainly would not be in the public interest for an antitrust remedy, or the Court will have to take primary responsibility for defining its terms during enforcement proceedings. DOJ's answer seems to be to let Microsoft set the terms of its obligations: the RPFJ gives the defendant ''sole discretion'' to define the decree's most important term, ''Windows Operating System Product,'' which appears 46 times to delimit the RPFJ's 10 substantive provisions.

Indeed, much of DOJ's Competitive Impact Statement (''CIS'') seems to reflect an understanding that the RPFJ is inadequate in several critical respects. The CIS defines terms not defined in the RPFJ, exaggerates the scope of certain RPFJ provisions, and redefines other terms in order to minimize the impact of some of the broad exemptions in the RPFJ. It is the RPFJ that the Court would have to enforce, however, as the CIS is not part of the contract between DOJ and Microsoft.

In sum, although the RPFJ's provisions superficially seem to restrict Microsoft's practices, there is no substance behind them. The provisions accomplish little beyond laying down criteria for Microsoft to follow in order to avoid any interference with its continuing campaign of illegal monopolization.

The terms of the RPFJ, as much as the circumstances of the settlement, strongly suggest that Microsoft and the Department of Justice shared a desire to end this case, rather than to provide an effective remedy for Microsoft's substantial antitrust violations. The 1995 consent decree with Microsoft produced uninterrupted illegal monopolization, prompting the filing of this case in 1998. The Court can expect the same with this decree. The RPFJ, if approved, might temporarily end DOJ's involvement, but would not provide the type of remedy that the public interest and the Tunney Act demand. To the contrary, because the harm to the competitive process caused by Microsoft's adjudicated illegal conduct is certain, a remedy that masks but does not cure that harm affirmatively injures the public interest, and therefore should be rejected.

A. Liability Rests On Microsoft's Suppression Of Middleware Threats That Threatened To Erode The Applications Barrier To Entry This case is about Microsoft's devastatingly thorough suppression of threats to its Windows operating system (''OS'') monopoly by ''middleware.'' That monopoly was insulated from competition by the applications barrier to entry described by the court of appeals and the CIS. See United States v. Microsoft Corp., 253 F.3d 34, 55–56 (DC Cir. 2001) (''Microsoft III''); CIS 10–11, 66 Fed. Reg. 59,452, 59,462 (2001). See also Declaration of Joseph E. Stiglitz & Jason Furman 7–9 (''Stiglitz/Furman Dec.'') (attached). The middleware at issue in this case exposed APIs that could be used by software applications developers to write programs

that did not rely on the underlying Windows operating system. As Microsoft recognized, if developers embraced non- Microsoft middleware APIs and designed their products to run on that middleware rather than directly on an operating system, ''middleware'' of this kind ''would erode the applications barrier to entry,'' as ''applications * * * could run on any operating system on which the middleware product was present with little, if any, porting.'' Microsoft III, 253 F.3d at 55. The threat that ''middleware could usurp the operating system's platform function,'' id. at 53, prompted Microsoft's anticompetitive conduct.

But non-Microsoft middleware can become a competing platform only if developers write software that calls on the non-Microsoft middleware APIs. Most developers will create software only to run on platforms that are distributed widely enough for the developers to be reasonably certain that the APIs (on which their programs rely) will be present on most, if not all PCs. Likewise, if developers can be certain that Microsoft's middleware APIs are present on all PCs, this will strongly influence their initial decision as to whether it is worth the effort to write applications to alternative, non-Microsoft middleware APIs.

The successful theory of the case—proved and accepted by two courts—is that Microsoft engaged in an ''extensive campaign of exclusionary acts'' that were designed ''to maintain its monopoly'' by suppressing middleware threats posed by the Netscape Navigator Internet browser and the cross-platform Java technologies. CIS 9, 66 Fed. Reg. 59,462; Microsoft III, 253 F.3d at 53–56, 60–62, 74–78. Microsoft's response to this threat guaranteed that developers would not use the APIs of competing middleware, destroying the platform threat.

Because Microsoft has a monopoly over the OS, it can ensure that its own versions of a middleware product have universal distribution, so that Microsoft's middle- ware APIs will be present on all PCs. For example, because Windows is both an operating system and a distribution channel for Microsoft's technologies, Microsoft could and did ensure that the code for its Internet Explorer (''IE'') browser was distributed to every PC.

Ensuring that the code for Microsoft middleware was on every PC accomplished two related goals. First, it guaranteed instant and unassailable ubiquity for the Microsoft version of the middleware and the middleware APIs on which developers rely. Second, the forced ubiquity of Microsoft middleware prevents competing middleware from achieving ubiquity, or anything like it, because few distribution channels will incur the support and other costs of distributing two versions of the same functionality. A key theory of the case is that the applications barrier to entry could have been eroded only if developers chose and used alternative middleware platforms on which to write software. End-user access to middleware was significant only to the extent it influenced developers'' choices to write to the APIs of that middleware.

Thus, ensuring that the code for the Microsoft version of middleware is on every PC destroys the competitive threat presented by the competing middleware's APIs, since few developers will them in preference to Microsoft middleware APIS that are certain to be ubiquitous. This fact provides the essential context for any meaningful analysis of the information disclosure and OEM flexibility provisions of the RPFJ.

B. The RPFJ Does Not Prevent Microsoft From Abusing Its Position And Does Not Meet Basic Standards For An Antitrust Remedy

The DC Circuit set out a simple standard for measuring the legal sufficiency of any remedy selected in the Microsoft litigation: the remedy must ''seek to unfetter [the] market from anticompetitive conduct,'' * * * to 'terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''' Microsoft HI, 253 F.3d at 103 (quoting Ford Motor Co. v. United States, 405 U.S. 562, 577 (1972), and United States v. United Shoe Machinery Corp., 391 U.S. 244, 250 (1968)). As the District Court recognized in beginning remedy proceedings on remand (9/28/01 Tr. 6–7), not one word in the DC Circuit's opinion suggests the slightest antipathy toward any conduct remedy related to the illegal monopolization that the Court of Appeals exhaustively condemned.[1] The District Court warned the plaintiffs to be ''cautiously attentive to the efficacy of every element of the proposed relief.'' 9/28/01 Tr. 8. That is, the plaintiffs must make sure that the proposed remedy works.

