engaging in the same sorts of conduct that underlie the current finding of liability, and (2) prevent other types of conduct that could preserve the monopoly. The ''monopolization in the future'' that must be prevented includes both the simple maintenance of the current monopoly and the expansion of that monopoly's scope. Relief should make it impossible for the monopolist to continue its pattern of using current market power to foreclose imminent or contemplated competitive threats. Because Microsoft has been ''caught violating the [Sherman] Act,'' it ''must expect some fencing in.'' Otter Tail Power Co. v. United States, 410 U.S. 366, 381 (1973).

A monopolist that has been litigating for years no doubt has developed anticompetitive techniques that achieve the same goals through slightly different means. Microsoft embarrassed DOJ by obtaining language in the 1995 consent decree that was tailored to exclude, at least arguably, the company's next planned anticompetitive initiative. Exemptions, provisos, and narrow definitions should be scrutinized on the assumption that Microsoft again has tried to ensure that the RPFJ will not impede currently planned anticompetitive acts.

C. The Relief Should ''Deny To The Defendant The Fruits Of Its Statutory Violation''

Relief in an antitrust case not only must prevent ''recurrence of the violation,'' but also must ''eliminate its consequences.'' National Society of Professional Engineers v. United States, 435 U.S. 679, 697 (1978). Thus, a remedy should prevent a monopolist from retaining the accrued competitive benefits of its illegal conduct. These advantages may permit a monopolist to maintain its monopoly without additional antitrust violations. Relief that allows a wrongdoer the full benefit of its illegal activity fails the most basic test of any remedy under any branch of the law.

In this case, the ''fruits'' of Microsoft's illegal conduct may be the most important target of a responsible remedy. One of the chief advantages that Microsoft gained by incorporating the Internet browser into the Windows monopoly was the ability to control not only the browser for its own sake, suppressing the possibility that the Internet browser would provide a source of alternate, OS-neutral APIs, but also the browser as the gateway to all Internet computing. As the Litan/Noll/Nordhaus Comment explains (at 58–60), one of the most important fruits of monopolistic conduct is the suppressed development of competitive threats. That is why a forward-looking remedy must be rooted in current market conditions, and must seek to restore competition to where it likely would have been in the absence of the anticompetitive conduct. Litan/Noll/Nordhaus Comment 35–36, 40–42, 58–59.

D. Broader Principles Applicable To Injunctive Relief Also Should Inform The Analysis Of The RPFJ

The remedial analysis here resembles other remedial undertakings. Although civil antitrust relief is not punitive, effective antitrust relief shares with criminal sentencing the broad goals of incapacitation and deterrence. As much as possible, an illegal monopolist should be flatly prevented from engaging in the same or similar suppression of competition in the future. In addition, the remedy should be enforceable with sufficient speed and certainty to make stiff contempt sanctions likely if the monopolist nonetheless manages to engage in anticompetitive conduct again.

The point of antitrust relief after a finding of liability is to learn from history, not to permit the offender to repeat it. This consideration is particularly acute here, where the purposes of the expiring 1995 consent decree clearly have not been realized, but rather have been evaded or neutralized.

Because antitrust relief necessarily is forward-looking, a remedy's effectiveness should be judged with respect to where the market is going, not where it has been. Microsoft has directed its efforts to destroy the competitive threat of Internet computing. The more functionality that is performed on the Web, the less significant the operating system on a particular client device connected to the Web. Thus, Internet computing represents the maturation of the competitive threat posed by the Internet browser and squelched by Microsoft's illegal conduct. The current industry-wide focus on Web-based services reflects the realization that a competitive market still survives in this sector. The Court will have to consider whether the RPFJ in fact is ''all about the past, not the future battle in Internet services[, and] doesn't touch the company's ability to use Windows XP to extend its monopoly to these new areas.'' Walter Mossberg, For Microsoft, 2001 Was A Good Year, WALL ST. J., Dec. 27, 2001, at B1. See Stiglitz/Furman Dec. 38–39.

III. THE RPFJ FALLS FAR SHORT OF PROVIDING A REMEDY FOR PROVEN OFFENSES UPHELD ON APPEAL

The RPFJ lights upon narrowly defined practices and prohibits narrowly defined versions of them, in ways that might have mitigated, but would not have ended, the very conduct at issue in this case. The RPFJ does not measure up to the sweeping monopolization violations found by two courts. The RPFJ's provisions do not address Microsoft's ability and incentives to strengthen the applications barrier to entry, which was the underlying issue at the core of the case, instead focusing on techniques of monopolization that have been defined so narrowly that Microsoft's actual behavior need not change. And when addressing a precise technique that directly implicated the reinforcement of the applications barrier to entry—Microsoft's ability to stop porting its Office productivity suite to the Apple Macintosh platform—the RPFJ permits Microsoft to retain the ability to repeat that threat in slightly altered contexts.

A. DOJ's Effort To Minimize The Scope Of The DC Circuit's Affirmance Cannot Obscure The Failure Of The RPFJ To Remediate Clear, Proven Violations

DOJ has tried to lower the bar for approval of its proposal by minimizing the most significant appellate imposition of monopolization liability in the past half-century, and adopting Microsoft's crabbed view of its own liability. In Senate testimony, Assistant Attorney General James made the remarkable assertion that the DC Circuit, despite affirming ''the District Court's holding that Microsoft violated ¶ 2 of the Sherman Act in a variety of ways,'' 253 F.3d at 59, somehow precluded any consideration, for remedial purposes of Microsoft's astonishing anticompetitive campaign as a whole. See James Testimony 5. To the contrary, the court of appeals never rejected the common-sense notion that ''Microsoft's specific practices could be viewed as parts of a broader, more general monopolistic scheme''; much less did the court of appeals insist (or even hint) that ''Microsoft's practices must be viewed individually'' for all purposes. Id. Rather, the court of appeals clearly considered some illegal acts in the context of others. Thus, the court held that Microsoft's exclusive contracts with ISVs, though affecting only ''a relatively small channel for browser distribution,'' had ''greater significance because * * * Microsoft had largely foreclosed the two primary channels to its rivals.'' 253 F.3d at 72.

The DC Circuit's examination of the divestiture remedy is telling. If the many separately illegal monopolistic acts could not be viewed as cumulatively contributing to the illegal maintenance of Microsoft's monopoly, divestiture would have been an unthinkable remedy, since no specific act held illegal on appeal changed the structure of the company or of the market. But the court of appeals recognized that divestiture could be justified if the many separate illegal acts, taken together, were shown to have had a sufficiently certain causal connection to justify using structural relief to undermine, if not end, the monopoly. See 253 F.3d at 80, 106–107.

The court of appeals did ''reverse [the] conclusion that Microsoft's course of conduct separately violates 2 of the Sherman Act.'' 253 F.3d at 78 (emphasis added). But the reversal occurred because the district court purported to find that a series of acts that did not constitute separate, free-standing antitrust violations had a ''cumulative effect * * * significant enough to form an independent basis for liability''—but never specified acts other than those that separately violated Section 2 that might be aggregated into such a violation. Id.

It is a remarkable leap from this unremarkable holding to the absurd notion that Microsoft's extraordinary series of separate adjudicated antitrust violations cannot be considered together for any purpose. Even the CIS recognizes that those violations are part of one coordinated and ''extensive pattern of conduct designed to eliminate the threat posed by middleware.'' CIS 11, 66 Fed. Reg. 59,462. They should be remedied as such.

B. The RPFJ Simply Restates The Antitrust Laws At Critical Points And Thus Forfeits The Clarity And Efficiency Of The Contempt Process

Another striking feature of the RPFJ is its repeated reliance on a reasonableness standard of conduct that simply imports full rule-of-reason analysis under the antitrust laws. Antitrust remedies, like other injunctive decrees, are supposed to be amenable to swift and sure enforcement,

according to standards that give warning of what is forbidden and what is permitted both to the wrongdoer and to its potential victims. But the RPFJ would regularly require the decree Court to determine whether Microsoft's conduct was ''reasonable.'' For example, the Court would have to determine

* whether volume discounts were ''reasonable'' or exclusionary (RPFJ § III(B)(2));

* whether technical requirements for the bootup sequence that Microsoft imposed on OEMs were ''reasonable'' (id. § III(C)(5));

* whether the terms on which Microsoft makes Communications Protocols available are ''reasonable'' (id. § III(E));

* whether exclusivity requirements imposed on ISVs were ''reasonable'' in ''scope and duration'' (id. § III(F)(2)); see also id. § (III(G)(2));

* whether technical requirements designed to force the invocation of Microsoft Middleware despite contrary consumer or OEM preferences are ''reasonable'' (id. § III(H)(2)[second]);

* whether the licensing terms accompanying required disclosures, and terms of mandatory cross-licenses required for access to the disclosures, are ''reasonable'' (id. ???* and whether Microsoft's bases for excluding ISVs from access to security-related protocols are ''reasonable'' (id. § III(J)(2)(b)–(c)).

It is telling that the RPFJ states so many of its provisions in terms that simply duplicate the antitrust rule of reason. Rule of reason disputes are notoriously difficult to litigate, see Arizona v. Maricopa County Medical Soc., 457 U.S. 332, 343 (1982) (noting ''extensive and complex litigation'' involving ''elaborate inquiry'' at ''significant costs''), — and difficult for plaintiffs to win. These provisions add nothing to the antitrust laws themselves, either in clarity of obligation or in efficiency of enforcement. That is no remedy at all.

C. The RPFJ Provides No Remedy For Microsoft's Suppression Of The Browser And Java.

As noted above, perhaps the most glaring deficiency of the RPFJ is that it does nothing to restore the competitive threats to Windows posed by the Internet browser and cross-platform Java. That cannot be an oversight. The bulk of the evidence, and much of the opinion of the court of appeals affirming liability, focused on Microsoft's successful efforts to suppress these threats to the applications barrier to entry. See Microsoft III, 253 F.3d at 58–78. Even the CIS recognizes the primacy of these products in the case. See CIS 10–17, 66 Fed. Reg. 59,462–463.

Yet the RPFJ does not change the competitive picture for either product in the least. The RPFJ does not deprive Microsoft of these ''fruits'' of its illegal conduct, but instead takes that illegal conduct, and the advantages derived from it, as a tacit baseline for future competition. The RPFJ leaves Microsoft with the full benefit not only of the years of insulation from the competitive threats posed by those products, but also of the expanded power it has accumulated by incorporating Internet Explorer into the Windows monopoly. Microsoft thus has more, and stronger, weapons to suppress any middleware threats that it identifies in the future, since its monopoly control over the browser—now labeled part of the Windows monopoly product—provides Microsoft with complete control over the universal client for Internet computing. The RPFJ's approach is like sentencing a bank robber to probation, but letting him keep his weapons and the loot.

But the RPFJ's failure to provide relief that restores the specific competitive threats that Microsoft illegally suppressed is worse than that. In a platform technology market like that for PC operating systems, single standards tend to prevail, so that only sweeping changes can dislodge the incumbent. Platform threats are very rare. It could easily be another five or ten years or more before a comparable threat arises again; certainly no threat of similar strength to the Internet browser or Java has surfaced in the nearly seven years since Microsoft began the course of illegal conduct condemned by the court of appeals. See Stiglitz/Furman Dec. 35–36. That is what makes anticompetitive conduct directed at them so potentially profitable. The RPFJ makes that conduct profitable beyond any rational actor's wildest dreams, and greatly increases the incentives for its repetition. Having been caught illegally suppressing two related platform threats, Microsoft retains all the benefits that it sought through its illegal acts.

By eliminating Navigator, Microsoft has not only eliminated consumer choice in browsers, but it also seized the power to control the interfaces and protocols through which an enormously valuable set of Internet applications—ranging from instant messaging and e-mail to streaming video and e-commerce—are delivered to desktop computers and other digital devices. Microsoft's Internet Explorer is now the bottleneck through which all Internet-related middleware must pass. Instant messaging and media player technology are equally dependent on browser software. Microsoft has also seized the power to decide whether that browser functionality will be ported to any competing operating system, and, if so, to which ones. Finally, in destroying Navigator, Microsoft has also destroyed an important alternative distribution channel, one free of Microsoft's control or influence, through which Microsoft's competitors could formerly distribute middleware runtimes and products to desktop consumers and application developers.

Although Navigator has practically disappeared from the competitive scene, Java has not. But Java's importance has been limited to servers, where Microsoft has a leading share but not yet an operating systems monopoly. Microsoft's conduct appears to have assured that Java will not function as cross-platform middleware for client computers. Java thus poses no threat to the desktop OS monopoly. But the RPFJ lets Microsoft keep that anticompetitive benefit of its conduct.

IV. THE ICON-FOCUSED OEM FLEXIBILITY PROVISIONS ARE INEFFECTIVE

RPFJ §§ III(H)(1)–(2)[first] superficially allow OEMs and end users to rearrange icons and menu entries relating to middleware.[10] These provisions are hollow, however. Section III(H)(1) duplicates only what Microsoft unilaterally agreed to permit OEMs to do back on July 11, 2001. And the end-user provisions simply restate and preserve end-users'' longstanding options to delete icons and menu entries if they right-click and delete or drag the icon or menu entry to the Recycle bin. The default provisions in Section III(H)(2) are so limited, and so fully subject to Microsoft's architectural control, as to be competitively meaningless as well.

The icon provisions do not adequately address the competitive harms of Microsoft's adjudicated misconduct because Microsoft remains able to ensure that the Microsoft versions of middleware will appear, ready to be invoked by applications, on every PC. Even if the icon provisions had greater competitive significance in theory, they are unlikely to have any significance in fact, because few if any OEMs are likely to take advantage of the options provided. DOJ cannot claim to be unaware of this market reality. These provisions are mere window-dressing. See Stiglitz/Furman Dec. 35.

A. The PFJ Permits Microsoft's To Continue Illegally Commingling Middleware Code With The Code For The Monopoly Operating System

The RPFJ capitulates on DOJ's most hard-fought and significant substantive victory: the finding that Microsoft illegally preserved its monopoly by commingling the middleware code with the operating system, foreclosing the competitive threat to Windows while effectively expanding the scope of the monopoly to encompass middleware. DOJ's inability to enforce the 1995 consent decree against the binding of IE to Windows, see United States v. Microsoft, 147 F.3d 935 (DC Cir. 1998) (''Microsoft II''), was widely viewed as prompting this action. The conduct itself was viewed as the most successful in furthering Microsoft's anticompetitive goals.

Rather than repeat and strengthen the prohibition in the 1995 decree that failed to achieve its goals, the RPFJ does not even impose the type of superficial prohibition applied to other conduct condemned at trial and on appeal. To the contrary, under the RPFJ, the operating system is whatever Microsoft says it is, and Microsoft can commingle any new product to the monopoly product—foreclosing competition for the OS and the new product alike. See Stiglitz/Furman Dec. 34–37. Not only does Microsoft preserve its anticompetitive gains, but it obtains a green light to repeat the same conduct to destroy any new middleware threats. In a market characterized by serial dominance, an incumbent monopolist may need only to suppress one threat every few years in order to make its monopoly virtually permanent. Cf. id. at 35–36. A continued ability to commingle middleware gives Microsoft limitless tenure over the OS market. If Microsoft emerges from this case free to bind middleware to the OS, this action will be an exercise in futility.

1. The DC Circuit Specifically Condemned Commingling Twice

[10] 10 See n.2, supra.

DOJ's victory on the commingling point was crystal clear, and repeatedly underscored by the court of appeals. The court of appeals recognized that ''Microsoft's executives believed'' that ''contractual restrictions placed on OEMs would not be sufficient in themselves'' and therefore ''set out to bind'' IE ''more tightly to Windows 95 as a technical matter.'' Microsoft III, 253 F.3d at 64 (quoting Findings, 84 F. Supp.2d at 50 (¶ 160)). In the CIS (and in Assistant Attorney General James'' Senate testimony), DOJ appears to assume that icon-based relief that subjects some Microsoft Middleware Products to the Add/Remove utility equates with relief for commingling code. Thus, the CIS blends the two offenses in stating that Microsoft violated Section 2 when it ''integrated Internet Explorer into Windows in a non-removable way while excluding rivals.'' CIS 7, 66 Fed. Reg. 59,461. In affirming liability for both courses of conduct, however, the court of appeals clearly distinguished between Microsoft's ''excluding IE from the 'Add/Remove Programs'' utility'' and its ''commingling code related to browsing and other code in the same files.'' 253 F.3d at 64–65, 67. The court of appeals found no justification for commingling code or, indeed, more broadly, for ''integrating the browser and the operating system.'' Id. at 66. One could hardly ask for a clearer statement.

Microsoft argued bitterly against liability for commingling, and for a declaration that its product design decisions were beyond the reach of the antitrust laws. Instead, the DC Circuit pointedly rejected Microsoft's argument that it ''should vacate Finding of Fact 159 as it relates to the commingling of code.'' Microsoft III, 253 F.3d at 66; see Findings, 84 F. Supp.2d at 49–50 (¶ 159). And the court of appeals ''conclude[d] that such commingling has an anticompetitive effect,'' because it ''deters OEMs from pre-installing rival browsers, thereby reducing the rivals'' usage share and, hence, developers'' interest in rivals'' APIs as an alternative to the API set exposed by Microsoft's operating system.'' 253 F.3d at 66 (emphasis added). See generally id. at 64–67. That is, commingling helps reinforce the applications barrier to entry that shields the Windows monopoly.

The DC Circuit's holding reflected a principle of critical importance to the enforcement of the antitrust laws in the software industry, where the complementarity of different programs makes product design a potentially devastating weapon to foreclose competition: a ''monopolist's product design decisions'' can violate the antitrust laws just as any other economic conduct can. 253 F.3d at 65. Product design decisions may be grossly anticompetitive, particularly in the software industry where lines of code can be packaged (and marketed) in many different ways without affecting the operation of programs once they are installed. As Microsoft's James Allchin recently acknowledged, software ''code is malleable,'' so that ''[y]ou can make it do anything you want.'' Microsoft Net Profit Fell 13% in Recent Quarter, Wall St. J. Europe, Jan. 18, 2002, 2002 WL–WSJE 3352885 (quoting Allchin).

Lest there be any doubt on the matter, the court of appeals flatly rejected Microsoft's reheating petition aimed squarely at the remedial issue. Microsoft specifically sought to preclude relief that addressed the commingling violation, and instead to treat the commingling and the lack of add/remove functionality as the same. Microsoft's reheating petition made clear that the ''ruling with regard to 'commingling'' of software code is important because it might be read to suggest that OEMs should be given the option of removing the software code in Windows 98 (if any) that is specific to Web browsing [as opposed to] removing end-user access to Internet Explorer.'' Appellant's Petition for Reheating, at 1–2 (July 18, 2001). Microsoft argued that affirmance only on the ground of the add/remove issue would ensure that the remedy was tightly confined, because the ''problem will be fully addressed by including Internet Explorer in the Add/Remove Programs utility, which Microsoft has already announced it will do in response to the Court's decision.'' Id. at 2.

The court of appeals rejected this argument out of hand, adding this remarkable sentence in a terse per curiam order denying reheating: ''Nothing in the Court's opinion is intended to preclude the District Court's consideration of remedy issues.'' Order at 1 (DC Cir. Aug. 2, 2001) (per curiam). Nonetheless, the RPFJ would settle this case as if rehearing had been granted, requiring Microsoft only to allow OEMs and end users to ''add/remove'' the icons for middleware. This is insufficient to remedy technological binding—commingling [] since it does nothing to remove the underlying middleware code on which developers will continue to rely. If only the Internet Explorer icon is removed from the desktop, the IE middleware remains, and with it the same applications barrier issues that Microsoft preserved by stifling competition by Netscape and Java.

It is true that the interim conduct relief in the vacated Final Judgment required only that Microsoft offer an operating system where OEMs and end-users were permitted to remove end-user access to the middleware components, United States v. Microsoft Corp., 97 F. Supp.2d 59, 68 (D.DC 2000), vacated, 253 F.3d 34 (DC Cir. 2001), a provision similar to that in RPFJ § III(H)(1)[first]. That transitional provision of course assumed the existence of structural relief that would remove Microsoft's economic incentive to bind middleware to the OS unless the binding was independently justifiable. Without a structurally more competitive market, those modest provisions would be meaningless, and would permit Microsoft to follow much the same course that triggered the lawsuit.

There is no excuse for DOJ's failure to do anything about one of the principal, and most easily replicable, violations in the case. Even one of Microsoft's vocal, libertarian defenders, University of Chicago law professor Richard Epstein, recognized that the minimum plausible remedy after the DC Circuit decision would involve ''undoing a few product-design decisions.'' Richard Epstein, Phew/, Wall. St. J., June 29, 2001, at A10. But DOJ did not even insist on that. Instead, the RPFJ's omission of any relief for this violation gives Microsoft something the DC Circuit twice refused: a victory on the hardest-fought legal issue in the case. Given the central importance of middleware to the theory of the case, failing to address the principal means by which Microsoft bundled browser middleware to Windows would be plainly inadequate.

2. The Failure To Limit Commingling Is Critical Because Ubiquity Trumps Technology In Platform Software Markets

The failure to prohibit commingling of middleware deprives the RPFJ of any significant procompetitive effect on the emergence and adoption of competing platform software. The critical competitive phenomenon in this case was not middleware in itself, but rather the potential, and deeply feared, development of particular middleware into a competing platform for software applications. Middleware can develop into a competing applications platform by attracting software developers to use its Application Programming Interfaces (APIs) in preference to, or at least in addition, to the APIs offered by Microsoft in Windows. Developers will write their applications to invoke particular APIs—i.e., to run on a particular platform—based on how widely available the APIs will be.

Although potential platform software not distributed by Microsoft must attract users in order to achieve the widespread availability of their APIs that will attract developers, it is the expected presence of the APIs that matters, not how much consumers directly use the application exposing the APIs. Non-Microsoft middleware depends on the availability of the application in order to gain the critical mass of users that, in turn, may attract developers.

The availability and prominence of the application's icon may be significant for the purpose of attracting end-users. In platform competition, however, the availability of the application is only a means to the desired end. Developers don't write to icons; they write to APIs. The inclusion of Microsoft Middleware functionality in every copy of Windows is determinative, regardless of how or whether the icons are featured, and regardless even of the presence of the user interface or shell? [11] If developers know that the plumbing for a Microsoft version of middleware will be on every PC because it is commingled with Windows, then developers will write to the Microsoft version's APIs. Because the RPFJ permits Microsoft to include the APIs accompanying the software functionality that mimics middleware that is a potential platform threat, Microsoft will be able to defeat any middleware threat in exactly the same way it destroyed the threat of Netscape and Java on the PC desktop. See Stiglitz/Furman Dec. 36.

Under the RPFJ, developers will continue to assume that Windows Media Player, for example, is present on every computer. This will be true regardless of whether ''end user access'' is removed, because the remedy does

[11] The user interface is especially insignificant because the browser window already can serve as the user interface for many products, and could easily be adapted to serve as the user interface for many more.

not require Microsoft to remove the middleware. The result is that software developers will write applications to, for example, the Windows Media Player APIs, rather than to the APIs supplied by rival platforms. That is an advantage that no competitor can overcome.

It is no answer to say that OEMs can offer rival middleware even if the code for a Microsoft version of the same product is commingled with Windows, so that the Microsoft version of middleware appears on every desktop PC. If Microsoft's version of a product is everywhere, few OEMs will go to the effort of providing another product that does largely the same thing. The district court and court of appeals alike recognized that OEMs faced strong disincentives to install two competing products with similar middleware functionality, disincentives arising largely from support costs and disk space. See 84 F.Supp.2d at 49–50, 60–61 (¶¶ 159, 210); 253 F.3d at 61. If the Microsoft Middleware is there, the OEM will have to support it, even if—perhaps especially if—the end-user does not know that it is there.

Thus, rival middleware cannot undermine Microsoft's monopoly unless (1) the rival middleware is ubiquitous, or (2) the Microsoft version is not ubiquitous. If developers do not feel compelled to write to the rival middleware as well as the Microsoft middleware, the rival middleware will not undermine the monopoly. And if Microsoft's version of particular middleware can be ubiquitous by virtue of its inclusion in the monopoly operating system, as the RPFJ plainly allows, there is virtually no likelihood that rival middleware will ever achieve the ubiquity needed to present a platform challenge. See Stiglitz/Furman Dec. 36–37; see generally Litan/Noll/Nordhaus Comment 44–47.

3. The RPFJ Retreats From The 1995 Consent Decree

Microsoft uses Windows as an instant, universal distribution channel for Microsoft software that represents a response to a threat to the dominance of Windows as a program development platform. As a consequence, ''Windows'' has become whatever bundle Microsoft needs it to be to forestall competition. The 1995 Consent Decree contained a prohibition on contractual tying of applications to the operating system in order to prevent anticipated conduct that would maintain the operating systems monopoly by anticompetitive means. That the earlier provision failed in its purpose suggests that the provision should be broader, not that it should be abandoned, particularly since this case began as a way to stop conduct that had escaped summary condemnation under the earlier decree. It would be senseless as a matter of enforcement policy to bring and win an action prompted by an evasion (if not a violation) of a monopolization consent decree, win the case on the monopolization theory most closely related to the object of the earlier consent decree, and then reward the violator by removing the relevant restriction upon the expiration of the earlier decree rather than broadening it as proposed here.

Microsoft's monopoly gives it the power to make all systems integration and software bundle decisions, a power that Microsoft is exercising more broadly, as the breadth of the Windows XP bundles clearly illustrates. The RPFJ should not step back from the 1995 Consent Decree.

4. The RPFJ Encourages Illegal Commingling By Placing The Critical Definition of Windows Under Microsoft's Exclusive Control

But the RPFJ does step back from the 1995 Decree, and makes matters still worse. Not only does the RPFJ completely fail to prevent future illegal commingling, but it effectively approves that conduct by permitting Microsoft ''in its sole discretion'' to ''determine[]'' exactly which ''software code comprises [sic] a Windows Operating System Product.'' RPFJ § VI(U). That provision permits Microsoft an unearned advantage in repelling any future challenges to illegal commingling of applications code with Windows. Were the Court to enter this provision as part of its judgment, Microsoft could point to DOJ's capitulation on this issue—and the Court's approval—as extraordinarily persuasive evidence that its monopoly product was as broad as it says it is, and that, despite the contrary holding of the DC Circuit, any commingling of an application with the operating system is per se legal.

The Court can and should disapprove provisions that appear to endorse practices of apparent anticompetitive effect and dubious legality. Thomson Corp., 949 F. Supp. at 927–930 (refusing to approve fee schedule for mandatory license for legally dubious copyright). The Court should not approve this provision, which defangs many of the other obligations in the RPFJ.

Rather than learning from the difficulties with the ''integration proviso'' in that Decree, DOJ has ceded the issue to Microsoft, permitting Microsoft to decide for purposes of the decree obligations where the OS stops and where middleware begins. Much of the RPFJ rests on the relationship between the Windows OS and middleware. But the RPFJ places Microsoft firmly in control of every technical aspect of the proposed decree by permitting Microsoft absolute control over the definition of ''Windows Operating System Product.'' That subjects many of Microsoft's purported obligations to Microsoft's own discretion.

No term is more important in the RPFJ than ''Windows Operating System Product,'' which appears fully 46 times in the RPFJ: 26 times in the descriptions of substantive obligations, and 20 times in the definitions that circumscribe those obligations. The definition of Application Programming Interfaces (APIs) is the starkest example. ''Windows Operating System Product'' appears three times among the 41 words of the API definition. See RPFJ § VI(A.). Thus, Microsoft can determine ''in its sole discretion'' what an API is, and thus what must be disclosed.

One would think that DOJ would do everything possible to ensure that a new decree did not contain an analogue to the ''integration proviso'' that nullified much of the anti-tying provision of the 1995 decree. See generally Microsoft II, 147 F.3d 935. Instead, Section VI(U) ensures that few, if any, of the technical provisions of the RPFJ will mean anything except what Microsoft wants them to mean, and that none can be enforced without lengthy litigation that will further shrink the tightly limited duration of the proposed relief.

B. Empirical Evidence Shows That The Icon Flexibility Provisions Will Not Be Used

Not only do the icon flexibility provisions address the wrong problem, but the market already has tested their consequences. On July 11, 2001, Microsoft announced that OEMs and end users would be permitted to remove access to Microsoft's Internet Explorer browser, just as RPFJ § III(H)(1) permits. As of this writing, not one OEM has availed itself of this new liberalized policy. Windows XP is shipping with Internet Explorer on every single personal computer shipped by every single OEM. This real-world experience speaks volumes about the practical significance of this relief.

C. The Icon Flexibility Provisions Require—And Accomplish—Little

1. The icon flexibility provisions do not permit OEMs to swap out Microsoft Middleware Products and replace them with other products. Rather, the OEMs at most can hide the Microsoft icon, but need to be prepared to support the underlying Microsoft software when another software application invokes it. That means that these provisions do not address the added ''product testing and support costs'' that discourage OEMs from including more than one version of particular functionality. Microsoft III, 253 F.3d at 66.

This is a step backward from DOJ's settlement posture before liability was established. At that time, DOJ insisted that OEMs be allowed to alter or modify Windows, and that Microsoft provide OS development tools for that purpose. See Draft 18, §§ 4(1)(d), 4(g). The RPFJ provisions, by contrast, only permit OEMs to display icons, shortcuts, and menu entries for Non-Microsoft Middleware. The RPFJ does not require Microsoft to permit OEMs to remove any Microsoft Middleware Products, although even current Microsoft practice permits this. The RPFJ requires Microsoft only to allow the removal of ''icons, shortcuts, or menu entries.'' RPFJ § III(H)(1)[first].

2. Section III(H)(2)[first] seems to permit OEMs and end-users to choose default middleware for particular functions. Microsoft's obligations are far less than they appear.

The provision applies only where a Microsoft Middleware Product would launch into a top-level display window (rather than operating within another interface) and would either display ''a// of the user interface elements'' or the ''Trademark of the Microsoft Middleware Product.'' RPFJ § III(H)(2)(i)–(ii) (emphasis added). Thus, the provision does not apply if Microsoft designs the slightest variation on the interface elements that launch from within another application, so long as the trademark also is not displayed in the top-level window. These do not present serious programming challenges. Microsoft's ability to preclude OEM installation of desktop shortcuts that ''impair the functionality of the [Windows]

user interface'' (RPFJ § III(C)(2)) provides another, largely unreviewable set of opportunities to impede the use of innovative shortcuts to innovative software. Microsoft asserted similar reasons to defend some of the conduct condemned by the DC Circuit. See Microsoft III, 253 F.3d at 63–64. The DC Circuit rejected Microsoft's approach, but the RPFJ adopts it.

3. As explained above, the code beneath the surface is critically important to the success of middleware in undermining the applications barrier to entry in the OS market. The RPFJ contains exceptions that ensure that, however icons may be displayed on the surface, Microsoft Middleware will be firmly (and unchallengeably) established in the plumbing of each PC.

Sections III(H)(1)–(2)[second], undo what might be left of the obligations earlier in Section III(H). Section III(H)(1)[second] permits Microsoft to ensure that Microsoft Middleware Products are invoked whenever an end-user is prompted to use Microsoft Passport or the group of Microsoft web services now known as Hailstorm. Section III(H)(2)[second] ensures that Microsoft need only program in functions that invoke Active X or other similar Microsoft-proprietary implementations of common functions, in order to ensure that Microsoft Middleware Products constantly appear regardless of an end-user's stated preferences. And none of the provisions in Section III(H) would apply unless the corresponding Microsoft Middleware Products existed seven months before the last beta version of a new Windows release. As with other provisions, Microsoft would be constrained by these requirements only if it paid no attention to them when it decided when and how to release its products.

D. The 14-Day Sweep Provision Effectively Nullifies RPFJ § III(H)

Even if these provisions otherwise might mean something, the RPFJ ensures that they will be competitively meaningless by permitting Microsoft to nag users to give permission for Microsoft to override any array of non-Microsoft icons and menu entries 14 days after the initial boot-up of a PC. See RPFJ § III(H)(3). Thus, Microsoft only needs to prompt users with a dialog box inviting them to ''optimize the Windows user interface'' every time they boot up, or when they download the inevitable bug fixes and security patches among Windows updates, in order to undo any OEM's or end-user's customization of icons. Microsoft apparently provided DOJ with the name for this feature, which DOJ uses in the CIS: ''Clean Desktop Wizard.'' CIS 48, 66 Fed. Reg. 59,471. What user would not agree to have a cleaner desktop? No ISV is likely to pay an OEM a fee sufficient to cover the trouble of rearranging icons, and supporting additional software, for the privilege of having non-Microsoft software icons displayed advantageously for as little as two weeks.

The CIS suggests that the ability of Microsoft to sweep away icons of competing middleware and other products 14 days after a computer first boots up (RPFJ § III(H)(3)) applies only to ''unused icons'' (CIS 48, 66 Fed. Reg. 59,471), but the decree terms contain no such limitation. Once its ''Clean Desktop Wizard'' (id.) secures a click of user consent, Microsoft can hide any icons that offend it. Indeed, there is nothing in the RPFJ that would stop Microsoft from including similar ''wizards'' that would prompt users to reset middleware defaults, or even to remove Non-Microsoft Middleware,'' in order to ''optimize performance'' or to ''take full advantage of powerful new Windows features.''

E. By Placing The Burden To Restore Competition On OEMs, The PFJ Leads To No Remedy At All For Much Of The Misconduct At Issue

One of the most misguided elements of the RPFJ is its allocation to OEMs, ISVs and end-users of the primary responsibility for injecting competition into the OS market. The icon and default flexibility provisions of the RPFJ allocate to the OEMs almost all of the financial risk and responsibility for remediating Microsoft's antitrust violation, while the monopolist has no obligations except to allow others to make changes to hide (or add to) Microsoft's middleware. That approach ignores the fact that OEMs are motivated by their own fiduciary and economic considerations, not by the drive to remedy a monopolization offense. OEMs are risk-averse, as they operate in a low-margin, highly competitive environment in what has become a commodity-product market. In that environment OEMs are highly dependent on the good graces of Microsoft, not only for favorable pricing on Microsoft's monopoly software products [] Office as well as Windows [] but also for timely technical assistance, and access to technical information.

The Stiglitz/Furman Declaration confirms (at 32–34) that the economics of the OEM industry—a commodity industry captive to a bottleneck monopolist—discourage expenditures of this kind. It is bizarre and counterproductive to place the burden to restore competition on the innocent, low-margin OEMs rather than the monopolist. The ''hapless makers of PCs'' still ''aren't in any position to defy Microsoft,'' Walter Mossberg, For Microsoft, 2001 Was A Good Year, But At Consumers'' Expense, Wall. St. J., Dec. 27, 2001, at B1, any more than they were when the illegal conduct in this case first occurred. See, e.g., Findings, 84 F. Supp.2d at 62 (¶ 14) (Hewlett-Packard observation to Microsoft that ''[I]f we had a choice of another supplier, * * * I assure you [that you] would not be our supplier of choice''). But if OEMs choose not to exercise their new ''flexibility'' under the middleware provision %62 a choice that seems likely in view of the demonstrated lack of a response to Microsoft's offer of July 11, 2001 [5 the government is left with no antitrust remedy for much of its case.[12]

Nor can ISVs be expected to pay OEMs to take advantage of the limited flexibility provided by RPFJ §§ III(C) and III(H). The RPFJ gives ISVs very slight incentives to subsidize OEM alterations of Microsoft's preferred desktop display, since the ISVs who sell middleware that competes against a Microsoft offering cannot buy exclusivity on the desktop of any computer. Rather, at best an ISV can obtain parity in the availability to developers of its middleware's code. No matter what ISVs and OEMs do, Microsoft Middleware will be ubiquitous. And ISVs could buy only 14 days of advantageous icon display before a Microsoft ''Clean Desktop Wizard'' (CIS 48, 66 Fed. Reg. 59,471) would begin prompting users to undo the OEM's arrangement of icons and reinstate the arrangement favored by Microsoft. No ISV would pay more than a pittance for such a shallow and short-lived advantage on the desktop.

F. The RPFJ Permits Microsoft To Control Consumers'' Access To Innovation To Suit Its Monopolistic Aims

The RPFJ allows Microsoft to exercise full control over the pace of innovation in middleware because Microsoft can ensure that consumers are denied access—or have only severely impeded access—to competitively threatening middleware products to which Microsoft has no analogue. Section III(C)(3) allows Microsoft to prohibit OEMs from configuring PCs to launch non-Microsoft middleware from any point unless Microsoft already has a competing product that launches from that point. Microsoft can prohibit OEMs from configuring non-Microsoft middleware from launching automatically at the end of the boot sequence or upon the opening or closing of an Internet connection unless a Microsoft Middleware Product with similar functionality would launch automatically. RPFJ §III(C)(3).

Even after this catch-up provision serves its delaying purpose, Microsoft can control how competing middleware products reach and serve consumers, so that products launch only in the way that best suits Microsoft. This provision appears designed to protect Microsoft from competition, and to give the monopolist a clear imprimatur to control the pace of innovation. See Stiglitz/Furman Dec. 28.

V. THE API AND COMMUNICATIONS PROTOCOL DISCLOSURE PROVISIONS ARE INEFFECTIVE

A. The API Provisions Require Little, If Anything, Beyond Current Disclosure Practices In Microsoft's Self-Interest

The API and Communications Protocol disclosure provisions (§§ III(D)–(E)) contain little in the way of hard, fast, enforceable obligations, and do not appear to add anything significant to Microsoft's current disclosure practices. As the CIS recognizes: Through its MSDN [Microsoft Developer's Network] service, Microsoft presently makes widely available on the Internet an extensive and detailed catalog of technical information that includes, among other things, information about most Windows APIs for use by developers to create various Windows applications. MSDN access is presently broadly available to developers and other interested third parties.

CIS 34, 66 Fed. Reg. 59,468.

Microsoft already discloses literally thousands of APIs to software developers

[12] Similarly, the RPFJ places no limits on Microsoft's conduct toward one of its largest current groups of licensees—direct corporate licensors of bulk Windows licenses. The corporate market has always been Microsoft's point of leverage, and those buyers now often buy direct. Microsoft has made clear its intention to make Windows and other software a renewable ''service.'' Microsoft can undo all of the provisions applying to OEMs upon the first license renewal with an end-user.

through MSDN for the good reason that it is in Microsoft's self-interest to promote the Microsoft Windows platform to software developers. The extent of information disclosure required by the RPFJ must be understood in the context of Microsoft's current information disclosure practices. A ''requirement'' that Microsoft disclose APIs for the most part simply ''requires'' that Microsoft do what it does voluntarily.

Microsoft has a business incentive not only to disseminate Windows APIs but to assist ISVs in understanding and implementing Windows APIs in their products. Microsoft and other platform software vendors compete to attract developers by disclosing technical information, creating easy-to-use development tools, and ''evangelizing'' their development platforms. Attracting developers helps Microsoft perpetuate the substantial network effects that produce the applications barrier to entry protecting the Windows monopoly. Because the strength of the Windows monopoly and the power of the applications barrier to entry are directly related to the number of developers writing applications for Windows, it is in Microsoft's interest to provide a robust information disclosure program.

By widely disclosing APIs, Microsoft ensures that applications will continue to be written for its platform software rather than for rival platforms. Properly understood, Section III(D) does not actually require Microsoft to provide any new disclosure of APIs and technical information to promote interoperability; Microsoft already engages in these disclosures. Rather, the incremental effect of the API disclosure provisions of the RPFJ is at most to prevent Microsoft from selectively withholding certain APIs from certain vendors. As explained below, however, the disclosure ''requirements'' in the RPFJ are too insubstantial and too easily manipulated to accomplish even that limited goal.

B. The RPFJ Does Not Require Disclosure of Windows APIs, But Rather Lets Microsoft Determine The Scope of Disclosure Through The Design and Labeling of Its Operating System And Middleware

To begin with, the API disclosure requirements aim at the wrong thing. The RPFJ defines APIs as the interfaces used by Microsoft Middleware to invoke resources from a Windows Operating System Product. RPFJ § VI(A). But innovative rival software vendors do not need APIs between Microsoft Middleware and Windows. The really threatening innovators are threatening precisely because their products perform functions that Microsoft's do not. In those cases, by definition, there will not be any fully analogous Microsoft middleware—just as Microsoft did not have an Internet browser when Netscape Navigator first appeared. Those developers need full access to Windows APIs—APIs for all functionalities enabled by the Windows platform, whether Microsoft calls them ''internal'' calls within Windows or external APIs that may be distributed to ISVs—not to the limited subset used by a Microsoft version of similar middleware.

That is what Netscape needed in 1995; there was no Internet Explorer to speak of at that time, and certainly Microsoft's rudimentary browser did not perform anywhere near the range of functions performed by Netscape Navigator. See Findings, 84 F. Supp.2d at 31–32 (§ 82–84), 33–34 (§ 91–92). The RPFJ provisions would not have helped Netscape then. See Letter from James L. Barksdale, former CEO of Netscape, to Chmn. Leahy & Sen. Hatch, Senate Comm. on the Judiciary, Attachment, Question 1 (Dec. 11, 2001). 13 And they will not help any software developer whose products exceed the functionality of existing Microsoft middleware. The API disclosure provisions in the RPFJ thus ensure that Microsoft can control the pace of middleware innovation, providing another level of assurance that non-Microsoft products will not gain the type of head start that might result in ubiquity before a similar Microsoft product can be included

Mr. Barksdale's letter in lieu of hearing testimony is available at http://java.sun.com/features/2002.01.barksdale-letter.html, and the attachment is available at http://java.sun.com/features/2002.01.barksdale-attach.htm in the bundle of products sold with every Windows operating system.

That limitation on API disclosure is severe enough. But it is just a beginning. The disclosure obligation is further limited by the definition of APIs at RPFJ § VI(A): ''Application Programming Interfaces (APIs)'' means the interfaces, including any associated callback interfaces, that Microsoft Middleware running on a Windows Operating System Product uses to call upon that Windows Operating System Product in order to obtain any services from that Windows Operating System Product.

Setting aside the circularity, the malleability of the two principal defined terms renders this definition (and the corresponding obligations) a practical nullity. The API definition depends on the relationship between two ''products,'' each of which is defined solely by Microsoft. As noted above, Microsoft has ''sole discretion'' to identify software code as part of a ''Windows Operating System Product.'' RPFJ § VI(U). Many APIs can disappear from view simply as a result of Microsoft's unreviewable decision to relabel certain interfaces as internal to Windows. If Microsoft says that an operation takes place entirely within Windows, rather than requiring the interaction of a middleware and Windows, then there is no API to disclose.[14]

C. The Definition of ''Microsoft Middleware'' Gives Microsoft Further Leeway to Limit Its Disclosure Obligation

The only APIs that need be disclosed are those used by ''Microsoft Middleware.'' But ''Microsoft Middleware,'' too, is defined in a way that gives Microsoft fight control over the scope of its own obligations. Remarkably, Assistant Attorney General James testified that this definition would have been difficult for DOJ to achieve in a litigated proceeding. Statement of Charles James to Senate Judiciary Committee 8 (Dec. 12, 2001). But it is difficult to imagine what Microsoft would have contested. Just as in the dispute whether Internet Explorer is part of Windows, Microsoft can simply relabel software as part of one product rather than another. The label does not affect the commands and operations in the software.

1. The RPFJ Requires Microsoft To Disclose Only The APIs Used By The ''User Interface'' Or Shell Of Microsoft Middleware

The APIs that must be disclosed are those that ''Microsoft Middleware * * * uses to call upon [a] Windows Operating System Product.'' RPFJ § VI(A); see id. § III(D). But Microsoft determines how much code performing a Microsoft Middleware function is part of the Middleware, and how much is part of the Windows Operating System Product, since the latter definition is within Microsoft's ''sole discretion.'' Id. § VI(U). The only code in Microsoft Middleware that Microsoft must consider separate for the purposes of API disclosure is the user interface, or shell, of the Middleware—or, rather, ''most'' of the shell. Id. § VI(J)(4). The only limit is that ''Microsoft Middleware'' must ''[i]nclude at least the software code that controls most or all of the user interface elements of that Microsoft Middleware.'' Id. Thus, the terms of the RPFJ permit Microsoft to provide only the APIs that go between 51% of the user interface elements of Microsoft Middleware and the rest of the Windows bundle of products. None of the APIs used by the Middleware's functionality—the APIs that permit the Middleware perform its functions while running on Windows—need be disclosed, so long as the shell APIs are disclosed. This definition appears to be designed to have nothing to do with developer preferences, or with the applications barrier to entry.

2. The RPFJ Requires Microsoft To Disclose APIs Only For ''Microsoft Middleware'' That Is Distributed Separately From Windows, Yet Is Distributed To Update Windows

To come within the disclosure obligation, Microsoft Middleware must be ''distributed separately from a Windows Operating System Product.'' That restriction alone is enough to take Windows Media Player 8 outside the definition, as that product is available only as part of the Windows XP bundle. But not all separate distributions prompt the API obligations; Microsoft must characterize the distribution as one that ''update[s] th[e] Windows Operating System Product.'' See RPFJ § VI(J)(1). Thus, the scope of the obligation depends entirely on the labeling of the product, which Microsoft can easily manipulate.

3. The Limitation Of Microsoft Middleware To ''Trademarked'' Products Further Eviscerates The API Disclosure Provision

But that is not all. At least equally significant is the restriction of the Microsoft Middleware definition, and thus the API disclosure obligation, to Middleware that is ''Trademarked.'' RPFJ § VI(J)(2). The definition of ''Trademarked'' allows Microsoft to exclude current middleware from the API disclosure obligation, and to prevent future middleware from becoming subject to the API disclosure obligation,

[14] Moreover, the term ''interfaces'' is not defined in the RPFJ. The CIS explains that '''[i]nterfaces'' includes, broadly, any interface, protocol or other method of information exchange between Microsoft Middleware and a Windows Operating System Product.'' CIS 33–34, 66 Fed. Reg. 59,468. But that definition would not be part of the judgment.

simply by manipulating its use of trademarks.

a. Microsoft Easily Can Ensure That Middleware Is Not ''Trademarked'' By Using A Generic Or Descriptive Name Combined With Microsoft(r) or Windows(r)

The definition of ''Trademarked'' does not include ''[a]ny product distributed under * * * a name compris[ing] the Microsoft(r) or Windows(r) trademarks together with descriptive or generic terms.'' Id. § VI(T). That is how Microsoft has chosen to name some of its newest and most important products: the combination of a monopoly brand with a simple descriptive mark that helps identify an entire software function with the Microsoft implementation of it. Windows(r) Messenger instant messaging software is one example.

Moreover, by the terms of the RPFJ Microsoft disclaims any rights in the use of such combinations of the Microsoft(r) or Windows(r) marks with generic or descriptive terms, and abandons any rights that may be acquired in the future. RPFJ § VI(T). These provisions suggest that Microsoft can change the scope of the definition of Middleware, and thus of the API disclosure obligation, by abandoning some marks it has registered as combinations of Microsoft(r) or Windows(r) with generic or descriptive terms—if the RPFJ does not accomplish that in itself. Windows Media Player is an example. Although Microsoft has registered the combination of Windows(r) and the generic term ''Media'' as Windows Media(r), at bottom the name Windows Media Player is a combination of the Windows(r) mark with the generic term ''media player.''

Indeed, Microsoft could plausibly argue that the Windows Media(r) mark does not come within the ''Trademarked'' definition as it is, since even that mark consists of no more than the Windows(r) mark in combination with the generic term ''media.'' 15 RPFJ § VI(T) may therefore embody Microsoft's ''disclaim[er of] any trademark rights in such descriptive or generic terms apart from the Microsoft(r) or Windows(r) trademarks.'' But even if Section VI(T) does not go so far, Microsoft could easily get Windows Media(r) Player outside of the ''Trademarked'' definition—and thus outside the scope of the In this discussion we set aside the non-trivial question whether ''Windows'' itself is a generic, or at best descriptive, mark for the type of ''windowing'' graphical user interfaces invented at the Xerox Palo Alto Research Center in the 1970s, popularized by the Apple Lisa and Macintosh in the 1980s, and since used by Microsoft and many other software vendors. disclosure obligations that apply only to ''Microsoft Middleware''—simply by abandoning the registration mark and moving the registration symbol to the left. Thus, Microsoft can transform ''Windows Media(r) Player,'' which might be subject to API disclosure requirements, into ''Windows(r) Media Player,'' which clearly is exempt.

b. The ''Microsoft Middleware'' Definition Governing Disclosure Obligations Is Far Narrower Than The ''Microsoft Middleware Product'' Definition Governing OEM Flexibility

That this highly restrictive definition is no accident is clear from comparison with the ''Microsoft Middleware Product'' definition which governs the icon-display obligations. To provisions paralleling the ''Microsoft Middleware'' definition, the ''Microsoft Middleware Product'' definition adds several named current products, including ''Internet Explorer, Microsoft's Java Virtual Machine, Windows Media Player, Windows Messenger, Outlook Express and their successors,'' RPFJ § VI(K)(1), although only to the extent that Microsoft ''in its sole discretion'' (id. § VI(U)) decides that those products are ''in a Windows Operating System Product.'' Id. § VI(K)(1). Thus, Microsoft's icon display/removal obligations for those named products would not change merely because of a strategic product renaming or abandonment of a trademark that combines the Microsoft(r) or Windows(r) name with generic or descriptive terms. But none of those current products is named in the ''Microsoft Middleware'' definition that governs the disclosure obligations. That enables Microsoft to manipulate whether those products, although surely middleware, also satisfy the four subparts of RPFJ § VI(J).

c. The CIS Broadens The ''Trademarked'' Definition Beyond Its Terms

The CIS overstates the breadth of the ''Trademarked'' definition, contending that it ''covers products distributed * * * under distinctive names or logos other than by the Microsoft(r) or Windows(r) names by themselves.'' CIS 22, 66 Fed. Reg. 59,465. The CIS further claims that the exception for products known by combinations of generic terms with Microsoft(r) or Windows(r) does not cover marks that ''are presented as a part of a distinctive logo or another stylized presentation because the mark itself would not be either generic or descriptive.'' CIS 23, 66 Fed. Reg. 59,465 (emphasis added). To the contrary, the terms of the RPFJ definition of ''Trademarked'' focus entirely on ''names,'' not ''logos'' or ''marks'' as a whole. RPFJ § VI(T). The distinction is striking: the word ''name'' appears five times in the definition, and ''descriptive or generic terms'' appears three times. Neither ''logo'' nor ''mark'' appears at all.

Microsoft clearly appreciates the distinction. Although Microsoft apparently has not yet formally abandoned the mark ''Internet Explorer'' (U.S. Trademark Reg. No. 2277122), it does not assert that mark when it lists its trademarks as a warning to the public. See http://www.microsoft.com/misc/info/cpyright.htm. Microsoft does list its trademark for the Microsoft Internet Explorer logo, however. Id.; see U.S. Trademark Reg. No. 2470273.

d. Microsoft Can Easily Manipulate Which Middleware Releases Are ''New Major Versions''

Indeed, even a ''Microsoft Middleware Product'' satisfying that four-part test may not be ''Microsoft Middleware'' subject to the disclosure obligation unless it is a ''new major version'' of the product, that is, if the release is ''identified by a whole number or by a number with just a single digit to the right of the decimal point.'' RPFJ § VI(J). That has two implications. First, Microsoft can simply adopt a different method of naming new releases. Second, even under current practice a version with two digits to the right of the decimal point may fix significant errors, so that disclosure only of the prior version of the APIs might leave developers without the ability to invoke some needed functionality with the disclosed APIs.