That admonition appears to have fallen on deaf ears. Because liability has been established and affirmed in great detail, the scope of the District Court's appropriate deference to DOJ is extremely limited because the range of permissible action by DOJ is closely confined. There is no litigation risk other than the risk that the District Court would not approve a particular remedy, or that the District Court's exercise of discretion in approving a remedy might be reversed on appeal. A remedy, even one imposed by agreement, must provide adequate relief for the violations that have been proved, however. DOJ is entitled to deference only for choices that fall within the range of adequate relief.

The RPFJ misses the point of the central theory of liability. The RPFJ does not impose certain, enforceable, or competitively significant obligations on Microsoft to restore competition or to avoid suppressing future threats. The RPFJ allows Microsoft to keep every anticompetitive gain that resulted from its illegal conduct, simply requiring Microsoft to find new and slightly different ways to accomplish its anticompetitive goals. DOJ seems to recognize that the case focused on two specific products—Netscape Navigator and Java—that embodied the broader threat of middleware and the Internet to the stability and significance of Microsoft's monopoly. The RPFJ does nothing to restore the specific competitive threat posed by an independent Internet browser. It does nothing to restore the threat of cross-platform Java. And it does nothing to protect any other middleware threat—in the unlikely event that another such threat might arise within the short duration of the RPFJ—from much similar exclusionary conduct, or indeed from the identical commingling of code that sealed Netscape's fate. Rather, the RPFJ appears to assume that it is still 1995, and that the threat of the Internet browser can begin anew without confronting a more thoroughly entrenched Microsoft. The RPFJ does not take account of the impact on participants at different levels of the computer and software industries of an additional seven years of Microsoft's anticompetitive abuses. That view does not accord with reality, and the provisions intended to permit open competition in that counterfactual world cannot achieve their goal.

C. The Obligations That Supposedly Restore Competitive Conditions In Fact Make Microsoft Do Virtually Nothing Against Its Will

The RPFJ purports to give current and future middleware the ability to present the same threats to the Microsoft monopoly that Netscape and Java presented before the onset of Microsoft's illegal conduct. DOJ describes the obligations in the RPFJ as if they would have stopped Microsoft's suppression of Netscape, and as if they would allow rival middleware vendors to obtain the technical information that they need to ''emulate Microsoft's integrated functions'' (Testimony of Charles James before Senate Judiciary Committee 7 (Dec. 12, 2001)) and to step into the shoes of Microsoft middleware in relation to Windows and the Windows monopoly. The RPFJ does not achieve those goals.

Most of the RPFJ reduces to two sets of obligations, along with some prohibitions on exclusive deals and on retaliation against those who take advantage of Microsoft's obligations. One set of obligations appears to restrain Microsoft from taking particular actions to interfere with OEMs'' placement of the icons of Non-Microsoft Middleware on their machines, or with end-users'' use of those products. These OEM flexibility provisions principally rely on the OEMs to provide a remedy for Microsoft's misconduct. The other set of obligations requires a certain degree of disclosure of APIs and Communications Protocols to allow competing software products can ''interoperate''— an undefined term—with the monopoly OS.

For the most part, the obligations placed on Microsoft by the RPFJ simply replicate current options voluntarily provided by Microsoft. For example, Microsoft must continue to disclose the APIs it currently discloses in the Microsoft Developers'' Network (MSDN), a program Microsoft developed to further its self-interest in making the Windows platform popular with software developers. And Microsoft must continue to allow end-users to delete icons from the desktop and start menu. Such provisions at most simply prohibit Microsoft from making matters worse than they are after Microsoft's years-long anticompetitive campaign. Indeed, the RPFJ in some instances specifically approves potential

[1] Indeed, in denying rehearing, the DC Circuit made crystal clear that ''[n]othing in the Court's opinion is intended to preclude the District Court's consideration of remedy issues.'' Order, at 1 (DC Cir. Aug. 2, 2001) (per curiam).

misuse of Microsoft's current voluntary implementations of the flexibility and disclosure provisions.

To begin with the flexibility provisions, their chief flaw is their focus on icons rather than on middleware functionality. This is literally a superficial approach. Microsoft can include its own middleware and middleware APIs on every PC. Developers will know those APIs are there and consequently will write to them in preference to the APIs of a competing product that may or may not be on a particular machine. No provision of the RPFJ restricts Microsoft's insertion and commingling of middleware code into the ''Windows Operating System Product'' bundle that Microsoft receives the right to define for decree purposes ''in its sole discretion.'' RPFJ § VI(U). From the point of view of developers—and thus of the ability of middleware to erode the applications barrier to entry—these ''flexibility'' provisions are meaningless.

Even to the extent that competing middleware vendors might obtain favorable placement for their products'' icons in preference to the icons for Microsoft products, that achievement would be both superficial and temporary. The functionality of the Microsoft product would remain on the machine, and Microsoft could insist on its invocation for a variety of functions. And, 14 days after a PC first boots up, Microsoft would be free to nag users to click a ''Clean Desktop Wizard'' which would organize icons in the way that suited Microsoft. There is nothing in the RPFJ to stop that ''Wizard'' from resetting default applications to coincide with Microsoft's preferences as well, or even from enhancing the product so that it becomes a Clean File Wizard to remove code of competing middleware with a single click.

These provisions place responsibility for restoring competition on innocent OEMs and ISVs rather than on Microsoft. And many provisions give end-users what they have now: the ability to remove an icon from the desktop or a program menu by right-clicking it and selecting ''Delete,'' or by dragging it to the Recycle Bin. The provisions do change the status quo in one way. The ''Add/Remove'' function, which now removes some underlying code for applications, will only remove a few icons when the removed application is Microsoft middleware.

The disclosure provisions are no better. The RPFJ requires Microsoft to disclose APIs between ''Microsoft Middleware'' and a ''Windows Operating System Product,'' but the definitions of those terms are so completely within Microsoft's control that it is impossible to tell whether Microsoft ever would have to disclose an API that might have competitive significance. As noted above, a ''Windows Operating System Product'' is whatever Microsoft says it is. ''Microsoft Middleware'' must be distributed separately from the OS (unlike, e.g., the current version of Windows Media Player). ''Microsoft Middleware'' must be ''Trademarked'' in a way that would exclude Windows Messenger, may exclude Windows Media Player, and certainly would exclude any products that followed Microsoft's practice of simply combining the Microsoft(r) or Windows(r) marks with a generic or descriptive term.