D. The Disclosure Provisions—Particularly Those Concerning ''Communications Protocols''—Depend On An Undefined And Thus Unenforceable Concept of ''Interoperability''

Both the API and Communications Protocol disclosure provisions define the scope of the data to be disclosed as that necessary to permit non-Microsoft products to ''interoperate'' with the Windows client OS and to ''interoperate natively'' with Microsoft server operating system products. See RPFJ § III(D), (E). The disclosure obligations are limited to ''the sole purpose of interoperating with a Windows Operating System Product.'' Id.

The obligations depend on the meaning of ''interoperate,'' but the RPFJ never defines that term, and there is no non-discrimination provision attached to this obligation. That is critical because interoperability is not something that can be achieved half way. Either two software products interoperate for all functions that they must perform together, or they do not. Any impediment in any aspect of the interoperation nullifies the interoperability. The CIS seems to equate ''interoperate'' with ''fully take advantage of,'' see CIS 36, 66 Fed. Reg. 59,468, but there is no such language in the RPFJ itself.

The Communications Protocol disclosure provision (RPFJ § III(E))outlines a seeming ''obligation'' that is entirely undefined. Section III(E) seems to require disclosure of Communications Protocols on Windows clients that are ''used to interoperate natively * * * with a Microsoft server operating system product.'' But just as ''interoperate'' is not defined, neither does the RPFJ define ''Microsoft server operating system product.''

One of the most important aspects of the Windows 2000 Server product bundle is Microsoft's web server, IIS. In the absence of a definition of ''Microsoft server operating system product,'' however, it is unclear whether the disclosure obligation encompasses protocols used to interoperate with this and other aspects of the current server product. Cf. RPFJ § VI(U) (defining ''Windows Operating System Product'' as all software code ''distributed commercially * * * as Windows 2000 Professional'' and other named products, and ''Personal Computer versions'' of their successors).

Again, the CIS attempts to provide assurances that go beyond the terms of the proposed judgment. The CIS states (at 37, 66 Fed. Reg. 59469):

The term ''server operating system product'' includes, but is not limited to, the entire Windows 2000 Server product families and any successors. All software code that is identified as being incorporated within a Microsoft server operating system and/or is distributed with the server operating system (whether or not its installation is optional or is subject to supplemental license agreements) is encompassed by the term. For example, a number of server software

products and functionality, including Internet Information Services (a ''web server'') and Active Directory (a ''directory server''), are included in the commercial distribution of most versions of Windows 2000 Server and fall within the ambit of ''server operating system product.''

That definition would be appropriate. But no corresponding language—no enforceable definition—appears in the RPFJ.

E. The Narrow Scope Of The Disclosure Provisions Contrasts Sharply With The Broader Definitions In DOJ's Earlier Remedy Proposals

Before liability had been confirmed on appeal, DOJ took a far broader view of what should be disclosed. The interim remedies in the vacated judgment required disclosure of APIs, Communications Interfaces, and ''technical information'' needed to enable competing products ''to interoperate effectively with Microsoft Platform Software.'' 97 F. Supp.2d at 67 (3(b)). That disclosure requirement was backed up by a requirement, absent from the RPFJ, that Microsoft create a secure facility so that developers could work with Windows source code to ensure that their applications worked properly on the Microsoft platform, gee id.

The definition of ''technical information,'' moreover, helped ensure that disclosure would be complete and not subject to many different methods of manipulative narrowing. The ''technical information'' definition encompassed the following items: all information regarding the identification and means of using APIs and Communications Interfaces that competent software developers require to make their products running on any computer interoperate effectively with Microsoft Platform Software running on a Personal Computer. Technical information includes but is not limited to reference implementations, communications protocols, file formats, data formats, syntaxes and grammars, data structure definitions and layouts, error codes, memory allocation and deallocation conventions, threading and synchronization conventions, functional specifications and descriptions, algorithms for data translation or reformatting (including compression/decompression algorithms and encryption/decryption algorithms), registry settings, and field contents.

97 F. Supp.2d at 73 (7(dd)).

Indeed, DOJ's position was stronger even before liability had been imposed at all.

Draft 18 from the Posner mediation imposed a disclosure obligation using this definition Of ''technical information'':

all information, regarding the identification and means of using APIs (or communications interfaces), that competent software developers require to make their products running on a personal computer, server, or other device interoperate satisfactorily with Windows platform software running on a personal computer. Technical information includes reference implementa- tions, communications protocols, file formats, data formats, data structure definitions and layouts, error codes, memory allocation and deallocation conversions, threading and synchronization conventions, algorithms for data translation or reformatting (including compression/decompression algorithms and encryption/decryption algorithms), registry settings, and field contents. The RPFJ, by contrast, contains no analogue to these precise and inclusive definitions. Instead, the RPFJ relies solely on the circular (and completely manipulable) definition of API (RPFJ § VI(A)), a similarly narrow definition of ''Communications Protocol'' (id. § VI(B)), and a definition of ''Documentation'' that is wholly dependent on the API definition (id. § VI(E)).

F. The ''Security'' Exceptions in Section III(J) Permit Microsoft To Avoid Its Disclosure Obligations

RPFJ § III(J) provides Microsoft with two additional lines of defense in the event that any competitively sensitive APIs nonetheless fall within the malleable definition of API. Section III(J)(1) severely undercuts the disclosure requirements to the extent they apply in the modem world where security protocols are critical to any communication between networked computers, particularly over the Internet. And Section III(J)(2) provides Microsoft with seemingly unfettered discretion to decide who is worthy to receive technical information necessary to make middleware function on the Internet.

Microsoft can plausibly rely on Section III(J) to decline to comply with disclosure requests based on concerns with authentication and security that it will be able to assert with respect to any program that involves communication between a PC and a server on the Internet (or even within many private networks). Authentication, security, and similar protection mechanisms are and will continue to be integral parts of the functioning of those products. See, e.g., Comment, William A. Hodkowski, The Future of Internet Security: How New Technologies Will Shape the Internet and Affect the Law, 13 SANTA CLARA COMPUTER & HIGH TECH. L.J. 217 (1997). Indeed, security and rights-protection are particularly critical to Internet-based economic activity, which encompasses much of the computing on the Internet. As a consequence, the security mechanisms are critically important to any Internet-based middleware threat to the Windows OS monopoly.

For example, digital rights management (''DRM'') has become a principal part of Windows Media Player. Allowing Microsoft to withhold data needed to permit rivals to interoperate with the DRM specifications in Windows Media Player—specifications that Microsoft is making universal by including Windows Media Player on every PC— may well end effective competition for media players within the next upgrade cycle for Windows. Similarly, any distant remaining possibility of Internet browser (or even e-mail client) competition should be squelched by the RPFJ's approval for Microsoft to withhold parts of encryption-related protocols (again, as distinct from the customer-specific keys that make use of those protocols). For another example, Secure Socket Layer (SSL) is an open standard that has been critical to the open development of a relatively secure Internet. As Microsoft implements a proprietary version of SSL—one that others will have to follow given the ubiquity of the Microsoft browser as a result of the misconduct at issue in this case—it will be able to conceal critical layers of that altered protocol from rivals, essentially ending the possibility of competition for client software for Internet computing. And by giving Microsoft a basis to conceal authentication protocols (not merely data), the RPFJ frees Microsoft Passport from scrutiny and permits Microsoft to bind a proprietary universal password and identity utility to its monopoly operating system without hope of interoperation.

By permitting Microsoft to withhold key parts of encryption, digital rights management, authentication, and other security protocols, the RPFJ effectively allocates Web-based computing to the monopolist of the desktop. A decree could hardly try to place a clearer stamp of approval on an expansion of the scope of an illegally maintained monopoly.

1. The Exclusions for Security-Related APIs and Protocols in RPFJ(J)(1) Permit Microsoft To Hobble Disclosures That Are Critical in Internet Computing

It is no coincidence that Bill Gates has now emphasized the centrality of security concerns in Microsoft's future software offerings. See, e.g., John Markoff, Stung by Security Flaws, Microsoft Makes Software Safety a Top Goal, N.Y. TIMES, Jan. 17, 2002, at C1. That is no more than an acknowledgment of market and technical realities that have been widely known throughout the industry for years as Internet computing has taken hold. That market reality should have been sufficient to make clear that an indistinct exception of the type in RPFJ § III(J)(1) would allow Microsoft to disclose ''crippled'' versions of APIs and Communications Protocols. Microsoft's sudden dedication to security leaves no doubt that it will inject security aspects into its proprietary APIs and its proprietary, extended implementations of Communication Protocols. Under the terms of Section III(J)(1), Microsoft can easily argue that disclosure of those aspects—necessary for one machine to communicate with another—will compromise the security from any installation or group of installations. See also Stiglitz/Furman Dec. 30.

The CIS maintains that Section III(J)(1) simply protects Microsoft and its customers from disclosure of customer-specific ''keys, authorization tokens, or enforcement criteria,'' and states that the exception ''does not permit [Microsoft] to withhold any capabilities that are inherent in the Kerberos and Secure Audio Path features as they are implemented in a Windows Operating System Product.'' CIS 52, 66 Fed. Reg. 59,472. But that reading does not square with the text of the exemption. The quoted examples are specifically presented ''without limitation.'' RPFJ § III(J)(1). The RPFJ language easily permits Microsoft to contend that any release of the way its proprietary security protocols work ''would compromise the security of a particular installation.''

Most important, Section III(J)(1) clearly permits Microsoft to withhold portions of APIs or Communications Protocols, but the examples given of keys and authorization codes are not parts of APIs or Communications Protocols. They may be part

of customer- specific Documentation, rather than the Documentation used by customers, consultants, and developers to create or identify and implement particular keys, tokens, or enforcement criteria.) The APIs and Communications Protocols for security-related applications are not customer-specific, nor does their disclosure compromise security. To the contrary, the most powerful encryption and other security-related software is openly disclosed, as is the Kerberos standard, or even open source, as is the federal government's new encryption standard. See, e.g., Watch your AES: A new encryption standard is emerging, Red Herring (Dec. 1, 1999) (open source government standard).

Unless RPFJ § III(J)(1) refers to a null set, however, Microsoft will have a basis to withhold some parts of Communications Protocols and APIs. The CIS states that Communications Protocols ''must be made available for third parties to license at all layers of the communications stack,'' (CIS 36–37, 66 Fed. Reg. 59,468 (emphasis added)) but the RPFJ to which Microsoft agreed—and which alone is potentially enforceable— says no such thing. To the contrary, Section III(J)(1) explicitly relieves Microsoft from the obligation to license some ''portions or layers of Communications Protocols'' (and some ''[p]ortions of APIs'')—not just client-specific data. If part of a Communications Protocol is withheld, not ''all layers of the communications stack'' are ''available * * * to license.'' And if part of a Communications Protocol is unavailable, interoperation is impossible; at certain points, the interaction between two computers will break down.

Limited withholding of APIs or Communications Protocols (rather than merely withholding customer-specific data) will render middleware non-functional, since software cannot interoperate with other software partially. Carving off some aspects of interoperability means that there is no interoperability, thwarting the premise of the disclosure provisions altogether.

The CIS also describes other limits that do not exist in the text of the RPFJ. The CIS claims that the RPFJ requires disclosure of the Communications Protocols used for the Microsoft-proprietary implementation of the Kerberos security standard a ''polluted'' Kerberos that is the strict analogue to the ''pollute[d]'' Java that figured prominently at trial. See Microsoft III, 253 F.3d at 76–77 (quoting 22 J.A. 14,514). But Section III(J) explicitly relieves Microsoft of the obligation to disclose ''portions'' of APIs or Communications Protocols that would ''compromise the security of a particular installation or group of installations of security software. That is an open invitation to withhold some part of the Microsoft-proprietary variation of Kerberos.

The type of customer-specific information that the CIS claims is all that can be withheld could and should be described much more accurately and specifically in the RPFJ, not as [p]ortions of APIs or * * * portions or layers of Communications Protocols,'' but rather as ''customer-specific or installation-specific data the disclosure of which would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems, including without limitation keys, authorization tokens or enforcement criteria.'' But that is not the approach the RPFJ takes. Rather, the RPFJ makes clear that Microsoft is entitled to withhold, not merely customer- or installation-specific data, but some ''portions'' of APIs and some ''portions or layers'' of Communications Protocols. All communication of substance between desktops (or other client computers) and server computers over the Internet increasingly involves layers of security protocols, anti-virus routines, and the like. And one of Microsoft's principal current efforts is to foist its own version of digital rights management (DRM) upon providers of copyrighted content over the Internet.

When Microsoft asserts a right to withhold information, it will be difficult indeed for the Technical Committee, DO J, or the Court to exclude the possibility that particular ''portions or layers of Communications Protocols,'' or ''[p]ortions'' of the APIs that permit middleware programs to operate atop Microsoft operating systems, in fact ''compromise the security of a particular installation or group of installations.'' RPFJ § III(J)(1). Any such determination is likely to be time-consuming, and related enforcement therefore would be slow. It should be a simple matter for Microsoft to delay disclosures of this type long enough to disadvantage competitors.

2. RPFJ III(J)(2) Permits Microsoft To Refuse Effective Disclosure To A Range Of Potentially Effective Competitors

While RPFJ § III(J)(1) allows Microsoft to refuse to disclose portions of APIs, RPFJ § III(J)(2) permits Microsoft to withhold all of any ''API, Documentation, or Communications Protocol'' having to do with ''anti-piracy systems, anti-virus technologies, license enforcement mechanisms, authentication/authorization security, or third party intellectual property protection mechanisms of any Microsoft product.'' The RPFJ allows Microsoft to select to whom it will disclose this information by imposing several tests that may be based on standards apparently committed to Microsoft's sole discretion as much as is the definition of Windows Operating System Product.

Thug, RPFJ § III(J)(2)(b) permits Microsoft to evaluate whether a competitor has a ''reasonable business need'' for the desired information. What Microsoft is likely to consider a ''reasonable'' business need by a competitor may be narrow indeed. As the DC Circuit observed, Microsoft viewed its desire ''to preserve its'' monopoly ''power in the operating system market'' as a procompetitive justification for exclusionary conduct. Microsoft III, 253 F.3d at 71. No doubt Microsoft will view direct or indirect efforts to undermine its hammerlock on the OS market as unreasonable efforts to confuse consumers or impair the ''Windows experience.''

Even bona fide attempts by a monopolist to objectively evaluate a potential competitor's ''reasonable business need'' can scarcely be expected to produce consistent or foreseeable results. Rather, that amorphous standard is likely to produce a flood of disputes—each of which will delay the competitor's receipt of technical information while Microsoft gains more time to respond (by legal or illegal means) to the competitive threat. Moreover, the ''reasonable business need'' must be for a ''planned or shipping product.'' If the product is already ''shipping,'' it may be too late for disclosure to be helpful in the market. How fully ''planned'' a product must be raises further questions that Microsoft will be able to resolve to its own disadvantage.

In addition, Microsoft need not provide security-related APIs, protocols, or documentation to any vendor that does not ''meet[] reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business.'' RPFJ § III(J)(2)(c) (emphasis added). That provides Microsoft with a basis for excluding almost all nascent competitors except for those associated with established, profitable companies. It would not be difficult to craft ''reasonable, objective standards'' for ''viability of [a] business'' that would exclude any Internet-focused startup, including Netscape in 1995. Indeed, the history of the software industry both before and after the dot-com bubble shows that very few software companies have had ''viable'' businesses. Certainly Section III(J)(2)(c) would give Microsoft at least a debatable basis for withholding the APIs and Communications Protocols needed to interoperate with Microsoft software over the Internet from all open source ISVs—who are more interested in constantly improving the quality of software than in obtaining licensing profits. Although open source software is widely recognized as a major threat to Microsoft's monopoly power, the business models even of the leading Linux providers might fail any number of ''reasonable, objective standards'' for ''viability.'' Indeed, Microsoft's CEO Steve Ballmer describes open source software as a ''cancer'' that threatens the viability of any software business. See Mark Boslet, Open Source.'' Microsoft Takes Heat, INDUSTRY STANDARD, July 30, 2001; Dave Newbart, Microsoft CEO Takes Launch Break with the Sun-Times, CHI. SUN-TIMES, June 1, 2001, at 57. For that matter, it is not entirely unreasonable to regard head-to-head competition with Microsoft in platform software as a less than viable business plan; certainly most venture capitalist and other investors hold that view. It would not be difficult for Microsoft to craft ''objective'' standards of business viability that would exclude Corel and Novell, to name two examples. Microsoft should be able to exclude many sources of potential cross-platform middleware threats through RPFJ § III(J)(2)(c) alone.

Yet RPFJ § III(J)(2) contains yet another method for screening competitors from access to technical information needed by Internet-centric middleware applications. Any ISV that clears the hurdles and receives the information nonetheless must submit its implementation of the APIs, Documentation or Communications Protocols for review by a Microsoft-approved third party (likely a captive commercial ally) ''to test for and ensure verification and compliance with

Microsoft specifications for use of the API or interface, which specifications shall be related to proper operation and integrity of the systems and mechanisms identified in this paragraph.'' RPFJ § III(J)(2)(d). ''[P]roper'' no doubt will mean ''the way Microsoft does it,'' making this provision into yet another way in which Microsoft can control the pace of innovation to ensure that the market has no or limited access to products that improve upon Microsoft's offerings. This mechanism means that vendors who tried to adapt APIs to function as bridges to other platforms would have to give Microsoft the ammunition to defeat that function—if not simply disapprove it and await the slow operation, if any, of the RPFJ enforcement mechanism.

The CIS suggests that there are strict limits on Microsoft's discretionary ability to deny access to security-related aspects of Communications Protocols and APIs, CIS 53, 66 Fed. Reg. 59,473, but those limits are absent from the decree language. The CIS contends that these exceptions ''are limited to the narrowest scope of what is necessary and reasonable, and are focused on screening out individuals or firms that * * * have a history of engaging in unlawful conduct related to computer software * * *, do not have any legitimate basis for needing the information, or are using the information in a way that threatens the proper operation and integrity of the systems and mechanisms to which they relate.'' Id. Setting aside the opportunity for Microsoft to argue, as it has in other contexts, that the injection of competing software ''threatens the proper operation and integrity'' of its products, see Microsoft III, 253 F.3d at 63–64, the CIS simply does not address the broadest basis for withholding APIs and Communications Protocols under Section 111(1)(2): Microsoft's ability to decide, based on criteria within its own discretion, that an ISV is not ''authentic[]'' and ''viab[le].'' RPFJ § III(J)(2). That provision could provide a basis for excluding all but a handful of other software companies.

G. RPFJ § III(I) Would Place A Judicial Imprimatur On Microsoft's Use Of Technical Information As A Lever To Extract Competitors'' Intellectual Property

The RPFJ would actually increase Microsoft's bargaining power by explicitly placing a judicial imprimatur on demands by Microsoft that recipients of APIs cross-license any intellectual property developed using the APIs. Section III(I) of the RPFJ permits Microsoft to use intellectual property licensing terms to impede whatever competitive benefits otherwise might have arisen from its disclosure obligations. Microsoft's licenses ''need be no broader than is necessary to ensure'' the licensee's ability to ''exercise the options or alternatives expressly provided'' by the RPFJ. RPFJ III(I)(2). A welter of litigation over the breadth that is ''necessary''—and the collateral restrictions that are permissible—is certain to continue through the life of the decree.

Similarly, Microsoft should have no difficulty delaying the use of any option for which it is entitled to charge a royalty, simply by setting a ''reasonable'' royalty (RPFJ § III(I)(1)) beyond what any OEM could afford to pay in that competitive, low-margin business. If OEMs have to pay Microsoft to exercise any of their icon-shuffling options — a state of affairs clearly envisioned in RPFJ § III(I)—the slim likelihood that any OEM will take advantage of those provisions will be lessened still further. Microsoft need not permit transfers or sublicenses of API rights, imposing yet another barrier to entry. Id. § III(I)(3). And Microsoft could ensure, through licenses, that end-users could not make competitively significant alterations to the Microsoft-approved package.

Most important, however, the RPFJ specifically permits Microsoft to use its monopoly as a means to force access to others'' intellectual property. Microsoft can assert a right to license ''any intellectual property rights'' a competitor ''may have relating to the exercise of their options or alternatives provided by'' the RPFJ. RPFJ § III(J)(5). Thus, to take advantage of a competitive option, an ISV will need to license its product to Microsoft, and hope that Microsoft does not use that license as a means to produce a copycat program and bundle it into Windows. Many companies long since departed the software industry after entering into what they thought were limited exchanges of intellectual property with Microsoft. 16

Although the CIS states that Microsoft could demand only any IP rights it would need to comply with its own disclosure obligations under the RPFJ, CIS 50–51, 66 Fed. Reg. 59,472, the broad ''relating to'' language does not compel that narrow reading, and may not support it at all. The vague limitations in Section III(I)(5) are unlikely to reassure ISVs that Microsoft will not use its license to analyze the ISV's IP rights well enough to design around it and bundle a copycat program into Windows or Office, as has happened many times before. This weapon should give Microsoft additional ability to prevent industry participants from taking advantage of the superficially appealing provisions of the RPFJ.

VI. BUILT-IN DELAYS EXACERBATE THE DECREE'S UNJUSTIFIABLY BRIEF DURATION

It is remarkable that the RPFJ would reward Microsoft for litigating and losing broadly on liability with a consent decree that is shorter than other such decrees, and may 16 See, e.g., Testimony of Mitchell Kertzman before the Sen. Jud. Comm., July 23, 1998 (detailing Sybase's difficulties in this regard); Statement of Michael Jeffress before the Sen. Jud. Comm., July 23, 1998 (after TVHost revealed its intellectual property to Microsoft in failed negotiations to sell the company, Microsoft imitated the product). be the shortest ever. DOJ antitrust consent decrees now routinely last ten years. 17 Section V of the RPFJ provides for a term of only five years, however, less time even than Microsoft has engaged in the illegal conduct that was the subject of this litigation. The decree plainly should be longer than the period between the initiation of the misconduct and the imposition of relief, and at least as long as the typical relief. 18 Microsoft has enjoyed the benefits of its misconduct for at least seven years. The RPFJ not only would allow Microsoft to retain those benefits, but would subject Microsoft to its light and uncertain obligations for no more than five years, and scarcely four and one-half years for the many obligations that are delayed.

The RPFJ further abbreviates its already brief duration, and undermines its already insubstantial requirements, by building in long delays before Microsoft must comply with its limited duties. Thus, Microsoft need not comply with the icon-related requirements until November 2002, see RPFJ § III(H)(1), although Microsoft needed only two weeks after the DC Circuit decision to offer OEMs roughly the same flexibility with icon display as the RPFJ requires, and needed no more than three additional months to implement that flexibility on Windows XP. See Microsoft Announces Greater OEM Flexibility for Windows (Microsoft press release July 11, 2001). Similarly, Microsoft need not comply with its API disclosure requirements or the OEM flexibility provisions until November 2002, RPFJ §§ III(D), (H), and need not comply with the Communica-

As of 1998 it was the policy of the Antitrust Division that consent decrees last for at least 10 years. See ANTITRUST DIVISION MANUAL, at IV:54 (3d ed. Feb. 1998); see also V VON KALINOWSKI ET AL., ANTITRUST LAWS AND TRADE REGULATION §§ 96.01[2], at 96–4; 96.02[1] at 96–10 (2d ed. 2000).

If Microsoft actually and convincingly lost its monopoly before the expiration of a decree of appropriate length, it could, of course, move for modification or termination of the decree under Rufo v. Inmates of Suffolk County Jail, 502 U.S. 367 (1992).

Protocol disclosure requirement until August 2002. Id. § III(E). See also Stiglitz/Furman Dec. 30. These built-in delays cut far into the unusually brief term of the decree.

The ''Timely Manner'' governing Microsoft's disclosure obligations in RPFJ §§ III(D)-(E)—after the initial delay—permits Microsoft to withhold that disclosure until a product version has been distributed to 150,000 beta testers. See RPFJ § VI(R). ''Beta testers'' in undefined. Until recently, Microsoft, like other vendors, distinguished between ''beta testers'' who agreed to provide substantial feedback to the software manufacturer, and ''beta copies'' of a program that might be distributed without such obligations or expectations. Few, if any, beta testing programs involved 150,000 beta testers under that usage. A return to the former terminology could postpone the ''Timely Manner'' until commercial release. And in any event, it should be a simple matter for Microsoft to delay distribution of any beta version to 150,000 testers, however defined.

Here again, the contrast with the interim remedies of the original decree is striking. The ''Timely Manner'' definition in that judgment required Microsoft to disclose ''APIs, Technical Information and Communications Interfaces * * * at the earliest of the time that'' those items were

(1) disclosed to Microsoft's applications developers, (2) used by Microsoft's own

Platform Software developers in software released by Microsoft in alpha, beta, release candidate, final or other form, (3) disclosed to any third party, or (4) within 90 days of a final release of a Windows Operating System Product, no less than 5 days after a material change is made between the most recent beta or release candidate version and the final release.

97 F. Supp.2d at 73–74 (§ 7(ff)) (emphasis added). While the vacated judgment made a strong effort to place outside developers on the same footing as Microsoft's applications developers throughout the development process, the RPFJ permits Microsoft to delay disclosure until the last minute, without any analogue to the requirement that Microsoft promptly update changes made in the final pre-release stage.

Another significant built-in delay results from the definition of ''Non-Microsoft Middleware Product'' to include only products that have one million users. RPFJ § VI(N) (ii). That definition governs the extent of the anti-retaliation provisions in RPFJ §§ III(A)(1), III(C), and III(H). Moreover, the icon flexibility and information disclosure provisions apply only to Microsoft Middleware and Microsoft Middleware Products, each of which must have functionality similar to a Non-Microsoft Middleware Product. See RPFJ §§ VI(J)(3), VI(K)(2)(b)(ii). By restricting all of these protections to middleware products that have distributed more than one million copies, the RPFJ encourages Microsoft to crush new middleware threats at the earliest stages. That is, the RPFJ puts a premium—indeed, a judicial imprimatur—on the monopolistic exclusion of nascent threats before the innovations in those products reach a sizable mass of consumers. That flies in the face of the concerns behind the judgments of liability in this case. See Microsoft III, 253 F.3d at 54, 79.

VII. ADDITIONAL WEAKNESSES UNDERCUT THE RPFJ

A. The Anti-Retaliation Provisions Are Deeply Flawed

Although anti-retaliation provisions are clearly necessary, the provisions in the RPFJ proceed from a misguided premise that retaliation by the monopolist—abuse of monopoly power—is permitted unless squarely forbidden. The well-meaning restrictions in the RPFJ leave Microsoft with ample recourse to use its monopoly power to retaliate against those who aid competitive threats. See Stiglitz/Furman Dec. 31–32.

Most important, the anti-retaliation provisions permit Microsoft to withdraw the Windows license of any OEM (or other licensee) that does not serve Microsoft's anticompetitive bidding. The CIS (at 27, 66 Fed. Reg. 59,466) suggests that the provision of RPFJ § III(A) requiring notice and opportunity to cure a violation provides some kind of protection to OEMs. But the protection is evanescent, disappearing entirely after two notices within a license term. See RPFJ § III(A). See also Stiglitz/Furman Dec. 31–32.

Such notices will become routine, quickly and completely nullifying this provision. In the rough-and-tumble of everyday business, parties frequently diverge in minor respects from the terms of their agreements. The CIS admits that ''Windows license royalties and terms are inherently complex.'' CIS 28, 66 Fed. Reg. 59,466. Given that complexity, it would be surprising if most OEMs did not transgress some term of their Windows licensing agreements every year or so, if not more often. Such transgressions would provide ample basis for Microsoft to retaliate without fear of interference from the RPFJ.

There is no limit on what Microsoft can invoke as a reason for termination, that is, there is no requirement that terminations be for cause, much less for a material breach of the license agreement. Indeed, the sudden termination that Microsoft may impose after two notices—even notices of purported violations that were promptly and completely cured—need not even be based on something the OEM could cure.

The anti-retaliation provisions for software and hardware vendors contain another weakness. Section III(F)(1)(a) forbids retaliation against hardware and software vendors who support software that competes with Microsoft Platform Software or that runs on other platforms. But that provision therefore permits Microsoft to use its Windows monopoly to crush middleware vendors if Microsoft does not yet have competing middleware (see RPFJ §§ VI(K)-(L)) and whose middleware applications are used on the Windows platform—where any middleware would have to start in order to be a practical bridge to another platform.

Moreover, when prohibiting a specific type of retaliation would also help undermine the applications barrier to entry, the RPFJ hews to a general approach rather than focusing on precise adjudicated conduct. For example, Microsoft threatened to discontinue its port of Microsoft Office for the Macintosh unless Apple ceased supporting Netscape Navigator. See Microsoft III, 253 F.3d at 73–74. Yet the RPFJ does not require Microsoft to continue to offer Mac Office (much less to keep the port current)—an expedient that would take away Microsoft's weapon rather than merely admonishing it to behave well, and would tend to undermine the applications barrier to entry as well.

B. Microsoft Can Evade The Price Discrimination Restrictions

The uniform pricing provisions in RPFJ § III(B) have too narrow a reach to provide significant limits on Microsoft's ability to engage in price discrimination in order to force OEMs to eschew non-Microsoft products that may threaten Microsoft's OS monopoly. Microsoft's well-known market position in other products permits easy evasion of these limits. For example, nothing prevents Microsoft from discriminating in the pricing of its monopoly suite of desktop productivity applications, Microsoft Office, to which every OEM of any size needs access. Moreover, the leading PC OEMs all build server computers using Intel-based hardware, and increasingly rely on revenue from servers to make up for the exceptionally low margins on desktop PCs. To continue in the Intel-based server business, PC OEMs must license Microsoft's server operating systems, which are dominant on the Intel-based platform. The RPFJ places no limits on Microsoft's pricing of server operating systems, providing another outlet for the nullification of RPFJ § III(B).

Even on their own terms, however, the RPFJ pricing provisions contain a substantial loophole. Microsoft can reward an OEM for an ''absolute level * * * of promotion'' of Microsoft products. RPFJ § III(A). That provides a means for Microsoft to distinguish between OEMs who make sure that Microsoft software dominates their offerings, and OEMs who either promote competing software or simply do not interfere with consumers'' choices.

C. Microsoft Can Enforce De Facto Exclusivity

Despite a superficial prohibition, Sections III(F)(2) and Ill(G) permit Microsoft to impose practical, effective exclusivity obligations on ISVs and others who need access to Windows to develop their products. Microsoft need do no more than recast its agreements with ISVs as contracts to ''use, distribute, or promote * * * Microsoft software'' or ''to develop software for, or in conjunction with, Microsoft,'' RPFJ § III(F)(2), or as a ''joint venture,'' joint development * * * arrangement'' or ''joint services arrangement.'' Id. § III(G). New ''joint development agreements'' or ''joint services arrangements'' likely will supersede the current licenses for use by ISVs of Microsoft software developments tools and perhaps also the current arrangements for preferential access under MSDN. At best, a decree court would have to undertake a full antitrust analysis of whether the joint venture was ''bona fide.'' Id. § III(G). To nullify RPFJ § III(F)(2), Microsoft could simply change its development tools agreements to require use of Microsoft software— which literally would be ''a bona fide contractual obligation * * * to use * * * Microsoft software.'' Since any ISV that wants its software to run on Windows almost certainly would need to use Microsoft's development tools, the anti-exclusivity provision, like so many others in the RPFJ, would have no practical effect.

DOJ has defended this provision as necessary to permit legitimate ''procompetitive collaborations.'' CIS 44, 66 Fed. Reg. 59,470. But the broad terms of the RPFJ itself provide little basis for hope that the objects of joint ventures permitting exclusivity will not include a variety of ''new'' products that amount to little more than routine alterations to Windows and other Microsoft products in conjunction with requests from other industry participants. It is not uncommon for an ISV to ask for a new API, or for an IHV to ask for some other specification in Windows. These exercises soon may become objects of ''joint ventures'' or ''joint development agreements'' under RPFJ § III(G).

RPFJ § III(G)(1) undercuts its superficial prohibition on contracts that would require participants at different levels of the market to install or promote Microsoft Platform Software to a ''fixed percentage'' of those participants'' own customers. Section III(G)(1) permits Microsoft to impose such contracts so long as it ''in good faith obtains a representation that it is commercially practicable for the entity to provide equal or greater distribution, promotion, use or support for software that competes with

Microsoft Platform Software.'' Such representations should be easy to come by, so long as Microsoft pays enough. There is nothing to require a single party making such a representation actually to carry out the parallel distribution that it told Microsoft was ''commercially practicable.'' And it should be easy enough for Microsoft, through a wink and a nod, to ensure that any such representations were not accompanied by efforts to prove that commercial practicability to Microsoft's detriment.

VIII. THE RPFJ'S ENFORCEMENT MECHANISMS ARE FUNDAMENTALLY INADEQUATE.

As we have shown above, the RPFJ fails adequately to prevent Microsoft from engaging in illegal and anticompetitive practices, and allows it to continue the patterns of behavior that led to this litigation in the first place. The RPFJ suffers from an important secondary flaw, however: the enforcement mechanisms contained in Section IV are fundamentally inadequate. The RPFJ commits much of the practical enforcement responsibility to a ''Technical Committee,'' RPFJ § IV(B), that would monitor ''enforcement of and compliance with'' the RPFJ. Id. § IV(B)(1). The Technical Committee is likely to impede enforcement rather than aid it.

First, Microsoft—the antitrust violator—could exert inappropriate control over the membership of the Technical Committee. Rather than creating a special master or an independent review committee to monitor compliance with the consent decree, the RPFJ allows Microsoft to have an equal voice with the plaintiffs in choosing the members of the Technical Committee; indeed, Microsoft may choose one of the three members outright. Id. § IV(B)(3). Although appointing a special master with real (though reviewable) power might make sense as a matter of judicial administration, allowing Microsoft to choose its own monitor makes no sense at all.

The composition of the Technical Committee suffers from a second defect. The RPFJ provides that ''[t]he Technical Committee members shall be experts in software design and programming.'' RPFJ § IV(B)(2) (emphasis added). The interpretation of the RPFJ is largely a legal matter, however, dependent on adequate knowledge of the antitrust Section after section of the RPFJ is extraordinarily vague. 19 Experts in software design simply will not have any basis adequately to review complaints that Microsoft's 19 For example, as we discussed above the RPFJ relies heavily on a ''reasonableness'' standard of conduct that simply reproduces a full analysis under the antitrust laws. Antitrust remedies, like other injunctive decrees, are supposed to be amenable to swift and sure enforcement, according to standards that give warning of what is forbidden and what is permitted both to the wrongdoer and to its potential victims. But again and again, the RPFJ would require both the Technical Committee and eventually the decree court to determine whether Microsoft's conduct was ''reasonable.'' behavior fails to comply with the RPFJ. However, that is the entire purpose of the Technical Committee. Not only is the selection and composition of the Technical Committee problematic; the RPFJ's restrictions on how the Technical Committee can go about its business are equally inadequate. For example, it is likely that all third-party allegations of misconduct by Microsoft will be reviewed by the Technical Committee. 20 But the Technical Committee lacks any real power, and operates almost entirely in secrecy. Even if the Technical Committee finds Microsoft to be violating the RPFJ, its sole recourse is to ''advise Microsoft and the Plaintiffs of its conclusion and its proposal for cure.'' Id. IV(D)(4)(c). If DOJ or the settling State plaintiffs proceed with a complaint, none of the ''work product, findings or recommendations by the Technical Committee may be admitted in any enforcement proceeding before the Court for any purpose, and no member of the Technical Committee shall testify by deposition, in court or before any other tribunal regarding any matter related to [the RPFJ].'' Id. § IV(D)(4)(d). Enforce- ment would have to start over from scratch. In effect, the Technical Committee's investigation is simply a waste of time. Even were the plaintiffs to decide, based on a Technical Committee report, that Microsoft had violated the RPFJ, the plaintiffs would need independently to investigate that violation under Section IV(A)(2). Indeed, the Technical Committee's reports to the 20 While third parties have the right to raise complaints with the Internal Compliance Officer, see RPFJ § IV(C)(3)(g), the RPFJ gives them no incentive to do so; such complaints would merely allow a proven antitrust violator itself to determine whether it has violated the RPFJ or again violated the antitrust laws. Although the RPFJ also allows third parties to submit complaints directly to the plaintiffs, see id. § IV(D)(1), the plaintiffs can thereafter at their sole discretion refer any such complaints to the Technical Committee, id. § IV(D)(4)(a), or to the Internal Compliance Officer, id. § IV(D)(3)(a). plaintiffs will be secret. See RPFJ § IV(B)(8)(e), (9). Ultimately, the Technical Committee simply injects delay into the process. But delay is indisputably in Microsoft's interest; Microsoft's monopolies bring it $1 billion each month in free cash flow, see Rebecca Buckman, Microsoft Has the Cash, and Holders Suggest a Dividend, WALL ST. J., Jan 18, 2002, at A3. Microsoft not only can afford to contest enforcement vigorously, but would not have to postpone enforcement for long before the RPFJ expires.

Finally, the ''crown jewel'' provision in the RPFJ is grossly inadequate. If at any point the court were to find that Microsoft had ''engaged in a pattern of willful and systematic violations,'' RPFJ § V(B) (emphasis added), the RPFJ provides only one remedy for plaintiffs or the court: to extend the inadequate, and already overly-short, consent decree by ''up to two years.'' But that is no deterrent. Willful and systematic violations should result in divestiture that terminates the illegally maintained monopoly once and for all. See Microsoft III, 253 F.3d at 103; United Shoe, 391 U.S. at 250. Slightly prolonging a failed decree makes no sense at all.

CONCLUSION

The Revised Proposed Final Judgment should be rejected as contrary to the public interest.

Respectfully submitted.

BEFORE THE UNITED STATES DEPARTMENT OF JUSTICE UNITED STATES OF AMERICA, Plaintiff, V. MICROSOFT CORPORATION, Defendant. Civil Action No. 98–1232 (CKK)

STATE OF NEW YORK ex rel. Attorney General Eliot Spitzer, et al., Plaintiffs, v. MICROSOFT CORPORATION, Defendant. Civil Action No. 98–1233 (CKK)

DECLARATION OF JOSEPH E. STIGLITZ AND JASON FURMAN

TABLE OF CONTENTS

I. QUALIFICATIONS

Our names are Joseph Stiglitz and Jason Furman. Dr. Stiglitz is a Professor at Columbia Business School, Columbia's Graduate School of Arts and Sciences (in the Department of Economics), and Columbia's School of International and Public Affairs. In 2001, Dr. Stiglitz was awarded the Nobel Prize in Economic Sciences. In addition, Dr. Stiglitz serves as a Senior Director and Chairman of the Advisory Committee at Sebago Associates, Inc., an economic and public policy consulting firm.

Dr. Stiglitz previously served as the World Bank's Chief Economist and Senior Vice President for Development Economics. Before joining the Bank, he was the Chairman of the President's Council of Economic Advisers. Dr. Stiglitz has also served as a professor of economics at Stanford, Princeton, Yale, and All Souls College, Oxford.

As an academic, Dr. Stiglitz helped create a new branch of economics—''The Economics of Information''—which has received widespread application throughout economics. In the late 1970s and early 1980s, Dr. Stiglitz helped revive interest in the economics of technical change and other factors that contribute to long-run increases in productivity and living standards. Dr. Stiglitz is also a leading scholar of competition policy.

In 1979, the American Economic Association awarded Dr. Stiglitz its biennial John Bates Clark Award, given to the economist under 40 who has made the most significant contributions to economics. His work has also been recognized through his election as a fellow to the National Academy of Sciences, the American Academy of Arts and Sciences, and the American Philosophical Society, as well as his election as a corresponding fellow of the British Academy. He has also been awarded several honorary doctorates.

Jason Furman is a Lecturer in economics at Yale University. In addition, Mr. Furman is a Director at Sebago Associates. Mr. Furman previously served as Special Assistant to the President for Economic Policy at the White House, where his responsibilities included tax policy, the Federal budget, Social Security, anti-poverty programs, and other economic policy issues.

II. PURPOSE

This Declaration was commissioned by the Computer & Communications Industry Association (CCIA) as an independent analysis of the competitive effects of the Proposed Final Judgment. The views and opinions expressed in this Declaration are solely those of the authors based on their own detailed study of the relevant economic theory and court documents; they do not necessarily reflect the views and opinions of CCIA. In addition, the views and opinion expressed in this Declaration should not be attributed to any of the organizations with which the authors are or have previously been associated.

III. INTRODUCTION

Competition is the defining characteristic of a market economy. It provides the incentive to produce new products that consumers want, to improve efficiency and lower the costs of production, and to pass on these innovations in the form of lower prices for consumers. In a competitive market, a firm that does not act in the best interests of consumers will be punished and, ultimately, will fail. But when competition is imperfect—or when it is nonexistent as in the limiting case of monopoly—the incentives to undertake these beneficial actions may be attenuated. In fact, a firm may even face incentives to behave in ways which do not serve the interests of consumers or the economy more generally. Monopoly power may lead a firm to underinvest in innovation, misdirect its investments, or undertake other activities in order to stifle competition rather than to improve products. Costs of production may be excessive because the monopolist has insufficient incentives for efficiency, has incentives to undertake costly measures to deter competition, or undertakes measures to raise rivals'' costs. And consumers will face higher prices and fewer choices in the short run; in the long run, the losses to consumers may be even more severe.

In a unanimous decision, the full Court of Appeals for the DC Circuit upheld the District Court finding that Microsoft was guilty of violating 2 of the Sherman Act through its illegal maintenance of a monopoly in the market for Intel-compatible personal computer (PC) operating systems.[1] The Court of Appeals also affirmed numerous findings of fact concerning the consequences of this illegal monopolization for misdirecting innovation, raising rivals'' costs, and limiting consumer choice.

The desire to maintain this monopoly, even against potentially superior products, creates a powerful incentive for Microsoft to eliminate or weaken competition that could erode or even eliminate its monopoly. In the mid-1990s, the principal threat to Microsoft's Windows operating system came from the development of the Netscape browser and Java technologies,[2] which allowed programmers to write applications to Netscape and Java, meaning that such programs would then work on any operating system that would run Netscape or lava. By reducing or even eliminating the cost of producing applications for different operating systems, these technological rivals reduced the barriers to entry for a new operating system and threatened, over the longer run, to erode Microsoft's monopoly in Intel-compatible PC operating systems by allowing competitors to provide superior products at a lower cost.

Microsoft's conduct has effectively eliminated the threat posed by Netscape and Java. Given ongoing rapid technological progress, it is impossible to predict with certainty where the next challenge to Microsoft Windows will come from. The experience in this area, however, suggests that it is likely to come from rivalry at the borders of operating systems, in particular from ''middleware'' that makes it possible for programmers to write to the ''middleware'' rather than to the underlying operating system. One such example comes from the increasingly important area of multimedia: streaming media players. Whether the next challenge to Microsoft's operating systems monopoly comes from a multimedia package or another technology, Microsoft will continue to have the same incentives and ability to stifle competition as it displayed against Netscape and Java in the mid- 1990s.

The principal goal of any remedy for Microsoft's illegal behavior in this case should be to foster competition and expand choices for consumers. The key to achieving this goal is changing Microsoft's incentives and taking steps to increase competition. A structural remedy, such as splitting up the company, would most directly alter incentives. Where such structural changes are not possible, the remedy should prohibit and regulate the conduct that Microsoft has used in the past and will have an incentive to use in the future to eliminate threats from ''middleware'' products that threaten to limit its monopoly power by usurping some, and perhaps eventually all, of the important functions of the Windows operating system.

The Revised Proposed Final Judgment (PFJ) of November 6, 2001 does not change Microsoft's incentives to undertake anticompetitive acts to stifle consumer choice by thwarting potentially superior products[3]) Furthermore, the PFJ provides few effective prohibitions against future anticompetitive conduct: It alternatively ratifies Microsoft's existing conduct, contains sufficient loopholes to allow Microsoft to circumvent the legislation, and suffers from toothless enforcement procedures that would allow Microsoft to reap the fruits of its monopoly for a significant, and potentially even indefinite, period. In our view, the PFJ would leave intact Microsoft's ability to maintain, and benefit from, its Windows operating system monopoly, while allowing

[1] United States v. Microsoft Corp., 253 F.3d 34 (DC Cir. 2001).

[2] ''The Java technologies include: (1) a programming language; (2) a set of programs written in that language, called the 'Java class libraries,'' which expose APIs; (3) a compiler, which translates code written by a developer into 'bytecode'; and (4) a Java Virtual Machine ('JVM'), which translates bytecode into instructions to the operating system.'' See 253 F.3d at 74, citing Findings of Fact ¶ 73, United States v. Microsoft Corp., 84 F. Supp. 2d 9, 29 (D.DC 1999).

[3] United States v. Microsoft Corp., Revised Proposed Final Judgment, in the U.S. District Court for D.C, November 6, 2001.

it to continue to limit choices for consumers and stifle innovation.

The PFJ does not even accomplish the limited remedial goals articulated in the U.S. Department of Justice's Competitive Impact Statement (CIS).[4] Specifically, in addition to its loopholes and its inadequate enforcement mechanism, the PFJ is entirely silent on several key findings of the Court of Appeals, including the commingling of applications and operating systems code, the pollution of Java, and the applications barrier to entry more broadly.

The PFJ should be rejected and replaced with a remedy that changes Microsoft's incentives to unfetter the market for competition. At a minimum, a remedy in this case needs to restrain Microsoft's conduct, by restricting the means through which Microsoft can illegally maintain and benefit from its monopoly.

The goal of this Declaration is to analyze the PFJ. It does not propose a detailed alternative remedy. It is important to note, however, that the proposal by the litigating States, while imperfect, is clearly superior to the PFJ in all of these regards. We do not address more aggressive remedies—such as structural changes to break up Microsoft or impose more extensive limitations on its intellectual property rights—but we note that such broader measures may well be necessary and desirable in order to alter Microsoft's incentives for anti-competitive behavior.[5] We are convinced, however, that the PFJ fails to meet the minimum requirement of an acceptable remedy—that is, it is unlikely to substantially increase competition in the relevant market.

The remainder of this Declaration contains five sections. First, it presents a brief discussion of the modem theory of competition, focusing on its relation to innovation. Second, it summarizes the relevant facts and legal conclusions relating to Microsoft. Third, it outlines what an effective remedy in this case should entail. Fourth, it examines the PFJ and highlights its deficiencies in comparison to this effective remedy. Finally, the paper concludes with a brief discussion of practical measures that could provide a more effective remedy.

IV. THE MODERN ECONOMIC THEORY OF COMPETITION AND MONOPOLY

This section presents a brief overview of the modem economic theory of competition and monopoly. The theory of competition has evolved rapidly in the last few decades, due in part to the natural evolution of economic thought and in part to the issues raised by the ''new economy'' (such as the importance of network effects and rapid innovation). Given the vast literature on the topic, this discussion is necessarily selective and focuses on the most relevant issues for Microsoft's monopoly of the market for operating systems for Intel-compatible PCs. This theoretical background motivates the conclusions about the PFJ.

A. Acquisition of a monopoly

The traditional view of monopoly is that in specific industries, like public utilities, increasing returns to scale create a situation in which luck or initial success will eventually lead to one firm that can maintain its monopoly by controlling an entire market and thus benefiting from the lower average costs of production that result from the larger scale of production. This aspect of the traditional view is still salient in the software market. Producing a software program has high fixed costs in the form of investments in research and development but, once this investment has been made, virtually no marginal cost from producing additional units. As a result, the larger the scale of production, the lower the average cost. By itself, these increasing returns to scale will provide a powerful force for consolidation.

The modem view of monopoly has added an additional effect that can strengthen the advantages enjoyed by the lucky or initially successful firm: network effects.[6] 6 Network effects arise when the desirability of a product depends not just on the characteristics of the product itself but also on how many other people are using it.

Network externalities may be direct: as a user of Microsoft Word, I benefit when many other people also use the program because it is easier to share Word files. Network externalities may also be indirect: I am more likely to purchase a computer and operating system if I know that more software choices are currently available (and will be available in the future) for this system. An operating system with a larger set of existing (and expected) compatible applications will be more desirable. This indirect network effect has been called the ''applications barrier to entry.'' [7] The main reason that consumers demand a particular operating system is its ability to run the applications that they want. In developing applications, Independent Software Vendors (ISVs) incur substantial sunk costs and thus face increasing returns to scale. This motivates ISVs to first write to the operating system with the largest installed base. Because ''porting'' an application to a different operating system will result in substantial additional fixed costs, a firm will have less incentive to produce the application for operating systems with a smaller installed base, and may do so with a delay or forgo porting completely.

The applications barrier to entry can skew competition for an extended period of time and ensure that any monopoly power, once established, will tend to persist. In choosing a PC and an operating system, consumers make a large fixed investment. In addition, because a considerable amount of learning is associated with the use of operating systems and associated applications, and because files created under one applications software program may not be easily or perfectly transferable to others, there are large costs associated with switching. As a result, consumers will evaluate, among other factors, the current existence of compatible applications and the likely number of future compatible applications.[8] 8 The current number of compatible applications is likely to depend directly on the past and current market share of the operating system. A consumer's reasonable evaluation of the prospects for the continued support of his or her favorite applications and the development of new applications is also likely to be based on current market share. As a result, increased market share indirectly increases the desirability of an operating system.

Empirically, this applications barrier to entry is dramatic. At its peak in the mid-1990s, IBM's operating system, OS/2 Warp, had 10 percent of the market for operating systems for Intel-compatible PCs and ran approximately 2,500 applications. In contrast, Windows supported over 70,000 applications.[9] Establishing a new operating system that effectively competes head-to-head with Windows would require the hugely expensive task of attracting ISVs to port thousands or even tens of thousands of programs to the new operating system, a process with a substantial fixed cost and, in the absence of a large guaranteed market, little scope to benefit from economies of scale. Particularly important to the applications barrier to entry is the availability of applications providing key functionalities, such as office productivity. Microsoft's dominance in this area, and its choice about whether or not to port its Microsoft Office program to alternative operating systems, can add a new and even higher level to the applications barrier to entry.

With this barrier to entry, a monopoly once established may be hard to dislodge. Anticompetitive practices early in the competitive struggle can lead to a market dominance that can persist, even if the anticompetitive practices which gave rise to the monopoly position are subsequently prohibited. These hysteresis effects are reinforced by switching costs. Learning a language or a program interface may involve significant costs. Users must therefore be convinced that an alternative program is substantially superior if they are to be induced to incur the learning and other costs associated with switching to an alternative product. These ''lock in'' effects make it more difficult to dislodge a firm that has established a dominant position, even when it is technically inferior to rivals.

This perspective has two important policy implications. First, it is imperative to address anticompetitive practices as quickly as possible. Delay is not only costly, but it impedes the restoration of competition even in the longer run. Second, prohibiting the

practices that gave rise to the monopoly may not suffice to restore competition. Stronger conduct, and possibly structural, remedies may be required.

B. Potential for competition

In the most simplistic view, a monopoly once attained is permanent. Increasing returns to scale and network externalities make the monopolist impregnable—any new entrant can be priced out of business by the monopolist—which can then go back to charging the monopoly price for the product.