Indeed, because ''Microsoft Middleware'' need not mean any more than the user interface of a middleware functionality that meets the other definitional requirements, see RPFJ § VI(J)(4), the only APIs that must be disclosed are those between the middleware user interface and ''Windows,'' which Microsoft in its discretion can define to include all of any given middleware functionality. See id. § VI(U). Microsoft need not disclose how the middleware actually invokes Windows to work, except for the way that the OS displays the middleware's shell.

The disclosure provisions applying to Communications Protocols are similarly weakened by non-existent definitions. The disclosable Protocols are those required to ''interoperate''—whatever that may mean—with equally undefined ''Microsoft server operating products.'' RPFJ § III(E). In addition, the Communications Protocol disclosure provisions are limited by sweeping exceptions applying to security protocols that are intertwined with all significant computer-to-computer communication. See id. § III(J)(I). Microsoft can withhold parts of those Protocols (and, indeed, parts of APIs) on the basis that disclosure would compromise security of an installation.

If this exemption were limited to the customer-specific data like encryption keys or authorization tokens, it would be necessary, not objectionable. But the exemption explicitly permits Microsoft to withhold portions of the Protocols and APIs themselves, which necessarily makes ''interoperation'' (as that term normally is used) incomplete. Interoperation, however, is an all-or-nothing state. Software that can use only parts of APIs and Communications Protocols simply cannot ''intemperate'' with the software on the other side of the API or Protocol.

But that is not all. RPFJ § III(J)(2) permits Microsoft to refuse to (disclose security-related Protocols or APIs to any company that does not meet Microsoft's standards of business viability or its standards for a business need. Again, little if anything is left of this disclosure requirement if Microsoft chooses to resist disclosure when that serves its anticompetitive goals.

One thing is certain. Unless Microsoft and DOJ alike render the RPFJ irrelevant by simply ignoring it, the District Court will be faced again and again with the task of interpreting the RPFJ's indistinct provisions. Microsoft has demonstrated its incentive and ability to contest even the most seemingly obvious points of any court order.

D. The Public Interest Requires An Effective Remedy That The RPFJ Does Not Provide

Despite the belated efforts of DOJ to minimize the scope of this case, it remains the largest, most successful prosecution for monopolization liability since at least the Second World War. The DC Circuit affirmed ''the District Court's holding that Microsoft violated ? 2 of the Sherman Act in a variety of ways.'' 253 F.3d at 59. The breadth of that holding is clear from the 20 Federal Reporter pages consumed by the court's detailed discussion of Microsoft's array of exclusionary behavior. The competitive significance of the conduct condemned by that holding is explained both in the opinion, in the Declaration of Joseph E. Stiglitz and Jason Furman (''Stiglitz/Furman Dec.'') 16–20, and in the Comment of Robert E. Litan, Roger G. Noll, and William D. Nordhaus (''Litan/Noll/Nordhaus Comment'') 12–31, among other submissions for this Tunney Act proceeding. The difficulties encountered by peripheral claims are irrelevant, particularly because all of the challenged conduct supported monopolization liability in addition to one or more of the since-abandoned theories. The supposed ''narrowing'' left a huge monopolization case with a stark judgment affirming the government's theory. e RPFJ does not provide a remedy commensurate with that liability.

The RPFJ is insufficient for another overarching reason. The passage of time has only exacerbated the problem of Microsoft's successful abuse of its operating systems monopoly to extend that monopoly to embrace other sectors of computing and to forestall threats to the monopoly from those sectors. Microsoft's monopoly over Internet browsing is complete, as its current 91% market share indicates. Julia Angwin, et al., AOL Sues Microsoft Over Netscape in Case That Could Seek Billions, WALL ST. J., Jan. 23, 2002, at B 1. Even the RPFJ recognizes, albeit through toothless provisions, that Microsoft is using its desktop OS monopoly to force greater use of its server operating systems. And Microsoft's efforts to use the inclusion of its Passport authentication software on every Windows machine as a means of directing through a Microsoft server all authentication and identification transactions—gaining a literal chokehold over the communications aspect of Internet computing—is so significant that Microsoft sought and obtained an exemption in the RPFJ specifically designed to excuse that known monopolistic strategy. See RPFJ § III(H)(1)[second] [2] see also id. § Ill(J).

Microsoft has made ample use of the seven years since the beginning of the conduct at issue in this case. The RPFJ is wholly inadequate even on its own terms, which assume that the world has returned to 1995. But the RPFJ does not begin to address what has happened since then. The public interest in a remedy that achieves what antitrust law says it must cannot be obscured by focusing either on the preference of the technology industry for standards, or on the never-litigated assumption that Microsoft obtained its original operating systems monopoly legally in the 1980s. The last premise, after all, still suggests that the last ten years or so of Microsoft's hegemony have resulted from the illegal acts that prompted two government antitrust lawsuits. If DOJ's enforcement history is to be credited, Microsoft has at least doubled the life of its monopoly through illegal conduct.

In addition, even if the nature of software platforms generally, or computer operating

[2] RPFJ § III(H) contains two subsections (1) and (2). We distinguish between the two sets of subsections with the bracketed terms ''first'' and ''second.''

systems in particular, results in transitory single-firm dominance, that does not mean that competition has no place, or that entrenched monopoly is somehow without social costs. See Stiglitz/Furman Dec. 13–16. Innovation results in the periodic replacement or ''leapfrogging'' of one standard by another. This is not some meaningless replacement of one monopoly with another, as some would have it. To the contrary, as economists—including those of the Chicago school—have recognized, ''competition * * * 'for the field''' provides consumers with substantial benefits. See Microsoft III, 253 F.3d at 49 and sources cited therein. But if competition in a market is limited in scope to serial competition for transitory dominance, predatory conduct is especially harmful. See generally Stiglitz/Furman Dec. 13–16. The monopolist may need to eliminate only a few incipient but significant threats in the course of a decade in order to transform transitory dominance into a durable, even impregnable monopoly.

That is what happened here. Although Netscape Navigator had not developed into a competing applications platform when Microsoft cut off its revenue sources, Netscape contemplated just such a development—and Microsoft both contemplated and deeply feared it. The outcome of the competition that Microsoft thwarted is unknowable. But there will be no further competition—much less competitive outcomes—if Microsoft is allowed to repeat the course of conduct it undertook here.