In contrast to this simplistic static view, the economist Joseph Schumpeter presented a dynamic vision of technological change giving rise to a series of temporary monopolies. In his vision, the most successful firm in a winner-take-all contest would become a temporary monopolist, benefiting from the rents that this monopoly confers—a process necessary to justify incurring the sunk costs in research and development required to obtain the monopoly in the first place. But, in the Schumpeterian vision, this monopoly would eventually be toppled by entry as a newly innovative entrant displaced the monopolist with a superior product, thus reaping the benefits of increasing returns to scale and network externalities.[10]

The real world likely lies somewhere between these two views. A monopoly is not a fixed part of the economic landscape. But the downfall of a monopoly is not inevitable. In fact, more recent economic research strongly indicates that Schumpeter's conclusion was wrong; when restraints on anticompetitive conduct are absent, a monopoly can take steps to ensure that it is likely to be perpetuated.[11] These steps can suppress the overall level of innovation and have other high social costs.[12] Significant network effects combined with switching costs, as discussed above, represent one way in which a firm can perpetuate its market power.

Understanding this point is central to understanding what motivated the actions of Microsoft in promoting Internet Explorer and restraining Netscape and Java, and also to understanding the motivations of a conduct remedy to improve competition. Network externalities are not a ''d factor'' in the economic landscape. They depend, at least in part, on decisions by the monopolist. A monopolist has substantial resources at its disposal to strengthen barriers to entry and thus to maintain and strengthen its monopoly power. Exclusionary conduct by the monopoly can be used to prevent a reduction in the barriers to entry or even affirmatively to raise them even higher. Java and Netscape would have reduced the monopoly power of Windows by allowing a greater variety of programs to function on a greater variety of operating systems. The social benefits from such innovation were likely significant, but Microsoft would have experienced significant losses from the innovation through the erosion of its monopoly power.

Similarly, this same point can provide the rationale for structural or conduct remedies that can potentially reduce barriers to entry and thus increase competition in part, or all, of the market. The fundamental idea is that Microsoft acted as it did because it was afraid that Netscape and Java would reduce the applications barrier to entry and thus undermine its operating systems monopoly. By preventing this anticompetitive behavior, and indeed promoting competition, a conduct remedy could have precisely the opposite effect, creating the conditions for the dynamic, innovative Schumpeterian competition that would otherwise be absent in this market.

In understanding the monopoly in the operating systems market, and how it fits into the overall PC platform, it is useful to introduce some issues specific to this area. Timothy Bresnahan, a Professor of Economics at Stanford University and a former Deputy Assistant Attorney General and Chief Economist at the U.S. Department of Justice Antitrust Division, formulated the concept of ''Divided Technical Leadership.'' [13] The concept is that although each aspect of the platform is dominated by a single company, different companies dominate different ''layers'' of the platform: ''At one stage, all of IBM and Compaq (computer), Microsoft (OS), Intel (CPU), Netware (networking OS), WordPerfect and Lotus (near-universal applications) participated in technological leadership of the PC platform.'' [14] In a situation of divided technical leadership, according to Bresnahan, competition comes from two sources: ''(1) firms in one layer encouraging entry and epochal change in another layer and (2) rivalry at layer boundaries.'' [15] To the degree that divided technical leadership is absent, because for example Microsoft controls many of the layers (operating system, office applications, networking, browsers, etc.), competition will be restricted. Any measures to facilitate divided technical leadership, even if they leave the monopoly at any given layer intact, will facilitate competition and thereby benefit consumers in the form of greater innovation, more choices, and lower prices.

C. Consequences of monopoly

Traditional economic theory suggests that the principal consequence of a monopoly is to raise prices and restrict production. This combination has two consequences. First, higher prices allow the monopolist to capture some of the surplus previously enjoyed by consumers. Second, restricted production results in a deadweight loss for society, the so-called ''Harberger triangle,'' to the extent that the value placed on the forgone consumption by consumers exceeds its cost to producers.[16]

Over the last few decades, economists have substantially enhanced this traditional theory and explored other ways in which market power imposes social costs. The modem view is that when competition is imperfect, firms try to maintain and extend their market power by taking actions to restrict competition. firms is producing innovations In the world of perfect competition, the source of success for that benefit consumers and reduce prices. In the world of imperfect competition, an additional—and perhaps paramount—source of success is the effort to reap monopoly profits, capture rents, deter entry into the market, restrict competition, and raise rivals'' costs.[17]

Under the new view, the social costs of monopolies go well beyond the ''Harberger triangles'' that result from higher prices and restricted output. In fact, even if the monopolist is not currently restricting output, the steps taken to maintain the monopoly will result in substantial economic inefficiencies and costs to society. These costs may be far larger than the monopoly profits and far larger than the Harberger triangles. These social losses reflect higher costs of production (both for the firm and its rival), limited or distorted investment in innovation, a restricted set of potentially inferior choices for consumers, and, in the long run, higher prices.

D. Monopolies and innovation

The information technology industry is characterized by a rapid rate of technological change. As the modem theory of competition and monopoly underscores, it is important to focus not just on the static issues that affect consumers today, but also on how the mixture of monopoly, competition, and the intellectual property regime affects the pace and direction of innovation.

Schumpeter emphasized that monopolies would provide both the incentives and the means for innovation. According to Schumpeter, the fear of losing monopoly rents would drive a monopolist to continue innovating and these monopoly rents—or the promise of further monopoly rents in the future—would provide the financing for these innovations. Schumpeter's vision contains elements of truth: the threat of competition may induce monopolists to invest more in innovation than it otherwise might. But the pace of innovation may be even higher if the incumbent's monopoly power were curtailed. Monopoly power could lower the pace of innovation for four reasons.

First, previous innovations are inputs into any subsequent innovation. Monopoly power can be thought of as increasing the cost of one of the central inputs into follow-on innovations. Standard economic theory

predicts that as the cost of inputs into any activity increases, the level of that activity falls.

Second, with more substantial barriers to entry, the threat of Schumpeterian competition and therefore the incentives to innovate are diminished. In the extreme case, if a monopoly could ensure that there were no threat of competition, it would no longer have to innovate. A monopolist's anticompetitive actions to raise barriers to entry will reduce its future incentives to innovate, similarly measures that increase competition will increase the Schumpeterian incentive.

Third, innovation itself may be misdirected in order to secure a monopoly by deterring entry and raising rivals'' costs. In operating systems, for example, the development of alternative proprietary standards and the construction of non-interoperable middleware are examples of innovations that could potentially strengthen monopoly power.

Fourth, the incentives of a monopoly to innovate are limited.[18] Since a monopolist produces less than the socially optimal output, the savings from a reduction in the cost of production are less than in a competitive market. Also, a monopolist's incentives to undertake research will not lead it to the socially efficient level. Rather, its concern is only how fast it must innovate in order to stave off the competition—a level of innovation that may be markedly lower than socially optimal. Consider, for example, a simple patent race in which a monopoly incumbent can observe the position (at least partially) of potential rivals. The monopolist's incentive is to move out in front of the potential rivals by just enough to convince them that they cannot beat the monopolist. Given those beliefs, the rivals do not engage in research, and the monopolist can then slow down its research to a lower level (since it no longer faces a viable threat).

In short, monopolization not only harms consumers by raising prices and reducing output in the short run, but may reduce innovation in the long run. These long-run harms, which are especially important in innovative industries, may substantially exceed the short-run costs to consumers.

v. FACTS AND LEGAL CONCLUSION RELATING TO MICROSOFT

In its decision, the Court of Appeals affirmed the District Court's overall judgment, albeit on a narrowed factual and legal basis. The Court of Appeals concluded that ''Microsoft violated § 2 of the Sherman Act by employing anticompetitive means to maintain a monopoly in the operating system market.'' 19 In addition, the Court of Appeals overturned the lower court's judgment that Microsoft violated § 2 of the Sherman Act by attempting to monopolize the web browser market. The Court of Appeals remanded the decision on whether the tying of Internet Explorer to Windows violated § 1 of the Sherman Act and indicated that tying should be evaluated under the rule of reason, rather than under a per se rule; the U.S. Department of Justice chose not pursue this issue further. The Court of Appeals also vacated the District Court's Final Judgment, in part because of the narrowed scope of the judgment on the conclusions of law.

The current task in this case is to develop a remedy that addresses the central finding of the Court of Appeals: the monopolization of the operating systems market. This judgment was based on findings of fact and conclusions of law in three areas: Microsoft has monopoly power in the relevant market, Microsoft behaved anticompetitively, and Microsoft's anticompetitive behavior contributed to the maintenance of its monopoly. These are briefly discussed in turn.

A. Monopoly power

Monopoly power is the power to set prices without regard to competition. It can be inferred by the combination of market share in the relevant market and significant barriers to entry. The District Court found that Microsoft's share of the worldwide market for Intel- compatible PC operating systems exceeded 90 percent in every year of the 1990s and has risen to 19 253 F.3d at 46.

more than 95 percent in recent years. Microsoft did not dispute these facts, but instead argued that the relevant market was broader and should include all platform software (e.g., servers, handheld devices, Macintosh computers, etc.). The Court of Appeals, however, rejected Microsoft's attempt to broaden the definition of the market, agreeing with the District Court that these other platforms were not '''reasonably interchangeable by consumers for the same purposes.''' [20]

In addition, the Court of Appeals affirmed the finding that Microsoft's dominant market share was likely to persist. This conclusion was based on the substantial barriers to entry, including increasing returns to scale and the applications barrier to entry discussed above. As a result, according to the Court of Appeals, ''Because the applications barrier to entry protects a dominant operating system irrespective of quality, it gives Microsoft the power to stave off even superior new rivals. The barrier is thus a characteristic of the operating systems market, not of Microsoft's popularity.'' [21]

B. Anticompetitive behavior

The Court of Appeals found numerous instances where Microsoft behaved anticompetitively through exclusionary conduct that harmed consumers, had an anticompetitive effect, and had either no ''procompetitive justification'' or an insufficient ''procompetitive justification'' to outweigh the harm. These actions, according to the Court of Appeals, had the intention and effect of preserving or increasing the applications barrier to entry. The Court of Appeals upheld most of the general categories of anticompetitive behavior originally found by 20 253 F.3d at 52, quoting United States v. E.I. du Pont de Nemours & Co., 351 U.S. 377, 395 (1956).

the District Court, but overturned some of the District Court's specific findings in these areas. The key instances of this anticompetitive behavior found by the Court of Appeals include: Restrictive Licenses to Original Equipment Manufacturers (OEMs).[22] Microsoft's Windows license placed restrictions on OEMs that limited their ability to change the look of the Windows desktop, the placement or removal of icons for browsers, or the initial boot sequence. The result was to increase the user share of Internet Explorer, not because of its merits, but because Microsoft limited the crucial OEM channel of distribution for Explorer's chief rival, Netscape. ú Integration of Internet Explorer into Windows.[23] Microsoft discouraged OEMs from installing other browsers and deterred consumers from using them by not including Internet Explorer in the Add/Remove programs list for Windows 98 and commingling the operating system and browser code.

úAgreements with Internet Access Providers (IAPs).[24] Microsoft engaged in exclusionary conduct to restrict the second main distribution channel for Netscape by offering IAPs, including America Online, the opportunity to be prominently featured in Windows in exchange for using the Internet Explorer browser exclusively. Dealings with ISVs and Apple.[25] Microsoft further restricted additional outlets for Netscape by providing ISVs with preferential access to information about forthcoming releases of Windows 98 in exchange for their writing to Internet Explorer rather than Netscape. In addition, Microsoft negotiated with Apple to restrict the ability of Macintosh consumers to use Netscape in exchange for continuing to develop and support Microsoft Office for the Macintosh operating system. ú Polluting Java. The Court of Appeals also found that much of Microsoft's behavior vis- a-vis Java was an attempt to limit a threat to its operating system monopoly rather than benefit consumers. These illegal actions included entering into contracts requiring ISVs to write exclusively to Microsoft's Java Virtual Machine, misleading ISVs into thinking that Microsoft's Java tools were cross-platform compatible, and forcing Intel to terminate its work with Sun Microsystems on Java.[26]

[18] Kenneth Arrow (1962), ''Economic Welfare and the Allocation of Resources for Invention.'' In The Rate and Direction of Inventive Activity, Princeton University Press, Princeton: pp. 609–625.

[20] 253 F.3d at 52, quoting United States v. E.I. du Pont de Nemours & Co., 351 U.S. 377, 395 (1956).

[21] 253 F.3d at 56.

[22] The Court of Appeals narrowed the scope of this anticompetitive behavior slightly, rejecting the District Court's finding that Microsoft's restrictions on alternative interfaces was anticompetitive, arguing that the ''marginal anticompetitive effect'' of Microsoft's license restrictions was outweighed by the alternative, the ''drastic alteration of Microsoft's copyrighted work.'' See 253 F.3d at 63.

[23] The Court of Appeals, however, overruled the District Court in one instance, finding a sufficient justification for the fact that in certain situations Internet Explorer will override user defaults and launch, for example when alternative browsers do not provide the functionality required by Windows Update. See 253 F.3d at 67.

[24] The Court of Appeals found that several inducements offered by Microsoft to encourage IAPs to use Internet Explorer were not anticompetitive. See 253 F.3d at 68.

[25] The Court of Appeals overturned the finding that Microsoft's deals with Internet Content Providers were anticompetitive. See 253 F.3d at 71.

[26] See 253 F.3d at 74–78. The Court of Appeals, however, found a sufficient procompetitive justification for Microsoft's development of its own version of a Java virtual machine. See id. at 74–75.

C. Effectiveness of anticompetitive behavior in maintaining the monopoly

Finally, the Court of Appeals found that Microsoft's anticompetitive efforts to increase usage of Internet Explorer and Microsoft's Java Virtual Machine at the expense of Netscape and Sun's Java had the effect of increasing the applications barrier to entry and thus helping to maintain Microsoft's monopoly of the market for operating systems for Intel-compatible PCs. This finding is the crucial link to the economics of the case; a monopoly is neither automatically permanent nor automatically transient. Rather, its persistence depends, in part, on the barriers to entry which, in turn, depend on the actions of the monopolist and the regulation of the government. This finding is also crucial to the development of proposed remedies.

Specifically, the Court of Appeals found that although neither Netscape nor Java posed an imminent threat of completely replacing all the functions of the operating system (and thus should be excluded from the definition of the relevant market for the test of monopoly power), they did pose a nascent threat to Microsoft's future dominance of the operating system market. Though not part of the ''operating systems market,'' they clearly affected the nature of competition in this market. Both Netscape and Java established Applications Programming Interfaces (APIs) that allowed developers to write some programs to Netscape and Java. These programs would then be able to run on any operating system that runs Netscape or Java. The result would be, at least in one segment of applications, a dramatic reduction in the applications barrier to entry. No longer would software developers have to incur additional costs to run on additional operating systems. As a result, Netscape and Java had the potential to act as a crucial level of ''middleware'' between the operating system and the programs, and eventually could ''commoditize the underlying operating system,'' to use the memorable words of then-Microsoft Chairman and CEO Bill Gates in an internal memo.[27]

The Court of Appeals wrote:

We may infer causation when exclusionary conduct is aimed at producers of nascent competitive technologies as well as when it is aimed at producers of established substitutes... the question in this case is not whether Java or Navigator would actually have developed into viable platform substitutes, but (1) whether as a general matter the exclusion of nascent threats is the type of conduct that is reasonably capable of contributing significantly to a defendant's continued monopoly power and (2) whether Java and Navigator reasonably constituted nascent threats at the time Microsoft engaged in the anticompetitive conduct at issue.'' [28]

The court answered in the affirmative on both issues.

VI. OUTLINE OF AN EFFECTIVE CONDUCT REMEDY

The Court of Appeals was clear that the District Court has ''broad discretion'' to fashion a remedy that is ''tailored to fit the wrong creating the occasion for the remedy.'' [29] In the CIS, the Department of Justice appears to take a minimal view of the goals of a remedy, writing that it should ''eliminate Microsoft's illegal practices, prevent recurrence of the same or similar practices, and restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings.'' [30] We believe that the PFJ fails even within the narrow terms that the Department of Justice set for itself.

The Court of Appeals appears to provide guidance for a broader remedy, quoting the Supreme Court in saying that the role of a remedies decree in an antitrust case is to ''unfetter a market from anticompetitive conduct'' and ''terminate the illegal monopoly, deny the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.'' [31]

One type of potential remedy, imposed by the District Court but vacated by the Court of Appeals, is structural. Such a structural remedy would involve breaking Microsoft into two or more companies with the goal of establishing a new set of incentives that foster competition. Although potentially disruptive in the short run, the goal of a structural remedy is to terminate the monopoly and create the structural conditions to prevent it from re-emerging, without requiring ongoing regulation or supervision by the court or the government. Such structural remedies are particularly suitable when there have been a wide variety of anticompetitive practices in the past and when changing market conditions (such as innovation) provide opportunities for new types of anticompetitive conduct in the future. Structural remedies have the further advantage of fundamentally altering incentives.

A second type of potential remedy relates to conduct or licensing, seeking to prevent anticompetitive conduct and foster competition. A conduct remedy has the advantage of avoiding the dramatic and potentially deleterious changes associated with a structural remedy, but suffers from the defect that it is necessarily complicated and requires at least some involvement of the court and the government in regulating private enterprise. Ideally, a conduct remedy would also be structured to affect incentives: in particular, such a remedy should raise the costs of acting in an exclusionary manner.

The remainder of this section discusses an outline of the elements of an effective conduct remedy that seeks to achieve three goals: creating more choices for consumers, reducing the applications barrier to entry, and preventing Microsoft from strengthening its operating systems monopoly by bringing new products within its scope. A. Creating more choices for consumers

A conduct remedy should empower rival computer companies to modify their own versions of the computer experience to appeal to consumers. Not only will consumers benefit from the greater product choice, but entry and competition may be enhanced as consumers learn how to interact with a variety of interfaces. At a minimum, empowering OEMs and possibly ISVs to create more choices for consumers would involve: (1) the right to modify the desktop, the start menu, or other fundamental aspects of the computer experience so that OEMs can market PCs with alternative overall ''looks'', different software packages (including supplementing, replacing, or removing Microsoft middleware), and to offer lower-priced options with reduced features; (2) adequate information and technical access to develop applications for, and even modifications to, functionalities included with Windows, which would allow ISVs to develop their own bundle of the Windows operating system plus applications (and/or minus Microsoft middleware) that could be marketed either to OEMs or directly to end users; (3) protection from retaliation by Microsoft for engaging in this conduct; and (4) financial incentives to make changes that benefit consumers.

B. Reducing the applications barrier to entry

The central goal of Microsoft's illegal conduct was to preserve and strengthen the applications barrier to entry so that the Windows operating system continued to be essential to desktop computing. An effective conduct remedy in this case should take steps to reduce the applications barrier to entry, by creating conditions conducive to more competition and by requiring Microsoft to undertake actions that would lower that barrier. Reducing the applications barrier to entry is consistent with the findings of the Court of Appeals and is central to an effective remedy in this case. Although the Court of Appeals rejected or remanded the District Court's findings of liability for tying and for monopolization of the browser market, both of these actions were central to the Court's finding of liability on the § 2 Sherman Act violation for monopolizing the market for operating systems. The Court found that Microsoft used commingling of code and other exclusionary measures to increase the market share for Internet Explorer and reduce the distribution of Netscape and Java in order to strengthen the Windows monopoly.

There are two specific aspects to reducing the applications barrier to entry:

(1) encouraging competition in middleware in a manner that makes it easier for developers to write programs that run on a variety of operating systems, and (2) requiring Microsoft to port its dominant applications to alternative operating systems.

C. Preventing Microsoft from strengthening its operating system monopoly by bringing new products within its scope

Microsoft's ability to leverage its Windows monopoly to control other aspects of computing that then reinforce the Windows monopoly is a key part of its strategy of 23 anticompetitive conduct that formed the foundation for the Court o[Appeals ruling. To deal with the anticompetitive practices that are ''likely to result in monopolization in the future'' requires a remedy that addresses not just areas of past misconduct, but emerging areas as well.

The next section compares the actual agreement to these elements.

VII. ANALYSIS OF THE PROPOSED FINAL JUDGMENT

The PFJ fails to fulfill even the minimal goals set by the CIS. It does not address many of the proven illegal practices, including commingling, polluting Java, and strengthening the applications barrier to entry more broadly. Furthermore, in our judgment the PFJ would not ''restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings.'' [32] Nothing in the PFJ would be likely to resuscitate the conditions of greater ''divided technical leadership'' that prevailed in the mid-1990s when Netscape and Java both presented a serious threat to Microsoft, which Microsoft suppressed through anticompetitive actions.

The PFJ also falls dramatically short of all three elements of the guidelines that appear to have been endorsed by the Court of Appeals for the DC Circuit: it allows Microsoft's illegal monopoly in operating systems to continue and perhaps even be strengthened, it allows Microsoft to keep the fruits of its statutory violation, and it leaves intact all of the incentives— and many of the means—for Microsoft to maintain and extend its monopoly in the future, especially in the important emerging areas of web services, multimedia, and hand-held computing.

The main impact of the PFJ is to codify much of Microsoft's existing conduct. Where the agreement limits Microsoft's conduct, there are often sufficient exceptions, loopholes, or alternative actions that Microsoft could undertake to make the initial conduct limits meaningless. Even where the limits are binding, Microsoft could still flout the conduct restrictions without fear of a timely enforcement mechanism. Because the Technical Committee [33] is essentially advisory and only has expertise in software design, not law and marketing, the only enforcement of the PFJ is through a full legal proceeding—which would provide enough time for Microsoft to inflict irreversible harm on competition. The time issues are especially important because in a market characterized by increasing returns to scale and network externalities, once a dominant position is established it will be hard to reverse, even if the original abusive practices are subsequently circumscribed.

The fundamental problem with the agreement is that it does not change the incentives that Microsoft faces. All of the illegal anticompetitive actions identified by the District Court and affirmed by the Court of Appeals were the result of rational decisions by Microsoft about how best to enhance its value by maintaining and expanding its monopoly. These same incentives will persist under the PFJ; given these incentives, it impossible to foresee—let alone effectively prohibit—the wide variety of potentially anticompetitive conduct that may result. Indeed, the reason that many economists have argued for the more drastic structural settlement (such splitting up Microsoft) is that such structural changes would alter incentives.[34] Though the Court of Appeals has determined that such a remedy might be too drastic, the imperative in evaluating any remedy is to ascertain its impact on incentives.

The following analyzes the details of the PFJ by comparing it to the principles outlined in the previous section. Our discussion does not aim to be comprehensive, but instead to focus on areas that illustrate or represent important economic aspects of the PFJ. Although the enforcement aspects of the PFJ, in particular the powers of the Technical Committee, are essential to understanding the limitations of the agreement, we only briefly discuss these issues.

A. Creating more choices for consumers

In developing a remedy, the court is well aware of its technical shortcomings in deciding exactly what should or should not be included as part of an operating system today—or in the future. Neither should these determinations be made solely by a monopolist. These choices should be made by consumers through the choices they have between different OEMs and ISVs. Stanford Law Professor Lawrence Lessig described this strategy as follows: ''To use the market to police Microsoft's monopoly... by assuring that computer manufacturers and software vendors remain free to bundle and support non-Microsoft software without fear of punishment by Microsoft.''[35] We agree with Professor Lessig that this should be among the goals of a final judgment and that the current agreement is woefully inadequate in meeting this objective. In our view, this is in fact a minimal objective that mitigates some of the harms to consumers from Microsoft's monopoly position but, by itself, would do little to reduce the applications barrier to entry or facilitate competition in the operating systems market itself. applications would be designed and marketed to maximize their own profits, with no regard to how this might affect the profitability of the operating system.

As noted above, a remedy that turns this overall strategy into a reality requires four different elements: (1)ensuring that OEMs and potentially ISVs have the right to modify the desktop, the start menu, or other fundamental aspects of the computer experience in any way they choose; (2) ensuring that OEMs and ISVs have adequate information and technical access to develop applications for, and even modifications to, Windows; (3) ensuring that they are protected from retaliation by Microsoft for providing alternatives to consumers; and (4) ensuring that they have financial incentives to make changes that benefit consumers. The PFJ is deficient in all four.

1. Ensuring that OEMs and potentially ISVs have the right to modify fundamental aspects of the computer experience in any way they choose

The PFJ codifies several new rights for OEMs to modify the desktop or the computer experience, some of which were already voluntarily announced by Microsoft on July 11,2001 and implemented with the release of Windows XP on October 25, 2001. Specifically, Section III.C of the PFJ prohibits Microsoft from restricting OEMs from ''Installing or displaying icons, shortcuts, or menu entries for, any Non-Microsoft Middleware... distributing or promoting Non-Microsoft Middleware by installing and displaying on the desktop shortcuts of any size or shape...'' among other actions.

This new required latitude, however, is unduly limited in several respects: New flexibility is quite narrow. OEMs can only modify the initial boot screen to market IAPs to users, but cannot modify it to uninstall Microsoft middleware or to market middleware that competes with Microsoft middleware (Section III.C.5). Nothing in the PFJ would allow ISVs to acquire licenses to create their own bundles of Windows plus applications to market to consumers or OEMs, a measure that could enhance competition by bringing additional participants with substantial experience in software development into the market. While the benefits to consumers and competition of allowing ISVs to acquire such licenses are evident, Microsoft Would only be harmed to the extent that it reduces its monopoly power. There is no other convincing explanation for these restrictive trade practices.

u It contains several limitations that limit the overall look of Non-Microsoft Middleware and pace of innovation. For example, the PFJ requires that the user interface on automatically launched Non-Microsoft Middleware[36] must be ''of similar size and shape to the user interface displayed by the corresponding Microsoft Middleware Product'', can only be launched when a similar Microsoft product would have been launched, and Microsoft can impose non-discriminatory bans on icons (Section III.C.3). In addition to the fact that these limitation are frivolous, asymmetric, and would seem to serve no purpose other than restricting competitive threats—no such limitations apply to Microsoft—they could also have a severe impact in limiting competition. Specifically, it allows Microsoft to control the pace of innovation in the computer experience, letting Microsoft delay the effective launch of a new type of product until it is ready to compete in that area. Thus

[32] CIS, p. 3.

[33] The Technical Committee consists of three experts in ''software design and programming''—one appointed by Microsoft, one by the plaintiffs, and the third by these previous two. The Committee would have broad access to internal Microsoft documents, source code, etc. It would be responsible for reporting any violations of the PFJ to the plaintiffs. They would not, however, be able to rely on the work of the Technical Committee in Court proceedings. See PFJ, Section IV.B.

[34] See, for example, Robert Litan, Roger Noll, and William Nordhaus (2002), ''Comment of Robert E. Litan, Roger D. Noll, and William D. Nordhaus on the Revised Proposed Final Judgment.'' United States v. Microsoft Corp., Before the Department of Justice. The point is simple: now strategy with respect both to applications and the operating system is designed to maximize total profits, including the monopoly profits. With structural separation,

[35] Lawrence Lessig (December 12, 2001). ''Testimony before the Senate Committee on the Judiciary.''

[36] 36 AS defined in Section VI.M.

both competition and innovation may be impeded.

u It is unnecessarily delayed. Specifically, Section III.H gives Microsoft up to 12 months or the release of Service Pack 1 for Windows XP, whichever is sooner, to provide end users and OEMs a straightforward mechanism to remove icons, shortcuts, or menu entries for Microsoft Middleware Products or to allow OEMs or end users to designate alternative Non-Microsoft Middleware Products [37] to be invoked by the Windows operating system in place of Microsoft Middleware Products.[38] There is certainly no economic or legal justification for this delay and our understanding is that it is technically feasible to carry out these changes in a few weeks time, as demonstrated by Microsoft's July 11, 2001 voluntary agreement to implement elements of this provision. As we have emphasized, there can be significant long-run consequences for competition from even short delays.

u Microsoft could encourage users to undo changes after 14 days. The value of the new contractual freedoms is limited by Microsoft's ability to encourage the user to undo all OEM changes after 14 days by allowing a user-initiated ''alteration of the OEM's configuration... 14 clays after the initial boot up of a new Personal Computer.'' (Section III.H.3) This provision, in effect, would allow Microsoft to present a message to end users (e.g., ''Press 'yes'' to optimize your computer for multimedia'') that could bias choices toward Microsoft products, regardless of what the OEM had chosen. This provision could therefore greatly reduce the scope and value of the changes that OEMs make.[39]

2.Ensuring that OEMs ISVs have adequate information and technical access to develop applications for, or even modifications to, Windows

The right to make modifications to Windows will only work effectively if OEMs and ISVs have the knowledge to exercise this right. Microsoft currently releases an enormous quantity of information on the Windows operating system and its APIs, through the Microsoft Developer Network (MSDN) and other means. Indeed, the indirect network externalities supporting the Windows monopoly provide a strong incentive for Microsoft to ensure that as many applications as possible run well on its system. But Microsoft also has an incentive to bolster its operating system monopoly by selectively withholding timely information to impede or delay the development of products that threaten to reduce the applications barrier to entry.[40] In addition, Microsoft has also required anticompetitive actions in exchange for information, as in the ''first wave'' agreements found illegal by the Court of Appeals.[41]

The PFJ requires disclosure of ''the APIs and related Documentation that are used by Microsoft Middleware to interoperate with a Windows Operating System Product'' (Section III.D) and specified Communications Protocols (Section III.E).

These requirements, however, are deficient in several ways:

u Windows APIs are not covered. In particular, the PFJ does not require the disclosure of the APIs used by Windows. Although Microsoft already has an incentive to disclose Windows APIs, there are circumstances where delay could be more profitable. The consequences of this omission are aggravated by the definition in Section VI.U: ''the software code that comprises a Windows Operating System Product shall be determined by Microsoft in its sole discretion.'' Thus, as middleware gets blended in the operating system, the scope of disclosures could be narrowed.

u Internet Explorer and other middleware APIs are not covered. Furthermore, the agreement does not require the disclosure of the APIs used by Internet Explorer. Although the government did not prove that Microsoft was guilty of monopolizing the browser market, dominating this market played a key role in shoring up its monopoly in the operating systems market. As a result, requiring disclosure of the APIs for Internet Explorer and other middleware could play a role both in denying the fruits of that monopoly and reducing this barrier to entry in its operating systems market. . Definitions could limit disclosure even further. The scope of APIs required to be disclosed under the agreement could be potentially limited even further by the control Microsoft has over what is ''Microsoft Middleware'' and what is the ''Windows Operating System Product.''

. Additional loopholes further limit disclosure and ability of non-Microsoft middleware to fully interoperate with Windows. Section III.J.1 provides a substantial loophole that exempts from the disclosure requirements anything that ''would compromise the security of a particular installation,... digital rights management, encryption or authorization systems...'' These are all very important technologies for Windows Media Player, Passport, the Internet Explorer browser, and any of the many programs that rely increasingly on security and encryption. In addition to giving Microsoft substantial discretion and blurring the disclosure requirements further, these exceptions would make it impossible for competitors to design middleware that fully interoperated with the Windows operating system, leaving certain features only accessible to Microsoft middleware.

. Disclosures are not timely. The disclosures are not very timely, allowing Microsoft enough time to ensure that its products—and products by favored OEMs and ISVs— enjoy a substantial ''first to market'' benefit in taking advantage of the functionality of the operating system. Microsoft has up to 9–12 months to disclose the APIs and communications protocols. In the case of a new version of the Windows Operating System Product, the PFJ bases the timing of the disclosure on the number of beta testers, effectively giving Microsoft substantial discretion over the timing of the required disclosures through its definition of the term ''beta tester'' and its control over their number. (Sections III.D and VI.R)

. Microsoft could cripple rival products. The PFJ does nothing to prevent Microsoft from deliberately making changes in Windows with the sole or primary purpose of disabling or crippling competitors'' software products. 30

3. Ensuring that OEMs and ISVs are protected from retaliation by Microsoft for providing alternatives to consumers The right to make alterations to the Windows desktop will only be effective if companies are protected from retaliation for exercising it. The PFJ provides some protection against retaliation (Section III.A) and requirements for uniform licensing and pricing for Microsoft Windows (Section III.B). The protections, however, are only partial, in that they omit several important behaviors, still leave substantial scope for Microsoft to retaliate, and contain a very large loophole.

First, the prevention against retaliation only applies to a very specific set of actions that are specified in the PFJ, such as altering the icons on the desktop or promoting an IAP in the initial boot sequence. This rule does not apply to other actions by OEMs, such as the inclusion of third party software that does not fall under the definition of Non-Microsoft Middleware.

Second, there may still be some scope for discrimination and retaliation. Section III.B.3 of the PFJ explicitly gives Microsoft the right to use ''market development allowances,'' for example to provide a pre-license rebate to selected OEMs on the basis of potentially ambiguous joint ventures. Although these incentives would have to be offered uniformly, there still could be some scope for defining them in an exclusionary manner. Furthermore, the relationships between Microsoft and computer companies are very complex and multifaceted, leaving substantial scope for retaliation in aspects not covered by the PFJ, including potentially the pricing of Microsoft Office and the server business.

Finally, Section III.A allows Microsoft to terminate the relationship with an OEM without cause and within a brief span of time simply by delivering two notices of termination. With no ready substitutes for Windows available, this power would give Microsoft substantial leverage in its relationships with OEMs. Although the OEM would have the option of litigating Microsoft's denial of a Windows license, the text of Section III.A and the lack of ''bright

---

[37] As defined in Section VI.N.

[38] As defined in Section VI.K.

[39] This provision would allow Microsoft to run the ''Desktop Cleanup Wizard'' that removes unused shortcuts from the desktop in a non-discriminatory manner. Nothing in our reading of the language of Section III.H.3, however, would limit the power of Microsoft to remove all user access to non-Microsoft middleware or restore access to Microsoft middleware.

[40] 40 For example, the District Court found that Microsoft withheld the ''Remote Network Access'' API from Netscape for more than three crucial months in mid-1995. Findings of Fact, • 90–91, 84 F. Supp. 2d at 33.

[41] These agreements, which were entered into between the Fall of 1997 and Spring of 1998 between Microsoft and several ISVs, provided preferential early access to Windows 98 and Windows NT betas and other technical information in exchange for using Internet Explorer as the default browser. See See 253 F.3d at 71–72.

line'' rules in the PFJ would make this litigation costly and uncertain—and thus an imperfect means of protection against this threat. 4. Ensuring that OEMs have financial incentives to make changes that benefit consumers

Even if the three previous conditions were met, they would be economically irrelevant if OEMs did not have financial incentives to take advantage of the new licensing freedoms. The production of PCs is a highly competitive industry with very low profit margins.[42] PCs are virtually a commodity that can be priced based on a limited set of characteristics like processor speed and hard drive size. All of the steps allowed by the PFJ—including installing non- Microsoft middleware or removing user access to Microsoft middleware—entail higher costs for the OEMs both in the costs associated with the initial configuration of the system and in the added costs of end user support.[43] In addition, OEMs may perceive that Microsoft would take additional steps to raise their costs through forms of retaliation either permitted by the PFJ or imperfectly banned. These costs may explain why, to our knowledge, no major computer manufacturer has yet taken Microsoft up on its July 11, 2001 offer to remove access to Microsoft middleware and replace it with non-Microsoft middleware.[44]

As a result, the key source of greater competition and consumer choice in the computer experience—OEMs—would have limited economic basis for promoting such choice. In part this is because the value of some of the new freedoms obtained by the OEMs in the PFJ are limited

by loopholes. For example, by allowing Microsoft to bar OEMs from marketing non-Microsoft middleware in the initial boot sequence, the PFJ removes one source of revenue and choice. In addition, allowing Microsoft to encourage users to ''voluntarily'' revert to the Microsoft-preferred configuration of icons, the Desktop, and the Start Menu after 14 days may reduce substantially the value of this screen ''real estate.'' As a result, the PFJ precludes some of the principal means by which OEMs could be remunerated for providing additional or alternative functionality desirable to consumers.

The more fundamental problem is that OEMs continue to be required to license a version of Windows that includes middleware like Internet Explorer, Windows Media Player, and Windows Messenger. By not requiring Microsoft to sell a cheaper, stripped-down version of the operating system—excluding many of these added features—the PFJ in effect would require OEMs to pay twice—once for Microsoft's version of the product (as bundled into the price of Windows) and once for the alternative. Such bundling is a particularly invidious way of undermining competition. In effect, it implies that the marginal cost of any item in the bundle is zero, making competitive entry, even for a superior product, impossible. The fact that such entry has occurred is testimony to the superiority of the rival products—consumers are willing to pay substantial amounts for the alternatives. In addition, forced bundling can have adverse effects on consumers, because it uses up memory and storage space, and there is always the possibility that the commingled code will interfere with the performance of other applications.

In summary, under the PFJ, OEMs are not provided the rights, means, protections, or incentives to create alternative choices for consumers. As a result, the lynchpin of the PFJ's strategy for promoting competition would be greatly attenuated.

B. Reducing the applications barrier to entry

The applications barrier to entry was central to the Court of Appeals'' understanding of this case. It is the principal barrier to entry that protects Microsoft's overwhelming dominance of the market for operating systems for Intel-compatible PCs. Furthermore, the court found that Microsoft engaged in illegal acts to increase the applications barrier to entry, principally by suppressing Netscape and Java at the expense of Internet Explorer and Microsoft's version of Java. Thus, any remedy that is ''tailored to fit the wrong creating the occasion for the remedy'' must necessarily take affirmative steps to reduce the applications barrier to entry and also prevent Microsoft from engaging in anticompetitive actions to increase this barrier. Unfortunately, the PFJ barely addresses this central issue.

The following discusses two key aspects of the applications barrier to entry: the use of anticompetitive means to reduce the market share of rival middleware (and thus its potential to reduce the cost of porting applications to different operating systems) and the use of decisions about Microsoft Office to influence the prospects of rival operating systems. 1. Middleware and the applications barrier to entry

The CIS states that under the PFJ, ''OEMs have the contractual and economic freedom to make decisions about distributing and supporting non-Microsoft software products that have the potential to weaken Microsoft's personal computer operating system monopoly without fear of coercion or retaliation by Microsoft.''[45] Even if the PFJ did give OEMs this contractual and economic freedom without fear of retaliation, and the previous subsection expressed severe doubts on this point, it still would do little if anything to weaken Microsoft's operating system monopoly.

Enhancing competition by allowing OEMs and ISVs to provide consumers with a greater variety of choices, the subject of the previous subsection, is in some sense literally superficial. It involves the ability of firms in the computer industry to change the outer appearance of a computer and the way it is perceived and used by users, including the ability and ease of accessing programs that are included with the Windows operating system or added by the OEM or end user. The issues raised by the applications barrier to entry go deeper, to the underlying code in Windows. In particular, although the PFJ allows end users or OEMs to remove user access to Microsoft Middleware, it also allows Microsoft to leave in place all of the programming underlying this middleware. This code could still be accessed by other programs that write to the APIs exposed by the middleware.

The Court of Appeals explicitly rejected Microsoft's explanation for commmingling the code of Windows 98 and Internet Explorer, concluding that it deterred users from installing Netscape, had no substantive purpose, and thus that ''such commingling has an anticompetitive effect.''[46] Despite this strong finding, no provision in the PFJ addresses this issue.[47]

Netscape and Java represented a very rare challenge to Windows—they offered the opportunity to develop middleware that would allow a wide range of applications to be costlessly transferred between different systems. It is difficult to imagine when, if ever, there will be a challenge of this magnitude again. Nonetheless, some existing middleware—and future middleware that we may not even be able to forecast today—will continue to present challenges to Windows. For example, there is still substantial competition in the market today for multimedia players, with Windows Media Player, RealNetworks RealOne player, and Apple's QuickTime, among others, all offering different versions of similar functionality.

The treatment of middleware is crucial because the market for middleware, like the market for operating systems, is subject to substantial network externalities. These externalities mean that the desirability of a middleware package increases as the installed user base increases. As with operating systems, such externalities arise for direct reasons (e.g., users can share files in a particular media format) and indirect reasons (writing a program to different middleware, so the dominant middleware will have the most programs associated with it). With regard to indirect network effects, the key point is that the installed base is not the number of computers with shortcuts to the given middleware, but the number of computers with the underlying code permitting the middleware to be invoked by a call from another program. A programmer that wanted to develop, for example, an interactive TV program could still use Windows Media Player regardless of whether or not an OEM or end user had removed the icons or shortcuts that allow easy user access to this program.

By providing no means for OEMs or end users to undo the commingling of code that ties

[42] For example, the Washington Post recently noted that profit margins are in ''single digits.'' See Rob Pegoraro and Dina E1 Boghdady (January 20, 2002), ''Building Creativity Into the Box'' Washington Post.

[43] In the Microsoft trial numerous industry witnesses testified to the user confusion and added support costs associated with having alternative browsers pre-installed on a computer. See 253 F.3d at 71–72.

[44] Microsoft Press Release (July 11, 2001), ''Microsoft Announces Greater OEM Flexibility for Windows.''

[45] CIS, p. 25.

[46] See 253 F.3d at 66.

[47] The Court of Appeals rejected, per curiam, Microsoft's petition for a reheating on this point. Order (DC Cir. Aug. 2, 2001).

Microsoft middleware to the operating system, the PFJ ensures that Microsoft middleware will have an installed base, in the relevant sense, of nearly the entire PC market. As a result, programmers will find it cheaper to write to Microsoft middleware rather than to rival programs. In this case, ubiquity could trump quality—because the size of a middleware's installed base could be more important than the quality of the middleware program. Microsoft middleware thus increases the applications barrier to entry in the same manner that promoting Internet Explorer and restricting the distribution of Netscape do. By allowing Microsoft to continue to commingle the code for middleware and its operating system, and preventing OEMs or end users from making real choices, the PFJ contributes to Microsoft's ability to restrict the market share of its rivals in neighboring ''layers'' to the operating system, reducing the main form of potential future competition at ''layer boundaries.''

2. Microsoft Office and the applications barrier to entry

As noted above, in the mid-1990s, Microsoft Windows was compatible with more than twenty times as many programs as IBM's OS/2 Warp. This offers a dramatic example of the applications barrier to entry. One crucial feature of Microsoft is that in addition to producing the Windows operating system, it is also a leader in many other applications. Network externalities work here to help create and maintain market dominance. Thus, for a rival operating system to succeed it would need not only to persuade ''neutral'' software companies to write to it, but also persuade Microsoft itself to port some of its leading applications to the operating system. To the degree that Microsoft produces leading or essential applications, they can use their refusal to port these applications to reinforce their Windows monopoly.

One application, in particular, is especially important to users: Microsoft Office and its associated programs, including Word (for word processing), Outlook (for e-mail and scheduling), Excel (for spreadsheets), and PowerPoint (for presentations). Indeed, Microsoft Office has about 95 percent of the market for business productivity suites. 48

The Court of Appeals affirmed the District Court's finding that the desire by Apple to ensure that Microsoft continued to maintain and update Mac Office was central to its motivation to enter into an illegal, anticompetitive deal with Microsoft to suppress Netscape and promote Internet Explorer. In addition, Microsoft does not currently have a version of Office that operates on Linux, the primary alternative to Windows in the PC operating system market. Withholding or simply threatening to withhold Microsoft Office from other operating systems is 48 Richard Poynder (October 1, 2001). ''The Open Source Movement.'' Information Today, 9:18. a powerful way in which Microsoft can use anticompetitive means to reduce the desirability of rivals while also extracting concessions or exchanges that help support the Windows monopoly of PC operating systems.

The PFJ, however, does not address any issues relating to the pricing, distribution, or porting of Microsoft Office. This considerable loophole has been used by Microsoft in the past. In the future, Microsoft will have the same incentives to use this loophole again. In addition, it may be necessary to examine additional Microsoft applications that can be used to reinforce the Windows monopoly. Given the difficulty of undoing a monopoly of this sort, once established, it is particularly appropriate to reach beyond remedies that are narrowly circumscribed.

C. Preventing Microsoft from strengthening its operating system monopoly by extending it to encompass additional products

The Court is charged with fashioning a remedy that ''ensure[s] that there remain no practices likely to result in monopolization in the future.'' Some of the most important newly emerging areas are multimedia, networking, web services, and hand-held computing. Microsoft is already making substantial investments in these areas with its .NET strategy, Microsoft Passport, MSN, Windows Messenger, Windows Media Player, and the Pocket PC operating system.

The recently released Windows XP is characterized by substantial integration between all of these features; indeed the seamless integration is one of Microsoft's chief selling points for Windows XP. Microsoft has marketed Windows XP (standing for ''experience'') on the basis of its seamless integration between the Internet, multimedia, and the computer. For example, on the day it was released, a Microsoft press release announced, ''Windows XP Home Edition is designed for individuals or families and includes experiences for digital photos, music and video, home networking, and communications.'' [49]

Like Internet Explorer, these new areas present new opportunities for Microsoft to leverage its monopoly in the operating system to dominate other markets. In addition, Microsoft could use its strong or dominant position in these new markets to erect new barriers to entry that prevent potential competitors from offering products and services with part or all of the functionality provided by Windows. For example, if Passport is successful then a rival operating system would not just need to persuade other developers to write for it, but would also need to develop its own version of Passport and convince numerous e-commerce sites to use it. If the rival operating system failed in any of these steps, its attempts to establish itself could be seriously curtailed. The PFJ, however, does not address any aspects of these important emerging barriers to entry.

VIII. STEPS TO IMPROVE THE PROPOSED FINAL JUDGMENT: THE LITIGATING STATES'' ALTERNATIVE

The goal of this Declaration is to explain why we believe that the PFJ is deficient and why the Court should exercise its discretion to fashion a remedy in this case that would promote competition and benefit consumers. We do not propose an alternative remedy or provide an exhaustive analysis of any other proposals. Our analysis of the shortcomings of the PFJ, however, can be illustrated and strengthened by a selective comparison of some of the provisions in the PFJ with the proposal transmitted to the court by the nine litigating States and the District of Columbia on December 7, 2001.[50]

Many of the issues in the ''Plaintiff Litigating States'' Remedial Proposals'' are technical and involve loopholes, some of which were discussed above including stronger anti-retaliation provisions and a broader definition of middleware that could not be manipulated by Microsoft. In addition, this proposed remedy makes an important change in enforcement: it proposes a Special Master, rather than requiring new legal proceedings to enforce the judgment. None of these important issues are discussed here. Instead, we focus on selected areas in which the litigating States'' proposal illustrates some of the principal economic points identified in the preceding analysis.

A. Fostering competition through OEMs and reducing the applications barrier to entry

The litigating States proposal would require Microsoft to license a cheaper version of Windows that does not include commingled code from added middleware. [51] In addition, the proposal would require Microsoft to continue to license older versions of its operating system without raising its prices. This would have two effects. First, it would more effectively promote competition and consumer choice by allowing OEMs to ship computers with a wide range of alternative middleware, thereby allowing consumers to choose between different versions or

Moreover, such a provision would provide Microsoft with better incentives; only if it produced an operating system which performed substantially better would it be able to sell its new releases. It would at least attenuate its ability to use new releases as a way of extending its market power. Some have advocated even stronger measures to ensure Microsoft faces pro- consumer, pro-competition incentives, including requiring Microsoft to release all of its Windows source code and requiring the free distribution of its operating system after 3 to 5 years. Second, this provision would directly address the Court of Appeals finding that Microsoft's commingling of code was anticompetitive. By

[49] Microsoft Press Release, ''Windows XP is Here!'' 10/15/01.

[50] United States v. Microsoft Corp., ''Plaintiff Litigating States'' Remedial Proposals,'' in the U.S. District Court for D.C, December 7, 2001.

[51] The Court of Appeals overturned the District Court, finding that Microsoft could not be held liable for the fact that in certain situations, like updating Windows or accessing help files, Internet Explorer overrides the user's default browser settings and opens automatically. This implies that the complete removal of HTML-reading software is impossible. But Windows could be shipped with, for example, a stripped-down browser that performs essential system functions. Most of the functionality of Internet Explorer, however, is not necessary for the examples Microsoft invoked. This is analogous to the way in which Windows is shipped with a stripped-down text editor, Notepad, but not with a full-fledged word processor.
combinations. The lack of financial incentives for OEMs to take advantage of the more liberalized licensing rules is one of the principal deficiencies in the PFJ.

disentangling the middleware from the operating system, this proposal would allow greater competition in middleware—and thus ultimately in operating systems—by reducing the network externalities that benefit Microsoft middleware at the expense of potentially superior products.

B. Internet Explorer browser open source and Java distribution

Two of the fruits of Microsoft's monopolization of the operating systems market are the dominance of the Internet Explorer browser and the destruction of Java as a viable competitor.

The anticompetitive measures that helped achieve these goals protected a crucial ''chink in the armor'' of the Windows operating system. The PFJ does nothing to ''deny the defendant the fruits of its statutory violation.'' [52] Furthermore, it does not enhance the ability of competitors to interoperate with Internet Explorer because it includes no disclosure requirement for the Internet Explorer APIs.

The litigating States propose to remedy these deficiencies by requiring Microsoft to publish the source code and APIs for Internet Explorer and freely license them to competitors. In addition, their proposal would require Microsoft to distribute a Sun-compatible version of Java Virtual Machine with all future operating systems. The result would be to decrease the applications barrier to entry and promote competition.

C. Cross-platform porting of Office

As discussed in the previous section, Microsoft Office is one of the most crucial applications for many users. The existence of this application for a particular operating system is one key factor in the demand for the operating system. The litigating States'' proposal would remove the ability of Microsoft to either threaten to withhold Office or actually withhold Office by requiring Microsoft to continue to port Office to Macintosh. In addition, the proposal would require Microsoft to auction off licenses to ISVs that would provide them with the entire source code and documentation for Office in order for them to port the product to alternative operating systems. Although we draw no conclusions about the particular rules proposed by the litigating States, this proposal would clearly reduce Microsoft's ability to deliberately raise the applications barrier to entry.

D. Mandatory disclosure to ensure interoperability

The PFJ requires some disclosure to ensure that Microsoft is not able to withhold certain information to illegally benefit Microsoft Middleware at the expense of Non-Microsoft Middleware. The disclosures are limited in scope and timing. The litigating States'' proposal is substantially broader.

Of particular importance, the litigating States'' proposal recognizes that ''nascent threats to Microsoft's monopoly operating system currently exist beyond the middleware platform resident on the same computer'' and thus the States'' proposal requires timely disclosure of technical information to facilitate ''interoperability with respect to other technologies that could provide a significant competitive platform, including network servers, web servers, and hand- held devices.'' [53] In doing this, the proposal would reduce the ability of Microsoft to use its dominant position in operating systems to eliminate emerging threats at the boundary of this ''layer'' of computing.

IX. CONCLUSION

The Revised Proposed Final Judgment agreed to by the U.S. Department of Justice, the Attorneys General of nine States, and Microsoft Corporation is critically deficient. The overall aims of the PFJ are laudable—to increase competition and reduce Microsoft's ability to maintain its monopoly at the expense of consumers. But the PFJ will not succeed in achieving these goals. It does not change any of the incentives faced by Microsoft to undertake anticompetitive actions. It restrains these anticompetitive actions only with highly specific and exception-ridden conduct requirements. And it has an insufficient enforcement mechanism.

The interest of consumers in a greater range of choices, lower prices, and greater innovation would be served by rejecting the PFJ and replacing it with a more effective conduct remedy. A remedy for this case should recognize that the monopoly power created by Microsoft's past anticompetitive, illegal practices is likely to persist, and that it will therefore be likely to continue to enjoy the fruits of its illegal behavior, unless there are far stronger remedies than those in the PFJ. The new remedy should change Microsoft's incentives. It should restrict Microsoft's ability to repeat its past, or develop new, anticompetitive practices. It should provide OEMs and ISVs with the means and incentives to stimulate genuine competition in the provision of platforms. And it should take whatever steps are possible to reduce the applications barrier to entry so that there is greater scope for genuine competition in the market for PC operating systems.