But the RPFJ permits Microsoft to continue to fortify and expand its monopoly. Indeed, the RPFJ provides an imprimatur for Microsoft to continue and expand a whole range of additional, related anticompetitive practices. As a consequence, the RPFJ is an instrument of monopolization, not a remedy for it. The Court should not add judicial endorsement to DOJ's agreement to give up the case. The ''public interest,'' within the meaning of the Tunney Act, 15 U.S.C. § 16(e), requires far more effective relief.

I. THE TUNNEY ACT REQUIRES CLOSE SCRUTINY UNDER THE PRESENT CIRCUMSTANCES

The Tunney Act exists ''to prevent 'judicial rubber stamping''' of proposed antitrust consent decrees. United States v. Microsoft Corp., 56 F.3d 1448, 1458 (DC Cir. 1995) (quoting H.R. Rep. No. 1463, 93d Cong. 2d sess. 8, reprinted in 1974 U.S.C.C.A.N. 6535, 6538) (''Microsoft/''); United States v. BNS, Inc., 858 F.2d 456, 459 (9th Cir. 1988); In re IBM, 687 F.2d 591,600 (2d Cir. 1982). Upon enactment it was immediately clear that ''Congress did not intend the court's'' review of a proposed settlement ''to be merely pro forma, or to be limited to what appears on the surface.'' United States v. Gillette Co., 406 F. Supp. 713,715 (D. Mass. 1975) (Aldrich, J.).

The Tunney Act requires particularly close scrutiny of the RPFJ in this case. The government seeks to remedy a proven, well-defined, serious violation of the antitrust laws. Microsoft's heavy lobbying of the executive and legislative branches in order to bring political pressure for a lenient settlement heightens the need for scrutiny, and in addition makes necessary the Court's active investigation into Microsoft's failure to disclose the bulk of that lobbying despite the command of 15 U.S.C. 16(g). The lenient terms of the RPFJ itself further underscore the need for close judicial scrutiny. Never in the history of the Tunney Act has a Court been confronted with this combination of an impregnable judgment of liability, pervasive lobbying, and apparent surrender by the federal government. The circumstances here indicate exactly the sort of ''failure of the government to discharge its duty''—whether or not actually ''corrupt''—that even DOJ concedes warrants close judicial scrutiny of a settlement. CIS 66, 66 Fed. Reg. 59,476 (quoting United States v. Mid-America Dairymen, Inc., 1997–1 Trade Cas. * 61,508, at 71,980, 1977 WL 4352 at * 8 (W.D. Mo. 1977)).

A. The Government's Victory On Liability Removes Litigation Risk And Therefore Limits Deference

The CIS suggests (at 65–68, 66 Fed. Reg. at 59,475–476) that the Court owes nearly absolute deference to DOJ's decision to retreat from its appellate victory. That is not true. The affirmance of liability on appeal removes any speculation that ''remedies which appear less than vigorous'' simply ''reflect an underlying weakness in the government's case.'' Microsoft I, 56 F.3d at 1461. There is no ''underlying weakness''; liability is a given, and provides a clear benchmark for measuring whether the proposed relief is sufficiently effective to come ''within the reaches of the public interest.'' Id. at 1460. Those ''reaches'' are narrower when liability is proved and affirmed than when it is merely alleged, as it was in Microsoft I.

1. The Imposition And Affirmance Of Liability Remove Any Constitutional Concerns About Searching Review And Require The Court To Perform Its Constitutional Duty

Most important, the current posture of this case places it beyond the scope of the prudential and constitutional concerns expressed by some courts (and dissenting Justices) about judicial scrutiny of DOJ's charging decisions, or of its settlement of unproven claims. It may be that when ''the government is challenged for not bringing as extensive an action as it might, a district judge must be careful not to exceed his or her constitutional role.'' Microsoft I, 56 F.3d at 1462. Such concerns did not persuade the majority of the Supreme Court, however, which over a dissent rejected similar arguments in summarily affirming the modifications imposed by the district court in the AT&T consent decree. See Maryland v. United States, 460 U.S. 1001 (1983).

In any event, when the action has been brought, tried, and won, and the only question is whether the proposed relief is adequate, the constitutional concerns dissipate. Because DOJ already made the discretionary decision to bring the case, and successfully proved liability to the satisfaction of two courts, the Court in reviewing this settlement runs no risk that by exercising its normal remedial discretion under established legal principles it somehow might be said ''to assume the role of Attorney General.'' Microsoft I, 56 F.3d at 1462. It was precisely the absence of a ''judicial finding of illegality'' that might impede the Tunney Act from ''supply[ing] a judicially manageable standard for review.'' Id. at 1459. Here, two courts have provided the ''findings that the defendant has actually engaged in illegal practices'' that were missing in both Microsoft I and AT&T (like other cases settled before trial). Id. at 1460–1461 (emphasis added). In addition, the appellate affirmance imposed monopolization liability for all of the significant conduct that had been alleged to support the additional, largely supererogatory legal theories that were rejected as ground for additional liability.

It is accordingly entirely appropriate, and indeed necessary, for the Court in this case ''to measure the remedies in the decree as if they were fashioned after trial,'' Microsoft I, 56 F.3d at 1461, because they were ''fashioned after trial'' and appellate affirmance. The Court need not ''assume that the allegations in the complaint have been formally made out'' (id.), but rather knows beyond doubt exactly which allegations were proved. There is a ''judicial finding of relevant markets, closed or otherwise, to be opened'' and ''of anticompetitive activity to be prevented.'' Maryland v. United States, 460 U.S. at 1004 (Rehnquist, J., dissenting). ''IT]hat there was an antitrust violation,'' and ''the scope and effects of the violation,'' were not assumed, as they must be in a pretrial settlement, but proved to the satisfaction of two courts. Id.

Very limited prosecutorial discretion remains in this situation. The amorphous, policy-laden choices whether to bring a case and how much to allege, are behind us. The predictive judgment as to the chances of success on liability likewise is beyond serious dispute in light of the unanimous affirmance of monopolization liability by the en banc court of appeals. DOJ has some leeway in choosing a remedy, but its chosen remedy must be ''adequate to remedy the antitrust violations alleged in the complaint,'' United States v. Bechtel Corp., 648 F.2d 660, 665 (9th Cir. 1981), under the well-established legal standards for antitrust relief. See Microsoft III, 253 F.3d at 103. Those standards inform the ''public interest'' determination under the Tunney Act, and, by contrast with the ''public interest'' standing alone, are judicially manageable without a doubt.

The DC Circuit has made crystal clear that a consent decree ''even entered as a pretrial settlement, is a judicial act,'' so that ''the district judge is not obliged to accept one that, on its face and even after government explanation, appears to make a mockery of judicial power.'' Microsoft I, 56 F.3d at 1462. Judicial approval of the settlement in this case is far more of a classic ''judicial act'' than the typical settlement without proof of liability. As in the context of post-conviction criminal sentencing, the Court must act as more than a passive recipient of arrangements made between the parties

There is no serious question that a federal court may reject a plea bargain in its sound discretion, Fed. R. Crim. P. 11, Santobello v. New York, 454 U.S. 257, 262 (1971), for reasons that may include the ''court's belief

that the defendant would receive too light a sentence under the circumstances.'' United States v. Adams, 634 F.2d 830, 835 (5th Cir. 1981).[3] Granted, plea bargains in the criminal context generally involve admissions of liability. But the case here, if anything, is stronger here, where liability has been, not admitted, but established after extensive litigation and affirmed by an en banc court of appeals over the vigorous objection of the defendant.

At this stage, ''the discrepancy between the remedy and undisputed facts of antitrust violations'' can ''be such as to render the decree 'a mockery of judicial power.''' Massachusetts School of Law, Inc. v. United States, 118 F.3d 776, 782 (DC Cir. 1997) (quoting Microsoft I, 56 F.3d at 1462). By contrast with the concerns expressed in the pretrial settlement context about the intrusion of Tunney Act courts on functions that are constitutionally allocated to the executive branch, the situation after liability is established presents opposite concerns under our system of separated powers, and of checks and balances between the branches of government. Constitutional concerns in this case would arise only if the Court failed to apply the legal standards governing antitrust relief to the adjudicated liability here. DOJ asks the Court not only to abandon its traditional power over the relief to be imposed in an adjudicated case, but also to ignore the clear command of Congress to provide a check on the irresponsible exercise of power by a suddenly and inexplicably compliant prosecutor. The Court should refuse that suggestion.

2. The Extensive Record And Judicial Opinions Provide Clear, Manageable Standards For Substantive Review Of The RPFJ

None of the authorities on which DOJ relies involved a full trial in which liability was proved, much less one in which liability was affirmed on appeal. Indeed, the statements quoted in the CIS draw heavily on that fact—that in each case there had been no finding of liability, and that review of the settlement at issue necessarily involved second-guessing DOJ's prosecutorial discretion in making two rather standardless assessments: (1) whether to bring a case at all, and thus place the matter in a judicial forum, see Microsoft I, 56 F.3d at 1459–1460, and (2) the chances for success. See, e.g., Mid-America Dairymen, 1977 WL 4352, at *8 (Tunney Act ''did not give this Court authority to substitute its judgment about the advisability of settlement by consent judgment in lieu of trial'') (emphasis added).

Here, neither of these fundamentally discretionary prosecutorial judgments is at issue. The decision to bring the case was made years ago, and the case was litigated and won, establishing liability to a known extent.

It is telling that in asking for broad deference DOJ places heavy reliance on language from the Ninth Circuit's decision in United States v. Bechtel Corp., 648 F.2d 660 (9th Cir. 1981). See CIS 66–67 & n.4; 66 Fed. Reg. 59,476. One could hardly find a setting more distant from this one. Not only did Bechtel not involve a finding of liability after full litigation and affirmance on appeal; and not only did the setting there—alleged complicity in the ''Arab boycott'' of Israel in the mid-1970s—implicate the foreign policy powers of the executive branch; but the issue before the curt in Bechtel was the defendant's effort to avoid its own settlement by arguing that the settlement to which it had agreed was ''not in the public interest.'' Bechtel, 648 F.2d at 665.[4]

As it happens, however, the court of appeals in Bechtel enunciated the legal standard that should be applied here: ''whether the relief provided for in the proposed judgment was adequate to remedy the antitrust violations alleged in the complaint.'' Bechtel, 648 F.2d at 665 (emphasis added). That is precisely the standard that DOJ wishes to avoid. Where liability is a given, as it is here, the Court must ensure that the ''remedies negotiated between the parties and proposed by the Justice Department clearly and effectively address the anticompetitive harms'' that have been proved. United States v. Thomson Corp., 949 F. Supp. 907, 913 (D.DC 1996). When the ''anticompetitive harms'' and their illegality have been proved, the fit between those harms and the proposed remedies must be closer than when those harms merely have been ''initially identified,'' id., as is usually the case in Tunney Act proceedings.

Even if there were no finding a liability, the Court would not be compelled ''unquestionably [to] accept a consent decree as long as it somehow, and, however inadequately, deals with the antitrust problems implicated in the lawsuit.'' United States v. Alcan Aluminum, Ltd., 605 F. Supp. 619, 622 (W.D. Ky. 1985) (citing United States v. AT&T, 552 F. Supp. 131,151 (D.DC 1982), aff'd sub nom. Maryland v. United States, 460 U.S. 1001 (1983). With liability in place, however, the Court need not proceed ''on the assumption that the government would have won.'' Gillette, 406 F. Supp. at 716 n.2.

The government did win. The Court in this case need not ''speculate in regard to the probability of what facts may or may not have been established at trial.'' United States v. Mid-America Dairymen, Inc., 1977 WL 4352, at *1. Those facts are a matter of record.

Whatever narrow deference may be afforded here amounts only to the tested rule that ''[i]t is not the court's duty to determine whether this is the best possible settlement that could have been obtained.'' Gillette, 406 F. Supp. at 716 (emphasis added). Although the Court may not be able to insist on the ''best possible'' decree, the proof and affirmance of liability require the Court to ensure that the RPFJ is at least adequate on that record under well-established remedial principles. Bechtel, 648 F.2d at 665.