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA, UNITED STATES OF AMERICA, Plaintiff, v. Civil Action No. 98–1232 (CKK) MICROSOFT CORPORATION, Defendant.)))

STATE OF NEW YORK, et al.,)) Plaintiffs, v. Civil Action No. 98–1233 (CKK) MICROSOFT CORPORATION,) Defendant.))

DECLARATION OF EDWARD ROEDER

Edward Roeder declares under penalty of perjury as follows:

I. INTRODUCTION

1. I am a Washington journalist, author, lecturer, and editor, expert on the U.S. Congress, elections and efforts to influence the U.S. government. My byline has appeared in most major U.S. newspapers, many top magazines, and on all major wires and networks. I have written, edited, produced and reported on money in politics, Congressional ethics and the American political economy for more than three decades. My experience includes work as a Senate subcommittee counsel, House select committee chief investigator, United Press International editor, publisher, White House speechwriter, government aide at level GS-15, freelance reporter and publisher. I founded Sunshine Press Services, Inc., a Washington news service and publishing house specializing in ''Casting Light on Money and Politics.'' Sunshine has developed References to Use,

Not Just Peruse TM, computer-based reference works on U.S. politics. As National Political/Finance

Editor for United Press International, I produced the nation's first weekly state-by-state computer- generated reports on federal election financing. In 1974, I became the first freelance correspondent fully accredited to U.S. House & Senate Press Galleries. As a freelance print and broadcast reporter, I specialized in covering elections and election financing. In Roeder v. FEC, I successfully sued Federal Election Commission under the federal Freedom of Information Act, forcing a reduction in fees for records and release of computerized data.

My experience includes lecturing about covering influences on government at the graduate schools of journalism at Columbia, Northwestern (Medill), American, Maryland and other universities, and at the Hastings Center, the Heritage Foundation, and many other forums, and testifying before U.S. House and Senate committees. I also taught a public affairs course, Shadow Government in the Sunshine State, for three terms at Florida State University. I have appeared on ABC's Nightline, the CBS Evening News, World News Tonight (ABC), NBC Nightly News, All Things Considered (NPR), John McLaughlin, and many other broadcast outlets.

My reference publications include PACs Americana, the 1,150-page authoritative reference on political action committees and their interests, Congress On Disk TM, the pioneer diskette publication on politics, PAC-Track TM, covering all transactions by political action committees and party committees, FatCat-Track TM, covering ''soft money'' and all contributions of $200-and-up from individuals to any federal party, campaign or PAC, and Ready Money Reports TM, comparing relative financial standings of each federal campaign. A partial list of news clients is attached as Appendix B.

[53] Litigating States, pp. 10–11.

2. I was commissioned by the Computer & Communications Industry Association to conduct a review of publicly available documents, news reports, and commentary regarding Microsoft's lobbying and political contributions since the United States Department of Justice and 19 States filed suit against Microsoft in 1998. [1]

3. My review of the available documents has led me to conclude that over the past five years Microsoft has engaged in a ''pattern and practice'' of political influence peddling in many ways unprecedented in modem political history. [2] What makes Microsoft's lobbying efforts so unique is not necessarily the size (i.e. level of political contributions) but the scope of its efforts and the speed at which Microsoft went from having almost no political presence in Washington DC to having one of the largest and most sophisticated political operations in history.

4. By ''scope'' I am referring to the breadth of Microsoft's efforts. Microsoft has not merely established one of the largest Political Action Committees, or leapt to the top of the corporate contributor list in ''soft money,'' unregulated corporate contributions. Over the past five years Microsoft has also assembled a large lobbying office and retained dozens of high-powered consultants; Microsoft has created numerous ''front'' groups and has contributed heavily to a variety of think tanks and other organizations willing to espouse Microsoft's view of antitrust policy and this case; and Microsoft has created a variety of grassroots capabilities that appear to be directed at state-level government.

5. Two key factors indicate that Microsoft's lobbying efforts were designed and directed to try to minimize the impact of its lawsuit and try to achieve a result in the political process that it is Wall Street Journal October 15, 1999. Their onset coincides with the time the government sued Microsoft and they have continued and escalated ever since. Second, Microsoft's efforts are completely out of proportion to the rest of the high- technology industry. There is not one other example of a software, computer hardware, or Internet firm that comes anywhere near Microsoft's level of campaign contributions.

6. I am not a lawyer, an expert on antitrust or an expert on the Tunney Act. My substantive views of of the Proposed Final Judgment are based primarily on the analysis of Nobel economist Joseph Stiglitz, whose declaration also supports the CCIA submission.

7. The Tunney Act was enacted after the ITT scandal during the Watergate affair. As the court is aware, Watergate spurred a number of political reforms requiring ''sunshine'' on the political activities of special interests, in particular. But the Tunney Act was also enacted during a different political era, when political influence peddling was far less sophisticated than it has become after a quarter-century of efforts to circumvent the ''reforms'' of the 1970s. By necessity, political influence peddling is no longer necessarily marked by a single ''transaction'' or a single ''meeting,''

or even an overt ''quid pro quo.'' In fact, one of the effects of the modem reforms has been to legalize many activities—especially the transfer of funds from corporate to political coffers—that had long been illegal under laws in effect since 1907 or 1934. Lobbying today is marked by incrementalism, where there may not be any single meeting, or any single contribution, or any single agreement. Rather, over time, what may develop is an ''understanding'' of the respective parties'' interests, objectives, and desired outcomes. Instead of corruptly influencing politicians to buy a discreet government decision, the money exerts far broader influence over appointments, policy frameworks or positions, and ultimately, decisions. Much of it may be legal, but it's far more corrupting than simple bribery.

The simple matter of paying off a corrupt politician to obtain a favorable government decision is certainly offensive and unfair to the voters and those who are disadvantaged by the decision. Yet such petty or grand corruption, if isolated, does not seriously threaten the American system. What Microsoft has accomplished over the past half decade, however, presents a far darker prospect.

By pouring money into America's institutions of political pluralism, rewarding those organizations and individuals that do its bidding and denying or limiting funding to its opponents, Microsoft has in some ways corrupted American political discourse itself. Newspapers that have run an editorial or opinion article sympathetic to a Microsoft position, reporters who have interviewed a professor, politician, or pundit about this antitrust action, and anyone who has hosted or observed public discourse on the subject must now wonder: Were the views expressed independent and sincere, or were they purchased by an unseen hand, smothering the American marketplace of ideas? As is detailed below, Microsoft's efforts to subvert democratic institutions such as political campaigns and debates, party organizations, news outlets, think tanks and government offices have been so vast as to be a new phenomenon, unenvisioned and unaddressed by existing political mechanisms intended to check the influence of special interests. Limited campaign contributions can serve the purpose of encouraging, facilitating, extending and opening political discussion.

But political money in such vast amounts is a substitute for politics, not a means of undertaking political action.

While the modem-day political pressure brought to bear by Microsoft in the last decade may not be precisely the same as that undertaken by ITT in the 70's, it is no less objectionable to the Court's charge of acting on behalf of the ''public interest.''

---

[1] I am aware that Microsoft has undertaken an effort to use the Court discovery process to build a political case against its competitors. The relevancy of Microsoft's strategy will have to be determined by the Court since Microsoft—and not its competitors—have been found to be liable under the antitrust laws. I took input and advice from a broad range of sources in conducting this research, including CCIA and its members. This research is nonetheless based on the extraordinary public record of Microsoft's political activities during the timeframe of this case. I have also undertaken extensive original review of the records of the Federal Election Commission regarding election finance. These records covering all election cycles since 1970–80 have been available in computerized format since the court-ordered settlement of Roeder v. FEC, a Freedom of Information lawsuit I filed in this very courthouse two decades ago.

[2] ''Microsoft Targets Funding for Antitrust Office.'' Dan Morgan and Juliet Eilperin. Washington Post October 15, 1999. ''Pro-Microsoft lobbying to limit antitrust funding irks top lawmakers.''

8. Based on my review of the public record and the declaration provided by Dr. Stiglitz, it is apparent that the Department of Justice undertook a major ''change in policy'' at a critical moment this past fall. My belief—again based largely on Dr. Stiglitz'' analysis and substantiated by a wide array of antitrust experts and scholars—is that the Proposed Final Judgment cannot be reconciled with the government's extensive court victory. The public record suggests a Microsoft strategy that appears to defeats in the legal process, but which focuses on winning an acceptable outcome through the political process. It appears to be working. Indeed, if it weren't working, such vast expenditures might give rise to a shareholder suit for breach of fiduciary duty. If Microsoft's money has had the desired effect of inducing the U.S. government to throw in the towel on the biggest antitrust suit in history, such a suit could be easily defended. But to argue that Microsoft had no such intent is tantamount to suggesting that its corporate spending it in the control of squandering fools.

9. I have also reviewed Microsoft's lobbying disclosures filed before the court as part of the Tunney Act. Again, while I am not a lawyer, my review of public documents, press reports and the plain language of the statute leads me to believe that disclosures made to the court can not possibly be reconciled with Microsoft's lobbying activities surrounding both this case and this settlement.

10. Various press reports indicate that Microsoft is trying to convince the court and the public that the litigating states have been ''put up to this'' (i.e. continuing to litigate through the remedy phase) by Microsoft's competitors, and therefore cannot be acting in the public interest. My review of public documents suggests this theory is backwards and should be particularly alarming to the Court. The far more likely scenario, into which the Court must inquire, is whether the Department of Justice has executed Administration policy in response to the unprecedented campaign to influence the new Administration's antitrust policy generally, and as antitrust policy applies to the high-technology sector and Microsoft, in particular.

11. In fact, with the benefit of hindsight, various Justice Department actions make perfect sense in the context of my research. The Department went to great lengths to create the appearance they were going to be ''tough'' with Microsoft, beginning with enlisting President Bush's renowned litigator, Phillip Beck. What actually occurred, however, is they systematically appear to have given away their hard-fought court victory. First, the Department unilaterally abandoned its pursuit of structural relief, and informed the court it would not seek a review of the Sherman Act Section tying claim on remand. Then the Department suggested it would base its remedy on the interim conduct remedies ordered by Judge Jackson. Then the Department began speaking of the extensive litigation risk involved in pursuing a remedy based on the need for immediate relief. Finally, the Department—outside of public scrutiny—emerges with the Proposed Final Judgment, which based on Dr. Stiglitz'' analysis appears to be woefully inadequate.

12. I declare to the court that where ''there is smoke there is typically fire.'' Even if the ''fire'' in the context of modem day political influence peddling is very subtle, it nonetheless does not serve the public interest. My view is that Microsoft's political campaign has been so extensive the court should take immediate notice. In modem political influence-peddling and purchasing, Microsoft has set a new bar. South Korea's spreading cash throughout Washington in the 1970s Tongsun Park scandal paled in comparison.

13. During the course of my research I was struck by the similarities between Microsoft and the current scandal involving Enron Corporation. While Enron, of course, is in an entirely different business, it seems the core issue—from a public disclosure perspective—is its campaign contributions and its ability to influence the nation's energy policy. Microsoft's campaign contributions significantly surpassed those of Enron; Microsoft was a defendant in a major governmental lawsuit; and it appears Microsoft may have successfully influenced the Administration's antitrust policy, with major implications for legal antitrust precedent.

14. My recommendation to the court is to undertake an immediate review of Microsoft's lobbying activities surrounding this settlement, with particular attention to meetings with the Justice Department or the White House by Microsoft or its agents. Included in this review should also be contacts made on Microsoft's behalf to the Justice Department or the White House by Members of Congress, their official staff, and campaign staff. The court should also interview Department of Justice staff who do not operate within the sphere of political appointees. And the court should interview the political appointees of the Attorney General and their staff. Moreover, the court should review any contacts or communications between the Republican National Committee, the National Republican Senatorial Committee, the Republican Congressional Campaign Committee, and the White House or the Justice Department. Lastly, the court should review any contacts or communications between Microsoft and the settling states. Anything less would clearly not vindicate the public interest.

II. REVIEW OF PUBLIC RECORD

15. Since May 1998, Microsoft has fought strenuously in the courtroom to defend its ''freedom to innovate'' and to continue with business as usual. In fact, plugging in ''Microsoft + trial'' into the Google search engine produces more than 697,000 article hits. When ''Microsoft + politics'' is entered into the search engine, Google produced nearly 448,000 articles and links. But as hard as it fought inside the courtroom, Microsoft fought far harder—often secretly—outside the courtroom to influence the outcome of the trial. In a campaign unprecedented in its size, scope, and cost, Microsoft used campaign contributions, phony front groups, intensive lobbying, biased polling, and other creative, if not possibly unethical, pressure and public relations tactics to escape from the trial with its monopoly intact. According to media accounts, experts, and my own research, Microsoft spent tens of millions of dollars to attempt to create an aura outside the courtroom of what it could not prove inside—innocence. According to Business Week Magazine: ''Even seasoned Washington hands say they have never seen anything quite as flamboyant as the Microsoft effort.'' [3]

16. In late 2001, when the Department of Justice and a group of state Attorneys General agreed to the currently proposed settlement, it appeared as if Microsoft's efforts were successful. Fortunately, two obstacles stand in the way of Microsoft and the continued monopolization of the software industry: the remaining state Attorneys General who are continuing to litigate for a more effective remedy and the Tunney Act, which—among other things—requires Microsoft to divulge all of its dealings with the Administration and Congress in conjunction with the antitrust trial. A. Campaign Contributions

17. In 1995, before the United States Department of Justice and state Attorneys General from 19 states and the District of Columbia brought an antitrust case against it, Microsoft had virtually no presence in Washington, DC The company had only one lobbyist working out of a Chevy Chase, Maryland sales office and had contributed less than $50,000 in the previous election cycle. [4] Its lobbyist, Jack Krumholtz, had no secretary and its PAC was financed by only $16,000. In those days, the Microsoft lobbying operation was affectionately referred to in press reports as ''Jack and his Jeep.''

18. However, since the beginning of the antitrust case against Microsoft, the company has become a major political contributor and was the fifth largest during the 2000 election cycle [5], alongside the giants of the tobacco, telecommunications, pharmaceuticals and insurance industries. Microsoft's political contributions to elected leaders in a position to help the software giant in this election cycle when the trial was at its peak, was greater than all previous, cumulative campaign contributions. In the history of American PACs, only three companies that have raised at least $50K in one election cycle have increased receipts by 500% in the next. In 1984–86, Drexel Burnham Lambert, the corrupt and now-defunct securities brokerage, increased its receipts from just under $67,000 to more than $446,000, a 567% jump. In that same cycle, AT&T, facing antitrust divestiture, increased its PAC receipts by 745%, from $215,000 to $1.8 million. In the history of corporate PACs, only 68 have increased their spending by half in one election cycle after reaching a level of a quarter of a million dollars. Only 15 have doubled their spending in one election cycle after reaching that level. Only one—Microsoft—has approached tripling its spending after reaching that threshold. Microsoft increased its spending almost fivefold, from $267,000 to more than $1.2 million, between the 1997–98 and 1999–2000 election cycles. (Table 5.)

20. Every year, Microsoft tops itself. The company's political giving in the 2000

[3] BusinessWeek, May 15, 2000, Carney

[4] ''The Microsoft Playbook'' Common Cause

[5] San Francisco Chronicle, July 1, 2001, Wildermuth

cycle—the time leading up to its day of judgment in federal court—was again more than it contributed in all previous cycles combined. Campaign money to candidates and political parties in just one state was greater than Microsoft's contributions from 1990 through 1996 to every state and federal candidate combined. (Note that the government first levied antitrust charges against Microsoft in 1995.)

Except for Microsoft, no corporate PAC sponsor in American history has increased its PAC receipts by an order of magnitude, starting from a base of $50,000 or more. Since 1986, the only such firm that has increased its PAC receipts by as much as 500% in one election cycle is Microsoft. Receipts for Microsoft's PAC rose a record-setting 903%, froth $59,790 in 1995–96 to just under $600,000 in 1997–98. (Table 1.) Microsoft followed this by another jump of 165% in 1999–2000, to $1.59 million. (Table 2.) In the history of corporate PACs, only 15 have had as much as a 300% rise in receipts after achieving a base of $50,000. (That requires rising from at least $50,000 to at least $200,000.) None has ever followed such a rise with another three-digit percentage increase in receipts, except Microsoft. (That would require a subsequent rise to at least $400,000.) 21. Between 1995 and 2000, Microsoft donated more than $3.5 million to federal candidates and to the national parties, about two-thirds of which was contributed during the 2000 election cycle alone.[6] Including company and employee donations to political parties, candidates and PACs in the 2000 election cycle, Microsoft's giving (that of the company, its PAC and its employees) amounted to more than $6.1 million, far more than has been previously reported. [7] Nearly $1 million came in the 40 days immediately before the November 7th election. As most political operatives know, these late contributions often are made by donors who don't want their participation known until after the election, when financial reports for the final days of a campaign are due, and public and news media attention are no longer focused upon the election. The effect of delaying contributions until very near the election is to thwart efforts by the news media and the political opposition to make disclosures meaningful to voters before they vote.

i. Federal Contributions

(a) ''Soft'' Money

22. Comprising the majority of Microsoft's campaign contributions was soft money.[8] Like their overall presence in Washington, Microsoft's soft money donations grew substantially since the beginning of the antitrust trial. In fact, in the seven days preceding Judge Thomas Penfield Jackson's ruling against Microsoft, the company donated more in soft money to the national political parties than it gave to federal candidates and political parties between 1989 and 1996. 23. During the 1999–2000 election cycle, Microsoft and its executives accounted for some $2,298,551 in ''soft money'' contributions, according to FEC records. For context, consider that this was two-thirds more than the $1,546,055 in soft money contributed by the now-bankrupt Enron and its executives during the same period. candidates and political parties and PACs federally and in all 50 states.

As one business commentator put it: ''...there's something quite disturbing about watching the world's richest man trying to buy his way out of trouble with Uncle Sam... Gates's actions undermine the legal system itself.'' [9]

(b) Political Action Committee (PAC) Money

24. Microsoft's PAC donations also grew substantially in the years since the beginning of the antitrust trial. In 1998, the company made a concerted effort to increase the size of its PAC.

Within a matter of days, the company grew its PAC from $31,000 to $326,000. [10] Employees contributed $1.6 million to Microsoft's PAC for the 2000 election cycle which allowed the PAC to contribute more than $1.2 million. The PAC began the 2002 election cycle with an impressive $772,000 cash-on-hand—more than any other American corporate PAC.

Microsoft's unprecedented rise as a political player took its PAC from just under $60,000 in 1995- 96 receipts to just under $1.6 million in 1999–2000. In the history of corporate PACs, only two have had a rise of more than 1,000% in receipts over four years (two election cycles), after attaining $50,000. Only one, Microsoft, has had an increase of more than 2,000%. From 1995–96 through 1999–2000, Microsoft's PAC increased in size by more than 2,500%. (Table 4.)

(c) Party Breakdown

25. While Microsoft has donated to both national political parties, the company has tended to favor Republicans, who have been more vocal in their defense of the company. Between 1995 and 1998, 72% of Microsoft's contributions went to Republicans, while the GOP received only 55% of the company's donations during the 2000 election cycle. [11] Republicans received a total of $3.2 million, about half of which—$1.69 million—went to the national Republican Party. 26. Yet, when analyzing Microsoft's campaign contributions by donating entity, some stark disparities emerge. Virtually all of the money donated by individual Microsoft employees ($222,750) benefited Democratic 527s, groups that raise and spend money independent of political campaigns During this same period Microsoft employees gave $15,000 to Republican affiliated 527s. Democratic PACs also benefited from Microsoft's employees largesse, receiving $222,100 compared to just $42,875 for Republican PACs.

27. But Republicans enjoyed an edge in every other category; the majority of donations to leadership PACs, state parties and candidates went to the Republican Party. The following table illustrates the disparity.

Republican Democrat

Leadership PACs $162,000 $41,500

State Parties $255,025 $38,887

Candidates $1,053,792 $818,951

(ii) State Contributions

28. Along with the Department of Justice, 19 states and the District of Columbia initially prosecuted Microsoft. Naturally, then, Microsoft concentrated a good deal of its campaign contributions on state races.

29. Candidates and political parties in all 50 states received contributions from Microsoft, but none more so than the company's home state of Washington, which received $830,478. Republicans received $359,000 while $458,000 went to Democrats. Nearly all of the $100,000 edge for the Democrats came from contributions to the State Democratic Party, which totaled $85,387. 30. One of the original states participating in the suit was South Carolina, whose attorney general, Charles Condon, was facing re-election in 1998. Shortly before the election, Microsoft contributed $25,000 to the South Carolina Republican Party. According to the Chairman of the South Carolina Republican Party this was the largest unsolicited donation ever received. Three weeks after he won, Attorney General Condon withdrew from the antitrust case. Two years ago, Condon solicited and received a $3,500 donation from Microsoft.[12]

31. In California, a state represented by Attorney General Bill Lockyer, Microsoft contributed $25,000 to the 1998 election campaign for challenger Dave Stirling, a Republican; a contribution made nine days before election day. The company contributed an additional $10,000 to gubernatorial democratic candidate Gray Davis, whose opponent was among the original 19 state attorneys general to bring the antitrust suit against Microsoft.

32. Within weeks of the 2000 election, Microsoft CEO Steve Ballmer made late contributions of $50,000 each to two state Republican Parties, Michigan and Washington, where Microsoft found its defenders under fire. Then U.S. Senator Spencer Abraham, a Michigan Republican who is now Secretary of Energy, had been an outspoken supporter of Microsoft. Former U.S. Senator Slade Gorton, a Washington state Republican, who proudly called himself ''the Senator from Microsoft'' had even sought to cut the funding of the Justice Department's Antitrust Division while the court case was ongoing.

33. Microsoft used back channels to direct even more undisclosed soft money into the 2000 Michigan Senate race. According to The Wall Street Journal, Microsoft ''funneled'' soft money into the race by secretly making undisclosed contributions to the Michigan Chamber of Commerce to fund negative ads aimed at Abraham's opponent, now U.S. Senator Deborah Stabenow. Some close to the Chamber have estimated that the contributions, while legal and not requiring reporting, may have amounted to more than $250,000.[13] Such contributions are usually made to organizations to support the organization's activities, not political ads—which is why there is no disclosure

[6] Common Cause

[7] Independent analysis of giving to elective office

[8] ''Soft'' money is the term generally applied to unregulated, unlimited corporate and individual contributions that can not go to candidates but typically goes to political parties in support of party ''efforts.''

[9] BusinessWeek, April 24, 2000, France

[10] ibid.

[11] ibid.

[12] USA Today, 5–30–00, Ullman, Drinkard

[13] Wall Street Journal, Oct. 16, 2000, Wilke

requirement. Microsoft knew this and took advantage of the loophole in Michigan. Political operatives throughout the country reported similar occurrences in other political races considered ''top targets'' by both national parties, but efforts to gain access to contributor lists from some of the ''independent'' groups believed to be accepting the contributions have unsuccessful.

34. Significant contributions were also made in Missouri by Microsoft to help re-elect Senator John Ashcroft, the current U.S. Attorney General. Missouri was another state where independent groups without significant resources of their own suddenly were flush with money to run ads defending Ashcroft and attacking his opponent. Ashcroft, whose campaign benefited greatly from Microsoft's disclosed campaign contributions—$19,000 in reported donations—lost his election bid. He now runs the federal executive department responsible for proposing the settlement offer, and his office is now staffed with political operatives who played a role in raising the $19,000 from Microsoft, coordinating his campaign efforts with those of Microsoft in Missouri, and in one case, directing the entire Republican National Committee fundraising and political campaign operation in the 2000 election cycle.

35. Deborah Senn, the Democratic primary opponent of Washington State Senator Cantwell, received $15,000 more from Microsoft than did Cantwell who received $30,150. This total, however, dwarfs the money poured into now-former Senator Gorton's campaign—$131,160. Only

Democratic Congressman Jay Inslee's total of $126,850 comes close to that of former Senator Gorton. Congressman Inslee represents Microsoft's home district, and defends the company vigorously in Washington, D.C.

36. In addition to those in Washington State, candidates or parties in three other states received contributions totaling six figures. California was second at $174,900 with virtually the entire amount going to Leadership PACs—Members'' PACs that contribute money to other allied candidates—and directly to Members of Congress. Texas was third at $107,250 although this amount does not include contributions to the Bush/Cheney campaign. This was an unusually large amount for the state when compared to previous giving patterns.

37. While Microsoft contributed $100,000 to the Bush/Cheney Inaugural Committee in January 2001, virtually all contributions to presidential campaigns were made prior to July 31st, with the exception of contributions to Libertarian Party candidate Harry Browne's campaign. (This is presumably because, to be eligible for federal matching funds for the primaries and federal funding for the general election, major party candidates receiving are not allowed to solicit or receive campaign contributions after they are nominated at their conventions.) Only four primary presidential candidates received contributions greater than $10,000: Bill Bradley, $33,400; George Bush, $57,300; Al Gore, $28,000, John McCain $39,448.

Table 1. Candidates & Organizations Receiving $10,000 or more from Microsoft Following is a breakdown of Microsoft's contributions of more than $10,000 to candidates and organizations during the 2000 election cycle.

Abraham for Senate $24,650.00 Kerrey for US Senate $10,000.00

Adam Smith for Congress $31,750.00 Leadership PAC 2000 (Oxley) $10,000.00

American Success PAC(Drier) $11,750.00 Majority Leader's Fund (Armey) $11,000.00

Ashcroft (combined) $19,250.00 McCain 2000 $39,448.00

Bill Bradley for President $33,400.00 McIntosh for Governor $25,000.00

Brian Baird for Congress $38,400.00 Michigan Republican State Ctte. $50,000.00

Bush for President $57,300.00 Montana Republican State Ctte. $10,000.00

Bush/Cheney Inaugural $100,000.00 NDN $38,750.00

California FriendsLatino PAC $10,000.00 New Majority Project $15,000.00

California Women Vote $10,000.00 New York Senate 2000 $40,000.00

Cantwell 2000 $30,150.00 NWLeadership PAC (Gorton) $17,000.00

Citizens for Rick Larsen $35,600.00 Republican Party $1,691,090.50

DASHPAC $10,000.00 Republican Campaign Committee of New Mexico $33,492.48

Democratic Party $1,300,892.00 Republican Majority Fund (Don Nickles) $15,000.00

Democratic Party of Georgia $20,000.00 Republican Party of Virginia $12,000.00

Dooley for Congress $10,500.00 Republican Senate Council $15,000.00

EMILY's List $176,600.00 Santorum 2000 $11,000.00

Ensign for Senate $10,000.00 Senn 2000 $45,651.00

Feinstein 2000 $12,000.00 Snowe for Senate $10,000.00

Friends for Slade Gorton $131,160.00 TechNet $10,000.00

Friends of Conrad Bums $15,250.00 Utah Republican Party $29,383.00

Friends of Heidi $16,300.00 Washington State Democratic Central Committee $30,387.00

Friends of Jennifer Dunn $14,700.00 Washington State Republican Party $104,150.00

Gore for President $28,000.00 Washington Victory Committee 1999 $35,500.00

Inslee for Congress $126,850.00 Washington Victory Fund $55,000.00

Jim Davis for Congress $17,250.00 Washington Women Vote $11,000.00

Jon Kyl for Senate $11,000.00 Western Republican PAC $10,000.00

Kennedy for Senate $12,000.00 Women Vote 2000 $100,000.00

B. ''Strategic'' Philanthropy

38. Microsoft has also contributed money to the causes of politicians as yet another method to use donations, political in nature, to gamer support and ultimately influence the outcome of the trial.

39. According to USA Today, Microsoft and the philanthropic arm of its founder and chairman, the Bill and Melinda Gates Foundation, ''donate millions of dollars to causes and projects that are dear to the hearts of government policymakers, such as a $50,000 gift to the Congressional Black Caucus Foundation.'' [14] Shortly after the donation to the CBC, according to Business Week, Microsoft gained an unlikely ally in the Caucus chairman, Representative James E. Clyburn (D- SC), ''who represents one of the least technology-rich districts in the country.'' [15] In addition, a timely $10 million gift to the U.S. Capitol Visitor's Center further endeared Microsoft to many Members of Congress.

40. Yet the strategic philanthropy began long before the 2000 election cycle. According to the Gates Foundation web site, there was a three-year hiatus in philanthropic giving between 1995 and 1998. Curiously, the last donation in 1995 occurred just prior to the signing of the 1995 consent decree and the first donation in 1998 occurred the day prior to the Department of Justice filing its antitrust suit against Microsoft.

c. Lobbying

41. In addition to the millions Microsoft spent on campaign contributions, the company spent millions more lobbying Congress, the Administration and state officials to influence the outcome of the antitrust trial. Much like its campaign contributions, the company's lobbying presence in

Washington has grown significantly in the last few years, its growth accelerating rapidly at the outset of the antitrust trial. Once just Jack Krumholtz, the company's lobbying group now employs

40 people in Redmond and Washington. The company has hired a dozen lobbying firms and counts among its consultants and lobbyists some of the most prominent figures in politics. A company with 30,000 employees, Microsoft has more lobbyists on retainer than the handful of U.S. companies with more than 300,000 employees. According to USA Today, ''in 1996, the company spent $1.2 million on its Washington lobbying operations. [In 1999], that figure topped $4.6 million.'' According to Business Week in reference to the company's political spending, ''These days, Microsoft money flows like champagne at a wedding.'' [16] Some of the biggest names in Washington going back 30 years represent Microsoft—many are former bosses of the people they lobby. There are more than a half-dozen former Members of Congress, four former White House Chief Counsels, countless dozens of former senior aides from the Congress, Justice Department and elsewhere throughout the highest levels of government.

i. Lobbying the Administration

42. Since the inauguration of George W, Bush in January 2001, Microsoft has made a concerted effort to strengthen its ties to the Administration. The Administration's decision to agree to a settlement widely accepted to be ineffective calls into question the nature of such ties.

---

[14] USA Today, May 30, 2000, Drinkard, Ullman

[15] BusinessWeek, May 15, 2000, Carney, Borrus, Greene

[16] 16 ibid.

43. Prior to the announcement of the settlement, for example, it has been reported there was an inappropriate, if not illegal, discussion between a senior aide to Attorney General John Ashcroft and a lobbyist for AOL-Time Warner.

44. According to the account in the New York Times, the senior aide to General Ashcroft is David Israelite. Israelite was the political director of the Republican National Committee which received more than a million dollars from Microsoft during the 2000 presidential campaign.

In that role, Mr. Israelite directed fundraising operations and coordinated campaign activities between entities like Microsoft and the national party apparatus. Now General Ashcroft's deputy chief of staff in the Office of the Attorney General, Mr. Israelite recused himself from the case as a result of his ownership of 100 shares of Microsoft stock.

45. The Times wrote, ''According to the notes of a person briefed about the conversation on Oct. 9, the day it is said to have occurred, Mr. Israelite called [AOL lobbyist] Mr. [Wayne] Berman. ''Are you guys behind this business of the states hiring their own lawyers in the Microsoft case?'' Mr. Israelite asked Mr. Berman in the predawn conversation, according to the notes. 'Tell your clients we wouldn't be too happy about that.''

46. Israelite allegedly said on that call that the Supreme Court was soon to deny Microsoft's appeal, which would prompt the Department of Justice to seek a settlement. He was reported to have complained that AOL was ''radicalizing'' the states. [17] While the conversation was confirmed, the participants denied the content of the conversation. Still, it was enough to provoke angry responses from the technology industry and an accusation of ''inappropriate and possibly illegal'' conduct from a key House Democrat, Congressman John Conyers, Ranking Democratic Member of the House Judiciary Committee. In a letter to Attorney General Ashcroft, Rep. Conyers asked for more information about Israelite's alleged contacts with Berman, specifically asking for a list of contacts between Israelite and AOL officials. ''If the allegations reported by the media are true, such active involvement by a recused public official could violate federal conflict of interest laws,'' Conyers wrote. [18]

ii. Lobbying on the Campaign Trail

47. Mirroring its political giving strategy, Microsoft's lobbying strategy has focused mainly on Republicans, while hedging its bets and simultaneously courting Democrats to a slightly lesser extent. 48. During the campaign, Microsoft Chairman Bill Gates was asked if a Republican administration would be a positive development for the company. It would ''help,'' he said. [19] After all, before Judge Jackson ruled against Microsoft, then Governor Bush was quoted as saying that he stood ''on the side of innovation, not litigation.''

49. In fact, according to Newsweek Magazine, Bill Gates's visit to then Governor Bush in Austin was ''part of a delicate political dance between the software giant and the Republican Party .... Dollar signs in their eyes, GOP leaders covet big political contributions from Microsoft's coffers. In turn, Microsoft executives, plagued by the Clinton Justice Department's lawsuit, hope that a Republican president and Congress might shut down the efforts to punish the company.'' 50. A number of other Microsoft executives, lobbyists and other paid counsel lead back to the Bush camp. The company's Chief Operating Officer, Steve Ballmer, served then Governor Bush as a technology adviser. Tony Feather, former Bush political director, is a partner with a Republican consulting firm Microsoft hired to manage grassroots lobbying efforts. And Microsoft has paid lobbyist and former head of the Republican Party Haley Barbour hundreds of thousands of dollars to assist the company in Washington. The company has also hired Vin Weber, a former Republican Congressman, and Michael Deaver, the former White House chief of staff and trusted adviser credited with crafting President Ronald Reagan's image and campaign advertisements in the 1980s. 51. In addition, Microsoft retained the services of Ralph Reed's Century Strategies ''for the stated purpose of improving the company's public image.'' [20] Reed's firm—a paid consultant to the Bush campaign—aimed itself at mobilizing Bush supporters to express to the candidate their dissatisfaction with the antitrust trial. Once it was reported in the New York Times, the firm issued an apology. The Wall Street Journal later reported more on Ralph Reed's lobbying efforts on Microsoft's behalf:

''BOUNTY PAYMENTS are offered for pro-Microsoft letters and calls. Republican Ralph Reed's lobbying firm coordinates a network of public-relations and lobbying partners that generates grass-roots comments for cash. Payments are for letters, calls and visits to lawmakers and policy makers. An e-mail offers sample letters opposing a Microsoft breakup. A letter to a member of Congress from a mayor or local Republican Party official is worth $200, the guidelines say. A ''premier'' letter or visit by a fund-raiser known to the lawmaker or a family member can be worth up to $450 apiece. An op-ed piece in local papers fetches $500.'' [21]

52. Microsoft was lobbying the Democratic side as well. Like its team of Republican all-stars, Microsoft's team of Democrats had very close ties to its party as well. The team included ''super lobbyist'' Tommy Boggs, a top Washington insider with deep Democratic ties, Tom Downey, a former Democratic Congressman with close ties to former Vice President Al Gore, and Craig Smith, former campaign manager for Gore and board member of the Microsoft front group, Americans for Technology Leadership. As a board member of the ATL, Smith wrote to the Democratic National Committee urging his fellow party members to abandon support for the antitrust case, citing that support ''would make us vulnerable to attack in the general election.'' [22]

53. The company also hired Ginny Terzano, former Gore press secretary, and tobacco industry ad man Carter Eskew, a former Gore adviser-cum-Microsoft image consultant who helped craft the company's 1999 advertising campaign aimed at bolstering its reputation as a ''good corporate citizen.'' Also retained by Microsoft was super-lobbyist Jack Quinn, former Chief of Staff to Vice President Al Gore and White House Counsel.

iii. Lobbying Capitol Hill

54. But Microsoft did not focus solely on lobbying those who would soon be in control of the Department of Justice. Microsoft also waged a massive lobbying campaign aimed at Congress.

55. Alongside its Administration-oriented team, Microsoft recruited more lobbyists and consultants with ties to Members of Congress on both sides of the aisle. Republican hires included Allison McSlarrow, former deputy chief of staff to Senate Majority Leader Trent Lott, Ed Kutler, former assistant to then Speaker of the House Newt Gingrich, Mitch Bainwol, former chief of staff to the Senate Republican Caucus and the Republcian National Committee, Kerry Knott, former chief of staff to House Majority Leader Richard Armey, Ed Gillespie, former Armey and Republican National Committee communications director, and Mimi Simoneaux, former legislative director to House Commerce Committee Chairman Billy Tauzin, who was then-chairman of the House subcommittee with jurisdiction over the technology industry.

56. Among the Democrats lobbying on behalf of Microsoft were Jamie Houton, former associate director of the Senate Democratic Steering Committee, former Democratic Representative Vic Fazio, the third-highest ranking House Democrat, and his former top staffer Tom Jurkovich.

57. Despite Microsoft's assertion in its mere three-page Tunney Act disclosure filing, the company has incessantly used its tremendous resources to contact and influence Members of Congress. Over the course of a 16-month period beginning in 1999, Microsoft flew at least 130 Members of Congress or their staff to the company's headquarters in Redmond, Washington to lobby on a number of issues, including the antitrust case.

58. Perhaps the most egregious example of its heavy-handed largesse came in late 1999, when Microsoft lobbied Congress to cut $9 million from the budget for the Department of Justice's Antitrust Division, the very body that was leading the prosecution against Microsoft. Pilloried industries like the gun and tobacco had considered and rejected the strategy as overly bold.

59. According to the Washington Post, ''Nonprofit organizations that receive financial support from [Microsoft] have also urged key congressional appropriators to limit spending for the division .... The non profits made their request in a letter last month after an all-expenses-paid trip to Microsoft headquarters in Redmond, Washington, where they were entertained and briefed on an array of issues facing the company.'' Further discussion follows in the next section entitled ''Front Groups.''

[17] 17 New York Times, Nov. 2, 2001

[18] The Kansas City Star, Nov. 8, 2000, Kraske

[19] Common Cause, ''The Microsoft Playbook''

[20] 20 ibid.

[21] WSJ, Oct. 20, 2000

[22] Common Cause, ''The Microsoft Playbook''

60. After the previously secret letters from these non-profit groups were exposed, news of the attempts received widespread bipartisan criticism from media and politicians alike. House Judiciary Committee Chairman Henry Hyde (R-IL), called the division ''one of the best-run departments in the government.'' Senator Herb Kohl, a Democrat on the Senate Judiciary Committee's antitrust subcommittee, said ''it would set [a] terrible precedent to alter the division's budget based on one case alone.'' ''It's like the Mafia trying to defund the FBI,'' said a prominent member of the Washington antitrust bar. [23] According to Jan McDavid, a lawyer with the Washington firm of Hogan & Hartson and chairperson of the American Bar Association's antitrust section, the section's policy states that it ''opposes the use of the congressional budget and appropriations process to intervene in or influence ongoing antitrust enforcement matters.'' [24]One congressional GOP staffer went as far as to say that Microsoft's lobbying had ''the odor of obstruction.'' [25]

61. Not surprisingly, Senator Slade Gorton, a Republican from Microsoft's home state of Washington, was adamantly supportive of the idea. Between 1997 and 1999, he received more than $50,000 from Microsoft and its employees. During the 2000 election cycle, Gorton's PAC received $17,000 while the Washington State Republican Party received more than $100,000.

iv. Lobbying the States

62. Because 19 state attorneys general initiated the antitrust case alongside the Department of Justice, Microsoft initiated a state lobbying campaign aimed at influencing those attorneys general to back away from the case. Microsoft even hired former Iowa House Speaker Donald Avenson to lobby the state's Attorney General, who was leading the group of states prosecuting the company. While Microsoft has retained professional ''grassroots consultants'' and others in many states, according to published reports, it is their efforts in the 19 states with Attorneys General who brought suit against them where the real pressure has occurred. In those states they have retained former lawmakers, law partners of the Attorneys General, their predecessors in that same office, business associates, and their own trusted political consultants. Microsoft has also hired those on whom the AGs are often most politically dependent, such as union leaders and activists in states with Democratic Attorneys General, and fiscally conservative activists in state with Republican AGs.

63. Perhaps the company's most successful effort to influence the state attorneys general came in 1998, when, three days after a $25,000 contribution to the South Carolina Republican Party, the state's Attorney General, Charles Condon, announced that he would withdraw from the case.

64. Yet, a few of its grassroots efforts targeted at the states have done more harm than good. Because of the unprecedented size, scope and cost of Microsoft's campaign, a number of high profile gaffes have exhibited the true nature of Microsoft's ''public support'' and the depths to which the company will go to influence the outcome of the trial.

65. In August 2001, the Los Angeles Times reported that two letters received by the Utah Attorney General's office, one of the prosecuting states, were sent by dead men. The campaign was funded by Craig Smith's Americans for Technology Leadership. Despite its claims to represent ''thousands of small and mid-sized technology companies,'' news reports have repeatedly characterized ATL and its counterpart, the Association for Competitive Technology (ACT) as essentially wholly- owned subsidiaries of Microsoft Corp., whose funding launched and sustains both groups. [26] Other characteristics of the letter writing campaign to the Attorneys General included similar phrases popping up again and again, invalid return addresses, and even masses of identical letters with different signatories.

66. In one news story, Jim Prendergast, director of ATL, initially admitted only to providing letter writers with ''message points.'' ''We gave them a few bullet points, but that's about the extent of it,'' he said. When asked why identical phrases were popping up again and again, he confessed that sometimes ATL did indeed provide whole letters for the citizens to sign and send. ''We'd write the letter and then send it to them,'' he admitted.

67. According to the same article, other states, like Minnesota and Iowa, were subjected to Microsoft's full-press grassroots lobbying campaign. Both states are participants in the antitrust case. In the case of Iowa, Attorney General Tom Miller received more than 50 letters in a month's time calling on him to drop the case. While none of the letters were identical, several phrases were similar. In four of the letters, for example, the following sentence appeared: ''Strong competition and innovation have been the twin hallmarks of the technology industry.'' Three others contained this sentence: ''If the future is going to be as successful as the recent past, the technology sector must remain free from excess regulation.'' [27]

68. Minnesota Attorney General Michael Hatch, who received 300 identical letters, characterized the campaign as ''sleazy.'' Many of the letter writers were misled by Microsoft and one even wrote by hand to Attorney General Hatch to say so and to apologize for his previous letter. ''I sure was misled,'' he wrote. ''It's time for you to get out there and kick butt.'' [28]

vi. Tying Up the Lobbyists and Lawyers

69. A frequently employed tactic of Microsoft is to retain all major lobbying firms in key states so that its opposition cannot. Similarly, the company has hired many Washington, DC-based law firms with antitrust expertise to work on issues not related to the antitrust case. ''They've got the whole town conflicted out,'' said one attorney. ''They've sucked out all the oxygen.'' [29]

D. Front Groups 70. Supporting its political contributions and lobbying campaign, Microsoft undertook an aggressive public relations campaign aimed at ''creating the appearance of a groundswell of public support for the company.'' [30]

71. In April 1998, a reporter for the Los Angeles Times received a package of confidential materials created by Edelman Public Relations for its client, Microsoft. Among the documents was a media relations strategy for a ''multi-million dollar'' campaign aimed at stemming the rash of antitrust investigations being undertaken by a number of states in conjunction with the federal government's investigation. According to the reporters, Greg Miller and Leslie Helm, ''the elaborate plan ... hinges on a number of unusual—and some say unethical—tactics, including the planting of articles, letters to the editor and opinion pieces to be commissioned by Microsoft's top media handlers but presented by local firms as spontaneous testimonials.'' [31] While Microsoft contends that this strategy was never implemented, a number of the company's activities since the outset of the trial clearly indicate that most of the elements have been employed, at times repeatedly.

72. Throughout the antitrust trial, Microsoft relied heavily on many ''independent'' groups to support the company and to oppose the suit publicly. Some groups they created themselves out of whole cloth during the trial. Others sullied their long, distinguished backgrounds by trading hard cash for the use of their good names. Many denied any involvement with Microsoft, claiming that their passion came from concern for the economy or ''innovation''—only to later be unmasked by the news media when evidence of their financial dealings with Microsoft came to light. One account suggests Microsoft has harnessed at least 15 advocacy groups and think tanks that use Microsoft donations to spread the company's message through polls, news conferences, Web sites, letters to the editor, research papers, opinion pieces and letter-writing campaigns aimed at lawmakers. [32]

73. Groups with names like Americans for Technology Leadership and the Association for Competitive Technology had the veneer of genuine independence, but were actually founded by Microsoft, launched with Microsoft dollars, and work on few other issues than the defense of Microsoft in its antitrust trial.

74. Even well known Washington, DC organizations with strong ties to the Administration and to Congress were well funded by Microsoft—respected fiscally conservative groups like Grover Norquist's Americans for Tax Reform, former White House Counsel C. Boyden Grey's Citizens for a Sound Economy, the National Taxpayers Union and Citizens Against Government Waste. But upon closer scrutiny, the true ties of these groups to Microsoft became apparent. By paying for pro-Microsoft advertisements, by sponsoring publications, by donating money outright, Microsoft both ensured and devalued their support.

75. According to Business Week, Microsoft ''secretly funds those that do its public-relations work and pulls funding from those that dare question its positions.'' [33] On one such occasion, Microsoft pulled funding from the American Enterprise Institute once one of its fellows, Robert Bork, came out in favor of the antitrust trial even though the institute itself has no position on the trial and many of its technical and antitrust experts have expressed their opposition to the case. In another case, they quit a technology industry trade group, the Software and Information Industry Association, because a majority of its members supported the antitrust case.

i. Independent Institute

76. In one instance, Microsoft paid for the placement of newspaper advertisements by the California-based Independent Institute. Published in June 1999 in the New York Times and the Washington Post, the full-page ads featured a pro-Microsoft letter signed by 240 academics. Nothing in the ad's copy indicated to readers who—other than the Institute itself- was paying for the ads. Apparently, no one at the Independent Institute indicated to the letter's 240 signatories who was paying for the ad either. One signatory, Professor Simon Hakim of Temple University, stated that he would not have signed on to the advertisement had he known who was behind it. [34]

77. At a Washington, DC press conference unveiling the ads, Independent Institute president David Theroux answered a reporter's specific question about whether Microsoft had anything to do with the ads, including paying for them, with a resounding ''no.'' When questioned months later by the New York Times, Theroux again denied that Microsoft paid for the ads. He said, instead, that the ads ''were paid for out of our general funds.'' He also said the ''implication that Microsoft had any influence is ridiculous.'' [35] But, according to a front-page article later written in the New York Times, ''among the institute's internal documents is a bill from Mr. Theroux sent to John A. C. Kelly of Microsoft for the full costs of the ads, plus his travel expenses from San Francisco to Washington for the news conference, totaling $153,868.67. Included was a $5,966 bill for airline tickets for himself (Theroux) and a colleague. Unfortunately, he wrote Mr. Kelly, 'the airlines were heavily booked'' and 'we had to fly first class to DC and business class on the return.''' Furthermore, despite additional statements from its president that it ''adheres to the highest standards of independent scholarly inquiry,'' internal institute documents have shown that, having contributed more than $200,000, or 20% of the institute's total outside contributions, Microsoft ''secretly served as the institute's largest outside benefactor [in 1999].'' [36] It wasn't until September that the institute finally admitted the extent of Microsoft's support.

78. In these instances, as in others, Microsoft's behavior outside the courtroom had a direct impact on the proceedings inside the courtroom. According to the New York Times, the ads prompted not only more news stories but also courtroom discussion. [37] Microsoft also covered the costs of the publication of the institute's book, ''Winners, Losers and Microsoft: Competition and Antitrust in High Technology,'' which Microsoft's economic witness in the trial then used to support his own testimony.

ii. Biased Polling

79. According to Business Week, Microsoft has also commissioned polls to help foster an image of great public support for the company. At the outset of the 2000 presidential campaign, around the time of the Iowa caucus and the New Hampshire primary, Microsoft funded polls aimed at demonstrating the public's opposition to the antitrust case. Once the results were in, Microsoft distributed the results to the media in order to compel the candidates to incorporate their opposition to the case into their platform.

80. In addition, while the state Attorneys General were working through the spring on formulating a remedy, Microsoft front group Americans for Technology Leadership conducted and issued the results of a poll, which concluded that the public wanted the Attorneys General to focus their time and energy on other issues. In this case, Microsoft failed to disclose the nature of its relationship with ATL and the source of funding for the poll.

iii. Targeting the Antitrust Division of the Department of Justice

81. As stated above, one of Microsoft's most egregious attempts to use lobbying to influence the outcome of the antitrust trial came when the company lobbied to cut funding for the Antitrust Division of the Department of Justice. Microsoft funded a host of third parties to push forth its agenda.

82. In September 1999, the company flew representatives from about 15 major Washington, DC- based think tanks to Microsoft's Redmond, Washington headquarters ''for three days of briefings that included tickets to a Seattle Mariners game and dinner and entertainment at Seattle's Teatro ZinZani, according to an itinerary.'' [38]Among the groups were Citizens for a Sound Economy, the National Taxpayers Union and Americans for Tax Reform, whose president, Grover Norquist, received $40,000 in lobbying payments from Microsoft during the second half of 1998.

83. Two days after returning from the trip, those three groups and three others secretly sent a letter to House appropriators urging that the Antitrust Division receive the lowest amount of funding proposed. In a coordinated effort, on the same day one of Microsoft's own lobbyists, Kerry Knott, met with Rep. Dan Miller of Florida to urge him to grant the Antitrust Division the lower amount of funds. That meeting prompted Rep. Miller to write to the chairman of the House Appropriations Commerce, Justice, State and Judiciary Subcommittee that ''it would be a devastating blow to the high-tech industry and to our overall economy if the federal government succeeds in its efforts to regulate this industry through litigation.'' According to the Washington Post, ''Miller said that while he objects to the funding on fiscal grounds, he had not focused on it until Knott and Citizens for a Sound Economy spokeswoman Christin Tinsworth, a former Miller staffer, made their pitch just off the House floor.'' [39]

84. A Washington Post editorial summarized the propriety of the incident this way: ''[T]he fact that Microsoft has the right to lobby ... doesn't make the lobbying any less unseemly. If Microsoft has a gripe, it should make its complaint to the court hearing its case.'' [40]

III. CONCLUSIONS

85. The end result of Microsoft's unprecedented political campaign seems to have been rewarded by the weak settlement presented by the Department of Justice.

Respectfully Submitted,

Edward Roeder

January 28, 2002

APPENDIX A: Selected Tables

Table 1. Rapid Rises in Corporate PAC Fundraising, 1979–2002

(After Raising More than $50,000)

Microsoft Corporation, Formed: 1987–88, Total Raised, 1995–96: $59,750, Total Raised, 1997–98: $599,568, Difference: $539,818 = 903.46% Rank: 1

American Telephone & Telegraph Co., Formed: 1983–84, Total Raised, 1983–84: $215,423, Total Raised, 1985–86: $1,820,621, Difference: $1,605,198 = 745.14% Rank: 2

Drexel Burnham Lambert Group, Inc. Formed: 1981–82, Total Raised, 1983–84: $66,844, Total Raised, 1985–86: $446,279, Difference: $379,435 = 567.64% Rank: 3

Safari Club International Formed: 1979–80, Total Raised, 1993=94: $94,149, Total Raised, 1995–96: $545,915, Difference: $451,766 = 479.84% Rank: 4

Fluor Corporation Formed: 1979–80, Total Raised, 1987–88: $87,236, Total Raised,

[34]

I am aware there have been allegations that material relating to the Independent Institute was uncovered by Investigative Group International (IGI), allegedly retained by Oracle Corporation. My understanding of the circumstances indicates that employees of IGI's were terminated as a result of their actions. I have not reviewed those allegations specifically, since the subject of my review was defendant, Microsoft Corporation. Regardless, neither the Independent Institute nor Microsoft ever denied the validity of the claims after they were exposed.