The differences are real, but not dramatic, between the Court's role in deciding whether to accept this settlement in Track I, and in deciding in Track II what relief to impose at the request of those plaintiffs who have not abandoned the pursuit of a full and effective remedy in this case. In each track, the Court must measure proposed remedies against the legal standards set out by the DC Circuit and by the Supreme Court. In each track, the Court should not approve a remedy that is inadequate to meet those standards. In evaluating the RPFJ, the Court is not at liberty to substitute its view of equally effective, or marginally more effective relief, if the terms of the RPFJ are fully adequate to the task as the law defines it. That is, the DOJ's choices among adequate alternatives warrant deference, but its determination of what is adequate warrants none. In the other track, the Court does have the liberty, not merely to go beyond any decree that might be entered in this track, but also to insist that the final decree address the competitive issues in a way that satisfies the Court's view as to the best and most effective means of opening the operating systems market to competition, depriving Microsoft of the fruits of its illegal conduct, and preventing similar monopolistic abuses in the future. That is, while in this track of the proceeding the Court cannot insist on the ''best possible settlement,'' Gillette, 406 F. Supp. at 716, so long as the proposed relief meets the remedial standards anchored in antitrust law, in Track II the Court has not only the power but the duty to impose the ''best possible'' decree.

B. Broad Deference Is Particularly Circumstances Are Suspicious

1. Inappropriate Because The Microsoft's Manifestly Inadequate Disclosure Under The Tunney Act's Sunshine Provisions Weighs Strongly Against Judicial Deference To The Terms Of The RPFJ Section 2(g) of the Tunney Act requires Microsoft to file a ''true and complete description'' of ''any and all written or oral communications'' by it or on its behalf ''with any officer or employee of the United States concerning or relevant to'' the proposed settlement. 15 U.S.C. § 16(g) (emphasis added). The only exception from this requirement is for settlement negotiations between ''counsel of record alone'' and ''employees of the Department of Justice alone.''/d. (emphasis added).

When Senator Tunney first introduced his bill, he focused on the significance of the disclosure provision. ''Sunlight is the best of disinfectants,'' he explained (quoting Justice Brandeis), and thus ''sunlight * * * is required in the case of lobbying activities attempting to influence the enforcement of the antitrust laws.'' 119 Cong. Rec. 3449, 3453 (1973). Minor amendments to Section 2(g) were designed ''to insure that no loopholes exist in the obligation to disclose all lobbying contacts made by defendants in antitrust cases culminating in a proposal for a consent decree.'' H.R. Rep. No. 1463, at 12 (emphasis added).

The breadth of Microsoft's effort to use political pressure to curtail this case has no parallel in the history of the antitrust laws.

[3] See also, e.g., United States v. Robertson, 250 F.3d 500, 509 (6th Cir. 2001); United States v. Greener, 979 F.2d 517, 521 (7th Cir. 1992); United States v. McGovern, 822 F.2d 739, 742 n.4 (8th Cir. 1987); United States v. Randahl, 712 F.2d 1274, 1275 (8th Cir. 1983).

[4] 4 Decided in an equally remote context was United States v. BNS, Inc., 858 F.2d 456 (9th Cir. 1988), in which the Ninth Circuit approved a preliminary injunction, entered over DOJ's objection, against a tender offer for an acquisition that a proposed consent decree would have permitted.

The ITT episode that prompted the Tunney Act pales in comparison. It has been widely known that since 1998 Microsoft has comprehensively lobbied both the legislative and executive branches of the federal government in an effort to create political pressure to end this case.[5] But Microsoft did not disclose any of these contacts, much less all of them, as the Tunney Act requires.

Rather, Microsoft disclosed only meetings that occurred during the last round of settlement negotiations ordered by the Court. Microsoft's insupportable interpretation of its statutory disclosure duty effectively nullifies the sunshine provisions of the Act, which are crucial to the Act's protection of the public interest.

a. Contacts With All Branches Must Be Disclosed.

All contacts with ''any officer or employee of the United States'' must be disclosed. As Senator Tunney explained,

Included under [section 16(g)] are contacts on behalf of a defendant by any of its officers, directors, employees, or agents or any other person acting on behalf of the defendant, with any Federal official or employee. Thus, * * * the provision would include contacts with Members of Congress or staff, Cabinet officials, staff members of executive departments and White House staff 119 Cong. Rec. at 3453 (emphasis added). In other words, the disclosure applies equally to contact with any branch of Government, including the Congress. * * * [T]here is a great deal to be gained by having a corporate official who seeks to influence a pending antitrust case through congressional pressure, know that this activity is subject to public view.

Id. Indeed, it is firmly established in other areas of the law that ''officer'' of the United States includes Members of Congress and their employees.[6]

But Microsoft did not disclose its extensive and heavily reported lobbying of Congress. Indeed, upon the remand to the District Court, Microsoft's lobbying of Congress produced a letter signed by more than 100 Members urging a swift settlement. But Microsoft did not disclose even that lobbying, aimed at pressuring a swift capitulation by the government despite its victory on appeal, directly before the last round of settlement negotiations.

b. The ''Counsel of Record'' Exception Is Very Narrow.

Section 16(g) provides a narrow exception from disclosure for contacts between ''counsel of record alone'' (emphasis added)—that is, without any other corporate officers or employees also involved—and ''the Attorney General or the employees of the Department of Justice alone.'' As Senator Tunney explained, this ''limited exception'' for attorneys of record ''is designed to avoid interference with legitimate settlement negotiations between attorneys representing a defendant and Justice Department attorneys handling the litigation. * * * [T]he provision is not intended as loophole for extensive lobbying activities by a horde of 'counsel of record.'' 119 Cong. Rec. at 3453. The House Report further clarifies that this ''limited exception'' distinguishes '''lawyering'' contacts of defendants from their 'lobbying contacts'.'' H.R. REP. No. 1463, supra, at 9.

Microsoft did not disclose the well-publicized participation in the last round of settlement negotiations of its lobbyist-lawyer, Charles F. ''Rick'' Rule. It appears that the critical ''negotiations'' leading to the RPFJ took place, not in the offices of Microsoft's counsel of record, but ''in Justice's offices and those of Microsoft legal consultant Rick Rule.'' Paul Davidson, Some States Fear Microsoft Deal Has Big Loopholes, USA TODAY, Nov. 5, 2001. Rule has been a registered lobbyist for Microsoft for some years, but was not named as counsel of record until November 15, 2001, after the settlement negotiations were complete. See Notice of Appearance (D.DC filed Nov. 15, 2001). That designation—long after the settlement deal had been struck cannot retroactively shield his extensive prior contacts with Mr. James or other executive or legislative officials from disclosure. Contacts by ''[a]ttorneys not counsel of record'' must be disclosed. Id. Of course, Microsoft's many other lobbyists do not conceivably come within this exception. But Microsoft concealed all of those lobbying contacts.

c. All Communications Urging The Government To Abandon Or Settle The Case Were ''Relevant To'' The Proposed Settlement

Section 16(g) requires the disclosure of all contacts ''concerning or relevant to'' a proposed settlement. This statutory definition is intentionally broad. Microsoft's disclosure interprets the word ''concerning'' very narrowly, so that the provision covers only actual settlement discussions—and only the last round of them. In Microsoft's view, the Tunney Act would require disclosure only of the very meetings that must precede any settlement. Microsoft reads the words ''relevant to'' right out of the statute. That this statutory provision is broad is obvious by its very terms; in order for the phrase ''relevant to'' not to be mere surplusage, it must encompass contacts less directly focused on the settlement than those that ''concern[]'' that agreement.