Subject: Microsoft Settlement
I disagree with the PFJ because it does not end Microsoft's monopoly but may allow MS to extend and expand its monopoly! Enforcement of the PFJ appears nearly impossible to enforce.
Thank you for considering my opinions.

I. Introduction
These comments on the Proposed Final Judgment [1] (''PFJ'') and the Competitive Impact Statement [2] (''CIS'') in the Microsoft case are submitted to provide the Department of Justice (''DOJ'') and the Court with information and analysis based on nearly five years of research by the authors on the legal, policy and economic implications of this landmark proceeding. Based on that research, it is our assessment that (a) the PFJ fails to address meaningfully the violations of law found by this court and upheld by the U.S. Court of Appeals and its entry by the court manifestly is not in the public interest; (b) the CIS fails to meet the standard of analysis demanded by the law and occasioned by the magnitude of the issues involved; and (c) the public interest will best be served through imposition of a ''hybrid'' structural remedy or, if the court chooses not to impose a structural remedy, a conduct remedy modeled after the proposals of the remaining litigating states.
A. The Authors
Dr. Eisenach is President and Senior Fellow at The Progress & Freedom

[1] United States v. Microsoft Corp., Stipulation and Revised Proposed Final Judgement (November 6, 2001) (hereafter ''PFJ'').

[2] United States v. Microsoft Corp., Competitive Impact Statement (November 15, 2001) (hereafter ''CIS'').

Foundation,[3] a non-profit research and educational institution dedicated to analyzing the impact of the digital revolution and its implications for public policy, and an Adjunct Professor at George Mason University Law School. As a professional economist, he has been actively engaged in the analysis of competition and regulatory policy issues for more than 20 years, and has served in senior positions at the Office of Management and Budget and the U.S. Federal Trade Commission and as a consultant to the U.S. Sentencing Commission on criminal sentencing guidelines for corporations. He has also served on the faculties of Harvard University's Kennedy School of Government, the University of Virginia and Virginia Polytechnic Institute and State University.

Dr. Lenard is Vice President and Senior Fellow at The Progress & Freedom Foundation and a professional economist with 30 years of experience in academia, government, private consulting and the non-profit sector. He has worked on a wide range of regulatory and antitrust issues covering a broad span of industries, and has consulted on antitrust cases for both private firms and the Federal Trade Commission. In government, he has held senior economic positions at the Council on Wage and Price Stability, the Office of Management and Budget and the Federal Trade Commission. A principal focus of his research has been the benefits and costs of regulatory interventions into the economy and the analytical underpinnings needed to make informed decisions about government interventions. Both Drs. Eisenach and Lenard have done extensive work on the economics of high-tech markets in general, and the Microsoft case in particular. They are co-authors of the annual Digital Economy Fact Book,[4] co-editors of Competition, Innovation and the Microsoft Monopoly: Antitrust in the Digital Marketplace and authors of numerous other papers on these and related topics.[5]

B. Summary of Comments

The PFJ is intended to settle the government's antitrust case against Microsoft and was agreed to by the United States, 9 of the 18 states that were also party to suit, and by Microsoft. The nine remaining states and the District of Columbia (the ''Litigating States'') have not agreed to the PFJ and are pursuing more stringent relief through a remedy hearing at the District Court.[6] The DOJ is required by the Antitrust Procedures and Penalty Act (''APPA'')[7] to prepare a CIS, which is intended to analyze the competitive implications of the PFJ and any alternatives to it.

The PFJ does not serve the public interest and will not achieve the government's objective that it ''halt continuance and prevent recurrence of the violations of the Sherman Act by Microsoft that were upheld by the Court of Appeals and restore competitive conditions to the market.''[8] Indeed, much of the behavior found by the Court of Appeals to be anticompetitive would be permitted under the PFJ. Further, even if the PFJ did preclude such behavior it would fail to restore competitive conditions because it fails to affect the behavior of participants in the marketplace.

The CIS does not satisfy the government's obligation to provide the District Court with an analytical basis for determining whether the PFJ is in the public interest. The APPA clearly requires, and good public policy demands, an ''evaluation'' of the proposed remedy and major alternatives to it. The CIS does not present such an evaluation. It does not explain why the PFJ will achieve the intended results, but merely asserts that it will do so. It also does not explain why the DOJ concluded that the PFJ will better serve the public interest than major alternatives, but merely states that ''[t]he United States ultimately concluded that the requirements and prohibitions set forth in the Proposed Final Judgment provided the most effective and certain relief in the most timely manner.''[9] The DOJ has produced no real analysis of the relative merits for Operating Systems: Alternative Structural Remedies in the Microsoft Case,'' George Mason Law Review, Vol., 9, Spring 2001, 803–841. of alternative forms of relief to guide the District Court in deciding whether to approve the PFJ. Indeed, the CIS fails by a wide margin to meet the standards required of analyses of regulatory proposals routinely promulgated by government agencies.

Accordingly, the District Court should not accept the PFJ, but should, instead, expand its hearing on the Litigating States Proposal (''LS Proposal'') to include the full range of major alternatives. This would permit the District Court to gather the information needed to make an informed judgment concerning which of the remedy proposals will best serve the public interest. The alternatives that should be considered include:

u The PFJ.

u The proposals of the Litigating States.

u Major structural remedies, including the vertical-divestiture remedy initially adopted by the District Court and the ''hybrid'' remedy proposed by Dr. Lenard and others.

Among these remedies, the ''hybrid'' structural approach would best serve the public interest and maximize net economic benefits to consumers.

In the sections that follow, we provide, first, a brief restatement of the facts and legal background in this case, including a brief discussion of what we believe to be the appropriate standards by which remedial action should be judged. Next we discuss the shortcomings in the PFJ and the CIS, explaining why the PFJ will not achieve the government's objectives or serve the public interest and demonstrating that the CIS falls far short of the analytical standard that should be demanded by the court. Finally, we turn to an evaluation of the remedial alternatives and explain why we believe that (a) a ''hybrid'' structural remedy would best serve consumers and competition and (b) that if the court chooses not to impose a structural remedy, the LS Proposal is superior to the PFJ.

II. Background: The Facts, the Law and the Remedy

The U.S. District Court[10] found, and the U.S. Court of Appeals[11] affirmed, a pattern of Sherman Act violations by Microsoft that had the effect of foreclosing competition in the market for personal computer operating systems. The District Court ordered a structural remedy, which was overturned by the Appeals Court, which remanded the remedy issue back to this court. The Appeals Court did not prescribe or prohibit adoption of any particular remedial actions by this court.

A. The Illegal Conduct and Its Effects

The Appeals Court unanimously affirmed the core of the government's case against Microsoft, finding that the company had undertaken a broad array of anticompetitive practices to maintain its monopoly in personal computer operating systems, in violation of Section 2 of the Sherman Act.[12] Microsoft's strategy was to use its monopoly power to prevent the emergence of any new technology that might compete with Windows. Microsoft's anticompetitive activities were particularly directed against two products—the Netscape browser and Sun's Java programming language—that could support operating-system-neutral computing and thereby erode Microsoft's market position. In summary, the District Court found, and the Appeals Court affirmed, that:

Microsoft has monopoly power in the market for Intel-compatible PC operating systems, with a market share of greater than 95 percent. Microsoft's market is protected by a substantial barber to entry—the ''applications barrier to entry''—that discourages software developers from writing applications for operating systems that do not already have an established base of users.

u Microsoft effectively excluded rival browsers from the two most efficient means of distribution—pre-installation by Original Equipment Manufacturers (OEMs) and distribution by Internet Access Providers (IAPs).

u Microsoft imposed restrictions on its Windows licenses that effectively prevented OEMs from pre-installing any browser other than Internet Explorer (IE).

[12]

u Microsoft's technological binding of IE to Windows deterred OEMs from pre-installing rival browsers and consumers from using them.

u Microsoft's contracts with IAPs—for example, agreeing to give AOL preferential placement on the Windows desktop in exchange for AOL's agreement not to distribute any non-Microsoft browser to more than 15 percent of its subscribers and to do so only at the customer's explicit request—blocked the distribution of a rival browser.

u Microsoft's deals with Independent Software Vendors (ISVs)—for example, giving preferential support to ISVs that used IE as the default browser in software they develop—and Apple—prohibiting Apple from pre-installing any non-Microsoft browser—were similarly exclusionary.

u Microsoft's agreements with ISVs that made receipt of Windows technical information conditional on the ISVs'' agreement to use Microsoft's version of the Java Virtual Machine (JVM) exclusively were anticompetitive. Microsoft also deceived Java developers into believing that its tools were not Windows-specific and were consistent with Sun's objective of developing cross-platform applications.

u Microsoft's pressuring of Intel to stop supporting cross-platform Java—by threatening to support an Intel competitor's development efforts—was exclusionary.

Microsoft was clearly successful in its efforts to eliminate threats to its desktop monopoly. Through its anticompetitive activities, Microsoft achieved dominance in the browser market and forestalled the development of such cross-platform technologies as the Netscape browser and Java that could have eroded the applications barrier to entry. The promise of operating-system-neutral computing was that it would inject competition into the market for operating systems, which would foster innovation throughout the industry. By preventing the development of competition, Microsoft's illegal conduct thwarted innovation and harmed consumers.

B. Appropriate Criteria for a Remedial Action

The Supreme Court has stated that the purpose of remedial action in an antitrust case is to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation and ensure that there remain no practices likely to result in monopolization.''[13] In other words, a remedy must be effective in the present (terminating the monopoly), the past (expropriating ill-gotten gains), and the future (preventing similar conduct going forward).

As professional economists, we suggest it is especially important to look to the future, where economic actors will make decisions based on the incentives inherent in whatever remedy the court imposes. The remedy should not only address the illegal practices Microsoft already has employed to maintain its operating system monopoly, it should also as the Supreme Court has said—address practices that Microsoft might employ in the future to erect barriers to operating system competition or to use anticompetitive practices to leverage its monopoly beyond the desktop into new phases of computing. In a business that moves as rapidly as the software marketplace (and other information technology and communications markets Microsoft is now entering or is likely to enter soon) it is particularly important that the remedy be forward looking.

The DOJ claims that the PFJ meets these standards, and ''will eliminate Microsoft's illegal practices, prevent recurrence of the same or similar practices, and restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings.''[14] For masons discussed at length below, we disagree. Here, we address two issues relating to the standard by which any remedy should be judged.

First, it is noteworthy that the DOJ does not claim the PFJ achieves the goal of denying Microsoft the fruits of its violations, and clearly it will not. Such restitution is important not only to ''make whole'' the victims of Microsoft's illegal activity (e.g., the United States), but also to establish appropriate incentives on a going forward basis. In general, allowing violators to retain the fruits of their illegal conduct deprives the antitrust laws of much of their force, because it sends a signal to violators that the returns to their behavior are positive—even when they are caught. With $42 billion in the bank, one wonders how Microsoft's senior management could read the proposed PFJ any other way.

Second, and relatedly, DOJ's stated goal of restoring ''the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings'' is not the appropriate objective, and certainly is not equivalent to the Supreme Court's standard of ''terminat[ing] the illegal monopoly.'' The competitive threat posed by the Netscape browser and Java was quantitatively relatively small at the time that Microsoft's illegal campaign against them was undertaken. But it was clear, certainly to Microsoft, that their competitive potential in the dynamic software marketplace was very significant. Had Microsoft not engaged in illegal activities, the competitive significance of these products would be much greater today than it was at the time.

There is a useful analogy here to simple commercial damage cases. If, for example, an individual or a company incurs monetary damages from actions in the past, compensation is generally based on the present value of those damages, typically calculated by bringing the damage amount forward (from the time of the damage to the present) at a normal rate of return. That would be the only way for the damaged party to be made whole. Similarly, society has been damaged by Microsoft's actions. For society to be made whole, competition should, to the extent possible, be restored to what it would be today in the absence of Microsoft's illegal conduct,[15] Equally important on a going forward basis, however, Microsoft should not be permitted to earn continuing returns based upon its illegally enhanced monopoly position. To do so would be to allow the company not only to retain the fruits of its illegal conduct in the past but to continue harvesting those fruits indefinitely.

III. The CIS and the PFJ: Flawed Analysis of a Flawed Remedy

DOJ and Microsoft prefer a PFJ which contains a number of restrictions on Microsoft's conduct on a going forward basis. The questions before the court are whether entry of the PFJ is consistent with the purpose and intent of the Sherman Act and, in addition, whether, under the APPA, it is consistent with the public interest. To facilitate the court's deliberations on the latter issue, the APPA requires the DOJ to submit a CIS.[16] However, the CIS submitted in this proceeding contains virtually no analysis of either the PFJ or alternative remedies. It represents nothing more than a set of unsupported assertions, and accordingly should be given little deference by the court.

In this section, we briefly describe the main provisions of the PFJ. Next, we explain why the CIS fails to meet a reasonable standard of substantive analysis. Third, we provide some examples of shortcomings in the PFJ which would have been obvious had DOJ performed a more complete analysis in the CIS.

A. Major Provisions of the PFJ

As described in the CIS, the proposed PFJ contains seven major provisions. In brief summary, they are:

. OEMs would have the freedom to support and distribute non-Microsoft middleware products or operating systems without fear of retaliation by Microsoft.

. To help ensure against retaliation, Microsoft would be required to provide uniform licensing terms to the 20 largest computer manufacturers.

. Computer manufacturers would have the freedom to feature and promote non-Microsoft middleware and customize their computers to use non-Microsoft middleware as the default.

. Microsoft would be required to disclose the interfaces and technical information that its own middleware uses, so that ISVs can develop competitive middleware products.

. Microsoft would be required to disclose communications protocols necessary for server and Windows desktop operating system software to interoperate with each other.

. Microsoft would be prohibited from retaliating against ISVs or IHVs that develop or distribute software that competes with Microsoft middleware or operating system software.

. Microsoft would be prohibited from entering into exclusive contracts concerning its middleware or operating system products.

The CIS claims that these provisions, and the supporting provisions pertaining to enforcement, ''will eliminate Microsoft's illegal practices, prevent recurrence of the same or similar practices, and restore the competitive threat that middleware products posed prior to Microsoft's unlawful

[13] 253 F 3d at 99–100, quoting (United States v. United Shoe Mach. Corp), 391 U.S. 244, 250 (1968).

[15] To truly be made whole in addition need to be compensated for the benefits it lost due to the absence of competition in the itnervening years, which is proably not possible.

[16] CIS at 3–4.

undertakings.'' But the CIS presents virtually no analysis to support this claim.

B. The Competitive Impact Statement

The CIS does not meet the standards established by the APPA and does not provide sufficient analysis for this court to make an informed decision on whether the PFJ is in the public interest.

Section 16(b)(3) of the APPA requires that the CIS include ''an explanation o* the proposal ... and the anticipated effects on competition of such relief.'' (Emphasis added.) Section 16(b)(6) further requires ''a description and evaluation of alternatives to such proposal actually considered by the United States.'' (Emphasis added). Under Section 16(e), the District Court is required to determine that the consent judgment is in the public interest and in making that determination ''may consider...anticipated effects of alternative remedies ....'' Taken together, these provisions make clear that the CIS was intended by Congress to serve as a guide to the court in evaluating the proposed relief relative to other alternatives which might better serve the public interest, not simply as a pro forma set of claims and assertions. Yet the CIS in this case fails even to fully ''explain,'' and certainly cannot be said to ''evaluate,'' either the likely effects of either the PFJ or the available alternatives. Such an analysis would seem especially important in a fully-litigated Tunney Act case such as this one, where a prior finding of liability suggests a lower degree of deference to the PFJ than would otherwise be appropriate, and thus a higher burden on the court to evaluate alternatives.

How should the court evaluate the adequacy of the CIS? Three sets of criteria present themselves. First, does the CIS satisfy the plain language of the statute? Second, how does it compare with previous CIS's in similarly significant cases? Third, how does it compare with the standards of analysis that are required to be performed in similar situations, such as agency rulemakings? This CIS fails all three standards.

First, does the CIS satisfy the plain language of the statute? It depends on how the words ''explain,'' and ''evaluate'' are defined. To defend successfully the plain-language adequacy of the CIS, the DOJ would have to adopt a very narrow interpretation of both words.

Granted, the CIS devotes 43 pages [17] to reciting and, DOJ presumably would argue, ''explaining'' the provisions of the PFJ. What the CIS does not do at any point, however, is explain ''the anticipated effects [of the PFJ] on competition.''

The semantic sleight of hand upon which DOJ relies to avoid this obligation is found on page 24 of the CIS. There, DOJ reminds us that ''Restoring competition is the 'key to the whole question of an antitrust remedy,'' du Pont, 366 U.S. at 326.'' Then it continues with a clever subterfuge: ''Competition was injured in this case principally because Microsoft's illegal conduct maintained the applications barrier to entry .... Thus, the key to the proper remedy in this case is to end Microsoft's restrictions on potentially threatening middleware....'' [18] (Emphasis added.)

There, in the word ''thus,'' lies the sum and the entirety of the CIS's explanation of the connection between the PFJ and its anticipated effects on competition. For as explained in more detail below, it is hardly obvious, indeed, it is highly unlikely, that simply ending Microsoft's illegal restrictions on middleware would have any significant effect on competition on a going forward basis. Even in these semantically troubled times, we submit, the word ''thus'' cannot be taken as the ''explanation'' the law requires.

But the CIS's discussion of the PFJ must be counted an analytical masterpiece when compared with its treatment of alternative remedies. In contrast to the lengthy, if failed, treatment accorded the PFJ, the CIS attempts its ''evaluation of alternatives'' in three pages. Not surprisingly, given its brevity, the analysis is limited in how much light it can shed on the DOJ's decisionmaking process or the relative merits of the alternatives before the court. With respect to structural remedies, for example, the evaluation consists of 49 words: ''After remand to the District Court, the United States informed the court and Microsoft that it had decided, in light of the Court of Appeals opinion and the need to obtain prompt, certain and effective relief, that it would not further seek a breakup of Microsoft into two businesses.'' [19] Receiving even less attention are six other remedy alternatives, which are summarily dismissed in a single paragraph, and an unknown number of ''others received or conceived'' which, in apparent direct violation of the APPA, are not even described.[20] There simply is no semantic standard by which this treatment of the alternative remedies can possibly be considered ''an evaluation.''

In summary, the CIS submitted by the DOJ in this case fails the first test the court should apply: It does not fulfill the plain language requirements of either Section 16(b)(3) or Section 16(b)(6) of the APPA.

Any effort the DOJ may make to defend the CIS would be on firmer ground if it could argue it is simply following past practice. While we believe, as suggested above, that the CIS in this case should be held to a higher standard than in cases where the issues have not been fully litigated and a finding of liability has not been entered, at least the DOJ could claim it was adhering to precedent. Even by the standards of past cases, however, this CIS falls far short.

Of course, Tunney Act cases vary in significance and complexity. The best standard for comparison for this case would appear to be the CIS filed in the AT&T case in 1982.[21] In that case as in this one, DOJ was tasked with explaining and evaluating a Proposed Final Judgment aimed at resolving a continuing series of complex antitrust actions affecting one of the most important sectors, and companies, in the U.S. economy.

The AT&T CIS differs markedly from the CIS in this proceeding both in its explanation of the competitive effects and in its evaluation of alternative remedies. Section III of the AT&T CIS [22] presents a comprehensive explanation of the proposed remedy and its anticipated effects on competition. Indeed, in stark contrast to the CIS in this case, the AT&T CIS contains, in Section III.E, an extensive discussion specifically detailing ''The Competitive Impact of the Proposed Modification.'' The section is a lengthy one, explaining in detail how each provision of the proposed remedy is expected to affect competition on a going forward basis, beginning as follows:

Put in simplest terms, the functional divestiture contemplated by the proposed modification will remove from AT&T the power to employ local exchange services in ways that impede competition in interdependent markets, and will remove from the Bell Operating Companies (''BOCs''), which will retain such power, any incentive to exercise it. The United States believes, therefore, that the modification's divestiture requirement, and its complementary injunctive provisions, will substantially accelerate the development of competitive markets for interexchange services, customer premises equipment, and telecommunications equipment generally.[23]

The ensuing pages present a careful analysis of why the government believes this to be the case and what the precise impacts on competition are likely to be. The proposed remedy will ''accelerate the emergence of competition in interexchange services,'' [24]''prevent the reemergence of the ... incentive and ability to leverage regulated monopoly power into the customer premises equipment market,'' [25] make AT&T ''subject to competition in all of its services,'' [26] ''remove the source of AT&T's monopoly power and its ability to leverage monopoly power into related markets,'' [27] and ''prevent the creation anew of incentives and abilities in the BOCs to use their monopoly power to undercut rivals in competitive markets.''[28] ''There is every reason to believe that, divested of the BOCs, AT&T will be a procompetitive force in the markets that it enters. As a result of the modification, it is likely that AT&T will expand not only its product lines, but also the areas in which it sells telecommunications equipment.''[29]

The authors have searched in vain, as will the court, for any similar explanation in the Microsoft CIS. As a procedural matter, the absence of such explanations flies in the face of the APPA. As a substantive one, it strongly suggests such statements are lacking for the simple reason that they are not justified by the remedy Microsoft and the DOJ are asking the court to adopt.

[24] AT&T CIS at 7179.

The AT&T CIS also differs from the one in this case in its treatment of alternative remedies.[30] The AT&T CIS appears to meet the requirements of the APPA by describing in some detail the alternative remedies considered and evaluating their likely impacts on competition relative to those expected from the one proposed. ''The United States believes,'' it concludes, ''that the [main alternative] did not approach even remotely the effectiveness of the proposed modification in achieving conditions that would assure full competition in the telecommunications industry.'' [31] Again, such evaluative language is simply absent from the CIS in this case. And again, one cannot help but conclude that, had today's DOJ conducted the same careful analysis as that conducted 20 years ago, it might well have reached different conclusions in the current case.

In summary, then, the CIS not only fails the satisfy the plain language of the APPA, but also fails to meet the standard established by DOJ for a CIS in the most directly analogous case.

The third criteria by which the court should evaluate the sufficiency of the CIS is whether it meets the standards of analysis that are required to be performed in similar situations, the most obvious of which is agency rulemakings.

For at least the last 20 years, agencies have been required to undertake a detailed regulatory impact analysis when they propose major regulatory actions. Under E.O. 12291 (in effect during the Reagan and Bush Administrations), and E.O. 12866 (issued by President Clinton and still in effect), government agencies have been expected to prepare a detailed analysis of the expected benefits and costs of major regulatory proposals and alternatives to them.[32] While the PFJ is technically not a regulation that would fall under E.O. 12866, the magnitude of its impact far exceeds the $100 million threshold that defines a ''major rule'' and thus triggers the requirement for a detailed analysis.

The analysis of regulatory interventions in the economy, which is what the PFJ in this case is, is not a black art. Increasingly, and on the basis of more than two decades of performing such analyses of all major rules, regulatory analysis has become a scientific process comprised of distinct steps and containing specific elements. E.O. 12866, for example, lays out specific criteria such analyses should meet, including: ''(i) An assessment, including the underlying analysis, of benefits anticipated from the regulatory action (such as, but not limited to, the promotion of the efficient functioning of the economy and private markets ....) together with, to the extent feasible, a quantification of those benefits; (ii) An assessment, including the underlying analysis, of costs anticipated from the regulatory action ... together with, to the extent feasible, a quantification of those costs; and (iii) An assessment, including the underlying analysis, of the costs and benefits of potentially effective and reasonably feasible alternatives to the planned regulation ....''

The specific analytical techniques to be used in such evaluations are further described in guidance from the Office of Management and Budget issued January 11, 1996,[33] and reiterated most recently by OMB on June 19, 2001.[34] These guidelines require agencies, before issuing any major regulation, to take into account such issues as whether more ''performance oriented'' approaches are possible, the impact of alternative levels of stringency and effective dates, and alternative methods of ensuring compliance, and to perform evaluations that take into account ''discounting,'' ''risk and uncertainty,'' and ''non-monetized benefits and costs.'' Each analysis, the guidance demands, must ''provide information allowing decisionmakers to determine that: There is adequate information indicating the need for and consequences of the proposed action; The potential benefits to society justify the potential costs ...; The proposed action will maximize the net benefits to society...; [and] .... Agency decisions are based on the best reasonably available scientific, technical, economic, and other information.''

To repeat what we asserted at the outset of this section, the court might evaluate the CIS in this case by three standards: First, does the CIS satisfy the plain language of the statute? Second, how does it compare with previous CIS's in similarly significant cases? Third, how does it compare with the standards of analysis that are required to be performed in similar situations, such as agency rulemakings? This CIS fails all three standards.

C. The PFJ Will Not Have Its Claimed Effect, Nor Any Pro-Competitive Effect

In fact, a close reading of the language of the PFJ indicates that it will not do what the DOJ claims. Moreover, even if DOJ's claims are taken at face value, the PFJ will not have its intended effect because of the realities of the marketplace. Indeed, this is the only conclusion that can be reached based upon a real analysis of the ''competitive impact'' of the PFJ, which is to say an analysis of how, if at all, the provisions of the PFJ will change the behavior of participants in the marketplace.

Other commentators will undoubtedly thoroughly catalogue the loopholes in the PFJ, of which there are many, and it is not our intention to do so here. It is, however, illustrative of the defects of the PFJ to analyze it through the lens of the Netscape browser experience, since so much of Microsoft's liability concerns its actions toward the Netscape browser. Accordingly, much of the PFJ is directed at precluding the type of anticompetitive acts that Microsoft undertook against Netscape (even though the browser war is over and the industry has now moved on to a different stage). But, the PFJ does not even succeed in this minimal goal—of creating the conditions under which the Netscape browser could have competed without being subject to Microsoft's exclusionary practices. Indeed, the PFJ specifically permits many of the exclusionary practices in which Microsoft engaged:

. Section III.A of the PFJ is supposed to protect OEMs from retaliation by Microsoft if they distribute non-Microsoft products. However, the language of Section III.A prohibits Microsoft from retaliating against an OEM for ''developing, distributing, promoting, using, selling, or licensing any software that competes with Microsoft Platform Software or any product or service that distributes or promotes any Non-Microsoft Middleware.'' (Emphasis added). (Microsoft Platform Software is defined as including (i) a Windows Operating System Product and/or (ii) a Microsoft Middleware Product.) While the Netscape browser was a potential competitor for the Microsoft operating system, it never became an actual competitor. Moreover, at the time Netscape introduced its browser, Microsoft did not have a comparable Middleware Product. Thus, the language of III.A would have permitted Microsoft to retaliate against OEMs for distributing the Netscape browser at the time it was introduced.

. Similarly, Section III.F. 1 prohibits Microsoft from retaliating against any ISV or IHV for ''developing, using, distributing, promoting or supporting any software that competes with Microsoft Platform Software or any software that runs on any software that competes with Microsoft Platform Software ....''(Emphasis added). The prohibitions in Section III.F.2 on Microsoft's relations with ISVs are also triggered by software that ''competes with Microsoft Platform Software'', which the Netscape browser did not initially do.

. Section III.G.2 is intended to prevent similar exclusionary behavior with respect to IAPs and ICPs, by prohibiting Microsoft from entering into any agreement with ''any IAP or ICP that grants placement on the desktop or elsewhere ... on the condition that the IAP or ICP refrain from distributing, promoting or using any software that competes with Microsoft Middleware.'' (Emphasis added). Again, Netscape's browser was a new product that did not compete with any Microsoft product at the time it was introduced.

. Section III.C is intended to prevent restrictive agreements with OEMs by, for

respect to Competitive Impact Statements are, of course, far less specific than those listed above. But the purpose of the APPA in requiring a CIS is presumably similar to the purpose of regulatory analyses: To allow decisionmakers, in this case the court, to understand the ramifications of their actions relative to alternative choices. By the standards of modem policy analysis, DOJ's CIS fails to perform this function at the level the court should expect, especially in a case of this magnitude. Office of Management and Budget, Memorandum for the Heads of Executive Departments and Agencies: Improving Regulatory Impact Analyses (June 19, 2001)(available at www.whitehouse.gov.omb/memoranda/m01-23.html)

example, preventing Microsoft from restricting the ability of its OEM licensees from ''[l]aunching automatically ...any Non-Microsoft Middleware if a Microsoft Middleware Product that provides similar functionality would otherwise be launched ....'' (See Section III.C.3, emphasis added). Under this language, Microsoft can preclude its OEM licensees from permitting the automatic launch of a new product if Microsoft does not have a similar product or if the Microsoft product does not have ''similar functionality'' (obviously, a term open to interpretation). Again, when the Netscape browser was launched, Microsoft did not have a similar product.

. Section III.D is intended to preclude Microsoft from excluding rival products by denying them the technical information they need to interoperate with the Windows operating systems. It requires Microsoft to ''disclose to ISVs, IHVs, IAPs, ICPs, and OEMs, for the sole purpose of interoperating with a Windows Operating System Product ... the APIs and related Documentation that are used by Microsoft Middleware to interoperate with a Windows Operating System Product.'' (Emphasis added). If, however, Microsoft does not produce an analogous product, it might not use the APIs needed for a new application, such as the Netscape browser, to get started.

. Section III.H contains a variety of provisions designed to enable choice of Non-Microsoft Middleware Products on the part of users and OEMs. The PFJ explicitly states, however, that ''Microsoft's obligations under this Section III.H as to any new Windows Operating System Product shall be determined based on the Microsoft Middleware Products which exist seven months prior to the last beta test version (i.e., the one immediately preceding the first release candidate) of that Windows Operating System Product.'' At the time the Netscape browser was introduced, there was no comparable Microsoft Middleware Product.

. Finally, Non-Microsoft Middleware Products are defined to include products ''of which at least one million copies were distributed in the United States within the previous year.'' (Section VI.N). Thus, regardless of any of the other provisions, the PFJ permits exclusionary behavior against new products that are trying to get established.

In sum, under the provisions of the PFJ Microsoft would have been permitted to engage in anticompetitive practices against the Netscape browser because the browser did not compete against the Windows operating system and because Microsoft did not at the outset have a comparable product. Moreover, at least in the early stages, the Netscape browser would not have been covered because a million copies had not been distributed in a single year. The DOJ obviously feels that the fabled entrepreneurs of Silicon Valley, working in their garages, are not worthy of protection against Microsoft under the PFJ. It is especially ironic that Microsoft, which has dedicated so much rhetoric to persuading the courts and the public that its monopoly could be overturned at any moment by the proverbial entrepreneur working out of her garage, should seek to preserve the right to squash precisely such competitive threats. More broadly, the requirement that Microsoft have a comparable product in order to trigger some of the PFJ's provisions creates perverse incentives. It may discourage Microsoft from introducing its own product, because to do so triggers provisions restricting its ability to exclude a potential competitor. The result could be that consumers would be deprived entirely of a useful middleware product that might potentially compete with the Windows operating system, because Microsoft is able to engage in exclusionary practices against another firm and does not find it in its interest to introduce its own product.

But the PFJ is flawed at an even deeper level: Even if it did what DOJ and Microsoft say it would, its effect on firms that operate in Microsoft's markets and its ability to restore competition in those markets would be minimal at most. Most of the PFJ is intended to prevent Microsoft from retaliating against OEMs, ISVs, IAPs and others that distribute, develop or otherwise support software that competes with Microsoft middleware. Under the terms of the PFJ, however, these entities would have little incentive to promote competitive middleware.

This is principally because, despite the Appeals Court ruling that Microsoft's integration of the browser and the operating system was anticompetitive, the PFJ would allow Microsoft to continue to bundle its middleware (and other) products with its operating system. Indeed, Microsoft's new XP software incorporates new functionality into the Windows operating system as never before. It includes, among other things, the IE browser, Microsoft's instant messaging and email software, Windows Media Player and the Microsoft Passport digital authentication software. All of these functions are bundled together and the combined package is sold at a fixed price.

Thus, OEMs have virtually no incentive to customize their offerings with non-Microsoft software. To do so involves an additional cost for the non-Microsoft software when compariable functionality is provided by Microsoft at no additional cost. An OEM that did this would have to pass these added costs on to its customers and would likely lose sales to other OEMs. Obviously, if OEMs don't have the incentive to install non-Microsoft software, ISVs won't have the incentive to develop it and IAPs won't have the incentive to distribute it.

As a result, the PFJ will not have any significant pro-competitive impact in the markets for either middleware or PC operating systems. Nor, for the same reasons, is it likely to have any significant pro-competitive impact on newly emerging markets, such as voice-over-IP instant messaging, game boxes, e-commerce technologies (e.g., ''Passport'') or digital rights management technologies. Indeed, the inability to make any plausible claims for such pro- competitive effects is the most likely explanation for the fact that, in contrast to the AT&T CIS, the CIS in this case doesn't make any.

IV. The Remedy Alternatives

There are two general classes of remedies that can be employed to remedy Microsoft's antitrust violations—conduct remedies and structural remedies. Conduct remedies leave Microsoft intact and attempt to constrain its anticompetitive behavior by imposing a set of behavioral requirements—essentially, a regulatory regime tailor-made for one firm. Microsoft's structure—and, importantly, its incentives—remain largely the same.[35] The challenge is to develop rules that effectively deter anticompetitive behavior, given that such behavior might continue to be in Microsoft's interest. The PFJ, which relies on conduct remedies, will not be effective in deterring anticompetitive behavior on the part of Microsoft.

Structural relief takes a different approach. Structural relief, as the name implies, involves restructuring the firm so as to change its incentives and ability to act anticompetitively. As DOJ explained eloquently in the AT&T CIS, if a restructuring is successful in achieving those goals, behavioral restrictions are largely unnecessary. The Appeals Court noted that structural relief is a common form of relief in antitrust cases and is ''the most important of antitrust remedies.'' [36]

In this section, we describe the alternative structural remedies available to the court. Then we offer an evaluation of the proposals offered by the remaining litigating states.

A. Alternative Structural Remedies

At the government's urging, the District Court initially adopted a structural remedy, supplemented by interim conduct relief. [37] The Appeals Court vacated the District Court's remedy, partly because it modified the District Court's liability finding and partly because the District Court had failed to hold an evidentiary hearing. [38] The Appeals Court did not, however, rule out a structural solution to this case. The Court directed that ''the District Court also should consider whether plaintiffs have established a sufficient causal connection between Microsoft's anticompetitive conduct and its dominant position in the OS market.'' [39] It continued, ''[i]f the court on remand is unconvinced of the causal connection between Microsoft's exclusionary conduct and the company's position in the OS market, it may well conclude that divestiture is not an appropriate remedy.'' [40]* This is an issue that should be explored in an evidentiary hearing.

While it is difficult to predict exactly how the industry would have developed in the absence of Microsoft's anticompetitive behavior, it is likely that an alternative to Microsoft's operating- system platform would have emerged and it is a virtual certainty that Microsoft's position would be far less dominant than it is today. Clearly, Microsoft thought that was a distinct possibility.

---

[35] 35 Microsoft's incentives would be modified to the extent it faces legal penalties, but those penalties would have to be very large to have a significant effect on Microsoft's incentives.

[36] 253 F 3d at 103, quoting United States v. E.I. du Pont de Nemours & Co., 366 U.S. 316, 331 (1961).

[38] 253 F 3d at 6.

[39] 253 F 3d at 105.

[40]

The causation between Microsoft's anticompetitive practices and its operating system monopoly runs both ways. Without its monopoly, Microsoft would have been unable to engage in the exclusionary practices documented by the District Court and affirmed by the Appeals Court. Moreover, because of the wide array of business practices at issue and the complexity of the industry, it is very difficult to fashion a conduct relief regime that will be effective if Microsoft retains its dominant market position. This is why the Department of Justice (initially) and others (including ourselves) favor a structural solution. Two different forms of structural solution have been proposed, which we review in turn.

The DOJ initially proposed, and the District Court initially ordered, a vertical divestiture, which would divide Microsoft along product lines, into an operating systems company and an applications company.[41] The DOJ argued that this remedy would create two powerful companies that would have the incentive to compete with each other, diminishing the market power of both. According to Timothy Bresnahan, Chief Economist at the Antitrust Division at the time, ''divestiture of the company into an applications and an operating system company restores competitive conditions very like those destroyed by the anticompetitive acts. Absent the anticompetitive acts, Microsoft would have lost the browser war, and other finns would have commercialized useful technologies now controlled by Microsoft. Divided technical leadership, which could be accomplished by having an independent browser company in the late 1990s or an applications company now, lowers barriers to entry and competition in many markets. It was exactly this route to an increase in competition that Microsoft avoided by its anticompetitive acts. Second, ending Microsoft's unique position in the industry offers innovative new technologies the choice of two mass-market distribution partners, either Appsco [the applications company] or OSCo [the operating system company]. The divestiture will do much to reduce the motive to violate and also to reduce the effectiveness of future anticompetitive acts. It restores conditions for competitive innovation at a moment in technology history [i.e., when the Internet is starting to be commercialized] when having a single firm set the direction of innovation in PC and end-user oriented internet markets is most unwise.'' [42]

Similarly, the Department of Justice, in initially proposing this remedy, argued that separating the operating system from the applications company would ''reduce the entry barriers that Microsoft's illegal conduct erected and make it less likely that Microsoft [would] have the incentive or ability to increase them in the future.'' [43] An independent applications company would have every incentive to support competitors to Windows rather than make decisions based on the level of threat those competitors pose to Microsoft.[44] A separate applications company would have appropriate incentives to port its products to competing operating systems, such as Linux, thereby lowering the applications barrier to entry that potential competitors face. Currently, Microsoft has an incentive to strategically withhold applications from actual or potential competitors, even if providing them would otherwise be economically justified. In addition, the applications company would have the incentive to make its tools available to Independent Software Vendors (ISVs) that cooperate with competing operating system providers.

Separate operating system and applications companies would make it possible for middleware technologies in the applications company to be competitive with Windows. When applications are written to middleware technologies, like the Netscape browser, which operate between the applications software and the operating system, they become operating system neutral,[45] reducing the applications barrier to entry and facilitating competition with Windows. There are several desktop applications, including Microsoft Office, that expose APIs and could become important middleware technologies.

Of course, a vertical divesture now would have a somewhat different effect than when it was first adopted by the District Court, because Microsoft has bundled many more applications into its new XP operating system. If the District Court again decided to adopt this remedy, it would also have to decide whether to require Microsoft to remove some applications functionality from its XP operating system or permit it to remain as is. If the XP operating system were allowed to remain as is, applications that would previously have been part of the applications company would be part of the operating system company. However, significant applications—principally, Microsoft Office—still remain separate from the operating system.

The alternative to a vertical approach is what we term a ''hybrid'' structural remedy, which combines both vertical and horizontal elements. A purely horizontal divestiture would divide Microsoft into several vertically integrated companies, each with full rights to Microsoft's intellectual property, creating several sellers of Windows as well as Microsoft's other software products. This remedy arguably goes beyond what is necessary or could be justified as matter of law, since it divides up products that were not the subject of the case.

A number of commentators, including Dr. Lenard, have proposed a ''hybrid'' remedy, which has elements of both vertical and horizontal divestiture.[46] It goes a step beyond the vertical divestiture remedy that the District Court adopted by first separating the operating systems company from the applications company and then creating three equivalent operating system companies.

Microsoft's bundling of more applications functionality into the new XP operating system strengthens the arguments for the hybrid remedy relative to other remedies. The PFJ (as discussed above) does not contain any restrictions on bundling, which will hinder its effectiveness dramatically. In addition, as more applications are moved into the operating system, the vertical divestiture becomes less able to restore the competitive balance, because the newly formed applications company would be a less powerful competitor.

By creating competing Windows companies, the hybrid remedy directly addresses the monopoly problem, which is the source of Microsoft's anticompetitive behavior. As indicated above, without the monopoly, Microsoft would never have been able to exclude the Netscape browser from the most effective means of distribution—OEMs and IAPs. It would not, for example, have been able to get the OEMs to refrain from pre-installing the Netscape browser as a condition for receiving a Windows license. Similarly, Microsoft would not have been able to extinguish the market for a competing browser by bundling the Windows operating system with IE. Microsoft would not have been able to do these things—which are at the core of the Appeals Court's liability finding—because the OEMs and the IAPs would have had competitive alternatives to which they could turn.

The hybrid remedy would eliminate the applications barrier to entry for the new Windows companies and deprive Microsoft of its ability to leverage its desktop monopoly into new markets. Because it really does restore competition, extensive behavioral restrictions are not required, making this the least regulatory of the available alternatives.

The hybrid remedy is to a significant extent an ''intellectual property'' remedy, requiring Microsoft to grant full intellectual property rights to its Windows Operating System to two new companies. This type of remedy is particularly suited to ''new-economy'' companies like Microsoft, whose assets consist primarily of informational capital, which can easily be replicated.[47] The rationale for going further and dividing up employees is that much of the intellectual property is embodied in the employees.[48] In contrast to traditional ''old-economy''

companies, however, there is very little physical capital to be divided up.

This factor should alleviate some of the concerns expressed in the Appeals Court opinion about the use of a structural remedy in the case of a ''unitary company''—i.e., a company not formed by mergers and acquisitions.[49] Such concerns have more validity in the case of old- economy companies, because of the difficulty of dividing up physical capital. What is being proposed in the hybrid remedy is much closer to a reproduction than it is to a division of the company's assets. When those assets consist primarily of information, they can be reproduced at very low cost.

B. The Litigating States Proposal

We believe a structural remedy continues to offer the best hope of deterring Microsoft's anticompetitive behavior in a way that is not overly regulatory. If, however, a structural remedy is off the table, the conduct remedy proposed by the Litigating States (LS) is far better than the PFJ. The LS Proposal does not contain the obvious loopholes and exceptions that are pervasive in the PFJ. Moreover, the LS Proposal includes a number of provisions that can partially restore competition to what it might have been absent the anticompetitive behavior. Because it will change the behavior of the participants in the market, the LS Proposal provides a serious remedy to Microsoft's offenses. Some of the attractive features of the LS proposal are as follows:

ù In contrast to the PFJ, the LS Proposal contains prohibitions on exclusionary and retaliatory behavior that are clear and unambiguous and mean what they purport to mean. In general, they provide meaningful protection against retaliation for the development and distribution of non-Microsoft software.

The LS Proposal would require Microsoft to license an unbundled version of its software. As discussed above, the bundling of applications together with the monopoly operating system makes it uneconomic in most cases to develop and distribute software that competes with Microsoft. This requirement would address that problem and create an environment in which rival software can be developed.

ù The LS Proposal would require Microsoft to license its software to third parties (not just OEMs) who could produce a customized product that would enlarge the range of consumer choice and provide competition for Microsoft.

ù The proposal also would require Microsoft to continue to license predecessor versions of Windows. This would permit OEMs to expand the range of consumer choice by providing a lower-priced operating-system product that might be perfectly satisfactory for a large number of users. In addition, it would permit OEMs and third parties to continue to develop a differentiated product that might be competitive with Microsoft.

ùThe LS Proposal would require Microsoft to make IE available on an open-source basis, and would require Microsoft to distribute Java, thereby partially reversing some of the effects of Microsoft's illegal activities

ù Finally, the LS Proposal would require Microsoft ''to auction to a third party the right to port Microsoft Office to competing operating systems.'' This would reduce the applications barrier to entry for a competing operating system, such as Linux. All of these aspects of the LS Proposal would add significantly to the probability that the remedy in this case would actually have the desired effect of increasing competition in one or more of the relevant product markets.

V. Conclusion

The PFJ is not an adequate remedy and its adoption is not in the public interest. It will not deter Microsoft from engaging in anticompetitive activities and it will not restore competition in this extremely important sector of the economy. Moreover, the CIS that the government has prepared does not provide the information necessary for the District Court to determine that the PFJ is in the public interest.

In order to generate the necessary information for such a determination, the District Court should hold an evidentiary hearing in which the competitive impacts, benefits and costs of all the available remedies are closely evaluated. In addition to the PFJ, the Court should consider structural remedies—which appear to be justified under the criteria established by the Court of Appeals—as well as the LS Proposal. We believe that at the end of this process, the court will agree that the PFJ is not in the public interest and that the ''hybrid'' structural remedy we recommend best meets all the of the criteria governing the court's deliberations in this matter.

Subject: Microsoft Settlement

Microsoft should be punished to the fullest extent of the law. The government should understand that Microsoft has been found guilty and should make restitution and change its predatory practices. Microsoft does not innovate, but makes shoddy software that many hackers attack at will. At Chicago public schools, the network administrators now prefer Linux and OSX from Apple since they are stable platforms.

Subject: FW: Microsoft Settlement

To whom it may concern:

I am a computer scientist (Ph.D Carnegie-Mellon University) who has worked in the field for over 25 years. I have been a close observer of Microsoft's behavior since its inception. I believe that the proposed Microsoft settlement is a farce.

Microsoft has exhibited rapacious behavior since its start. The courts have found them to be a monopoly and guilty of monopolistic practices, which only attests to what most professionals in the field have known for a long time. Even as the case has been progressing through the courts, Microsoft has continued its aggressive tactics. The recent allegation that they lobbied congressional members in defiance of the Tunney act once again bears out my belief that they think they are above the law.

The government has a duty to pursue a course of action that will effectively remedy the situation. This has not been achieved. The proposed settlement terms are extremely weak. They will have virtually no effect in curbing Microsoft's behavior. On the contrary, they seem to be an endorsement of Microsoft's tactics. How can anyone who has any knowledge of the matter imagine that the playing field has been leveled, or that Microsoft will modify its monopolistic practices on the basis of said terms? In addition, where is the penalty for their past actions? The government is about to fail very badly in its duty to protect the American public.

If Microsoft continues to dominate through monopolistic practices, it will significantly affect the technology available to consumers, and what they pay for it. Microsoft has always rushed to market with shoddy software, expecting users to exercise and test it. Large numbers of bug fixes are generally required to any given product, but the products themselves never stabilize because Microsoft releases the next version with more bells and whistles and even more bugs. This process explains why their operating systems are so vulnerable to security attacks, i.e., as the systems have become larger and more complex, adequate security, which has never been very good in any of their products, becomes more tenuous. A lack of real competition exacerbates this kind of result. Businesses and individuals who use Microsoft products and suffer the consequences of viruses, worms, etc. pay an enormous cost. In a competitive market, consumers could make other choices unless the problems were fixed.

Finally, I don't understand how anyone can support Microsoft's argument that the consumer has benefited in the form of low-cost software. One doesn't buy such a product and have done with further expense. Rather, it is a case of buying on the installment plan, as one pays again and again for each new release that is made, along with the need to pay separately for user manuals. If the average person were to calculate the outlay for software over a reasonable time period, it would be shown that the cost is far from the bargain Microsoft portrays.

In conclusion, the government must find a way to curb Microsoft's behavior. The currently proposed settlement signally fails to do that.

Sincerely,
Ronald B. Ohlander

To: Microsoft ATR
Date: 1/28/02 4:58pm
Subject: Microsoft Settlement.

In response to the government's request for comments on the proposed Microsoft Settlement:

As a computer professional with over three decades of experience writing software for a variety of operating systems including Windows, and as one-time fan of Microsoft, I would like to make two points. The first is to suggest one route which in the absence of a breakup I expect Microsoft to continue to exploit to maintain it's monopoly. The second point is to call attention to a related danger from Microsoft's monopoly which I believe is accelerating the flight of manufacturing from the US to foreign countries.

First the monopoly preservation strategy:

Most competent computer programmers can, if they wish, write and document functioning code which is virtually incomprehensible to any other competent programmer (including the author him/herself). Moreover said author can almost certainly (disingenuously but successfully) argue in a court comprised of non-experts that the code is straightforward, well-documented and easy to understand.

What does this have to do with Microsoft maintaining and extending their monopoly? Everything. Whether hardware or software, it is in the interests of the creator of any product to facilitate use by the consumer while hiding as much of the internal workings as possible to discourage competition. Microsoft's strategy has been to continuously expand the boundaries of it's ''operating system'' (more properly now an operating environment) enveloping or attempting to envelope entire classes of applications, office, networking, on-line shopping, manufacturing etc... within the boundaries of the ''operating system''. This can be done explicitly as in the case of Internet Explorer, or implicitly by simply making it difficult and or prohibitively expensive for outsiders, to access, or even know about operating system, or hardware features which may be important for fields Microsoft dominates, or wishes to dominate. The ''browser wars'' were about exposing the inner workings of Microsoft's operating system so others might use them.

Because of the ease of writing and defending impenetrable code Microsoft already has an almost unlimited ability to restrict access to the core of the operating system and to the hardware beyond, whether or not a court orders it to provide access. Microsoft sells just enough tools to access selected parts its operating environment to be able to provide lip-service to openness. Generally speaking the products are scaled in such a way that only those who have made a large commitment, financial or ''sweat equity'' which will tend to lock in their allegiance to Microsoft are allowed access to the more powerful tools.

Because of the high barrier created by the impenetrability of the Microsoft code, it is hard to imagine any remedy short of a breakup will be able to curtail Microsoft's illegal monopolistic practices. The second comment, related to manufacturing flight, is contained in a letter I sent to the Attorney General general of Massachusetts several months ago. The text follows:

Dear Mr. Attorney General,

I must congratulate you and your staff on the stand you have taken against the proposed Microsoft settlement.

I am a software developer who has long been appalled by the relentless manner in which the American public interest continues to be steamrolled by the Microsoft juggernaut. Therefore I was shocked by the decision by the Justice Department to take the breakup option off the table. It is my opinion that this option offered the only chance to restore competition to the software marketplace. Needless to say, I was further dismayed by the terms of the proposed settlement.

As you are obviously well aware, under the guise of ''innovation'' Microsoft has succeeded in stifling true innovation in many ways. Much of the damage done by Microsoft is not as a result of overt actions towards the ''victim'' whether an individual or a company. Rather it is in creating an environment in which the fate of others who have tried to innovate in the face of Microsoft serves as a deterrent to further innovation. Of course this type of deterrence by example does not carry the connotation of physical danger as might be expected from similar threats by organized crime or terrorists. Nevertheless it is quite effective. This is an environment in which:

1. Intelligent software developers know that they have little chance of being successful unless they join the Microsoft camp. Once in that camp more of a developer's time will be likely spent keeping up with Microsoft's complexity-increasing-whims than improving their product.

2. Intelligent funding institutions know from history that there is no point in developing a product in a market in which Microsoft is known or believed to have interest. The best one can hope for in the case of a very successful product is the opportunity to sell the product to Microsoft at a price determined only by the latter.

3. The required ''operating system'' (now more properly an operating environment) is so complex as to create a huge barrier between the creative idea of a researcher, developer, or engineer and its implementation into a useful product.

I'm reminded of a university researcher's website I saw several years ago. The researcher noted that he was using older, and by then outdated, analysis software for his research. Although he had written the original software himself, he believed that the new requirement of interfacing with Windows had introduced such complexities that he could not afford either the time to update the software himself, or the money to to hire a Windows specialist to update it for him. Whether or not the researcher's assumption was actually true, Microsoft literature and promotions (the so-called FUD factor) would certainly lead him to this conclusion. Hence his further research in this field was stymied.

4. Similarly the Microsoft ''one size fits all'' operating system and tools, interposed between America's manufacturing engineers and the computer, hamper their creative efforts. Modern Windows software effectively prevents these engineers from writing high speed one-of-a-kind applications necessary for the most efficient manufacturing. Ten years ago the same engineer would have had no trouble writing this type of software. As a Senior Member and member of the Peer Review Committee of the Machine Vision Association of the Society of Manufacturing Engineers I became personally concerned about this issue several years ago. I was particularly worried that is resulting in substantial advantages for manufacturing facilities in foreign countries and earlier this year prepared the attached document.