Senator Tunney an example: ''the provision would require disclosure * * * of a meeting between a corporate official and a Cabinet officer discussing 'antitrust policy'' during the pendency of antitrust litigation against that corporation.'' 119 Cong. Rec. at 3453. The Act borrows from evidentiary concepts, including the privilege for settlement discussions, which prompted the narrow exception for counsel of record. The evidentiary concept of relevance is very broad. See Fed. R. Evid. 401. ''Relevance of evidence is established by any showing, however slight, that the evidence'' makes a legally important factor ''more or less likely.'' United States v. Mora, 81 F.3d 781,783 (8th Cir. 1996) (emphasis added) (citation omitted). Plainly ''relevant'' to the question whether a defendant's lobbying activities influenced the existence and terms of a consent decree are contacts with the administration, and with members of Congress, that touch on the desirability of the government's agreeing to end the case. It is startling, for example, that Microsoft would omit reference to its efforts to enlist support for congressional proposals that would have cut DOJ's funding for the pursuit of this case, and for antitrust enforcement in high technology industries in general.[7]

Disclosure under Section 2(g) is not usually burdensome; most defendants do not try to win their case politically rather than in the courtroom. Microsoft's massive and unprecedented effort to distort the judicial process through political pressure makes its compliance burdensome, but all the more necessary. It is exactly this sort of manipulation that the Tunney Act was designed to discourage by bringing it to light.

d. Microsoft's Flouting Of Its Statutory Duty Counsels Painstaking Judicial Scrutiny Of The RPFJ

Microsoft's cunning ''interpretation'' of the statutory disclosure requirements—so that disclosures reach only the very settlement discussions that the Tunney Act was not concerned about—sheds considerable light on Microsoft's likely ''interpretations'' of any remedy imposed on it, especially one like the RPFJ of which it can claim to be an equal drafter, if not the principal author. Microsoft's disclosure is so inadequate as to raise questions about Microsoft's good faith. The filing includes no disclosure of any lobbying contacts between Microsoft and the administration; it includes no disclosure of any contacts between Microsoft and members of Congress; it includes no disclosure of any contacts whatsoever before September 27, 2001, although it is well known that Microsoft and the government have tried to settle the government's antitrust action since before it was filed, and that Microsoft lobbied Congress to bring pressure on DOJ to settle or simply abandon the case.

Microsoft should face contempt sanctions for its certification ''that the requirements of [Section 16(g)] have been complied with and that such filing is a true and complete description of such communications known to the defendant or which the defendant reasonably should have known.'' DOJ should refuse to acquiesce in Microsoft's deception. Although DOJ cannot be expected to be

[6] ee, e.g., Williams v. Brooks, 945 F.2d 1322, 1325 n.2 (5th Cir. 1991) (''a congressman is an ''officer of the United States'' within the meaning of [28 U.S.C. 1442(a)(1)]''); Nebraska v. Finch, 339 F. Supp. 528, 531 (D. Neb. 1972) (''It is * * * clear that a representative to the Congress of the United States is an officer of the United States, not an officer of the district in which he was elected.''); United States v. Meyers, 75 F. Supp. 486, 487 (D.DC 1948) (''Obviously, a Senator of the United States is an officer of the United States.'').

[7] See Chandrasekaran & Mintz, supra, WASH. POST, May 7, 1999, at A 1; Grimaldi & Greene, supra, SEATTLE TIMES, Feb. 17, 1999, at A1.

aware of all of Microsoft's lobbying of Congress in an effort to create pressure for a favorable settlement, DOJ should reveal the end-product of that pressure in the form of communications from Members and their staffs. And there is no excuse for DOJ to be complicit with Microsoft when it comes to contacts with DOJ itself. In particular, DOJ certainly is aware of Mr. Rule's lobbying contacts with before he belatedly appeared as counsel after the settlement had been concluded. The proper resolution of this issue is the appointment of a special master with the ability to examine the relevant participants under oath. In view of its responsibility to enforce 15 U.S.C. § 16(g) along with the rest of the antitrust laws, DOJ should request (and support) the implementation of such a procedure by the Court.

2. The RPFJ Represents A Swift And Significant Retreat By DOJ

Another factor counseling against deference here is the DOJ's striking capitulation to Microsoft's view of an appropriate remedy, despite the unanimous affirmance of the core of DOJ's case. The insubstantial provisions of the RPFJ provide ample ''reason to infer a sell-out by the Department,'' Massachusetts School of Law, 118 F.3d at 784.

After prevailing on liability in the district court, DOJ sought and obtained not only structural relief—as is ''common'' in broad monopolization cases, see Microsoft III, 253 F.3d at 105—but also ''interim'' conduct restrictions that clearly could not stand alone as a monopolization remedy. DOJ earlier recognized that the interim conduct remedies were stopgaps to keep the competitive situation from continuing to decline in the year or so before divestiture jumpstarted competition. See Plaintiffs'' Memorandum in Support of Proposed Final Judgment 30–31 (corrected version) (filed May 2, 2000). On remand, DOJ abandoned the structural relief that it formerly found necessary, even though liability on the monopolization claim—which alone could support structural relief in the first place—was affirmed with minor modifications. DOJ stated that it would pursue relief ''modeled upon'' the interim ''conduct-related provisions,'' along ''with such additional provisions as Plaintiffs may conclude are necessary to ensure that the relief is effective, given their decision not to seek a structural reorganization of the company.'' Joint Status Report 2 (filed Sept. 20, 2001).