I'm not sure any of this will be of any help in the successful resolution of the Microsoft situation, However I thought it might be helpful in explaining why at least one of us is behind you.

Again, congratulations and good luck on your stand!

Sincerely,

Robert McConnell

Attorney General John Ashcroft
U.S. Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft,

Most individuals and companies affiliated with computer software products are very excited about the recent antitrust settlement between Microsoft Corp. and the U.S. Justice Department. The lawsuit has significantly dampened technological innovation as well

as investment. Continuing the lawsuit would only make matters worse; therefore, the settlement should be accepted and finalized as soon as possible as it is fair and reasonable.

For example, it has agreed to disclose its internal interfaces for Windows to its competitors. It also agreed not to retaliate against computer makers who ship software that competes with anything in its Windows operating system. Last, and perhaps most important, Microsoft has to design future versions of Windows to provide a mechanism to make it easy for computer makers, consumers and software developers to promote non-Microsoft software within Windows.

I sincerely hope the settlement is allowed to take hold as soon as the public comment period concludes and that those who may attempt to derail it are not successful in their attempts.

Sincerely,
Stephen Hopkins

Date: 1/28/02 5:05pm
Subject: Microsoft Settlement

To whom it may concern:

I am writing in opposition to the Proposed Final Judgment (PFJ) in the case of United States v. Microsoft.

I am a programmer with over 20 years experience, and I currently work as a web site administrator for a large medical association.

I agree wholeheartedly with the Open Letter created by Dan Kegel and signed by over 2000 people (http://www.kegel.com/remedy/letter.html). I would like to single out two points which deserve special attention.

As stated in the Findings of Fact, Microsoft enjoys a monopoly in the operating systems market (section 33–44). According to the Court of Appeals ruling, ''a remedies decree in an antitrust case must seek to ''unfetter a market from anticompetitive conduct'', to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future'' (section V.D., p. 99).

First, to meet these standards the Windows API—almost all of them, not just ''Microsoft Middleware'' as narrowly defined in the PFJ—must be completely open and documented in such a manner that third-party developers can create an environment that can run Windows applications. An example of such an environment is the WINE (WINdows Emulator) middleware that is available for the Linux operating system.

Second, the enforcement mechanism must be nimble. The original suit which led to the PFJ was filed in 1995. Since then, Microsoft has released three new versions of the operating system (Windows 98, ME, XP) and is positioning itself to be the middleman in Internet transactions via the .Net initiative. If the courts are used as an enforcement mechanism then Microsoft is guaranteed several more years without serious competition in the operating systems market.

From: Sara Yurman
To: Microsoft ATR
Date: 1/28/02 4:59pm
Subject: Please reject this settlement.

Thank you for the opportunity to comment on this ruling. I am sure than many people have offered excellent technical reasons for rejecting this extraordinarily weak settlement. I have two reasons that I hope the court will consider:

1) I am a small business person. At the moment I can operate on Linux, and not be hampered by some of the Microsoft-specific formats that I receive. This, however, is tenuous and getting more so. As Microsoft extends its reach into the internet, and continues to keep its formats closed my ability to communicate without Microsoft is somewhat serendipitous. Operating with Microsoft products is not an option for us. We are a distributed company and cannot afford the expense and security problems inherent in those products. A virus could be fatal to our small firm.

2) It appears that Microsoft's monopoly power is having a corrosive affect on our political system. I wrote my U.S. Senators (Zell Miller and Max Cleland), urging them to support Senator Schumer's call to block the distribution of the XP operating system. Senator Miller never answered. The following was included in Senator Cleland's response:

>Despite Judge Jackson's ruling last June, Microsoft remains the single most >dominant technology firm in the world. Microsoft's core businesses, its Windows >operating system and Office software, are certainly under legal challenges on >several fronts, but at the moment they are still generating tremendous revenues >and profits for the company. In addition, Microsoft plans to jump-start its >Internet access operation, MSN, which is also unlikely to be affected by Judge >Jackson's verdict. >

Why is it more important to the Senator from Georgia that Microsoft generate profits than have conditions favorable to small businesses in his district? I never got a response, despite phone calls and emails to the Senator's office. This is the ultimate aim of monopoly power, and Microsoft has achieved it. Please stop them. I'd like to have my government back.

Respectfully submitted,
Sara Yurman

Subject: Microsoft Settlement

The following are my comments regarding the proposed settlement of the United States vs. Microsoft antitrust case.

Personal Background

I am Information Technology specialist who works primarily in Systems architecture, design, and development. Over the past ten years I have specialized in Information Security. I have been a user of Microsoft products (for both consumers and developers) since the early 1980s.

United States v. Microsoft Background

The District Court and the Court of Appeals concluded that Microsoft had ''unlawfully maintained its monopoly power by suppressing emerging technologies that threatened to undermine its monopoly control of the personal computer operating system market.''

The Court of Appeals held ''a remedies decree in an antitrust case must seek to ''unfetter a market from anticompetitive conduct,'' to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''

Comments

Scope of Protection is Too Limited

Microsoft's competition in the Operating system area varies greatly in type and size. This competion includes:

. direct competitors, organizations creating different Operating systems (e.g. Linux)

. organizations that build applications and middleware that run ''on top'' of an operating system (e.g. Java and Netscape Communicator)

.* organizations that customize operating systems for their clients (hardware OEMs)

.* organizations that provide software equivalence of the services of one operating system on a different system or environment.

The proposed restrictions on Microsoft business conduct will provide protection to a subset of these Microsoft competitors. The majority of the Proposed Settlement focuses on providing relief for

1) organizations that provide middleware that run exclusively on Microsoft Windows products, and hardware OEM vendors. There are only minimal changes in the Microsoft conduct to protect vendors of competing operating systems.

Only Large Competitors Are Protected

The size of organizations that develop software varies greatly. Even Microsoft started as a small number of people. Unlike many other businesses, there is not a requirement for a large capital investment to start developing software.

The restrictions on Microsoft conduct apply only to large organizations (both OEM and software developers). Not only does this not work to terminate the monopoly it creates new exclusionary and discriminatory practices which did not previously exist.

Scope of Interfaces to be Disclosed is too Narrow

The Proposed Settlement requires that Microsoft disclose the APIs for its middleware. However, in the Proposed Settlement the definition of Middleware is so limited that it excludes many of the interfaces required by competitors. The Interfaces to be disclosed need to include not just Application Programming Interfaces (APIs) but all other data structures and protocols extemalized by Microsoft software components. The Department of Justice chose not to pursue issues related to the comigling of software and yet the Proposed Settlement assumes to have sufficient knowledge of the separate pieces (middleware vs. operating system) to provide a working definition in the Proposed Settlement.

As long as the definition of the Windows Operating Systems is outside the scope of the Proposed Settlement Microsoft will maintain the control over which interfaces must be disclosed. It would be more appropriate to require Microsoft to disclose ALL interfaces between all components of their products.

Not All Middleware Components are Identified.

Given that some of the Microsoft Middleware components that are subject to this settlement are mentioned in the Proposed Settlement, the ''.net'' interfaces, as the Microsoft followon to Java should be included. Given the complexity of the definition of Middleware provided in the Proposed Settlement, it would be desireable to include the complete list of all Microsoft Middleware. This list should be publicly available for the time period that the Settlement is enforced.

Not All Current Versions of Windows are Covered in the Settlement

All current versions of Windows that are based on Win-32 should be covered by the Settlement. This should at least include Windows CE and Windows XP Tablet Edition. Too Many Restrictions on Disclosure of Security Interfaces The Proposed Settlement places restrictions on the disclosure of Microsoft security interfaces in the name of National Security. I would suggest that the reverse is true. In the current environment it is important to nurture the development of security functionality. All Microsoft security programmable interfaces, protocols, and data structures should be fully disclosed. The only restriction should be that the content of some specific data elements may not be disclosed (private keys, etc.)

Limits on Which Organizations can Seek Disclosure of Interfaces

The proposed Settlement places restrictions on which competitors Microsoft must disclose their APIs. The competitors must be of sufficient size and have a valid business case. This allows Microsoft to chose which organizations they wish to compete. Even Microsoft in its earliest years would have failed these requirements. Given that in the current environment one of Microsoft's strongest competitors is primarily a volunteer organization (Lunix) it seems likely that Microsoft would not disclose any APIs to ''Free'' Software development organizations.

Poor Enforcement Mechanisms

A good settlement should include enforcement that is easily understood, quantifiable, and verifiable. There should be metrics that can be used over a period of time to evaluate the success of the Settlement. A good enforcement needs to provide quick resolution of issues related the Settlement for the business needs of both any plaintiff as well as Microsoft. Finally, there needs to be a sufficient motivation to insure Microsoft will not violate the Settlement.

The Proposed Settlement provides almost none of the above. There is technical review by a three person team but all of their work will be confidential and not subject to review. There is no public or judicial review of the progress of the Settlement. The only option for handling misconduct, outside of the technical team, is to go back to court—one of the slowest ways to resolve any violations. Finally, given that there is no financial incentive required in this Settlement and that Microsoft earns billions of dollars using their current business conduct it is hard to see why Microsoft will be motivated to make any changes in their conduct.

Conclusion

The Proposed Settlement does not provide adequate changes in business conduct of Microsoft to provide a remedy that meet the requirements of the Court of Appeals mandate. In some cases the Proposed Settlement adds new barriers to the competition to Microsoft Operating Systems and Middleware. Thus, the Proposed Settlement does not serve in the public interest. I recommend that the Proposed Settlement be rejected.

Sincerely,
Jerry L. Hadsell

The Hard Truth About Invention in the U.S. Marketplace

Two courts have reaffirmed that Netscape nor its browser were shut out of the marketplace. The browser wars produced a winner and a loser; and Netscape was the loser. However, within thousands of briefs and legal arguments criticizing the U.S. vs. Microsoft settlement is the repeated concern about the future of new Netscape's in the technology sector. Almost every other issue is tangential, and we must differentiate the arguments properly.

We see an interchanging of terms being used, specifically, ''....the settlement should make the marketplace safe for firms to compete with Microsoft...'' vs. ''...the settlement should be safe for firms to introduce new products...ie, like Netscape Navigator...'' The Department of Justice has proposed a settlement that properly speaks to its duty—to introduce a remedy which allows firms to safely introduce new products. Microsoft has agreed to the rules; which include a mandate that Microsoft disclose any information necessary for rival firms to produce fully interoperable products with Windows for competing software and servers.

The reason why critics want a settlement which goes further is because they want Microsoft completely out of the way. The case is merely obfuscation. With billions of dollars in resources, Microsoft's competitors want every advantage because 1) the marketplace for new technology is overwhelming and having a chief competitor eliminated makes things a little easier and 2) the competitors lobbying for a far-reaching settlement are among the most aggressive and fierce technologists in the world.

The reality is that the marketplace, particularly the marketplace for new

technology has never been safe from a competitor. What Microsoft's competitors want is an oxymoron because no technology product is ever ''competition-free'' or guaranteed success in the marketplace. This benefits consumers, the country and ironically inventors themselves, which makes it relevant to observe the reality of the marketplace (beyond the courtroom) for a moment.

Great Inventors Must Be Fierce Strategists

Every inventor and innovator small and large must face the formidable odds to succeed in the marketplace for new technology. Since the day the first idea was registered in the U.S. patent office, countless inventions and innovations have become cinders in the furnace of competition. Relentless markets in America only sustain the fiercest competitors, without exception. Technologists rewarded with fabulous wealth and fame did so at the expense of employing hard-hitting, merciless strategies. Regardless of ingenuity, technologists without the ability to navigate in the marketplace were failures; and lucky to even receive credit as creators of their own inventions.

The marketplace for food, furniture and other goods each have their challenges. But, the technology marketplace is unique because it demands both inventive genius and keen business savvy. The combination of the two is rare in individuals and corporations, and particularly scarce among pure inventors such as physicists, mathematicians or engineers. From the light bulb to the PC operating system, every innovator that history has been kind to, had the indomitable capability to merge intellectual power with commercial insight. In the end, technologists with these qualities became far more successful than their counterparts with better inventions or greater talent.

Competitive Inventors Preserve U.S. Leadership

However, America's owes its technological leadership in the world to its competitive battleground. Although education, vigorous intellectual property rights and democracy are also credit to American invention, its ability to surface inventors with commercial savvy, make it a source of the most competitive innovations in the world.

In the end, the U.S. is a leader in world-changing innovations, at the expense of sustaining a ''bare-knuckled'' marketplace.

After an excruciating and lengthy examination by the court system, the federal government and 9 states (actually 41 when you consider the states that never filed suit) agree on the U.S. vs. Microsoft settlement. Regardless of the differences among the parties, we can't expect any ruling to settle the differences between Microsoft and its competitors. However, this dissatisfaction is in the best interest of our country and will only spawn better ideas and products that will propel the U.S. to new heights. U.S. technological leadership depends on the undying will of its innovators to be no. 1.

The ''Electric'' War Between Edison and Tesla The debate over Windows is similar to many stories about wars between rival innovators throughout history, particularly aspects of the Thomas Edison story. Although the Edison-Tesla rivalry did not involve anti-trust law, the contest details the reality of the ''invention business'' in the most competitive capitalist society in the world.

Contrary to popular belief, the idea of electric lighting was not Edison's. A number of individuals had developed forms of electric lighting, but none had developed a system that was practical for home use. Using lower current, a small carbonized filament, and an improved vacuum inside the bulb, Edison was able to produce a reliable, long-lasting source of light. Thomas Edison didn't ''invent'' the light bulb, but became a legend for making a 50-year-old idea a fantastic commercial success.

Edison's fiercest rival, was an ex-employee named Nikola Tesla from Smijlan, Croatia. Tesla was a genius who invented the fluorescent bulb in his lab forty years before industry ''invented'' them. At World's Fairs and similar exhibitions, he demonstrated the world's first neon signs. Perhaps Tesla's greatest invention was the AC (alternating current) system we use in our homes today. DC (direct current), an inferior system, ironically, was designed by Thomas Edison. After years of fierce wars and debate between the Tesla and Edison teams, AC became the accepted system of transporting electricity. In fact, Edison later admitted that AC was the better system.

While both men were geniuses ahead of their time, the biggest difference between Edison and Tesla was their perspective and approach to invention. Edison had a keen understanding of capital markets and the strategies necessary to finance, promote and commercialize his inventions. Tesla was a great theoretician who worked perpetually to finance experiments.

Edison held a world record 1,093 patents and died a wealthy, famous man. Tesla received over 800 patents, died penniless and was literally erased from the history books. In fact, Tesla was poor the last thirty years of his life and arguably would have eclipsed Edison's patent record if he had the capital. Remembered for many things, Edison was known for saying, ''1 have more respect for the fellow with a single idea who gets there than for the fellow with a thousand ideas who does nothing.'' Edison's vision reflects the view of anti-trust law, that the greater value is in a stable marketplace, not the resurrection of competing ideas.

The Other Truth about Netscape

The Appeals Court ruling reflects another hard truth—Netscape fell, because it did. The DC Circuit rejected the course-of-conduct theory, under which Microsoft's specific practices could be viewed as part of a ''broad monopolistic scheme.'' This obviously has made anyone that viewed Microsoft as an evil-doer exponentially dissatisfied with DOJ's settlement. But again, is the responsibility of the DOJ to make the world safe from Microsoft?

Netscape maintained its Internet dominance until 1997, when Internet Explorer's fourth version was able to lap Netscape. Netscape Navigator never regained its prominence. In addition, by that time, the Netscape product was slow, outdated, and unstable, falling to a swifter surging Internet Explorer.

But perhaps the most unmentioned reality regarding Netscape's fall was their announcement to all (Microsoft included) that their strategy was to be the middleware that would be the ''new'' Windows, removing Microsoft's flagship product from dominance. Hindsight is 20/20 but when you consider how far ahead Netscape was in front of Microsoft, there are infinite what if's'' to consider if it had been mum about its strategy to take on Redmond. Microsoft had all but ignored the Internet and it is very questionable if they would have been able to play catch-up to a well-funded and branded Netscape team. The outcome of this possibility almost completely counters any damage claims in their civil suit recently announced. After all, Netscape's grand plan was never realized, thus the future is incalculable especially when taking into consideration the hubris of Netscape.

Innovators are the Lifeblood of U.S.

Today, new technology firms use every means available to compete including spending billions of dollars on research and development. Sun Microsystems, IBM and AOL and Microsoft combine to spend over $100 billion annually just on research and development. Firms spend exorbitant amounts of money to create and protect to new products. But again, this competition is to the benefit of inventors and the U.S. marketplace. 1Recently, the United States Patent Office released its annual list of the top ten private sector patent recipients. It reported that for the ninth consecutive year, IBM received more patents than any other organization in the world. ''1 am proud that American corporations are leaders among U.S. patent holders,'' said James E. Rogan, Undersecretary of Commerce for Intellectual Property. ''Patents promote technological progress and are a potent source for competitive free enterprise.''

USPTO's comments echo the importance of preserving the status quo of the U.S. marketplace.

In the end, it is in the interest of innovation that we close the chapter on U.S. vs. Microsoft. The judicial process has sorted through the facts and come to judgment. Those dissatisfied with the settlement should be reminded by W. M. Deming's famous quip, ''Learning is not essential, survival is not mandatory.'' Deming's point speaks not only to the Microsoft case; but the hard truth about invention and success in the technology business. The court system has done its job, and enough precious time has been dedicated to legal jurisprudence. It is now the time for Microsoft and its opponents to tuck in their chin, learn from their mistakes and return to the marketplace.

Attorney General John Ashcroft
US Department of Justice, 950
Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

I am writing you today to voice my opinion in regards to the Microsoft settlement issue. I feel that this debate has gone on long enough and that it is time to end this litigation. After three years of litigation, it is time to focus on more pressing issues. In my opinion, this lawsuit should never have occurred in the first place. Nonetheless, this settlement is the perfect means to end this dispute. Microsoft will remain together and continue designing and marketing their innovative software, while fostering competition and making it easier for other companies to compete. Microsoft has pledged to share more information about Windows operating system products and has agreed to be monitored for compliance. During these difficult times, it is vital to do all we can to boost our economy. Restricting Microsoft will not accomplish this. This country is at war with a world wide network of Islamic extremists intent on destroying us. The Department of Justice needs to focus on ''fixing'' the FBI and improving the security of our nation and protecting American citizens against more terrorist attacks. Has this short passage of time since September 11 dulled memories so quickly that we are back to the old games of using lawyers and politicians and the Department of Justice to squash competitors? Are things really back to normal? I don't think so...until the next terrorist attack... Antitrust laws are not meant to protect competitors against their inability to compete in the marketplace due to their own incompetence...Look who is suing? AOL, Sun Microsystems, Oracle, IBM are multibillion corporations.., not mom and pop outfits threatened by a bully...The antitrust laws were meant to protect consumers and to allow fair competition.

Consumers are not complaining. However antitrust laws are now being used to protect competitors, and to make trial lawyers even richer,,,at the expense of consumers and the economy. How many companies have been forced into bankruptcy now by trial lawyers over asbestos? 20? 30? 50?

AOL, Time Warner, IBM, Sun Microsystems, Oracle, etc have contributed heavily to politicians for years...long before Microsoft was forced to play this game, as a result of their persistent efforts to prosecute and persecute Microsoft.

Should the DOJ continue to ''work'' on behalf of Attorney Generals who are receiving large contributions and specific instructions from Microsoft's competitors via ProComp and other such organizations? After all, it was Sun Microsystems'' financing of ''Project Sherman'' which assembled of panel of so called antitrust experts to testify before the DOJ. This panel had worked secretly for months, to ''produce'' antitrust charges which would appear credible to the DOJ. Unknowing to the DOJ, these ''experts'' were being paid $600 to $700 an hour by Microsoft's competitors. Reputable antitrust experts like Carlson produced novel antitrust theories of harm from incomplete foreclosure of market share that even bamboozled the Appeals Court judges; their decision relied on this ''novel'' theory...and most of their findings of antitrust violations were based on Carlson's novel'' theories. Project Sherman, which cost Sun $3 million, initially convinced the Department of Justice to take this case..

I would think that the Enron scandal would make politicians and regulators more wary of the dangers involved from large contributors... I was surprised to learn the extent of Enron's contributions. They gave $50,000 to Paul Krugman, from the New York Times, who writes about economic matters, and not too surprisingly, Krugman apparently wrote positive articles in the past about Enron ....

I think it was American competitors of GE and Honeywell who gave secret testimony to the EU commission that lead the EU to disallow the GE-Honeywell merger, ge with Honeywell... It was a complaint from Sun Microsystems that lead the European Union to launch an antitrust case against Microsoft by the EU. There is something about certain American companies that borders on treason, in my opinion...when they resort to getting the European Union to crush their competition ..if they can't get the DOJ or FTC to do it... It is telling that Sun Microsystems has 200 lawyers in their legal department, more than many large firms, even in Washington. I think their shareholders might prefer they spent more on improving their products and competing...as their stock continues to decline. It's the old familiar story as Glassman says. ''Pick an unsympathetic target with deep pockets. Generate lots of publicity.

Change the laws, if need be.'' ''Then get the company to capitulate.'' Gee, Jesse Jackson is so good at these tactics of file:///C√/win/temp/tmp. getting large corporations to donate to his ''charities; it is not surprising he was involved with the class action lawsuits in California claiming Microsoft discriminated against blacks and then women too. Microsoft was consistently been rated one of the top corporations ''to work for and one of the most admired companies by Fortune until the trial lawyers and AG and MSFT's competitors started their hatchet jobs and made Microsoft into an ''unsympathetic target.'' http://www.techcentralstation.com/1051/techwrapper.jsp?PID=1051–250&CID=1051–012901A The Appeals Court judges in Microsoft's appeal were astonished to learn that 160 million copies of Netscape browsers were distributed overall, and that their user base doubled to 33 million ..... in 1998 ..... when Microsoft's competitors were accusing Microsoft of foreclosing competion. They claimed that Microsoft ''threatened to cut off Netscapes air supply,'' a statement MSFT never made.

Microsoft's competitors lobbied politicians for years before Microsoft was finally forced to join their game and forced to pay this'' protection money. '' For about 20 years Gates and his colleagues just sat out there in ''the other Washington,'' creating and selling. As the company got bigger, Washington, DC, politicians and journalists began sneering at Microsoft's political innocence. A congressional aide told the press, ''They don't want to play the DC game, that's clear, and they've gotten away with it so far. The problem is, in the long run they won't be able to.'' Politicians told Bill Gates, ''Nice little company ya got there. Shame if anything

happened to it.'' And Microsoft got the message: If you want to produce something in America, you'd better play the game. In 1995, after repeated assaults by the Federal Trade Commission and the Justice Department, Microsoft broke down and started playing the Washington game. It hired lobbyists and Washington PR firms. Its executives made political contributions. And every other high-tech company is getting the message, too, which is great news for lobbyists and fundraisers.'' (but not for consumers or innovators or successful companies..) From ''The Theft of Microsoft'' by David Boaz. http://www.cato.org/dailys/07–27–00.html

''What lesson should they draw? The antitrust laws are fatally flawed. When our antitrust laws are used by competitors to harm successful companies, when our most innovative companies are under assault from the federal government, when lawyers and politicians decide to restructure the software, credit-card and airline industries, it's time to repeal the antitrust laws and let firms compete in a free marketplace.''

''Our tobacco, gun and antitrust laws have essentially been rewritten by state AGs and their trial-lawyer allies. The result, as former Labor Secretary Robert Reich wrote in USA Today, has been ''regulation by litigation'' - a sorry state of affairs that has cut elected representatives out of the system.''

''Political science quiz: Today's category is decision making at the Federal Trade Commission and the Department of Justice.''

''Which is more important in the merger approval process?

1) a sophisticated economic study prepared by staff economists, complete with extensive industry data, statistical analysis, and tight reasoning,

2) a scratchy, three-minute cell-phone call from the secretary of commerce?'' ANSWER: 2) a scratchy, three-minute cell-phone call from the secretary of commerce?'' ''In 1991, the Time Warner buyout of Turner Broadcasting zipped past the FTC, despite a staff report branding the merger as anti-competitive. After Ted Turner and Gerald Levin, the two CEOs involved, visited top officials in Washington, the commissioners tossed the staff work out the window.'' From: ''Texas Swing:

The not-so-shocking reason the Lone Star state chose not to sue Microsoft.'' By Thomas W. Hazlett REASON August/September 1998 http://reason.com/9808/col.hazlett.html

''Did they disagree with the competitive analysis? Was it a difference of opinion as to the cross-elasticity of demand? Or were the politically appointed regulators moved by a higher voice? It would be nice if the pundits who explained our politics to us could see where the politics goes. ''That's what ''access,'' and the campaign contributions used to purchase it, are all about.'' Somehow this case reminds me of what terrorists living in the US are doing so well.

There are many front groups for violent terrorist groups like Hamas and Islamic Jihad residing in the US, claiming to be think tanks or charitable groups. Organizations like C.A.I.R. or the Council on''American Islamic Relations, masquerade as mainstream public affairs organizations. CAIR has taken the lead in trying to mislead the public about the terrorist underpinnings of militant Islamic movements, in particular Hamas. ''http://www.geocities.com/CollegePark/6453/emerson.html

CAIR and other such organizations have lobbied to change our US laws, like the use of secret evidence, to make it harder to deport them or to prosecute them; under the guise of protecting our freedom of speech.

These terrorists posing as phony charitable groups or think tanks also contribute to politicians and lobbyists and use the media to advance ''their cause. CAIR has routinely exaggerated or fabricated ''hate crimes'' against Muslims. Just one example:

''CAIR's 1997 report on ''hate crimes'' labeled the death of Ahmed Abdel Hameed Hamida as a ''hate crime.'' Hamida drove his car into a crowd of Israelis at a Jerusalem bus stop on February 26, 1996, killing one woman and injuring twenty-three other Israelis. He attempted to escape on foot but was shot to death by Israeli civilians. He shouted ''Allahu Akbar,'' (God is Great!) as his car struck the crowd. He had made statements previously affirming his intent to kill Jews.

Hamida was a terroris, yet CAIR classified his death as a ''hate crime.''

Why is this relevant to Microsoft's antitrust case? Microsoft's competitors and these phony front groups are using their influence over the media, and their power from contributions to politicians to give the appearance that they are concerned with civil rights or consumers, when they are only advancing their own agenda, which is harmful to most of us. Microsoft's competitors claim to have the interest of consumers at heart, when in reality their own incompetence lead to their loss of market share. AOL 5 was such a terrible product that even computer experts could not deal with the changes it made to the computer. It changed your default settings and took over. Mossberg from the Wall Street Journal, who has never been a fan of Microsoft, acknowledged this at the time and there were lawsuits over this which somehow failed to make the news.. Anyone who has ever used AOL knows about their inferior products and their poor customer service.

''In 1975 Microsoft had 3 employees and revenues of $16,000. Over the next 25 years they grew to 36,000 employees and revenues of $20 billion by obsessively figuring out what computer users needed and delivering it to them.'' ''Over the years Gates and his colleagues made a lot of people mad, especially their competitors. Some of those competitors delivered a 222-page white paper in 1996 to Joel Klein, head of the Justice Department's antitrust division, and urged him to do to Microsoft in court what they couldn't do in the marketplace. (Susan Creighton wrote that White Paper).

Justice worked closely with the competitors for four years, often showing them sentences or paragraphs in drafts of the department's plans and soliciting their approval. The politics of the case is a far cry from the Platonic ideal of rigorous economists devising the best possible antitrust rules and wise, disinterested judges carefully weighing the evidence.''

Microsoft's competitors have used the Department of Justice to try to take not just their money but their intellectual property as well.

From ''The Theft of Microsoft'' by David Boaz. http://www.cato.org/dailys/07–27–00.html ''In antitrust circles, Creighton is a card-carrying anti-Microsoft agitator. Creighton is now the deputy director for the FTC.

I hope she has recused herself from any involvement in this case.'' Five years ago—while her then-partner Gary Reback played a more public role—Creighton penned the infamous white paper commissioned by Netscape.'' Susan Creighton, and her partner Gary Reback, from Silicon Valley's Wilson Sonsini Goodrich & Rosati. Creighton ''helped ignite the government's landmark case against the monopolist from Redmond, Wash.

''Microsoft's Captain Ahab'' by Krysten Crawford, from The American Lawyer August 22, 2001from http://www.law.com ''Bill Gates draws praise from the cultural elite when he gives away his money—and he has given away more than $20 billion; the Bill and Melissa Gates foundation has given more than any other philanthropist foundation. Yet those contributions pale when compared to the g Microsoft's great contributions to the technological and economic advances of the last decade. It would be a shame to see Microsoft's assets and intellectual property distributed to greedy conniving corporations and lawyers and publicity seeking Attorney Generals trying to further their careers.

Mr. Tunney is now complaining about the way Microsoft has reported their political contribution. I doubt he is really impartial. Robert Bork was a prominent foe of antitrust law in the 1970's, and a colleague of Judge Posner. Bork though as ''changed'' sides and became very ''pro-antitrust'' when hired by Microsoft's competitors.

I sincerely hope the Department of Justice accepts this settlement and puts an end to this mess and turns their attention to real threats to the Nation- the terrorists who want to destroy the West. Caving into Microsoft's major competitors who are behind the Attorney Generals hurt consumers and the economy further. Let them innovate like Microsoft does, rather than litigate.

Thank you for your attention.
Sincerely,
Helen B. Gamsey

Subject: Microsoft Settlement
SUMMARY

The currently proposed settlement with Microsoft woefully fails to address the critically important need of restoring hope to all of the parties afflicted by the Microsoft's abuse of monopolistic power.

Restoring of hope is a critical criteria by which any and all proposed solutions to the Microsoft monopoly problem must be judged. Moving forward, a just and fair solution to the Microsoft monopoly can only be created through a combination of structural and behavioral remedies.

AXIOMS

(Rule of) Law

At the surface, (the rule of) law is the complex, accretive, disjointly semi-hierarchical, codification of the conglomeration of (the processes of) (dealing with) (quasi-) behaviors.

At the heart, (the rule of) law is a simple belief system.

Fundamentally, (the rule of) law is about hope.

Anti-Trust Law

At the surface, anti-trust laws are primarily about dealing with things like the (private sector) abuse of monopoly power to harm consumers. At the heart, anti-trust laws are about dealing with entities which unduly restrict free-market competition.

Fundamentally, anti-trust laws are about dealing with entities which eliminate hope.

MICROSOFT ANTI-TRUST CASE

Background

The facts are simple and clear:

* Microsoft has systematically and aggressively pursued monopolistic goals since its formation.

* Microsoft's behavioral outrageousness stems directly from the corporate, ''Cult of Bill'' culture [ala ''Cult of Personality] that has been created and fostered by all of the senior management of the company including Bill Gates himself.

* Microsoft has been very successful at gaining monopolistic power in many critical areas of the computer (software) business.

* Microsoft has repeatedly, aggressively, and unapologetically abused its monopolistic power to the detriment of the marketplace.

* Microsoft has clearly shown its obstinate incapability to adhere to behavioral restraints.

Lack of Hope

The settlement and (behavioral) remedies proposed by the US DoJ vs Microsoft anti-trust action are not only worthless to the marketplace but are outright detrimental. Why is that so clearly the case? Simple... The proposed settlement does absolutely nothing to address the fundamental abuse of Microsoft: the severe curtailing and, often, outright elimination of hope. For example:

* The hope of major (software) competitors has been mostly devastated over the years by e.g., Microsoft's abuse of its monopolistic power to exclude the competition from pre-built computers containing Microsoft operating systems (which increasingly forcing the ''up selling'', if not outright inclusion of more and more Microsoft products and services).

* The hope of computer vendors to sell whatever (software) it is that they want and are able to with their computers to satisfy their customers.

* The hope of upstart, would-be (software) competitors. It's a well known truism that a great many startup companies work so as to *not* attract the notice of Microsoft for as long as possible. It's incalculable how many companies (and projects within existing companies) have been canceled due to fear of Microsoft's (re)action.

* The hope of consumers for a fair price based on a fair, open market.

* The hope of (ignorant, inexperienced, etc.) consumers for computer systems that actually work (reliably, robustly, inexpensively, securely, etc.).

* The hope of (informed, experienced) consumers for computers and software that can (reliably, effectively, inexpensively, securely, etc.) inter-operate between all consumers (that don't explicitly choose to isolate themselves) without being, a priori, forced into using Microsoft products (due to such forces as the so called ''network externalities'' effects which reinforce monopolistic power).

* The hope of investors for a market which is unskewed by the insidious abuses of monopolistic power.

* The hope of citizens that the rule of law (still) has meaning and that breaking the law has serious, effective, and efficient consequences upon the violators, inhibitive effects upon would be violators, and some restitution for the violated. By neglecting dealing with hope, the proposed settlement precludes the reconstitution of a fair and open market, allows a vicious predator to continue their predations, and weakens the rule of law.

Therefore, any proposed settlement remedies must be judged in their effectiveness and efficiency at restoring hope.

Side-note on Consumer Pricing

I have heard many arguments, both pro and con, from various people using (''guesstimates'') of the effects of Microsoft's monopolistic abuses on the prices that consumers have paid for various products. I have found all of those such arguments that I have heard to be severely lacking directly in proportion to their failure to address the fundamental hopes and expectations of consumers.

For example, of what import is the fact that Microsoft may or may not have ''over-charged'' some customers for some of their products if there was no hope of having a fair and open market to determine the true pricing? The very fact that there was not (any hope of) a fair and open market meant that there was absolutely no possibility whatsoever that anyone could have paid a fair price for any product or service from Microsoft nor for any product or service impacted by the monopolistic effects of the so skewed marketplace.

Behavioral Remedies are Insufficient Given the facts of the case, it is crystal clear that the current proposed settlement's reliance upon strictly behavioral remedies is insufficient to effectively and efficiently restore any hope.

My analogy is that of modifying the behavior of children... It is clear that while an appropriate corrective action (e.g., a slap on the wrist) by a reasonable, supervising guardian may well affect a change of behavior (for the better) in an otherwise normal, well-behaved child; such a remedy does, at best, nothing to positively change the behavior of a willfully recalcitrant teenager (and, at worst, merely incenses and incents them to be more clever in their abuses). At least, Microsoft must be treated as such a willful violator.

Many others have gone through and picked apart each and every one of the behavioral remedies in the proposed settlement. I won't go further into analyzing them here due to my contention that those remedies are, by themselves, so clearly insufficient. That said, I have co-signed Dan Kegel's open letter—http://www.kegel.com/remedy/letter.html.

Structural Remedies are Necessary

Structural remedies are necessary to any proposed resolution to the Microsoft monopoly. Only by incontrovertibly dispersing and otherwise separating each of the major constituents can there be any hope of significantly and effectively modifying the behavior of Microsoft and its monopolistic effects.

Structural remedies are necessary so that each of the resulting entities can be effectively constrained from (attempting to) reconstitute the original company. In addition, the resulting entities must be sufficiently isolated in terms of its market power by having to stand and compete in a fair and open market without being able to rely on the direct and synergistic power effects that Microsoft currently abuses. Structural and Behavioral Remedies are Necessary and Sufficient I hope that it's clear from the preceding that the only ways to curtail the continued devastation of all of our collective hopes by Microsoft is to imposed significant structural remedies along with broad behavioral remedies.

I will leave it to another missive to go into details and rationale of my proposed remedies but the broad strokes are:

* Divest the current assets of Microsoft into three (4) new entities. One entity for creating operating systems for devices (PCs, handhelds, etc.). One entity for the end-user applications such as Microsoft Office suite of

applications. One entity for the development tools and libraries. And finally, one for end-user services such as MSN. Appropriate, suitably related portions of each of the general facets such as customer service & support and Microsoft Research would be dispersed to each of the new entities.

* Require that the (major) shareholders, the board members, and at least top three levels of executive management can only have anything whatsoever to do with at most one of the created entities. Also, inhibit their ability to switch between the created entities.

* Enjoin the resulting entities from colluding with any of the entities on any products or services to the exclusion of any other companies in any respective market. In conclusion:

* The currently proposed settlement fails completely to provide any hope for anyone, except those who gain by Microsoft continuing to abuse its monopoly, that anything will change for the better.

* Judging any proposed solution to Microsoft's monopoly must incorporate and account for the effects hope.

* Based on my experience and analysis, the only possible solutions necessarily must be based a combination of both structural and behavioral remedies.

Sincerely,
John D. Mitchell

Subject: Microsoft antitrust case —

I would like to say get this case over with and let Microsoft get on with business. Do not let the states do separate settlements. Because it will just turn into a money grab. How dose consumer protection benefit from fifty one separate legal cases? The only people that profit are the lawyers and state attorneys looking to make a name for themselves.

Making the source codes available will give new products an ability to integrate with microsoft. Will you require apple to do the same? The U.S. economy is in the toilet. Tens of thousands of jobs have been lost. Excess beating up on Microsoft will not help this situation. Dragging this issue out any longer will not help U.S. consumers.

I am writing this on a Mac G4. I have both Apple and Microsoft operating systems. I also have Netscape and Internet explorer on my home PC.

P.S. The U.S. lost a unfair trade case in the world court. Is this one of those cases where we are suppose to do what you say not as you do?

I find it amazing that the Federal Govt would go through such extrodianry lengths to prosecute Bill GAtes and Microsoft. I cant speak on the legal technacalities of the lawsuit but the Microsoft s impact on the United States is clear. Over the past 10 years computers the internet and technology have been made more available to households and schools across the country. I find it odd that this can be considered some sort of monoply that is harming our nation. Microsoft has done wonders for our scociety making computers cheaper easier to use and more avialable. Thank You for your time.

If there has ever been any doubt that AOL does not want a fair and expedient solution to it s legal challenge to Microsoft then it s latest legal action should remove a all doubt. The irony of all their actions is that there has never been a ground swell of consumer complaints stating that the consumer has been hurt by Microsoft business practices. It is obvious that AOL Time Warner is trying to use the courts for it s own competitive purposes. It is also time to challenge whether AOL is monopolistic in it s own business as the largest internet provider. If AOL should in fact buy the Linux operating system I suppose we will see yet another challenge to Microsoft in the courts. For the sake of the technology industry the nation s economy and America s consumers let s get these issues out of the courts and into the competetive marketplace where they should be.

Subject: reasons against the settlement

I know I might be sending this a bit late, but I just found out about the open comment period and I'd like to say a couple things from an educator's point of view.

I teach two computer classes—one in web site design and programming, the other in computer & network support (aimed at CompTIA's A+ and Network+ tests). Our high school uses Windows PC's almost exclusively because of a directive from our school board that has more or less banned Macs due to their lack of presence in most businesses. I primarily use Macs at home, but I also have 3 PC's and am very comfortable with the Windows and Linux operating systems (I'm A+, Network+ and Linux+ certified).

The settlement is bad for consumers, educators, students and the country as a whole for two major reasons.

The first reason is that educators and students would have very little say in what products are chosen to be placed in their classrooms. Deep discounts from Microsoft and used PC heardware not only limits choices, but also increases tech support costs for the school. I did an observation at an inner-city high school in Cincinnati when I was in college, and five brand-new PC's sat in a corner because kids had stolen the balls from inside the mice and they were rendered useless. Of course, a $2 mouse ball would have fixed this, but with very little tech support in that district, the technology is wasted. If you want to do anything with schools, give them some money for equipment but give a lot more money for tech support training and increased salaries for tech coordinators to attract more qualified individuals.

The second, and most important reason, is that the settlement does absolutely nothing to curb Microsoft's future domineering behavior. In fact, they come out looking like the good guys by donating to impoverished schools while increasing their installed user base! This sort of thing cannot be allowed to happen.

The Windows APIs that allow programs to run inside the Windows Operating System should be opened up for everyone to download, use, interpret, and include in another OS. For example, if Mac OS X could run Windows programs natively, it would be a dramatic improvement for the computer industry as a whole because it would provide some serious competition for Microsoft. If you look back to the beginning of the computer industry, IBM was very slow to improve its original 8086 and 80286 computers until competition (in the form of Compaq clones) came along. The same thing happened with Intel, which rested on its laurels until AMD released a chip (the Athlon) that was faster and cheaper than their Pentium 3.

Competition is good for the industry. Please don't allow Microsoft to get away with this sort of bribery.

Comments of the Computing Technology Industry Association on the Revised Proposed Final Judgment in United States v. Microsoft

Submitted to the United States Department of Justice pursuant to the Tunney Act, 15 U.S.C. u 16

January 28, 2002

I. EXECUTIVE SUMMARY

CompTIA supports the Revised Proposed Final Judgment (RPFJ) entered into between the United States Department of Justice, nine states, and Microsoft on November 6, 2001. The RPFJ represents a reasonable compromise of the parties' respective positions in this case. The benchmark under which the settlement must be judged is whether it is consistent with the United States Court of Appeals June 28, 2001 opinion. The Court of Appeals found that Microsoft took actions to unlawfully maintain its monopoly in the operating system market, but also ruled that Microsoft had not attempted to unlawfully monopolize the Internet browser market nor did it unlawfully tie its Internet Explorer to the Windows operating system. The RPFJ represents a reasonable balance of the Court of Appeals split decision by imposing obligations upon Microsoft in the areas where it was found liable, and avoiding obligations in areas where Microsoft's conduct was not found to be unlawful. As such, the RPFJ is narrowly tailored to fit the violations and will likely avoid collateral damages to the marketplace. After the November 6, 2001 Proposed Final Judgment was announced many of Microsoft's competitors complained that the settlement was too lenient. The antitrust laws, however, make clear that the settlement should not be designed as a wish list for Microsoft's competitors. The settlement should fairly address the areas of liability found by the Court of Appeals. Anything less would encourage Microsoft and other companies to engage in anti-competitive conduct in the future; anything more would inappropriately imperil the technology marketplace and cause harm to consumers.

The terms of the RPFJ insure that the technology sector will continue to expand and innovate. The settlement places strong and appropriate checks on Microsoft in areas where such checks are needed, but is designed in such a way that Microsoft will be able to compete fairly and aggressively in all markets. CompTIA urges the United States District Court to approve the settlement and reject the non-settling states more extensive remedy proposal as that would erode intellectual property protection, harm competition, and stall growth in the industry.

The only significant reservation regarding the RPFJ that CompTIA holds is that the settlement obligates Microsoft to disclose an abundance of intellectual property to the Plaintiffs and the Technical Committee. While this technical information is to be used for the purpose of achieving the interoperability goals specifically identified in the RPFJ, CompTIA is concerned that the precedent established by these disclosure provisions will be harmful to the technology sector in the long run. Innovation and growth in the IT industry are fostered by strong protection of intellectual property rights. If every antitrust violation is remedied by a wholesale forfeiture of valuable proprietary information by the defendant, intellectual property rights will suffer a significant blow. And, justifying the forced disclosure of a company's valuable technical information on the ground that it will be used for interoperability purposes only is not a sufficient protection. Because there is no bright line as to what constitutes interoperability information and what does not, the chance of valuable intellectual property being compromised is high.

CompTIA's reservation notwithstanding, we believe the settlement will benefit the industry as a whole and we respectfully urge the District Court to approve the RPFJ.

II.COMPTIA'S INTEREST IN THIS MATTER

The Computing Technology Industry Association (CompTIA) is the world's largest trade association in the information technology and communications sector. CompTIA represents over 8,000 hardware and software manufacturers, distributors, retailers, Internet, telecommunications, IT training and other service companies in over 50 countries. The overwhelming majority of CompTIA members are resellers companies that resell software and hardware to consumers, businesses, or other resellers. These resellers are vendor-neutral and their objective is to be able to sell whatever products their customers wish to buy. In that sense they believe that antitrust laws should focus primarily on consumer impact rather than competitor impact. Microsoft is a member of CompTIA as are many of Microsoft's competitors. In 1998, CompTIA's Board of Directors adopted a formal policy statement on antitrust.

That statement supports sensible antitrust enforcement that is based on demonstrable economic effects in the marketplace. CompTIA believes that market forces typically correct any temporary market imperfections and that government regulators should only intervene in the technology marketplace when there is overwhelming evidence of a substantial and pervasive market failure. Pursuant to its policy statement, CompTIA has written and spoken frequently on antitrust issues of relevance to the technology sector. In June 1998, CompTIA filed an amicus brief in the Intel v. Intergraph litigation in the U.S. Court of Appeals for the Federal Circuit. In that case

CompTIA urged the court to reject a lower court's finding that antitrust allegations could be a basis for ordering a company to disclose its valuable intellectual property. CompTIA co-authored an amicus brief in the United States Court of Appeals for the District of Columbia Circuit in the United States v. Microsoft case in November 2000. The amicus brief urged the Court of Appeals to reverse the District Court's order breaking Microsoft into two separate companies and further discussed the negative industry-wide ramifications of the District Court's liability findings were they all permitted to stand. The basis for CompTIA's participation as amicus and submission of these Comments is its interest in the overall health and prosperity of the technology sector.

III. THE CONSENT JUDGMENT IS IN THE PUBLIC INTEREST AND SHOULD BE APPROVED BY THE COURT

A. Standards Under Which the RPFJ Should Be Judged

Under the Tunney Act, 15 U.S.C. u 16, the consent judgment should be approved if it is in the ''public interest.'' The public interest analysis must be measured by the objectives of the antitrust laws; public interest concerns that are not within the purview of the antitrust laws are irrelevant. U.S. v. AT&T, 552 F. Supp 131 (D.DC 1982), affirmed, 103 S.Ct. 1240 (1983).

Nor is their a requirement that the settlement be, in the eyes of the District Court, ''the best possible settlement that could have been obtained;'' the settlement must simply be within the reaches of the public interest. U.S. v. Agri-Mark, Inc., 512 F. Supp 737 (D. Vt. 1981). In short the District Court should not reject the consent judgment
merely because [s]he believe[s] other remedies [are] preferable. United States v. Microsoft, 56 F.3d 1448, 1460 (DC Cir. 1995).

The language of the Tunney Act sets forth specific areas of inquiry relating to the public interest:

For the purpose of such determination, the court may consider—(1) the competitive impact of such judgment, including termination of alleged violations, provisions for enforcement and modification, duration or relief sought, anticipated effects of alternative remedies actually considered, and any other considerations bearing upon the adequacy of such judgment; (2) the impact of entry of such judgment upon the public generally and individuals alleging specific injury from the violations set forth in the complaint including consideration of the public benefit, if any, to be derived from a determination of the issues at trial.

15 U.S.C. u 16(e). Focusing on selected areas identified within the Tunney Act, CompTIA sets forth its analysis of the RPFJ below.

B. The Competitive Impact of Such Judgment

1. Termination of Violations

The RPFJ closely tracks the liability findings from the Court of Appeals opinion. First, the settlement prohibits Microsoft from retaliating against any OEM (original equipment manufacturer) because of an OEM's participation in promoting or developing non-Microsoft middleware or a non-Microsoft operating system. This provision takes the club out of Microsoft's hand and prevents the company from using anticompetitive means to discourage OEM's from promoting or preventing rival software from being developed or installed on the Windows desktop.

The anti-retaliation provisions of the RPFJ even go so far as to prohibit Microsoft from altering its license with an OEM even if the OEM offers users the option of launching other Operating Systems from the Basic Input/Output System or a non-Microsoft boot-loader or similar program that launches prior to the start of the Windows Operating System Product.

RPFJ at u III.C.4 (emphasis added). Thus, an OEM has the full ability to make decisions based on price, features and performance with respect to whether an alternative operating system will be loaded on its computers; and that operating system product may appear to the user before Windows does. This flexibility will insure that operating systems that compete with Windows will have a full opportunity to reach the consumer. Once there, the decision about whether they succeed or fail is in the hands of consumers. These anti-retaliation provisions deal head on with the bulk of the conduct the Court of Appeals found to be illegal in the monopoly maintenance section of its June 28, 2001 opinion.

Second, Microsoft is obligated to adhere to one uniform license agreement for Windows with the top twenty OEM's and the royalty for the license shall be made publically available on a web site accessible by all OEM's. The price schedule may vary for volume discounts and for those OEM's who are eligible for market development allowances in connection with Windows products. This allows Microsoft to continue to compete in all software markets with other software manufacturers and this competition will continue to benefit consumers.

Third, OEM's are permitted to alter the appearance of the Windows desktop to add icons, shortcuts and menu items for non-Microsoft middleware, and they may establish non- Microsoft programs as default programs in Windows. Consumers also have the option of removing the interface with any Microsoft middleware product.

Fourth, Microsoft must reveal the API's used by Microsoft middleware to interoperate with the Windows operating system. Microsoft must also offer to license its intellectual property rights to any entity who has need for the intellectual property to insure that their products will interoperate with the Windows operating system.

These central features of the settlement insure that other companies have the ability to challenge Microsoft products, both in the operating system and middleware/ applications markets, and are not unfairly shut out of those markets as a result of Microsoft's operating system monopoly. Consumers and OEM's have far greater freedom to install and use non- Microsoft products, Microsoft is prohibited from retaliating against any entity who promotes non-Microsoft programs, and all companies have equal access to Microsoft API's and technical information so that non-Microsoft middleware has the same opportunity to perform as well as Microsoft middleware. At the same time the RPFJ does not prevent Microsoft from integrating new technology into the Windows operating system and does not prohibit Microsoft from competing in any market that it chooses to enter. Such restrictions would have harmed consumers and been antithetical to the goals of the antitrust laws.

Because the RPFJ adheres closely and effectively addresses the liability findings of the Court of Appeals, it is a reasonable settlement and therefore in the public interest. Finally, the Court of Appeals directed the District Court to consider whether there is a causal connection between Microsoft's anticompetitive conduct and its dominant position in the OS market. United States v. Microsoft, 253 F.3d 34, 106 (DC Cir.), cert. denied, 122 S.Ct. 350 (2001). And while this direction was made in the context of whether structural relief is appropriate, it is logical to conclude that the foundation of that inquiry remains highly relevant even though structural relief is no longer at issue in this case. In the absence of evidence that the marketplace would have looked any differently absent Microsoft's anticompetitive behavior, the RPFJ provisions that enjoin the conduct found unlawful by the Court of Appeals are appropriate and in the public interest. Any remedy that extends beyond the monopoly maintenance findings by the Court of Appeals would not be in the public interest absent a finding of causal connection showing actual harm in the marketplace, and clear evidence of how the remedy would obviate the harm, while avoiding collateral damage to the marketplace.

2. Commingling of Software Code

Bundling can also capitalize on certain economies of scope. A possible example is the ''shared'' library [1] files that perform OS and browser functions with the very same lines of code and thus may save drive space from the clutter of redundant routines and memory when consumers use both the OS and browser simultaneously.

Some may criticize the settlement because the RPFJ does not address the issue of Microsoft's commingling of operating system code and Internet Explorer code which was found to be unlawful. See United States v. Microsoft, 253 F.3d 34, 66 (DC Cir. 2001). The Court of Appeals concluded that Microsoft's commingling of code
deters OEMs [original equipment manufacturers] from pre-installing rival browsers, thereby reducing the rivals'' usage share and, hence, developers'' interest in rivals'' APIs as an alternative to the API set exposed by Microsoft's operating system. Id.