Instead of fortifying the proposed decree to compensate for the abandonment of structural relief, however, DOJ moved considerably backward from the interim remedies, narrowing Microsoft's duties and providing broad exceptions. Indeed, the RPFJ is weaker than the final proposal in the settlement negotiations that took place during Spring 2000, before any judgment of antitrust liability, much less appellate affirmance.[8] Then, there was litigation risk as to liability. Now there is none. Nonetheless, the definitions and obligations in the current RPFJ fall short of those in the pre-judgment offer.

''[T]he government's virtual abandonment of the relief originally requested'' is ''a sufficient showing that the public interest was not * * * adequately represented'' in the RPFJ. United States v. Associated Milk Producers, Inc., 534 F.2d 113, 117 (8th Cir. 1976). It is precisely when DOJ appears to have ''abruptly ''knuckled under,'' id. at 118, as here, that judicial scrutiny under the Tunney Act should be most substantive and searching.

3. The CIS Overstates The Terms Of The RPFJ, Reflecting The Indefensibility of the RPFJ Itself

The CIS underscores the need for close scrutiny of the actual terms of the RPFJ and their effectiveness. The CIS seeks to convey an image of stringency by adding terms to provisions of the RPFJ that are absent from the RPFJ itself. But it is the RPFJ, not the CIS, that defines the enforceable bargain between the parties. As the Supreme Court has recognized, ''any command of a consent decree * * * must be found within its four comers, and not by reference to any purposes of the parties.'' United States v. ITT Continental Baking Co., 420 U.S. 223,233 (1975) (citations and internal quotation marks omitted). While the CIS may be useful in interpreting ambiguous terms in the REFJ, the wording of the CIS is not independently enforceable. Only the RPFJ would be entered as a judgment, and ''[t]he government cannot unilaterally change the meaning of a judgment.'' Bechtel, 648 F.2d at 665. It would be different, of course, if the CIS or its relevant refinements were ''expressly incorporated in the decree.'' ITT Continental, 420 U.S. at 238. In particular, the CIS goes beyond the text of the RPFJ to paint a far stricter picture of Microsoft's disclosure obligations than the RPFJ supports. It is no wonder that DOJ seeks to defend a document—the CIS—to which Microsoft would not be bound, rather than the far weaker RPFJ that alone would be judicially enforceable. The CIS cannot transform the RPFJ into a better deal for competition and consumers than it is.

II. THE RPFJ MUST MEET THE LEGAL STANDARDS NORMALLY APPLICABLE TO ANTITRUST REMEDIES

The ''public interest'' standard in the Tunney Act is not without content. Rather, those ''words take meaning from the purposes of the regulatory legislation,'' NAACP v. Federal Power Comm'n, 425 U.S. 662, 669 (1976). The well-developed jurisprudence of antitrust remedies provides sound guidance for the public interest determination.

Although a district court should not ''engage in an unrestricted evaluation of what relief would best serve the public,'' Microsoft I, 56 F.3d at 1458 (quoting Bechtel, 648 F.2d at 666) (emphasis added), principled restrictions for that evaluation in this case arise from the extensive, unvacated Findings of Fact, the comprehensive opinion affirming monopolization liability on appeal, and the long-standing remedial principles of antitrust law, principles that the DC Circuit instructed the District Court to apply to any proposed relief on remand. See Microsoft III, 253 F.3d at 103. The ''appropriate'' inquiry (Bechtel, 648 F.2d at 666) is ''whether the relief provided for in the proposed judgment [i]s adequate to remedy the antitrust violations'' that were proved at trial and affirmed on appeal. Id. at 665.

The DC Circuit provided benchmarks rooted in Supreme Court jurisprudence to guide the evaluation whether a remedy is ''adequate.'' A remedy in this case must serve ''the objectives that the Supreme Court deems relevant,'' Microsoft III, 253 F.3d at 103. That is, a remedy must ''seek to * * * [1] 'terminate the illegal monopoly, [2] deny to the defendant the fruits of its statutory violation, and [3] ensure that there remain no practices likely to result in monopolization in the future.'" Id. at 103 (quoting Ford, 405 U.S. at 577, and United Shoe, 391 U.S. at 250).[9]

A. The Relief Should ''Terminate The Illegal Monopoly''

In a monopolization case, the problem to be remedied is the monopoly itself. Because the RPFJ would leave the illegally maintained monopoly in place without making the market structure more competitive, to satisfy this criterion relief must exclude the possibility that Microsoft again will prolong its monopoly power by abusing it. At a minimum, however, a monopolist should emerge from a remedy facing competitive threats of similar scope and significance to those it illegally stamped out. The DC 35

Circuit recognized that the illegal conduct in this case was aimed at increasing and hardening the applications barrier to entry that insulates Microsoft's OS monopoly. See id. at 55–56, 79. The CIS similarly recognized that ''[c]ompetition was injured in this case principally because Microsoft's illegal conduct maintained the applications barrier to entry * * * by thwarting the success of middleware.'' CIS 24, 66 Fed. Reg. 59,465. A remedy that does not literally terminate the monopoly accordingly must undermine the applications barrier to entry that was strengthened by the illegal conduct.

B. The Relief Should Prevent ''Practices Likely To Result In Monopolization In The Future''

To satisfy this criterion, any remedy must both (1) prevent the monopolist from

[8] 8 That final proposal, known as Draft 18, was formerly posted on a now-defunct website, www.contentville.com, in connection with a review of a book that detailed the progress of this case. The text of Draft 18 may now be viewed at www.ccianet.org/legal/ms/draft 18.php3.

[9] 9 It is telling that the CIS ignores the remedial standard that the DC Circuit set out. See CIS 24, 66 Fed. Reg. 59,465. The CIS submerges the need to craft relief that tends to ''terminate'' the illegally maintained monopoly, despite the court of appeals'' contrary instructions. See 253 F.3d at 103. Rather, the CIS endorses a watered-down standard in order to set a lower bar for the RPFJ to clear, in tacit recognition that the RPFJ cannot satisfy the DC Circuit's standard. The CIS would require relief only to ''[e]nd the unlawful conduct,'' to prevent recurrence of the violation ''and others like it,'' and to ''undo its anticompetitive effects.'' CIS 24, 66 Fed. Reg. 59,465. The RPFJ falls short even of these modified, more modest objectives, however, particularly when measured by its failure to prevent future violations that work slight variations on the conduct condemned by two courts, and its failure to ''undo'' any of the ''anticompetitive effects'' of Microsoft's sweeping, coordinated, and successful anticompetitive campaign.