While Microsoft vigorously contested this finding of fact, and the Court of Appeals elsewhere acknowledged potential efficiencies from commingling of code, the Court denied1 Microsoft's petition for rehearing on this issue. In denying Microsoft's petition, however, the Court of Appeals expressly noted that [n]othing in the Court's opinion is intended to preclude the District Court's consideration of remedy issues. Order, August 2, 2001. Thus, the Court of Appeals signaled that its finding that Microsoft unlawfully commingled code does not necessarily mandate a remedial order requiring Microsoft to separate the code. Given the variety of other provisions in the RPFJ that encourage OEMs to place non-Microsoft middleware on the desktop, the consent judgment does not fail for the fact that it does not require Microsoft to separate the code. In the overall totality of circumstances, it is reasonable to conclude that the public interest would be better served by avoiding an order that would require Microsoft to engage in a fundamental redesign of its operating system. The object of such a remedy is effectively addressed through other provisions that do not harm consumers.

3. There are no Loopholes in the RPFJ

Some critics of the settlement have opined that the RPFJ contains loopholes in the language that requires Microsoft to disclose APIs (application programming interfaces) to software developers. See Washington Post, Wording of Microsoft Deal Too Loose, Analyses Say, January 18, 2002, E01. The settlement requires Microsoft to make such disclosures with respect to its browser, Internet Explorer, and other software such as Windows Media Player so that software developers may create competing software that interoperates with the Windows operating system. The allegation that the

[1] Id. at 87.

settlement has loopholes in this regard, however, is based on a faulty interpretation of the plain language of the settlement agreement. Section III.D of the RPFJ requires Microsoft to make available the APIs and related Documentation that are used by Microsoft Middleware to interoperate with a Windows Operating System Product. The term Microsoft Middleware is defined as software code that is contained within the operating system, but for which updates are distributed separately. The definition also requires, inter alia, that the software code be trademarked. The two programs cited by critics of the settlement as possibly excluded from disclosure requirements, Internet Explorer and Windows Media Player, are, however, clearly within the definition. Both are included within the Windows operating system as an initial matter and updates to both are distributed

A comprehensive list of downloadable updates to software that is contained within the Microsoft operating system is located at the following url: Updates to Internet Explorer and Windows Media Player are distributed on this site.

Publically available trademark information indicates that Internet Explorer is trademarked under serial Nos. 75663324 and 75340051 (assigned from Synet Inc.) and Windows Media, including descriptions of Windows Media Player are trademarked under serial Nos. 75663200, 75517785, and 75517786. separately. Moreover, both the logos and the words covering Internet Explorer and Windows2 Media Player are trademarked.3

A natural reading of the RPFJ demonstrates that there are no loopholes that would frustrate the overall intent of the document. The definitions are constructed in such a way to give meaning to certain terms, including middleware, that otherwise would be susceptible to a wide variance of interpretation. While some who are critical of the settlement may prefer broader definitions of certain terms, the danger in over-expansive definitions is that they exclude nothing and thus become unworkably vague.

4. Provisions for Enforcement and Modification CompTIA has carefully analyzed the enforcement provisions of the RPFJ and concludes that the enforcement provisions are stringent, thorough, comprehensive, and are carefully designed to insure that Microsoft comply with the substantive terms of the settlement agreement.

In addition, the terms are creative in that they include provisions that are likely to speed the resolution of consumer and competitor disputes, rather than result in additional lengthy litigation over the terms of the settlement. In sum, CompTIA finds little support for the characterization of the enforcement provisions as weak, and instead believes that the enforcement mechanisms are strong, effective, and will likely provide quick and effective resolution of any disputes under the agreement.

Plaintiff's Powers to Enforce: The RPFJ specifically provides that the United States or any of the individual states involved in the case have responsibility for enforcing the Final Judgment. To facilitate this enforcement, the Plaintiffs have the right to:

! inspect all books, records, ledgers, or any document within the control of Microsoft;

! inspect all source code for any Microsoft program;

! interview any Microsoft employee, and record such interview;

! order Microsoft to prepare any report under oath regarding any matter in the Final Judgment.

These access provisions give the Plaintiffs essentially unfettered ability to obtain any piece of information that they seek with respect to Microsoft's compliance with the Final Judgment. There is no loophole or exception that would prevent the Plaintiffs from acquiring information relating to Microsoft's compliance with the settlement. Further, any information obtained by the Plaintiff's may be presented directly to the Court in order to secure Microsoft's compliance.

The Technical Committee: In addition to the wide latitude given to the Plaintiffs to inspect Microsoft documents, code, and personnel, the settlement agreement also establishes an independent three person Technical Committee (TC). This TC will be made up of experts in software design and programming and shall establish permanent offices at Microsoft's Redmond campus. The expense of the TC shall be paid by Microsoft and the TC shall have the power to hire any consultants necessary to assist them in their duties.

The TC's sole function is to monitor Microsoft's compliance with its obligations under the Final Judgment. Thus, the TC has complete access to all Microsoft documents, computer programs, personnel, equipment, and physical facilities. The TC members may direct Microsoft to prepare reports of any information and in any format the TC desires.

Most significantly, the TC will have complete access to the confidential source code of Microsoft's programs. The TC may study the code, interrogate the code, and interact with the code in order to insure that Microsoft is complying fully with the Final Judgment. The TC may interview any Microsoft employee regarding the source code and its operation. Again, there is no loophole or exclusion that would prevent the TC from obtaining any piece of information in any way related to Microsoft's compliance with the agreement.

And, any information obtained by the TC may be shared with the Plaintiffs and the Court. Indeed, the TC has an obligation to report its activities to the Plaintiff at regular six- month intervals. If, however, the TC has reason to believe that a violation of the agreement has occurred, it is obligated to report that fact immediately to the Plaintiffs and provide a written summary of the nature of the violation. The Plaintiffs may then immediately initiate a contempt proceeding against Microsoft in the U.S. District Court as that Court has ongoing jurisdiction to enforce the terms of the Final Judgment.

Microsoft's Internal Compliance Officer: Another important aspect of the RPFJ is a provision requiring Microsoft to appoint an internal compliance officer. This person has the responsibility to administer the company's compliance with the settlement agreement. The officer must circulate a copy of the Final Judgment to all officers and directors of the company and brief those people on the meaning of the Final Judgment and the requirements of the U.S. antitrust laws. The compliance officer is responsible for securing the written certification from each and every officer and director in the company that they understand the terms of the Final Judgment, agree to comply with its terms, and that they understand that failure to comply may result in a finding of contempt of court.

Dispute Resolution: Any person may submit complaints concerning Microsoft's compliance with the Final Judgment to either the Justice Department, the States, the Technical Committee, or the Compliance Officer. Upon receipt of a complaint from any person the Plaintiffs may initiate an enforcement proceeding with the Court and seek to hold Microsoft in criminal or civil contempt. The Court has wide latitude to interpret the agreement, order compliance with the agreement, and/or impose fines or other sanctions upon the company.

Notwithstanding the Plaintiffs' ability to immediately seek Court intervention to resolve compliance issues, other dispute resolution mechanisms are available under the agreement. These less formal procedures allow complainants to quickly resolve compliance issues with the assistance of the independent Technical Committees's extensive knowledge of the Company's activities. Any person may submit a compliance issue to the Technical Committee for investigation. The TC shall investigate complaints, bring them to the attention of the Microsoft Compliance Officer and advise Microsoft of its conclusions and proposal for cure. The identity of any complainant may be kept from Microsoft to insure that no retaliation could possibly occur.

The only limitation placed on the TC's work is that its findings or recommendations in a informal dispute proceeding may not be admitted as evidence in Court, nor may the TC members be called to testify. This restriction does not interfere with the TC's responsibility to inform the Plaintiffs of any violation, explain the details of that violation, and provide supporting evidence to the Plaintiffs. Similarly, the restriction does not impede the Plaintiffs' ability to obtain and present all information obtained from Microsoft to the Court in support of the alleged violation. Instead, it permits the TC to actively and aggressively use every method possible to quickly negotiate the resolution of disputes between complainants and Microsoft without having the work-product of that negotiation process made public. Protecting the TC members from having to testify is consistent with the rules of every mediation session undertaken within the U.S. legal system. It encourages the parties to be fully candid and forthcoming before the TC in attempting to resolve disputes under the settlement agreement.

In sum, the extensive power and access that the TC has under the settlement agreement insures that the informal complaint procedure will not be a dead letter. Because the TC has full access to every book, record, person, and program at Microsoft, and has the ability to order

Microsoft to prepare any report it wishes, the TC can make life very difficult for Microsoft. Indeed, Microsoft has great incentive to satisfy the TC and avoid compliance issues altogether. The TC will provide an effective procedure for quick resolution of complaints against Microsoft typically far quicker than if a contempt proceeding were initiated.

The enforcement provisions of the RPFJ grant extremely broad powers of access to both the Plaintiffs and to the independent Technical Committee. Both entities have the power to present the information they obtain from Microsoft to the Court to insure Microsoft's compliance with the settlement agreement. The Court has wide discretion in punishing Microsoft for violations of the Final Judgment and the RPFJ specifically provides that the terms of the agreement may be extended for an additional two years if Microsoft has engaged in a pattern of willful violation. The RPFJ also includes a wide array of formal and informal dispute resolution mechanisms that give a complainant maximum ability to resolve disputes quickly and fairly. Charles James, head of the DOJ's Antitrust Division, testified that [t]he proposed decree contains some of the most stringent enforcement provisions ever contained in any modern consent decree. CompTIA's review of the enforcement procedures supports Mr. James' conclusions. The establishment of an exceptionally powerful Technical Committee as a permanent fixture on Microsoft's campus is unprecedented. The Technical Committee's investigatory duties and duties to report directly to the Plaintiffs insures that the enforcement provisions have the power necessary to force Microsoft to comply with the substantive terms of the Revised Proposed Final Judgment.

C. Anticipated Effects of Alternative Remedies Actually Considered

While the November 6, 2001 Revised Proposed Final Judgment goes beyond the liability found by the Court of Appeals in some areas (i.e., by requiring Microsoft to disclose its confidential technical information relating to servers), the non-settling States' proposal filed on December 7, 2001 goes so far beyond the judgment as to bear little relationship to the Court of Appeals decision.

The centerpiece of the states'' remedy demand is that Microsoft be compelled to create and market a stripped down version of its Windows operating system that would not include many of the features that current versions of Windows do include. Since consumers can now easily remove Microsoft features from their desktop and OEM's are free to place non-Microsoft programs on the desktop, it is difficult to see how this requirement would benefit consumers.

Instead of giving consumers more choices of software products, this unwarranted intrusion into marketing and design decision by the non-settling States would cause further delays in the development of software created to run on XP, with developers waiting to see which version would become the standard. Such delays would further postpone the salutary effects of XP on the computer market. It would also hamper programmers'' ability to take full advantage of technological improvements in Windows, creating a marketplace in which the same software applications would not necessarily have the same functionality. This remedy would balkanize the computing industry and would undermine the benefits consumers obtain from a standardized operating platform.

In addition to the stripped down version of Windows, the December 7, 2001 proposal would also require Microsoft to continue licensing and supporting prior versions of Windows for five years after the introduction of a new version of Windows. The primary effect of this requirement is to impose unnecessary costs upon Microsoft (that would likely be passed on to consumers) and reduce the incentives for Microsoft to improve the operating system. This disincentive to Microsoft to make technological advances would ripple throughout the software industry as applications developers would not have an advancing platform to write software to.

The non-settling States remedy proposal also includes a variety of restrictions that will have little if any quantifiable benefit to consumers but which will simply advance the interests of Microsoft competitors. Consumers and OEM's currently have full ability and freedom to include Java software on their computers; the States' requirement that Microsoft carry Java on all copies of Windows does not provide consumers or OEM's with any more choice than they already have. Similarly, the requirement that Microsoft continue to produce an Office Suite for Macintosh interferes with natural market forces that direct resources to the best use and may actually preclude the success of competing applications software. Directing Microsoft to produce and support any software without regard for market forces is likely to harm consumers, not help them. Moreover, the November 6 Proposed Judgment fully addresses and prevents Microsoft from retaliating or taking any anticompetitive actions against Apple.

Advances in technology are frequently made as a result of joint ventures between competitors. The Department of Justice and the Federal Trade Commission have recently released guidelines for the formation of such joint ventures. Notwithstanding the recognition by these enforcement agencies that most joint ventures are pro-competitive, the non-settling States seek to restrict Microsoft from entering into joint ventures whereby the parties to the joint venture agree not to compete with the product that is the subject of the joint venture. This restriction will chill innovation and prohibit countless consumer welfare enhancing arrangements.

Further, this proposal flatly ignores the fact that the Court of Appeals found in Microsoft's favor on the issue of the alleged illegality of its joint venture proposal to Netscape. The most harmful of the remaining remedy proposals include those that require the extensive and mandatory sharing of Microsoft's source code, without compensation to Microsoft.

The non-settling States proposals in this regard go well beyond those in the November 6 Proposed Final Judgment and appear to be aimed at benefitting Microsoft's competitors rather than insuring a level playing field for all participants in the software industry. In the absence of compelling justification for wholesale and forced disclosure of a company's intellectual property, the harm caused by such disclosure is unwarranted and harmful to the entire technology marketplace. The vigorous protection of intellectual property has fueled the rapid and dynamic growth of the technology industry. Actions that erode protections for intellectual property should be viewed with great trepidation.

The long term effects of the conduct restrictions proposed by the non-settling States encourage continued litigation, rather than competition in the marketplace.

IV. CONCLUSION

The RPFJ will never be and cannot be all things to all people. But, in the end, it is a reasonable result given the respective positions of the both sides in this litigation. In assessing the effectiveness of the current settlement, the Court should recognize that the marketplace is far different than it was at the time the case was originally brought in May 1998. The Court of Appeals spoke to this very issue:

[J]ust over six years have passed since Microsoft engaged in the first conduct plaintiffs allege to be anticompetitive. As the record in this case indicates, six years seems like an eternity in the computer industry. By the time a court can assess liability, firms, products, and the marketplace are likely to have changed dramatically. This, in turn, threatens enormous practical difficulties for courts considering the appropriate measure of relief in equitable enforcement actions, both in crafting injunctive remedies in the first instance and reviewing those remedies in the second. Conduct remedies may be unavailing in such cases, because innovation to a large degree has already rendered the anticompetitive conduct obsolete (although by no means harmless). United States v. Microsoft, 253 F.3d 34, 49 (DC Cir. 2001).

CompTIA does not interpret the Court of Appeals' language to support the proposition that minimal or no remedies should be imposed upon Microsoft because advancing technology has made the browser wars or other issues in the 1998 lawsuit irrelevant at this point in time. However, it appears that those who now seek to impose more far-reaching remedies against Microsoft are excessively focused on the marketplace as it was in 1998, ignoring its state in 2002. The advances in server technology, wireless and handheld devices, and web based applications all diminish the overall competitive significance of the Windows desktop. Thus, for example, the goal of attempting to inject more competition into the browser market at this time has little competitive significance to the overall technology marketplace.

The goal of the settlement in this case should not be to penalize Microsoft for past behavior, nor should it be to benefit Microsoft's competitors by forcing Microsoft to license its source code against its will. The settlement should insure that Microsoft does not engage in the actions found unlawful by the Court of Appeals. This consent judgment does just that and therefore it should be approved.

To Whom It May Concern:

I would like to express my opinion on the Microsoft settlement:

1- There should never have been a need. If microsoft competetors can't handle the competition, then its time for them to get out of the business (just as anyone else in business would).

2- Since there seems to be a need for a settlement, I think microsoft has offered one that is more than adequate.

3- Get the government out of the way of progress.

Thanks for this opportunity.

I think the facts, as well as the opinions, are in and it is time for the Department of Justice to act firmly against Microsoft. It has long been know that Microsoft has used it position to squelch competition and stifle creativity. Microsoft has used its position to deliver products that were full of flaws and demand premium prices. This, in light of their predatory practices, should not be tolerated.

Please take this opportunity to open up this monopoly to other players and get the economy back on track.

In response to the government's request for comments on the proposed Microsoft Settlement:

As a computer professional with over three decades of experience writing software for a variety of operating systems including Windows, and as one-time fan of Microsoft, I would like to make two points. The first is to suggest one route which in the absence of a breakup I expect Microsoft to continue to exploit to maintain it's monopoly. The second point is to call attention to a related danger from Microsoft's monopoly which I believe is accelerating the flight of manufacturing from the US to foreign countries.

First the monopoly preservation strategy:

Most competent computer programmers can, if they wish, write and document functioning code which is virtually incomprehensible to any other competent programmer (including the author him/herself). Moreover said author can almost certainly (disingenuously but successfully) argue in a court comprised of non-experts that the code is straightforward, well-documented and easy to understand.

What does this have to do with Microsoft maintaining and extending their monopoly? Everything. Whether hardware or software, it is in the interests of the creator of any product to facilitate use by the consumer while hiding as much of the internal workings as possible to discourage competition. Microsoft's strategy has been to continuously expand the boundaries of it's ''operating system'' (more properly now an operating environment) enveloping or attempting to envelope entire classes of applications, office, networking, on-line shopping, manufacturing etc... within the boundaries of the ''operating system''. This can be done explicitly as in the case of Internet Explorer, or implicitly by simply making it difficult and or prohibitively expensive for outsiders to access, or even know about, operating system or hardware features which may be important for fields Microsoft dominates, or wishes to dominate. The ''browser wars'' were about exposing the inner workings of Microsoft's operating system so others might use them.

Because of the ease of writing and defending impenetrable code Microsoft already has an almost unlimited ability to restrict access to the core of the operating system and to the hardware beyond, whether or not a court orders it to provide access. Microsoft sells just enough tools to access selected parts its operating environment to be able to provide lip-service to openness. Generally speaking the products are scaled in such a way that only those who have made a large commitment, financial or ''sweat equity'' which will tend to lock in their allegiance to Microsoft are allowed access to the more powerful tools.

Because of the high barrier created by the impenetrability of the Microsoft code, it is hard to imagine any remedy short of a breakup will be able to curtail Microsoft's illegal monopolistic practices.

The second comment, related to manufacturing flight, is contained in a letter I sent to the Attorney General general of Massachusetts several months ago. The text follows:

Dear Mr. Attorney General,

I must congratulate you and your staff on the stand you have taken against the proposed Microsoft settlement.

I am a software developer who has long been appalled by the relentless manner in which the American public interest continues to be steamrolled by the Microsoft juggernaut. Therefore I was shocked by the decision by the Justice Department to take the breakup option off the table. It is my opinion that this option offered the only chance to restore competition to the software marketplace. Needless to say, I was further dismayed by the terms of the proposed settlement.

As you are obviously well aware, under the guise of ''innovation'' Microsoft has succeeded in stifling true innovation in many ways. Much of the damage done by Microsoft is not as a result of overt actions towards the ''victim'' whether an individual or a company. Rather it is in creating an environment in which the fate of others who have tried to innovate in the face of Microsoft serves as a deterrent to further innovation. Of course this type of deterrence by example does not carry the connotation of physical danger as might be expected from similar threats by organized crime or terrorists.

Nevertheless it is quite effective. This is an environment in which:

1. Intelligent software developers know that they have little chance of being successful unless they join the Microsoft camp. Once in that camp more of a developer's time will be likely spent keeping up with Microsoft's complexity-increasing-whims than improving their product.

2. Intelligent funding institutions know from history that there is no point in developing a product in a market in which Microsoft is known or believed to have interest. The best one can hope for in the case of a very successful product is the opportunity to sell the product to Microsoft at a price determined only by the latter.

3. The required ''operating system'' (now more properly an operating environment) is so complex as to create a huge barrier between the creative idea of a researcher, developer, or engineer and its implementation into a useful product.

I'm reminded of a university researcher's website I saw several years ago. The researcher noted that he was using older, and by then outdated, analysis software for his research. Although he had written the original software himself, he believed that the new requirement of interfacing with Windows had introduced such complexities that he could not afford either the time to update the software himself, or the money to to hire a Windows specialist to update it for him. Whether or not the researcher's assumption was actually true, Microsoft literature and promotions (the so-called FUD factor) would certainly lead him to this conclusion. Hence his further research in this field was stymied.

4. Similarly the Microsoft ''one size fits all'' operating system and tools, interposed between America's manufacturing engineers and the computer, hamper their creative efforts. Modern Windows software effectively prevents these engineers from writing high speed one-of-a-kind applications necessary for the most efficient manufacturing. Ten years ago the same engineer would have had no trouble writing this type of software.

As a Senior Member and member of the Peer Review Committee of the Machine Vision Association of the Society of Manufacturing Engineers I became personally concerned about this issue several years ago. I was particularly worried that is resulting in substantial advantages for manufacturing facilities in foreign countries and earlier this year prepared the attached document.

I'm not sure any of this will be of any help in the successful resolution of the Microsoft situation, However I thought it might be helpful in explaining why at least one of us is behind you.

Again, congratulations and good luck on your stand!

Sincerely,

Robert McConnell

They say hindsight is 20–20. Sometimes we get the benefit of hindsight prior to the fact. In this case, the emerging Enron scandal shows us exactly what the Bush administration was attempting in their settlement with Microsoft: corporate capitulation.

The proposed settlement between Microsoft and the Federal government reeks of nepotism, favoritism and backroom shenanigans. Enron has shown us how our executive branch operates; please do not let similar actions favoring Microsoft provide yet more fodder for our growing recession.

I am dismayed by the DOJ action against Microsoft. It makes me ashamed to be an American. I urge the court to dismiss the suit entirely, or, failing that, to impose the mildest sanctions possible.

I use Microsoft's software on a regular basis—it's certainly improved my life. While I prefer using Macintosh computers to PCs running Windows, I have nothing but admiration for Microsoft's accomplishments. Claiming there are no alternatives to Microsoft products is laughable. Not only are there a host of alternatives, but if Microsoft were ever to attempt to charge exorbitant rates for its wares I and a host of others would rush in to compete.

To say that Microsoft has a monopoly for PC operating systems is meaningless. What makes an ''industry standard'' PC standard is precisely the fact that it runs Windows. Microsoft has a monopoly in the same sense that Tom Clancy has a monopoly on ''The Hunt for Red October''. This monopoly is the right of a producer to his product— it is guaranteed by Section 8 of the U.S. Constitution.

Microsoft has never harmed me, nor do I ever expect it to. How could it? My transactions with Microsoft are voluntary. This court, however, can harm me and every American. By restricting Microsoft's freedom everyone's freedom is restricted. This would be too big a price even if there were a public interest to be served by such a restriction. In fact there is none. It is Microsoft who has been serving the public, as evidenced daily by those who voluntarily purchase Microsoft's products. Whether or not they realize it, even Microsoft's competitors benefit from Microsoft's presence, which spurs them to added effort and ever-higher levels of quality. Were it not for Microsoft many of them would not exist! Without Microsoft most computers might still be running CP/M—that would be a sad state of affairs.

Subject: one more comment

I wrote an earlier comment against the settlement, but I wanted to add one last thing—Microsoft should not be allowed to engage in any ''exclusive contracts'' (ie, a computer that is shippsed booting Windows is only allowed to boot Windows and cannot boot or include another operating system like Linux or BeOS—this is why Dell, IBM, etc. won't sell PC's that have both Windows and Linux) for at least the next ten years. This would be roughly in line with how long Windows has been around. Just a thought. Thanks!

I would like to comment on section III.J.1 and III.J.2 of the proposed settlement. I worked at company last year that asked for information on a network communication protocol so that we could make our product work their products. Microsoft didnt refuse, they repeatedly failed to respond to the requests in any way. And sections III.J.1 and III.J.2 are so ambiguous in interpretation that there they could use it as an excuse to provide information, effectively squashing small companies who cant afford the legal warfare to compel a disclosure.

An example of how section III.J.1 and 2 could be used a smoke screen by Microsoft to deny access to communication protocols and APIs for security reasons: Virtually all security systems software is designed in such a way that even if you do know how the software works, it is virtually impossible to break it. For example, the software for the PGP encryption algorithm is public knowledge and used by a large number of people, because knowledge of how the encryption works does not help in breaking the code. In fact, public knowledge helps people identify potential problems early before the there is wide adoption. Microsoft can claim a large portion of their product falls under section III.J.1 and 2, when in fact, knowing the details does not lessen security in any measurable way. Small companies would not have the resources to contest this.

As a software engineer, I found most of Microsofts arguments about the need to inextricably bind their browser to the operating system very odd.

Fact #1: Microsofts Internet Explorer browser runs on Apples operating system and a UNIX version also existed. Further, their first versions of Microsoft IE ran without tight integration into its own operating system. So, the claim about it needing to be inextricably bound to the operating system to ''provide a better experience'' is without any merit.

Fact #2: Every competent software engineer will tell you that reliable and maintainable software is designed in pieces with very clearly defined interfaces that encapsulate and hide internal details of each piece. This makes it possible to keep defects in one piece from breaking things inside other pieces. Further, this encapsulation with well-defined interfaces makes it easy to pull out one piece and replace it with a better piece in the future, without breaking all the other pieces (makes future enhancements easier). This is analogous to replacing the incandescent light bulb in your lamp with a more energy efficient light bulb both bulbs use the same screw-in interface to your lamp).

Are we really to believe that all those top talent engineers at Microsoft are NOT using basic design principals of encapsulation and well-defined APIs, that would allow them to easily pull out a current version of their Internet Explorer and with a future enhanced version (and therefore also allow a third party browser to also use that same well defined interface to plug their browser in)?

Microsoft cant have it both ways: They're a competent software company who can speak with authority in court (design code that encapsulates internals with well-defined APIs) or the browser is so inextricably tied that another browser can not easily replace it (and thus can't believe what they say because they're incompetent).

I know Microsoft has some of the sharpest software engineers around. I know they write some pretty good software. So, this means their executive's excuses for Microsoft's behavior are not credible.

So, what does this indicate about Microsoft executives attitude and how they are likely to interpret an ambiguous settlement agreement? Will appointing a review committee that is not highly technical in specialized areas of software (e.g., specialied security) interpret this agreement in the public interest?

Your Honor,

I am writing to voice my displeasure with the Proposed Final Judgment in the Microsoft Anti-Trust Case. The PFJ has three major flaws.

1. It does not terminate Microsoft's illegal monopoly

2. The penalty for past illegal behavior is not a disincentive and will actually give Microsoft an advantage in another market segment.

3. The Department of Justice must pledge to prevent any future anti-competitive activity by Microsoft by maintaining a close watch of the companies activities.

Illegal monopolies hurt the consumer, inhibit innovation, and encourage future illegal activity if they are not handled in a manner far more aggressive than that in the Proposed Final Judgment. I urge you to reject the PFJ.

Thank You,
Sean Ryan

Subject: Microsoft Settlement

In the western system of capitalism, consumers do not usually buy directly from producers. In our economy, multiple levels of middlemen exist to satisfy the demand for finished goods. This results in healthy competition, reasonable profits and an increased tax base. The established Microsoft monopoly on technology (like AT&T's monopoly on communications before it) has not been used toward the public's good and the company's business practices illegally extend this monopoly by tying inferior products to its established ones slowing the rate of technology advancement. This substantially reduces the opportunities for competing technology producers and has resulted in decreased tax revenues which can be collected from the offending multinational corporation. Furthermore by refusing to support the Linux platform, Microsoft management reduces its value to shareholders. My explanation follows:

Microsoft does not just have a monopoly on PC operating systems. In the minds of middle management in the Western world, a new technology is not ready for deployment until a Microsoft product includes it. The successful managers have witnessed where business needs existed for a given technology, early adopters (using non-Microsoft tools) were burned by incompatibilities with key Microsoft software components or unavailability of updates to products such as Excel, Word, DOS, Windows, Internet Explorer and Media Player to name a few.

After slaying Goliath, Microsoft now holds hostage an even larger customer base than IBM did before it changed it business practices to remedy an earlier DOJ suit. Microsoft has not cooperated with the will of the people as pursued by the USDOJ and attorneys general of the 19 states. Unlike IBM, Microsoft cannot see the error of its ways. Its no longer just about profits ? instead it's about the power to be above the law. The ''software tax'' that it collects on all PCs sold planet-wide by leveraging US political and military influence makes Microsoft (and by extension the US) a target of foreign nationalistic pride/prejudice. Wars in the coming centuries will be fought over control of Information. Microsoft's way has not produced the technologically superior or secure operating system platform needed by the marketplace because they have not had to innovate as they hold a monopoly and successfully prevent competition into that space. The computer scientists that have built Linux allow for commercial proprietary software to run on this more reliable platform. They only want the operating system not the applications which run on it to be free/open and beyond subversion. They have produced a system which is more secure and reliable than Microsoft's operating systems. Businesses that have seen how often the Microsoft sands shift have chosen not build on the Microsoft choices of foundation.

The free operating system Linux was given as an example to the court as a serious threat to Microsoft's monopoly, but that argument should be discounted as that Operating System is totally free ? meaning no license cost per machine. So it does not compete with Microsoft. There is no company called Linux. No one company controls the direction Linux will take. The reason Linux? open source API can compete with Microsoft's Monopoly OS is because the companies that use it are guaranteed of a truly level operating system playing field. Linux is to operating system technology what free markets are to economic systems. Requiring Microsoft to support the Linux platform as a tier 1 operating system for all their application software is not taking money out of Microsoft's hand and putting it in the hand of some other company. If Microsoft's management doesn't respond to the viability of Linux, Microsoft's shareholders will be hurt on the order of what happened to Enron. That is not in the interest of middle America. What is in America's best interests is not a powerful Microsoft, but a software platform where no company has control over hardware or processor, but one where all businesses (and governments) can compete based on innovation, quality and their ability to meet customer requirements. Microsoft needs to become a technology producer instead of controlling technology deployment. Microsoft unfairly changes the operating system platform whenever a competitor has found a niche which Microsoft wants to occupy. Only when Microsoft agrees to support the Linux Operating system with their application software will competition in the business and office technology sector flourish to the benefit of all.

Microsoft is a grand marketing organization but they do not stimulate our economy to build (and profit from building) new technological advances. Business plans that would go head-to-head with Microsoft are rejected. Instead of hiring and training more computer scientists, software developers and programmers, our country has changed immigration laws to allow 500 thousand more H1-B Visas thereby increasing the unemployment of working class Americans. Furthermore, Microsoft is not pushing the envelope of technology. It recoups its investment on technology many fold more than necessary before developing new products. This is not good for consumers and has transformed

Microsoft into more of a marketing company than a purveyor of technology. It specifically breaks the law regarding the tying of a new product to a monopoly product by combining bug fixes (a warranty service) into product upgrades (for a fee) and by not making them available separately but combining fixes with new code (and a new set of bugs). While the argument has been made regarding Microsoft's Internet Explorer browser being part of the Microsoft Operating System instead of application software, two facts belie that claim. One, Internet Explorer is available for the Macintosh, Solaris and HP-Unix—platforms that are obviously not Microsoft operating systems. So tying Internet Explorer to the correct operation of the Windows Operating System was a deliberate attempt to sabotage competition in the browser space resulting in the demise and purchase of Netscape instead of more competition. Second, Microsoft's claim that Internet Explorer is free—just like Netscape Communicator is bogus. IE is only free to Microsoft customers. Internet Explorer is specifically not available on Linux (proving that it is not free) and because the API (operating system interface) which it uses is purposely obfuscated. Netscape Navigator and Communicator are free and are available on Linux along with the next generation Mozilla open source browser.

Artificially high operating system prices combined with fewer OS technological advances cause fewer computers to be sold by market forces due to customers learning to be disappointed in what their computers can do. More competition would increase the value of the computing infrastructure and motivate companies to invest in more computers. This was the expectation 20 years ago. All that money went to Microsoft. What do we have to show for all that investment? Some improvement but a lot of broken promises. Open Source Software delivers on that promise and the Linux operating system is the standards based vendor neutral mechanism to remedy the difficult situation the court finds itself needing to resolve.

I look to the court to render a decision which will increase employment of software developers in this country, increase the diversity of IT sector businesses, and punish the company which brazenly ignored anti-trust law, threat, and actual suit. Do not forget how the courts were unmistakably lied to. Now that Microsoft has been found guilty of being a monopolist, do not take the teeth out of enforcement by accepting the weak Proposed Final Judgement. Microsoft has injured the Information Technology sector and with remedies you can drive a truck through and will continue to do so for the next 5 to 7 years. The DOJ position has changed since the beginning of this trial with Joel Klein. Despite all the pressure to join the US DOJ, many of the state attorneys general could not in good conscience join the Revised Proposed Final Judgement. Do your job to ensure that America begins the 21st century by accelerating the deployment of technology rather than allowing business as usual at Microsoft to continue.

Nor is breaking up Microsoft the only solution! That is a simpleton's way to elicit the desired behavior, which won?t work because there will be uncontrollable collusion between the two subentities.

Releasing the source code for Internet Explorer would be in line with Microsoft's claim that Internet Explorer is free. Its? interconnection with Outlook (the Email client) is responsible for most of the virus vulnerabilities. The inevitable improvements in security once the source code is released would benefit the public. Getting Microsoft to drop the suit against Lindows.com ? a potential operating system competitor ? would also be proof that they will permit competition. The most important goal is to convince Microsoft that selling its Office Suite on Linux is good for Microsoft. The RPFJ does not accomplish that. That is one reason why all the state's attorneys general did not support it.

Microsoft writes good application software, but they have made operating systems which are not secure from viruses. Actually Java was designed from the start to be a more secure middleware platform, yet Microsoft quickly pushed its own alternative technology which has since been successfully targeted by virus writers. Why? Not to support the public good, but to retain control of their market.

There is no money in selling operating systems, yet the foundation of all applications is operating system support. Since the beginning, OSes have always been given away with the computer. The Microsoft licensing agreement must be changed to not require that Microsoft application software be used only with or on a Microsoft Operating System license. What Microsoft has done is that they have sold all the computer manufacturers on the idea of paying them to preload computers with their operating system. Thus the price of the operating system is inseparable from the hardware. Microsoft gets their ''tax'' whether you use their software or not. This lack of consumer choice in operating system middleware must end. As long as Microsoft products are only licensed for Microsoft operating systems, consumers will be tied to that platform and technology sector businesses will be unable to innovate and compete with Microsoft.

Lastly, market (business) and government (military) forces are finally responding to the fact that only open source software systems are secure. Your judgement should promote this trend without being legislative. Microsoft should be prevented by decree from developing a version of their operating systems which are incompatible with VMware or preventing their application software from running under WINE in Linux. Such measures are simply exclusionary. Only at this point in history will you be able to extract such willingness to compete from an avowed monopolist. They need to be taught that limits exist on acceptable business practices.

Washington, DC 20530
Dear Mr. Ashcroft:

I am very much in favor of the right of consumers to choose the configuration of the system they work in. I am, therefore, in favor of the settlement reached between Microsoft and the Department of Justice. There is no doubt in my mind that Microsoft was behaving monopolistically, but the corporation produces good software, and I do not believe that so much fuss should have been made about actions that were not, in effect, harming the public.

The settlement allows for a return of fair competition in the technology industry. Microsoft has, for example, agreed to reformat future versions of Windows so that computer makers as well as users will be free to reconfigure Windows using both Microsoft and non-Microsoft software to suit their specific needs. The settlement also requires that Microsoft's actions be monitored by a three-person technical committee consisting of software engineers who will resolve disputes and make sure Microsoft complies with the settlement. I think Microsoft deserves a chance to prove its ability to adhere to the settlement. It will cost more in the long run to continue litigation against Microsoft. The technology industry, the economy, and the American people have all felt the repercussions of this case. It is time to settle. I urge you to support the agreement and move on.

Sincerely,
Barbara Findley

Dear Mr. Ashcroft:

The Department of Justice and Microsoft have finally reached a settlement to the three-year antitrust dispute, and I am writing to champion that settlement and ask that it be approved as soon as possible. I am in favor of any agreement that will end litigation against Microsoft and that will help America.

Microsoft has agreed not to enter into any contractual obligations with third-party companies that mandate that they strictly use or promote Microsoft products. They have also agreed not to retaliate against computer companies that make or promote software that competes with Windows.

Believe it nor not, they will share source code and other data that is critical to the design and implementation of Windows. This allows the competition to make products that are compatible with Windows. This will improve the IT industry and the economy.

I fully support this settlement, and hope it is approves with haste. Thank you.

Sincerely,
Eddie Schwartz

Subject: Microsoft Settlement
January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

As a six-year teacher of PCs and the Windows operating system, I would like to voice my strong support for settling the pending Microsoft case. My experience as a PC instructor and my 26-year's as a military logistics officer has taught me the great value of standardization. Standardization buys everyone a lot. And, after standardization is achieved, ''the payback is forever.'' Witness: When we go to war, we want our bullets to fit into our allies'' guns and rifles, and want theirs to fit into ours. We want to be able to share, substitute and interchange their artillery rounds, fuel, and rations, etc., with ours. It's called being ''Interoperable.'' It's a great force-multiplier and keeps costs down.

Standardization, by definition, creates efficiency. It also makes for convenience and ease of use. Now, today, we need standardization and efficiency more than ever. Therefore, the proposed solution seems like a fair compromise that will provide the most effective long-term results for consumers. As seen with the International Standards Organization, the uniformity of Windows(R) and its supporting products is an asset to all computer users. This includes business and industry, schools, home users, . . . just everyone!

Technology is complicated enough for the average person, so the advantages Microsoft provides with the scope of their software presence is immeasurable in the form of America's almost seamless transition into the information age with young and old alike. Though I did not respect the government's case, the restrictions imposed with this deal

are far more favorable than the possibility of a corporate break up and chaos within the computer world. Based on the new, more even-handed approach of Microsoft toward competitors, and those who do business with competitors, plus the implementation of an objective technical committee of experts to ensure compliance, it seem to me it would be in the best interest of all parties involved to proceed with this agreement. This will save the consumer a great deal of heartache. It will also permit continued interoperability in future systems and software programs.

Thank you very much for your consideration.

Sincerely,
Bernard R. Buchta

Washington, DC 20530

Dear Mr. Ashcroft:

Thank you for your efforts to settle the Microsoft antitrust case. Concluding this litigation will be beneficial for the tech industry, as well as the economy.

The settlement agreement adequately addresses concerns about any predatory business practices on Microsoft's part. Upon approval of the agreement, Microsoft will refrain from taking retaliatory action against those who sell, promote, or develop software that competes with Windows. Another step Microsoft is taking is making it easier for consumers to remove features of Windows so they may replace these features with Microsoft's competitor's software programs. In my view, Microsoft has made adequate concessions to resolve this case. No further action should be taken by the Department of Justice against Microsoft.

Thank you for your consideration of my comments on this issue.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Attorney General Ashcroft:

The Microsoft antitrust case settlement agreement should be approved as soon as possible. We will all be better off. This lawsuit demonstrates that Microsoft's competitors, like Sun, are merely envious of Microsoft's success. Their failure to develop products of the same caliber, as Windows does not mean Microsoft engaged in anticompetitive behavior.

The terms of the settlement agreement are fair. There should be no hesitation in the settlement's approval. The agreement provides for such things as a technical oversight committee, which will monitor Microsoft's business, practices. Additionally, Microsoft has agreed to disclose to its competitors proprietary information, like interfaces that are internal to the Windows operating system. Given these types of concessions, no further action should be taken against Microsoft.

Thank you for your intelligent attention.

Sincere regards,
Linda Maher

Washington, DC 20530–0001

Dear Ms. Hesse,

I have been following the Microsoft case for many months and I believe that the proposed resolution of the case is clearly not in the interest of the American consumer and not good for the economy.

Microsoft will still be a monopoly for all intents and purposes and will continue to use their power to limit competition. The new regulations have far too many loop holes and with Microsoft's record there is no reason to believe they will change the way they do business. Microsoft must be held accountable and forced to allow applications that run on their system to be used anywhere. And they must be required to make their products compatible with competitive products.

To make this process fair to all, we need to hear from public consumer groups and from state governments not just Microsoft and their competitors. This is a right given by the Tunney act and must be preserved. It is my sincere hope that you will consider these points before going forward. The American people deserve and have a right to choose the products that serve them best, the proposed settlement is unfair and unjust. Please allow the people a voice.

Subject: I oppose the Department of Justice's proposed

I oppose the Department of Justice's proposed settlement with Microsoft. None of the proposed actions appear adequate to prevent Microsoft from entering any new market it chooses, then utilizing a

combination of exclusionary licensing, predatory pricing, and all but unlimited marketing capital to force the incumbents into extinction.

Microsoft continues to employ the tactics with which it decimated Netscape. Against RealPlayer, Microsoft has integrated Windows Media Player. To drive a wedge into the game console market, XBox is sold below cost.

While the short-term benefit to the consumer is reduced cost of the individual commodity, the overall cost to the consumer and to society is huge; Operating System (Windows) and Applications (Office) priced far higher than any hopeful rival of equal or greater quality (Linux/StarOffice); reluctance of new players to enter the market; laughable security (ILoveYou, Nimda, Code Red), and ultimately a hegemony imposed with Microsoft the gatekeeper of all society's information flow and transactions (pending success of ''.Net'').

Even Judge Jackson's rememdies seemed no guarantee that Microsoft couldn't find a circumvention; however, that the current Department of Justice has volunteered a remedy weaker than one to which Microsoft had already acquiesed is at best difficult to understand, and at worst smells of malfeasance. Judge Jackson's remedies should be imposed upon Microsoft without delay.

MTC–00028748

From: Larry Blunk
To: Microsoft ATR
Date: 1/28/02 5:16pm
Subject: Microsoft Settlement

I wish to stress my opposition to current United States vs. Microsoft proposed Settlement Agreement. The numerous loopholes and lack of consequences for violation of the agreement will result in little or no change in Microsoft's anti-competitive behaviour.

Perhaps most unsettling is the area of DRM and authentication systems, and audio/video codecs. Microsoft is attempting and dominate these fields through it's .Net and Windows Media services initiatives. There is no mention at all of compulsory licensing of audio/video codecs in the settlement. If Microsoft is able to monopolize these standards, they will extend their control beyond just PC hardware OEM's to all manner of audio/video playback devices. These include pocket audio players, personal video recorders, component audio receivers, DVD players, and handheld organizer (such as the Palm Organizer). All these device makers and will need to license the audio/video codecs on Microsoft's terms. These terms will likely forbid the use of competitive operating systems such as Palm OS and Linux on these devices. It will also require the use of Windows backend server operating systems rather than competing operating systems such as Unix.

Closely related to the audio/video codecs are Microsoft DRM systems which are used to wrap and ''secure'' the codecs. DRM services are specifically excluded from compulsory licensing. The rationale is that licsensing them would somehow undermine their effectiveness. However, there is no reason these systems could not be licensed under a standard non-disclosure agreement (NDA). The same type of agreement could be used for authentication systems. I also note that there is a major flaw in the Department's understanding of authentication and cryptographic systems. A basic tenet in cryptography is that in order to be trusted, a cryptographic system should be subjected to extensive public peer review. Rather than relying on secrecy for security, authentication systems rely on the strength of their cryptographic algorithms. Even though the algorithms are widely published, they remain secure because of the mathematical complexities in defeating them. It should be noted that the standard for securing transactions on the Web today (such as credit card purchases) is the openly specified SSL standard. SSL employs only publicly documented and reviewed cryptographic mechanisms. There is even an open source implementation known as OpenSSL which is used extensively to secure transactions on the Internet. This is a difficult concept for the layman to understand, but it is critical to an open and competetive environment on the Internet.

From: Stephanie Jayne Sailor
To: Microsoft ATR
Date: 1/28/02 5:20pm
Subject: Public comment—Microsoft

Department of Justice:

The lawsuit against Microsoft is supposed to be for the good of the people. Instead, it's for the good of Netscape, who failed to compete. Microsoft didn't hurt consumers. They helped consumers. If you truly want to put an end to a monopoly, why don't you start with The U.S. Postal Service? That's a Government-created monopoly, which has thrived since the 1840s. It has been against the law for anyone to compete with the U.S. Postal Service by carrying first-class mail. That's a monopoly that you should stop.

I beg of you, Department of Justice, end the Microsoft case now. Do not stifle innovation. Do not require Government permission for companies to improve their products. Such intervention only benefits companies who are lethargic to compete. In the end, that hurts taxpayers, consumers, the economy, and future of technology.

Do not meddle with Microsoft—or any other company's—future product design decisions. Leave that to software executives, not judges and bureaucrats. Keep America free, allowing Microsoft to continue to develop affordable products, create jobs, and please customers. This isn't about Microsoft. It's about the freedom of every American company to improve their products. Most importantly, it's about allowing consumers the freedom to pass judgment with their pocketbooks, by personal choice.

Washington, DC 20530

Dear Mr. Ashcroft,

Three years ago, Microsoft was found to be in violation of established antitrust laws and was brought to trial in the federal courts. The Department of Justice and Microsoft, after six months of negotiations last year, managed in November to reach an agreement with which both parties are satisfied. Now, we find out that it will be determined whether it is in the best public interest to settle. The alternative is to reopen the case, and spend an indeterminate amount of time trying to reach a better settlement. Meanwhile, Microsoft's competitors and those who wish to gain from further litigation, including nine plaintiff states, are attempting to undermine the settlement during its review period. I do not believe that continued litigation would serve the public at all. The economy and the technology industry have suffered while this case has dragged on, and no good can come of extended suit. The settlement is fair, and, if finalized it will allow things to finally return to normal.

Microsoft has agreed to a variety of restrictions and obligations under the settlement, all of which would restore a fair competitive atmosphere within the technology market. For example, Microsoft has agreed not to take retaliatory action against any software producer or computer maker that introduces software into the market that competes with Microsoft.

I do not believe that it is in the best public interest to continue litigation. I urge you to support the settlement as it now stands.

Sincerely,

Spencer Black

January 28, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft: My name is Becky Garrett. I am a resident of Gravette, Arkansas writing in support of the settlement recently reached between the federal government and Microsoft. The public interest will not be served by reopening litigation against Microsoft. Given all of the changes in direction the case has taken to date, the outcome of additional litigation is far from certain. You have a settlement agreement on the table at this time that not only provides certainty in the outcome of the case, but also provides increased opportunities for competition in the industry.

Microsoft has agreed to either modify or eliminate allegedly anticompetitive business practices in the areas of pricing, distribution contracts, relations with software developers, and systems configuration. If the agreement is implemented, these concessions will lead to great growth in the software and computer industries. I hope you decide to go forward with the settlement. It is in the best interests of all involved.

Yours truly,

Becky Garrett

January 25, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to express my interest on the recent antitrust settlement between Microsoft and the US department of Justice. The lawsuit has gone on long enough and should be finalized. All that is happening now is taxpayer dollars are being wasted and other companies are being given the chance to tack on their own lawsuits. Microsoft has done wonderful things for our country including creating jobs, wealth, and making technological breakthroughs.

They shouldn't be forced to disclose interfaces that are internal to Windows operating system products. They have spent huge amounts of money and resources developing these secrets. They should also not be prohibited from entering into agreements that obligate third parties to exclusively distribute Microsoft products. This inhibits their ability to gain market share.

Nevertheless, the settlement should be implemented so that our IT sector can rebound. Our nation needs to pull out of recession and cannot afford to have the government interfering with the most successful businesses. Make the right choice and do what is best for the public. End the dispute.

Sincerely,

MTC–00028756

Subject: Microsoft Settlement
January 28, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I would like to voice my position of support for concluding the litigation against Microsoft by approving the proposed settlement with the Justice Department. This case has proved not to be the best use of the government's resources, as the break-up attempt has only led to protracted dispute with no resolution. Consequently, it seems that accepting this current plan would be the best course of action for both sides at this point. The terms will be very favorable to Microsoft's opponents without causing severe disruption to its business model. Computer makers will have more flexibility to choose software programs for the Windows operating system, and even to manage specific features, like the supposedly controversial bundling options. Software developers will have unprecedented access to Windows internal interfaces and server protocols, as well as the ability to license its intellectual property. A non-partisan group of software experts will then monitor the process to ensure ongoing compliance. Based on these actions and measures, it seems that Microsoft is reaching out to the software community in a significant way to allow more competition in the marketplace. It should be in the best interest of all parties to take this opportunity and run with it, rather than delay further the possibility of a mutual solution. I look forward to your finalization of this agreement at your earliest convenience.

Thank you very much.

From: Linda Jo Hamlin
To: Microsoft ATR
Date: 1/28/02 5:25pm
Subject: Microsoft Settlement

Dear Antitrust Division,

I cannot even guess at what is fair or correct according to the law's eyes to levy upon Microsoft, but I do want to comment regarding this issue. I have always used an apple computer (for many reasons) but I have to use some Microsoft software (Word) to process documents into booklets and layouts. This software often causes crashes as it tries to install over my operating system. The entire screen will freeze and go into a loop. When I reboot my computer, it alerts me that something has tried to rewrite my software. That is just a wrong thing to have happen. It is installed, I bought it, paid Microsoft for it and that should be enough for Microsoft. The rest is nefarious intervention by software written with a company's agenda. Please reprimand this company fittingly. Today the world of competition and deregulation is being swallowed up by profiteering. How can the little guy protect himself from huge, powerful and rich entities if there is no substantial result from proven misdeeds? It must have consequence when actions are done that are not for the good of the economic system we have here in the United States and the consequences should be a deterrent in the future to dissuade others from the same type of actions.

Thank you for your time reading this. I appreciate it.

Sincerely,

Linda Jo Hamlin, one of the little guys.

From: Harlan Wilkerson
To: Microsoft ATR
Date: 1/28/02 5:25pm
Subject: Proposed Settlement

I feel that adoption of the proposed settlement is not in the public interest.

The Appeals Court ordered the District Court to craft a remedy that would ''unfetter [the] market from anticompetitive conduct,'' to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''

Windows has gained it's market position not by consumer demand, but by Microsoft's almost total control of production. In the past, Microsoft has used exclusive OEM licensing and —marketing incentives to pass along the so-called ''Microsoft tax'' to every PC consumer. Most of the top 20 OEMs simply don't offer PC systems without the Windows operating system pre-installed. Microsoft has urged (and rewarded) the 0EMs to ''just say no'' to buyers who request a so called ''naked PC'' (a PC with no pre-installed software). This is ironic since the OEM's associated support costs should actually be reduced. The OEMs that do offer alternatives to Microsoft's Windows charge essentially the same price for non-Windows models. This is true even for those with pre-installied versions of absolutely free operating systems e.g. Linux, or the BSDs. These operating systems can be freely downloaded and installed on all of a consumers PCs without any licensing fee whatsoever. Consumers who have opted to install these free operating systems (on their own) are usually frustrated in any attempt to obtain refunds from the OEMs for their unused Windows licenses. This despite provisions for a refund from the OEM that are contained in the Microsoft Windows EULA. It's no accident that consumers can't determine the fair price of a PC under these circumstances. This was highlighted during the trial by a grass roots movement that culminated in a ''Windows Refund Day''. Consumers who purchase Microsoft Windows through an OEM usually have no standing in class action suits brought against Microsoft.

Nothing in the proposed settlement prohibits Microsoft from continuing to offer OEMs existing forms of advertising or marketing incentives (on an equitable basis) to include Windows on every machine, or to decline to sell ''naked PCs''. We currently are in the worst economic recession in at least a decade. It's doubtful that some of todays OEMs will even survive. Nonetheless, many of these same ''equipment manufacturers'' won't sell their equipment at any price without pre-installed software from Microsoft. This is hardly the behavior of an unfettered market.

Microsoft should be required to post the costs of it's OEM products on a public web site, and they should be precluded from offerring any incentives to OEMs to curtail the sales of ''naked PCs''

To paraphrase the Appeals Court by the time this case is resolved the facts will be ancient history, but the effects of the illegal acts will have caused harm nonetheless. The proposed remedy does nothing to ''deny to the defendant the fruits of its statutory violation''. Microsoft staunchly denies any wrong doing in it's public statements, retains billions in capital, and isn't even held liable for the people's costs in prosecuting the case.

In crafting a remedy that terminates the illegal monopoly or eliminates practices likely to result in monopolization in the future it is important that hearings be held to investigate how we got here in the first place. The Federal Trade Commision and DOJ took up Microsoft's trade practices involving OEM per-machine-licensing of MSDOS. During this case a private antitrust suit was brought against Microsoft by Caldera. That suit was settled but provided no relief for the millions of consumers who purchased Digital Research's Disk Operating System. Digital publicly complained that they had sufferred from Microsoft's anticompetitive per-machine-licensing scheme and were wrongly excluded from the Windows 3.1 beta testing program—even though they were participants in beta testing earlier versions of Windows. Digital's Operating system didn't compete with Windows, but did compete with MSDOS. At the time these were seperate Microsoft retail products. The respected magazine and online publication Dr Dobbs Journal revealed that the Windows 3.1 beta contained code that was only useful for detecting Digital Research DOS. This code gave the user error messages or simply halted a users machine whenever Digital Research DOS was detected. Windows version 4 and MSDOS version 7 were eventually bundled into Windows 95 which carried exclusive OEM license agreements that didn't permit OEMs to use or dual boot other operating systems like Digital's DOS. For example, some Hitachi PCs had a hidden copy of the BeOS that consumers could only discover and activate using instructions on Hitachi's web site. Digital, Hitachi and BeOS have since exited the PC OEM and PC Operating system business. For it's part the DOJ has complained publicly that Microsoft violated the first consent agreement. The practice of monopolies denying companies that compete in any software catagory timely access to APIs, and the practice of bundling seperate retail products for anticompetitive reasons, and/or using exclusive licensing agreements to harm competitors is a common and recurring theme. The judge was correct in denying Microsoft's request to limit the scope of the remedies without an evidentiary hearing, and the DOJ was premature in dropping their case in-main on product bundling. Microsoft is engaged in world-wide trade and the DOJ and European antitrust regulators seem uncoordinated and out of step. The European regulators have taken up complaints that Microsoft has withheld access to Windows server software API's that are necessary for interoperability with other network operating systems, and the bundling of Windows Media Player in Windows XP. Microsoft is not so quietly announcing it's plans for a single Internet logon authentication service it's calling ''.NET''.

The stated objective of this initiative is to leverage the Windows monoply in order to create a new (Internet) monopoly. While these practices may or may not be lawful, it's doubtful that all of the practices likely to result in monopolization in the future have been eliminated without a single hearing on the issues here in our courts. Most non-Microsoft operating systems provide a boot manager that allows consumers to use several operating systems. In fact, Microsoft includes a boot manager that allows consumers to use multiple (older) versions of Windows e.g. Windows 2000 and Windows 98. The act of installing a Microsoft operating system doesn't invalidate a consumers licences for a competitors products. Yet installing (or reinstalling) Microsoft Windows will always result in a consumers other operating systems becoming inaccessable. This is anticompetitive behavior. Microsoft should be required to automatically add other operating systems to it's boot manager in the same manner that it adds it's own products.

The DOJ and Microsoft appear to have forgotten that this case is about—Personal Computers— if a consumer shops for a PC, and makes a purchase based on the software selection, it makes no sense to provide Microsoft the arbitrary right within fourteen days to delete icons or programs and substitute their own because they have judged the competitors product lacking in some quality or state they deem essential.

Microsoft has stated that their power to innovate or bundle applications into Windows XP is essential to the economic recovery of the PC industry. The PC OEMs have testified that there is no viable alternative to Windows. In the past year alone private business LANs and Internet companies have suffered billions of dollars in damages caused by trojan or virus programs that specifically targeted Windows PCs. The Executive and Legislative branches of the Federal Government have recognized the Internet as a vital piece of our national and international infrastructure. They have established agencies tasked with it's protection. Indeed one reason for pursuing the proposed settlement after September 11 was ''the national interest''. It's hard to understand why much of Microsoft's ill gotten monopoly shouldn't be considered an essential public facility. Certainly consumers have a right to migrate their own IP out of proprietary Microsoft file formats. Microsoft should be required to publish the file format information needed for other applications to interoperate with files created by MS Office. This is certainly the case with regard to Apple Computer users who have already been threatened with the cancellation of the Apple version of MS Office.

In conclusion, the court combined the individual State and DOJ cases. A settlement that doesn't include half the plantiffs is at best not a settlement.

Sincerely,
Harlan L. Wilkerson

Subject: Microsoft Settlement

I strongly disagree with the proposed settlement. It does not go nearly far enough to restore competition and deny Microsoft the fruits of their illegally obtained market advantage. In particular the Office suite monopoly is devastating to competitors and consumers through lack of choice. I think the

nine states that are still pursuing litigation are much closer to purposing a remedy that is in agreement with the appeals courts findings.

Subject: Proposed Microsoft settlement: woefully insufficient

Dear Justice Department,

As a software innovator and holder of several software patents, I have first hand knowledge of how extremely brutal, unfair and bullying Microsoft is to others in the industry. I was involved for five years in negotiation, arbitration and potential legal action against Microsoft which only caused Microsoft to spend incredible resources to deny me and Humanic Systems any just and due compensation for our innovative work.

In my opinion, as President of Humanic Systems, a company that was (above) abused by Microsoft regarding our intellectual property for significant components of Microsoft Outlook, the proposed remedy is extremely inadequate:

1. It does not provide substantial redress for the prior losses caused by MS on others

2. Secrecy provisions undermind the ability to obtain API information and will systematically be used by MS, in my opinion, to continue its monopoly stranglehold

3. There are no structural remedies, and, without those, the ''fascist'' mindset of Ballmer and Gates will continue to dominate the thinking of each and every employee

4. Microsoft's stated opinions about various forms of open software, being a ''cancer'' undermines the ability for consumers to get the maximum benefit for the least cost

This position, alone, demonstrates that they want ''all the marbles'' and it is a ''winner take all'' game

Consider, for example, a PBS documentary about extreme competition as taught within the Gates family as Mr. Gates grew up

This person does not know the word cooperation, and, without extremely directive measures, will never show cooperation to the rest of the software industry that is slowly dying under his ruthless hand.

Very truly yours,

Re: Microsoft Settlement

Incredibly, the foremost innovative and economy enhancing company of the past fifty years has faced and continues to face an onslaught of legal challenges because of its superior and highly successful business model. This is happening through the combined conspiratorial actions of past federal and present state governments allied with certain business companies, i.e., Sun Microsytems, Oracle, AOL, et al. What these companies could not achieve in the ultimate test—the marketplace—they seek to gain via the use of Machiavellian chicanery and political cronyism; particularly a number of State Attorneys General and the foul, disgraced Clinton Justice Department.

There is no harm here to the American or Foreign consumer. To the contrary, Microsoft has made sense of the Internet and has provided commonality and standardization and thus ease of use to the consumer, not obscurantism and confusion such as that which existed prior to the advent of Microsoft's operating systems.

If there is any illegality being practiced relative to the issues at hand concerning Microsoft, it is the conspiracy of Government operating hand in hand with some of the slimiest, slipperiest billionaire business operatives, and their surrogates, in existence in the world today.

The Government must reward business excellence and innovativeness; Government must recognize and commend those enterprises that enhance economic activity; the Government and the Courts must not penalize achievement and success to satisfy the politically connected obstructionist losers.

or to whom it may concern,

I am opposed, in principle, to any penalty meted to Microsoft for anti-trust reasons. I use Microsoft products voluntarily which is the only way one can use their products. Any claim to the contrary is simply wrong.

The free market will punish anyone who mistreats their customers. Microsoft has been nothing short of wonderful to the success of my business and personal life. They deserve their success and must be left unhindered to continue their efforts for my best interests. I do not want you to presume to tell me what software configuration I want in my computer nor what any company can bundle to meet my needs. I will decide whether Microsoft or any other company is a success for me or not.

The idea that another company cannot compete with Microsoft is every indication that it does not have what I nor others want. I and every person and/or company must be free to create and sell their property to any other willing person and it is your job to protect that most fundamental right not to undermine and punish it.

Sincerely,
Sam Axton

To Whom It May Concern:

It would be difficult in the time I have available to describe the transparent and political nature this case has taken. I will, however, do my best to summarize some of my thoughts for the record, as I believe I represent the majority of working America who simply don't have the time to make their opinions formally known. It is these people who some parties continue to claim have been so desparately harmed by Microsoft. I don't think this is so.

It is clear that MS was extremely aggressive and, in some instances, outside the law in its persuit of the browser market. In the media at the time were boastings by Netscape that they would destroy windows, creating their own desktop environment. They were quite serious and I think MS realized that. I would also like you to recognize that NS browsers were freely downloadable at the time and find it hard to believe that sales to average consumers were a significant source of revenue. It was the corporate sales that drove their engine so please keep in perspective that the majority of consumers were not paying for the endless revisions of the NS Browser, they simply downloaded and installed it.

When MS came out with IE, it was not very good and most people continued using NS, even though IE came with Windows 95. What difference does it make which ''comes with'' the OS. Do the complaintants believe the public is so stupid that they just take what is put before them? It was because IE became so much better than NS that NS failed. They had geared themselves towoard owning the market—their own ''monopoly''—and then beyond to the desktop. It didn't happen, in large part because MS created a much better browser and, forseeing that the Internet would be an extension of the desktop environment, included it as standard equipment with Windows. To this day one can install any browser one chooses—even pay for Opera. Or, one has the choice of using what comes with the Windows OS. Those 12% of users who purchase Apple systems, also have a built-in browser but can install any they like. For those of us that have been using computers for a long time, it is quite obvious that MS has done the unimaginable—converted a world of fragmented systems and hardware to the interchangable, useful, indespensible marvels of today. It had to happen that someone would do this, and I think it is the picture of an American success story that they did. We should not be continually beating on a company that is in reality the crown jewel of

American enterprise. What better example can you offer? And all this because it's fashionable to hate the big guy, and also that some people would rather blame their own business model failures on MS instead of finding ways to innovate.

To be perfectly blunt, as a middleclass, average American, I have been quite disgusted during most of this process. MS doesn't produce tobacco , they aren't the enemy. They deserve to be fined and put on notice about the laws they did in fact violate—not to have a state by state feeding frenzy on the most viable corporation in our country—all fueled by none other than. . . Competitors. It's not moral, should not be legal and the rest of the world is laughing the hidious way we have allowed it to happen.

It is unfortunate, but I believe much of the correspondance you receive will be from those with an axe to grind or who followed the directions on a form letter with hopes of collecting an offered prize. You probably won't hear from the majority, those who are simply working and enjoying the bright, boundless world open to them through the Internet and their computer. Not only would they not be enjoying this as easily or as cheaply if MS had not been sucessful, but they might not be enjoying it at all. These are the people who are collectively thrown around in discussions by politicians and sour CEO's hoping to score points or money by attacking MS while it's fashionable.

I emplore you to settle this trial as swiftly and as close to the current framework as possible. It has run on far too long as it is and we have far, far, more important things to work on. Thank you for your time.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing in full support of the recent settlement between Microsoft and the US Department of Justice.

Although the lawsuit was lengthy and costly for taxpayers, I am happy that Microsoft will not be broken up. The terms of the settlement seem fair.

Under the terms of the settlement Microsoft has agreed to improve its relations with computer makers and software developers. It has also agreed to design future Windows versions so that competitors can more easily promote their own products. These concessions and more make up the basis for a settlement that is aimed at protecting consumer rights.

While it is not perfect, it is the best thing that could happen. Our nation needs Microsoft back in action and innovating like they have been for over 10 years. Hopefully, your office can overcome any opposition there may be in the federal government to the settlement, and bring a swift end to this already tiresome case. Thank you.

Sincerely,
Paula Lazutin

MTC–00028770

From: Andrew Neely
To: Microsoft ATR
Date: 1/28/02 5:22pm
Subject: Microsoft Settlement

As a longtime computer user, and recent professional who uses both Windows and Macintosh both at work and at home, I feel that without a doubt, Microsoft is a predatory monopoly. I have used many different software products, and it has only been in the last three years or so, during the intense pressure that the DOJ initially brought to bear with it's antitrust lawsuit that I've even seen anything in the way of alternate OS offerings making their way onto store shelves and into OEM computers.

Microsoft has not only dominated the OS market to the detriment of its competition, but to that of its end users as well. That blackhat hackers have been able to repeatedly exploit the same set of vulnerabilities in the close relationship between recent versions of Windows and their mail clients, Outlook and Outlook Express, is inexplicable. Simply changing either piece of software, or both, would close a major security opening in it's products. However, not only has Microsoft failed to address this in a meaningful way, it has managed to avoid all liability to what for all intents and may be thought of as a design flaw. Had a car company's mistakes cost the same amount of lost man hours and money as Microsoft's oversights have, year after year, I doubt that they would even continue to operate as a company, much less as the most powerful one in its industry.

As a United States citizen I ask that my opinion be firmly registered that Microsoft can only be brought to heel as a good corporate citizen by direct oversight and measures designed to cripple the leverage that its Windows brand of operating systems software gives it over competitors. Simply allowing this company to give away so many billion dollars worth of retail software is ineffective. This will not only not cost the company anything like the sticker price of the donations, but in fact allow it to more firmly entrench itself into area it already has inroads into. Monetary damages should be settled in CASH, and the company should be subjected to direct oversight of its activities for at least five years. This seems to be the outside amount of time for it to develop a generation of products all the way across the board, and tying its hands for this length of time will help other companies to get a foothold they badly need to compete.

Sincerely,
Andrew Neely

Renata B. Hesse
Antitrust Division
United States Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001

Dear Ms. Hesse,

I am writing to comment on the proposed Microsoft/DOJ anti-trust settlement. As a business executive at a company both highly dependent on computing technology and specifically involved in software development, I've come to the conclusion that this settlement is not in the public interest, and fails to remedies the problems that provoked the action in the first place.

The settlement leaves the Microsoft monopoly intact, with numerous opportunities to the company to effectively exempt itself from crucial provisions. The recently proposed ''donation'' to schools is just one example of how Microsoft can turn matters to their own advantage (in this case by decimating Apple's position in the education market).

In addition, the proposed settlement fails to address the critical ''barrier to entry''

problem, enabling Microsoft to maintain an effective ''lock'' on the applications market.

In addition, the proposed settlement fails to address the critical ''applications barrier to entry'' associated with the installed base of 70,000 Windows applications, enabling Microsoft to maintain an effective ''lock'' on the operating systems market by denying competitors with other operating systems the information needed to run these other applications on other operating systems. Any settlement must make it easier—not harder—for competitors to run the Windows applications.

Consumers, not Microsoft, should decide what products are on their computers. The settlement must eliminate Microsoft's various barriers—business and technical—to allowing combinations of non-Microsoft operating systems, applications, and software components to run properly with Microsoft products.

The remedies proposed by the Plaintiff Litigating States are in the public interest and absolutely necessary, but they are not sufficient without these remedies.

The Tunney Act provides for the Court to hold public proceedings, with citizens and consumer groups afforded an equal opportunity to participate, along with Microsoft's competitors and customers. I hope you will encourage those proceedings, and consider carefully how to proceed in this matter. Your decisions have great significance for the health of the US economy's most vital industries, by eliminating Microsoft's ability to illegal constrain markets and innovation.

Thank you for the opportunity to comment on this important matter.

Sincerely yours,
Gil Friend

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I want to take a moment to express my support for the settlement reached in November between Microsoft and the Department of Justice. I believe the settlement is fair to both sides and represents an opportunity for everyone to move forward.

The terms of the settlement are very strict and mandate a number of concessions from Microsoft. Among the terms of the settlement, Microsoft has agreed to license its Windows operating system products to the twenty largest computer makers on identical terms and conditions, including price.

There should be no question as to Microsoft's compliance with the terms of the settlement. It calls for a technical committee to monitor Microsoft's business practices in the future.

I hope that your continued support for finalizing the settlement will convince those states who are moving forward in their litigation to amend their positions.

It is well past the point for the federal and state governments to focus their resources on more urgent matters, like stimulating our economy.

Sincerely,
William Foerster

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

Today is the last day that I can contact you regarding the finalization of the Microsoft antitrust settlement. I would like to share my view that as the settlement is written, it appears fair to all parties. Apparently, Microsoft has made numerous changes to satisfy this agreement, including agreeing to work with a Technical Committee that will serve as a watchdog of its activities and practices. It seems to me that Microsoft and the government, possibly no lover of the company, have hammered out an agreement that each party can live with. Since this is the case, there should be no reason to alter the agreement...I have become increasingly cynical, believing that additional requirements are wanted by competitors to satisfy their interests, certainly NOT the ''public's''.

My life, and my business'' life, have been improved and made easier by Microsoft. The adage ''crying over sprit milk'' has been a tactic for decades. It is time for competitors to step up their efforts to compete: to innovate, improve and participate in the technology revolution that just won't quit. I also support the philanthropic works of the Gates family and feel certain they will continue to lead the US in discovering and pursuing worthwhile projects, some that the United States has ignored or underfunded for decades. Let Microsoft's competitors follow in its footsteps and show the world that the corporate world can think beyond the ''bottom line'' and lead with generosity. Thank you for calling for comments, and for your attention.

Sincerely,
Carola Lewis

Antitrust Division
US Dept. of Justice (Legal)

The settlement is more then generous. I do not, and did not agree with the government

action. It is not the justice departments job to aid and abet competitors who cannot make it on their own.

As an example, I cannot buy a Chrysler auto frame, and a General Motors Body and a Ford Transmission, yet that is what you have asked Microsoft to do with it's software. To force a company to design product so that others made add on to it is nut justice. It maybe legal, but not justice. Were we the public to start to buy all Fords, would you take action against Ford to force them to redesign there product so that Chrysler can put its motor in? I think not.

ACCEPT THE SETTLEMENT AND GET OUT OF THE CASE NOW.

I am responding to the U.S. goverment's challenge to Microsoft regarding their conduct in the competitive marketplace. I am speaking from the position of a retired CEO for one of Howard Hughes'' companies.

I see a great parallel between the Microsoft case and the lawsuit against Hughes by TWA. After years of legal actions it finally reached the Supreme Court. In short order it was thrown out. Hughes won. The reason was logic. Hughes owned 70 percent of the TWA stock when he was challenged with mismanagement! The Supreme Court recognized the obvious. He had the legal right to make the decisions involved.

The Microsoft case is different in detail, but identical in concept. The actions each were (are) are charged with represent normal, legal and proper competitive practice. Both Hughes and Microsoft had the right to optimize their hard won positions just as every other company does in the worldwide marketplace. A point missed by the Monday morning, arm-chair critics is that competition is based on survival. The professional football team doesn't let up on the opposing team because it might lose the game in the process. The competitors in the Microsoft case know this is the way competition works. They operate this way too! In fact their present legal action is just another weapon they chose to use. And the state attourney generals who are fighting Microsoft see profit for their state or political advantage.

My plea is not to let them get away with it!! There is no end to this sort of challenge to the healthy capitalist system where innovation is the engine. My suggestion is to review the TWA versus Hughes Tool Company decision by the

U.S. Supreme Court as a reference.

Date: 1/28/02 5:34pm
Subject: Microsoft Settlement

To whom it may concern:

In regard to Microsoft's long history of noncompliance, and their more recent delay and defer strategies, I would strongly urge that you scrap the proposed settlement in favor of a penalty that is more self-enforcing. Breakup of the company would meet this criteria. If you give them the leeway contained in the proposed settlement, they will attempt to circumvent it at every opportunity.

Sincerely,
Allan Engle

Subject: Microsoft Settlement

Under the Tunney Act, I would like to comment on the proposed Microsoft settlement.

I find the punishments levied for a company that ?engaged in a variety of exclusionary acts designed to protect its operating system monopoly? are wholly inadequate, amounting to little more than a slap on the wrist. I would like the settlement to have more teeth that would serve to officially level the playing field in the personal computer operating system market without hurting the people at Microsoft that have put in countless hours to create what is a useful product. Splitting Microsoft into a number of companies that all have rights to sell and develop newly forked versions of the operating system would be a great first step. But if this cannot be accomplished, there are still several things that the Department of Justice can do to help with the state of Microsoft's monopoly.

There should be no monetary penalties from Microsoft for original equipment manufacturers (OEMs) that sell computers bundled with Microsoft's operating systems for the inclusion of any software, whether Sun's Java Virtual Machine, Netscape/AOL's Netscape browser, free alternatives to Microsoft Office, or the ability to ?dual-boot? into other alternative operating systems preinstalled on the machine, like Linux or FreeBSD. For every pre-packaged solution offered by Microsoft, whether its Internet Explorer, MediaPlayer, or what-have-you, there should be another, out of the box alternative for computer users ready for use like Mozilla or Real's

RealPlayer or Apple's QuickTime. These should not be secondary products, but true alternatives that users can choose upon first booting their new computers, and should also be alternatives that can be accessed at a future date.

Simply put, not enough has been done to level the playing field. Microsoft's aggressive tendencies can be counterbalanced by providing a level playing field for OEM's to sell their hardware of choice with software of choice without punishing those who have put in hard work at Microsoft unduly as well.

Please reconsider your original, relatively light sentencing.

Subject: Microsoft Settlement

January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am in favor of the settlement of the Microsoft antitrust case. In a perfect world, I would like to see the case dropped in its entirety.

However, I recognize that the likelihood of this happening is slim, so I support the steps Microsoft is taking to bring this case to a conclusion. The terms of the settlement

agreement are more than fair. In fact, I think they are entirely too harsh. For example, Microsoft has agreed to the creation of a technical oversight committee that will monitor the way they conduct their business. In our free enterprise system, this seems especially restrictive. They have also agreed to not retaliate against those who compete against them, or those who promote Microsoft's competitors. Our free market does not appear to be so free after all.

While I think the agreement really goes much farther than it should, I fully support Microsoft's decision to do what is best for consumers, the economy, and the IT industry as a whole—and that is to move on.

Thank you.

Sincerely,

Vicky Francis

Subject: microsoft settlement

It is time to bring the above matter to finalization. The time, effort and money being expended on this extended litagation is wrong. At this time we should be expending our efforts to enhance and develope the best in the computer world, both hardware and sfotware and not be bogged down in non productive situations. Reach a settlement now, so that we can all move forward. Litigation does not produce progress- only additional income for the legal profession.

Please find attached the objections to the settlement proposal. The original format is .sxw (OpenOffice), and I apologize in advance for any problems in converting it to MS Word, RTF and HTML formats, which I also attach. I will fax a copy in short order so you may see the original.

Unfortunately some time commitments have prevented me from fully addressing all the issues. Within the next week or two a more complete draft will be available. I pray you will still consider it that time- given the utmost importance of this settlement on the future of our society and the freedoms which we enjoy.

The Honorable Colleen Kollar-Kotelly
United States District Court for the District of Columbia
333 Constitution Avenue, NW
Washington, DC 20001
Re: US v. Microsoft, Civil Action No. 98–1232: Revised Proposed Final Judgment

The Honorable Judge Kollar-Kotelly and the US Department of Justice: Please find attached the firm objections of the KDE League, Inc. to the above- referenced proposed final judgment (the ''Proposal''). The KDE League is a group of industry leaders and KDE developers focused on facilitating the promotion, distribution, and development of KDE. KDE is a contemporary, free ''Open Source'' desktop environment.

In many ways, KDE is the functional equivalent of Windows. It consists of a modern, elegant, intuitive desktop environment, including a modern browser, accompanied by a host of easy-to-use and easy-to-learn applications, including the productivity/office suite KOffice. In addition, KDE provides a broad array of intuitive graphical configuration tools. In fact, APPS.KDE.com (a KDE/Qt application website) lists over 1,250 publicly-available KDE applications (it should be noted that someone using KDE can also run a number of non-KDE applications, such as GNOME, Motif, wxWindows, X, etc. applications).

The comprehensive set of tools available to KDE users combine to make system administration substantially easier than the standard command-line-driven UNIX/Linux administration, and hence make Linux and other UNIXes more competitive with Microsoft not only in the desktop markets but also in the server operating system markets.

While KDE is most commonly used in conjunction with Linux, it is extremely portable and versatile, and does not depend on any particular operating system. For example, it also runs successfully on many other systems (such as Sun's Solaris, Compaq's Tru64, IBM's AIX, HP's HP-UX, and other UNIXes).

Moreover, since KDE is based on an outstanding graphical toolkit called Qt, and since Qt is also available for Windows, the new Mac OS X, as well as embedded devices (such as Sharp's new Zaurus), KDE has the potential to become a familiar environment deployed in a broad array of heterogeneous environments.

As you are undoubtedly aware, Microsoft has often been noted, during the trial and particularly in recent months, as viewing Open Source as the only significant challenge to its reign. So far, Open Source—particularly Linux—has been largely limited to server systems. But in recent months the defendant has been paying increasing attention to KDE, and at this juncture KDE is the major direct competitor with Microsoft Windows desktop operating system products and Microsoft middleware and productivity applications and, through its capacity to simplify installation, usage and administration, a major indirect competitor with the defendant in the server operating system market.

In recognition of the strength and power of KDE as a desktop environment, an ever-growing body of companies and governments have started the switch to KDE, including the Korean government, which is migrating 120,000 office workers to KDE from Windows, and other companies and governments are seriously contemplating the switch, including the government of Germany. Due to its maturity, low cost, features and active developer community, as well as due to the freedoms KDE grants its users, KDE constitutes the most viable competitor to Microsoft Windows in the desktop operating system market and the strongest factor in the expansion of UNIX-based operating systems in the server market.

The defendant has now clearly observed that in fact KDE is ready and able to expand the role of Open Source as well as proprietary UNIXes on the office, school and home desktop, as well as on TV settop boxes, webpads, handheld- devices and other computing platforms.

The KDE League strongly feels that the proposed settlement does not adequately protect KDE from the defendant's monopoly power, and hence leaves the defendant free to attempt to crush its strongest potential competitor in an anticompetitive manner. In fact, we anticipate that if the Proposal is approved, the defendant may feel even less tethered than it has during the course of this seven-plus-year proceeding to use unlawful practices to attempt to derail KDE from widespread acceptance. The fact that the government has refused my requests for meetings to discuss how the Proposal might be reworded to provide some comfort that the defendant will be unable to use unlawful practices to crushing its strongest competitor adds little solace to a weakly-worded document.

At this juncture I would like to disclose that, from the time of commencement of this case until approximately June 1999, I was employed as an attorney by counsel for the defendant in this matter. However, I was exclusively involved in representing other clients in unrelated matters. I never performed any legal services for the defendant, nor was ! ever exposed to any non-public information about the defendant, whether relating to this litigation or otherwise.

I would also like to point out that the views and opinions in this memorandum express the views of the KDE League, and may not necessarily express the views of its members.

Best regards,
Andreas Pour
Chairman
KDE League, Inc.

Introduction

The KDE League opposes the above-referenced proposed final judgment (the ''Proposal''). Specifically, the Proposal lacks adequate enforcement provisions, is too limited in scope, and fails to address issues of restitution. Our objections will focus on the specific problems faced by an Open Source project such as KDE/Linux, though many will apply more broadly as well.

In conducting its review, the Court should bear in mind the applicable provisions of 15 U.S.C. Sec. 16(e):

(e) Public interest determination

Before entering any consent judgment proposed by the United States under this section, the court shall determine that the entry of such judgment is in the public interest. For the purpose of such determination, the court may consider—

(1) the competitive impact of such judgment, including termination of alleged violations, provisions for enforcement and modification, duration or relief sought, anticipated effects of alternative remedies

actually considered, and any other considerations bearing upon the adequacy of such judgment;

(2) the impact of entry of such judgment upon the public generally and individuals alleging specific injury from the violations set forth in the complaint including consideration of the public benefit, if any, to be derived from a determination of the issues at trial.

As the Supreme Court wrote in U.S. v. Grinnell Corp., 384 U.S. 563 (1966): We start from the premise that adequate relief in a monopolization case should put an end to the combination and deprive the defendants of any of the benefits of the illegal conduct, and break up or render impotent the monopoly power found to be in violation of the Act. That is the teaching of our cases, notably Schine Theatres v. United States, 334 U.S. 110, 128 -129.

As a result of its limited, if not negligible, scope, the absence of any enforcement provisions for private litigants who have shouldered the expense of the trial already and who have been financially injured by the defendant, and the absence of any restitution to the victims of the defendants'' unlawful conduct, the Proposal is at best palpably without, if not directly against, the public interest. As has been said by industry analyst Robert X. Cringely, ''If this deal goes through as it is written, Microsoft will emerge from the case not just unscathed, but stronger than before''.

Unenforceable.

The Proposal makes enforcement of its minimal restrictions by parties actually harmed by the defendant's violation of its provisions practically impossible. In particular, should the defendant use unlawful and anti-competitive practices against KDE, neither the KDE developers nor the KDE League will be likely to obtain redress for such violations. This failure may ultimately deny consumers the choice to forgo the use of some or all of defendants'' products.

To ensure private litigants, who, as the courts so far have agreed, have been financially injured by the defendant, have a remedy for the defendant's unlawful conduct, and so that the defendant's competitors, such as KDE, can have the hope to obtain justice should the defendant continues its pattern of unlawful practices, the Government should require that Microsoft admit to its standing as a monopolist and the violations of the Sherman Act affirmed by the court of appeals, together with any additional violations this Court may find upon remand of, and consistent with, the appellate court's order.

[pour [1]]

The proposed remedies are inadequate for private litigants for the following reasons. First, the Final Judgment provides that it ''does not constitute any admission by any party regarding any issue of fact or law''.[2] The clearest implication of this provision is that the defendant is not legally determined to be a ''monopoly'' in this case for purposes of res judicata or collateral estoppel. Microsoft has proven in this case that, for all practical resources, it has infinite resources, time, tenacity and patience to fight any potential litigants. In fact, recent SEC filings indicate that the defendant is sitting on a $36 billion cash horde. Even the government, with all its resource, has fought for almost seven- and-a-half years, only to end up with a Proposal which only the defendant's stockholders could cheer about. How is a free, open project like KDE to obtain redress against such a tenacious and resourceful opponent?

Though the conclusion was obvious to all judges engaged in this matter, both at trial and on appeal, the fact is that virtually no private plaintiff will be able to afford to prove that Microsoft is a monopoly, a necessary first step in obtaining relief against the defendant should it continue to abuse its monopoly position

Second, the enforcement provisions of the Proposal are weak enough to amount to nothing but a ruse. For example, the ''Technical Committee'' which is charged with the duty to ''assist in enforcement of and compliance with th[e] Final'' Judgment, are (1) picked by MS (though one is picked by MS and one by Justice and the third by the first two, in light of how this Proposal signals the government'' practical abandonment of prosecution of this matter, and in light of the defendant's tenacity, it is likely in our opinion that the third person will favor the defendant); (2) sworn to secrecy; (3) paid by MS; (4) required to work on MS's ''campus''; and (5) unable to speak with any MS employee without an MS lawyer present. See Proposal, Section IV.B. The Proposal reads in relevant part:

B. Appointment of a Technical Committee

1. Within 30 days of entry of this Final Judgment, the parties shall create and recommend to the Court for its appointment a three-person Technical Committee (''TC'') to assist in enforcement of and compliance with this Final Judgment.

2. The TC members shall be experts in software design and programming. No TC member shall have a conflict of interest that could prevent him or her from performing his or her duties under this Final Judgment in a fair and unbiased manner. Without limitation to the foregoing, no TC member (absent the agreement of both parties):

a. shall have been employed in any capacity by Microsoft or any competitor to Microsoft within the past year, nor shall she or he be so employed during his or her term on the TC;

b. shall have been retained as a consulting or testifying expert by any person in this action or in any other action adverse to or on behalf of Microsoft; or

c. shall perform any other work for Microsoft or any competitor of Microsoft for two years after the expiration of the term of his or her service on the TC.

3. Within 7 days of entry of this Final Judgment, the Plaintiffs as a group and Microsoft shall each select one member of the TC, and those two members shall then select the third member. The selection and approval process shall proceed as follows.

a. As soon as practicable after submission of this Final Judgment to the Court, the Plaintiffs as a group and Microsoft shall each identify to the other the individual it proposes to select as its designee to the TC. The Plaintiffs and Microsoft shall not object to each other's selection on any ground other than failure to satisfy the requirements of Section IV.B.2 above. Any such objection shall be made within ten business days of the receipt of notification of selection.

b. The Plaintiffs shall apply to the Court for appointment of the persons selected by the Plaintiffs and Microsoft pursuant to Section IV.B.3.a above. Any objections to the eligibility of a selected person that the parties have failed to resolve between themselves shall be decided by the Court based solely on the requirements stated in Section IV.B.2 above.

c. As soon as practical after their appointment by the Court, the two members of the TC selected by the Plaintiffs and Microsoft (the ''Standing Committee Members'') shall identify to the Plaintiffs and Microsoft the person that they in turn propose to select as the third member of the TC. The Plaintiffs and Microsoft shall not object to this selection on any grounds other than failure to satisfy the requirements of Section IV.B.2 above. Any such objection shall be made within ten business days of the receipt of notification of the selection and shall be served on the other party as well as on the Standing Committee Members.

d. The Plaintiffs shall apply to the Court for appointment of the person selected by the Standing Committee Members. If the Standing Committee Members cannot agree on a third member of the TC, the third member shall be appointed by the Court. Any objection by Microsoft or the Plaintiffs to the eligibility of the person selected by the Standing Committee Members which the parties have failed to resolve among themselves shall also be decided by the Court based on the requirements stated in Section W.B.2 above.

4. Each TC member shall serve for an initial term of 30 months. At the end of a TC member's initial 30-month term, the party that originally selected him or her may, in its sole discretion, either request re-appointment by the Court to a second 30-month term or replace the TC member in the same manner as provided for in Section IV.B.3.a above. In the case of the third member of the TC, that member shall be re-appointed or replaced in the manner provided in Section W.B.3.c above.

5. If the United States determines that a member of the TC has failed to act diligently and consistently with the purposes of this Final Judgment, or if a member of the TC resigns, or for any other reason ceases to serve in his or her capacity as a member of the TC, the person or persons that originally selected the TC member shall select a

[1] See Robert X. Cringely, He's Not in It for the Profit (Dec. 6, 2001, PBS Presents).

[2] See Proposal, Preamble. The Proposal reads in relevant part: AND WHEREAS, this Final Judgment does not constitute any admission by any party regarding any issue of fact or law; and thwart competition in its markets. The Government, having fought its battle in what in technological terms is a generation, cannot really take seriously its reference to remedies under Section 4 of the Clayton Act in Article VI of its Competitive Impact Statement (doc. 9549).

replacement member in the same manner as provided for in Section IV.B.3.

6. Promptly after appointment of the TC by the Court, the United States shall enter into a Technical Committee services agreement (''TC Services Agreement'') with each TC member that grants the rights, powers and authorities necessary to permit the TC to perform its duties under this Final Judgment. Microsoft shall indemnify each TC member and hold him or her harmless against any losses, claims, damages, liabilities or expenses arising out of, or in connection with, the performance of the TC's duties, except to the extent that such liabilities, losses, damages, claims, or expenses result from misfeasance, gross negligence, willful or wanton acts, or bad faith by the TC member. The TC Services Agreements shall include the following.

a. The TC members shall serve, without bond or other security, at the cost and expense of Microsoft on such terms and conditions as the Plaintiffs approve, including the payment of reasonable fees and expenses.

b. The TC Services Agreement shall provide that each member of the TC shall comply with the limitations provided for in Section IV.B.2 above.

7. Microsoft shall provide the TC with a permanent office, telephone, and other office support facilities at Microsoft's corporate campus in Redmond, Washington. Microsoft shall also, upon reasonable advance notice from the TC, provide the TC with reasonable access to available office space, telephone, and other office support facilities at any other Microsoft facility identified by the TC.

8. The TC shall have the following powers and duties:

a. The TC shall have the power and authority to monitor Microsoft's compliance with its obligations under this final judgment.

b. The TC may, on reasonable notice to Microsoft:

i. interview, either informally or on the record, any Microsoft personnel, who may have counsel present; any such interview to be subject to the reasonable convenience of such personnel and without restraint or interference by Microsoft;

ii. inspect and copy any document in the possession, custody or control of Microsoft personnel;

iii.. obtain reasonable access to any systems or equipment to which Microsoft personnel have access;

iv. obtain access to, and inspect, any physical facility, building or other premises to which Microsoft personnel have access; and

v. require Microsoft personnel to provide compilations of documents, data and other information, and to submit reports to the TC containing such material, in such form as the TC may reasonably direct.

c. The TC shall have access to Microsoft's source code, subject to the terms of Microsoft's standard source code Confidentiality Agreement, as approved by the Plaintiffs and to be agreed to by the TC members pursuant to Section IV.B.9 below, and by any staff or consultants who may have access to the source code. The TC may study, interrogate and interact with the source code in order to perform its functions and duties, including the handling of complaints and other inquiries from non-parties.

d. The TC shall receive complaints from the Compliance Officer, third parties or the Plaintiffs and handle them in the manner specified in Section IV.D below.

e. The TC shall report in writing to the Plaintiffs every six months until expiration of this Final Judgment the actions it has undertaken in performing its duties pursuant to this Final Judgment, including the identification of each business practice reviewed and any recommendations made by the TC.

f. Regardless of when reports are due, when the TC has reason to believe that there may have been a failure by Microsoft to comply with any term of this Final Judgment, the TC shall immediately notify the Plaintiffs in writing setting forth the relevant details.

g. TC members may communicate with non-parties about how their complaints or inquiries might be resolved with Microsoft, so long as the confidentiality of information obtained from Microsoft is maintained.

h. The TC may hire at the cost and expense of Microsoft, with prior notice to Microsoft and subject to approval by the Plaintiffs, such staff or consultants (all of whom must meet the qualifications of Section IV.B.2) as are reasonably necessary for the TC to carry out its duties and responsibilities under this Final Judgment. The compensation of any person retained by the TC shall be based on reasonable and customary terms commensurate with the individual's experience and responsibilities.

i. The TC shall account for all reasonable expenses incurred, including agreed upon fees for the TC members'' services, subject to the approval of the Plaintiffs. Microsoft may, on application to the Court, object to the reasonableness of any such fees or other expenses. On any such application: a) the burden shall be on Microsoft to demonstrate unreasonableness; and (b) the TC member(s) shall be entitled to recover all costs incurred on such application (including reasonable attorneys'' fees and costs), regardless of the Court's disposition of such application, unless the Court shall expressly find that the TC's opposition to the application was without substantial justification.

9. Each TC member, and any consultants or staff hired by the TC, shall sign a confidentiality agreement prohibiting disclosure of any information obtained in the course of performing his or her duties as a member of the TC or as a person assisting the TC to anyone other than Microsoft, the Plaintiffs, or the Court. All information gathered by the TC in connection with this Final Judgment and any report and recommendations prepared by the TC shall be treated as Highly Confidential under the Protective Order in this case, and shall not be disclosed to any person other than Microsoft and the Plaintiffs except as allowed by the Protective Order entered in the Action or by further order of this Court.

10. No member of the TC shall make any public statements relating to the TC's activities.

Appointment of a Microsoft Internal Compliance Officer

1. Microsoft shall designate, within 30 days of entry of this Final Judgment, an internal Compliance Officer who shall be an employee of Microsoft with responsibility for administering Microsoft's antitrust compliance program and helping to ensure compliance with this Final Judgment.

2. The Compliance Officer shall supervise the review of Microsoft's activities to ensure that they comply with this Final Judgment. He or she may be assisted by other employees of Microsoft.

3. The Compliance Officer shall be responsible for performing the following activities:

a. within 30 days after entry of this Final Judgment, distributing a copy of the Final Judgment to all officers and directors of Microsoft;

b. promptly distributing a copy of this Final Judgment to any person who succeeds to a position described in Section IV.C.3.a above;

c. ensuring that those persons designated in Section W.C.3.a above are annually briefed on the meaning and requirements of this Final Judgment and the U.S. antitrust laws and advising them that Microsoft's legal advisors are available to confer with them regarding any question concerning compliance with this Final Judgment or under the U.S. antitrust laws;

d. obtaining from each person designated in Section IV.C.3.a above an annual written certification that he or she: (i) has read and agrees to abide by the terms of this Final Judgment; and (ii) has been advised and understands that his or her failure to comply with this Final Judgment may result in a finding of contempt of court;

e. maintaining a record of all persons to whom a copy of this Final Judgment has been distributed and from whom the certification described in Section IV.C.3.d above has been obtained;

f. establishing and maintaining the website provided for in Section IV.D.3.b below.

g. receiving complaints from third parties, the TC and the Plaintiffs concerning Microsoft's compliance with this Final Judgment and following the appropriate procedures set forth in Section IV.D below; and

h. maintaining a record of all complaints received and action taken by Microsoft with respect to each such complaint.

Voluntary Dispute Resolution

1. Third parties may submit complaints concerning Microsoft's compliance with this Final Judgment to the Plaintiffs, the TC or the Compliance Officer.

2. In order to enhance the ability of the Plaintiffs to enforce compliance with this Final Judgment, and to advance the parties'' joint interest and the public interest in prompt resolution of issues and disputes, the parties have agreed that the TC and the Compliance Officer shall have the following additional responsibilities.

3. Submissions to the Compliance Officer.

a. Third parties, the TC, or the Plaintiffs in their discretion may

Third, making matters worse are the Proposal's ''No Third Party Rights''

provisions.[4] The absence of third party rights is, in fact, explicitly stated twice in the Proposal: first in Section III.I (last paragraph) and again in Section VIII). Thus if a private party has been harmed by the defendant's violation of the Final Judgment, that person's sole recourse is to approach the Justice Department or a State to request enforcement of the Proposal. Given the fact that the Justice Department has not even responded to the KDE League's request for a hearing regarding the settlement, it seems that the likelihood that the Justice Department acting on behalf of any Open Source project or other small company is marginal at best. In addition, many Open Source developers live in other countries, making it extremely difficult for them to obtain any redress through the courts. (Here it is important to bear in mind that while these developers live in other countries, their software is freely available to American consumers, and hence submit to the Compliance Officer any complaints concerning Microsoft's compliance with this Final Judgment. Without in any way limiting its authority to take any other action to enforce this Final Judgment, the Plaintiffs may submit complaints related to Sections III.C, III.D, III.E and III.H to the Compliance Officer whenever doing so would be consistent with the public interest.

b. To facilitate the communication of complaints and inquiries by third parties, the Compliance Officer shall place on Microsoft's Internet website, in a manner acceptable to the Plaintiffs, the procedures for submitting complaints. To encourage whenever possible the informal resolution of complaints and inquiries, the website shall provide a mechanism for communicating complaints and inquiries to the Compliance Officer.

c. Microsoft shall have 30 days after receiving a complaint to attempt to resolve it or reject it, and will then promptly advise the TC of the nature of the complaint and its disposition.

4. Submissions to the TC.

a. The Compliance Officer, third parties or the Plaintiffs in their discretion may submit to the TC any complaints concerning Microsoft's compliance with this Final Judgment.

b. The TC shall investigate complaints received and will consult with the Plaintiffs regarding its investigation. At least once during its investigation, and more often when it may help resolve complaints informally, the TC shall meet with the Compliance Officer to allow Microsoft to respond to the substance of the complaint and to determine whether the complaint can be resolved without further proceedings.

c. If the TC concludes that a complaint is meritorious, it shall advise Microsoft and the Plaintiffs of its conclusion and its proposal for cure.

d. No work product, findings or recommendations by the TC may be admitted in any enforcement proceeding before the Court for any purpose, and no member of the TC shall testify by deposition, in court or before any other tribunal regarding any matter related to this Final Judgment.

e. The TC may preserve the anonymity of any third party complainant where it deems it appropriate to do so upon the request of the Plaintiffs or the third party, or in its discretion. any harm visited upon these international developers results in direct harm to the American consumers which the Antitrust Laws are designed to protect.) This limitation should be particularly borne in mind when reading the entire Proposal, such as the supposed ''abandonment'' of certain trademark rights in Section VI.T.

Fourth, the term of the agreement is extremely short—only five years.[5] Even if the government proves to the court ''a pattern of willful and systematic violations'', the Proposal may only be extended once for a maximum of two years.[6] Thus, given the defendant's dilatory legal maneuverings, it is easily possible that the defendant can blatantly violate the Proposal from the get-go and have the Proposal expire before proceedings can adjudge it guilty of any violations.

Of course there is also a ''Voluntary Dispute Resolution'' provision, where essentially a victim of the defendant's monopoly abuses would have the opportunity to submit a grievance through a web form.[7] Insofar as the defendant adamantly denies any wrongdoing in the face of a lawsuit by the federal government and numerous States, and in the face of every judge to have reviewed the matter and disagreed with them, it strikes us as extremely unlikely that any aggrieved party would obtain resolution using this method. Under the Proposal, the defendant then has 30 days to decide, in effect, to ignore the request (it is possible the defendant might redress a grievance, of course, but since the defendant continues to assert it is not a monopoly and not guilty of any wrongdoing, it is totally unreasonable for the government to rely on this in its evaluation of the Proposal).[8]

Alternatively, a complaint may be submitted to the Technical Committee, which in turn may review a complaint (it is notable in this regard that though the Proposal speaks of ''shall investigate'', as there are no third party rights under the Proposal, a third party has no remedy in the event the Technical Committee fails to take such action).[9] In the event the Technical Committee agrees with the person filing a grievance, that person is barred from every presenting any evidence in court about the findings of the Technical Committee.[10] In the final analysis this situation probably does not have a great practical effect, as the person filing the grievance does not have any rights under the Proposal anyway.

However, it does highlight in how many ways the defendant has been able to insulate itself from any responsibility for actual wrongdoing it engages in, and how the Technical Committee is a veritable mirage with respect to any party having a legitimate grievance against the defendant. OS Only The restrictions imposed on the defendant in the Proposal are inadequate to prevent the defendant from further engaging in reasonably predictable unlawful behavior. Moreover, the restrictions are inadequate to protect our democracy from the overconcentration of power left in the defendant's hands. The restrictions of the Proposal have the following principal shortcomings:

First, Microsoft's office, multimedia, Internet and other products, although many of which from all appearances each constitutes a monopoly onto themselves, are not even addressed by the Proposal. Instead, only the ''OS'' is covered. Viewed in light of the defendant's .NET strategy for the future, this limitation all but renders the Proposal's prohibitions vacuous.

Although it is a fact proven in this case that the defendant used its OS as a basis to abuse its monopoly position and compete unfairly, the essence of the violations related to the incorporation by the defendant of additional technologies into its ''OS''. This inclusion repeatedly encompassed items, such as a browser or multimedia player that, in reality, do not form part of the OS but rather are separate applications as they do not have any responsibility for allocating limited resources, such as memory, disk space, screen space, etc., among competing applications, but rather themselves are applications competing for these limited resources).

Under the Proposal, the OS is, at least to some minimal extent (presumably far less than the defendant could have hoped when it formulated its current NET strategy), subject to restrictions. Accordingly, one can reasonably anticipate that the defendant's new strategy will be to extract functionality from the OS. Instead, these applications could be provided separately, either as ''free'' downloads from the Internet (of course if, as may be expected, they won't work without the defendant's OS they are not ''free'') or as network services provided over the Internet or a local network, providing a credible justification for reclassifying as an application what was before (at least according to the defendant) part of the OS.

Specifically, the defendant has ''bet the company'' on its .NET platform. The .NET strategy means any device which has one application (for simplicity, something equivalent to Java) can access a great multitude of services, whether provided by MS or its allies. The OS itself can be restored to what traditionally has been considered an OS, to wit, a system for allocating shared resources (such as access to memory, disk space, the screen, etc.) amongst competing applications, such as multimedia players, browsers, etc., rather that artificially defined to include those applications itself. Such an approach can be seen with some of the defendant's recent home products.

In other words, the last decade has witnessed MS simply ''integrating'' applications into the OS to ensure control over more applications and expand its OS monopoly (for example, when MS integrated its Internet browser into the OS, Netscape's Navigator was doomed). With the OS under

[4] See Proposal, Section III.I (last paragraph) and Section VIII.

[5] See Proposal, Section V.A.

[6] See Proposal, Section V.B.

[7] See Proposal, Section IV.D.

[8] See Proposal, Section W.D(3).

[9] See Proposal, Section W.D(4).

[10] See Proposal, Section IV.D(4)(d).

attack and possibly subject to regulation, the defendant has begun taking the direct opposite tack, undermining the importance of the OS and extracting and separating the core functionality provided by its applications. Of course, from the user's perspective, nothing will have visibly changed.

Second, by reserving to the defendant the right to determine ''in its sole discretion'' the software code which comprises a ''Windows Operating System Product'', the Proposal grants the defendant the uncurtailed freedom to redefine the term ''OS''.[11] Notably, the definition of ''Microsoft Middleware Product'' is limited to products which are ''in a Windows Operating System Product'')[12] Hence, if the OS is reduced in significance, and the Middleware Products are either bundled separately (as a group of add-ons, similar to how currently MS Office is an add-on, possibly available for free download or use to anyone with a registered MS Operating System) or provided as a service via the Internet or some other computer network, such products (though essentially the same) would not be covered by the Proposal either.

Thus, the minimal restrictions included in the Proposal relate to something about which the defendant may reasonably foreseeably no longer care. Having abused its monopoly in the desktop to gain a monopoly in applications (including certain middleware), the defendant can/likely will simply switch to abusing its monopoly in applications, and nothing in the Proposal places any restrictions on that foreseeable tactic.

Third, another extremely important inadequacy of the Proposal is the complete omission of the defendant's office/productivity applications (''Productivity Products''). It seems clear that the defendant enjoys a monopoly in at least the office productivity market (Word, Excel, Powerpoint, FrontPage, etc.) commensurate with (or perhaps even more so) its OS monopoly.

Thus, for example, the provisions of Section II.E of the Proposal, which (to some very limited extent) require the defendant to share ''Communication Protocols'' with third parties to enable them to interoperate with Windows Operating System Products, do not extent to Productivity Products. In particular, the definition of ''Communications Protocol'' is limited to tasks involving a ''Windows Operating Systems Product'', which as noted does not include Productivity Products) [13]

In addition, the principal way in which the defendant maintains its monopoly in Productivity Applications is through the use of file formats which are extremely - if not unnaturally—difficult for competitors to decipher. Without access to the details of such file formats (the standards published on the defendant's website are totally inadequate), competing developers cannot create adequate filters so that their projects can interoperate with the defendant's Productivity Products. As the vast majority of the human knowledge base has been ''locked'' into these decidedly proprietary formats, the absence of an open standard limits consumer choice and may even prevents consumers from switching to another operating system.

One obvious manner in which the lack of attention to Productivy Products comes into play is in the ''restrictions'' of Section III.A. These do not prevent the defendant from retaliating against an OEM for the ''protected'' conduct in the pricing of such additional software, as well as other popular software distributed by the defendant (such as its web server or database products). Similarly, the provisions of the Proposal which to some limited if not negligible extent require the defendant to permit others to learn the defendant's secret protocols do not even pretend to extend to the format of its information encryption, encoding and other obfuscation. Volumous Exceptions

What few requirements are imposed on the defendant are largely undone by the breadth of the qualifications in III.J of the Proposal, particularly subsection 2. Provision (a) thereof essentially disqualified all corporations (including the defendant itself), as it is impossible not to have a ''history'' of violation of intellectual property rights presumably even making an unpermitted backup copy would satisfy this broad provision). Provision (b) requires demonstration of a ''reasonable business'' need (as opposed to reasonable technical need) for a ''planned or shipping product''. The provision would essentially require a competitor to disclose to the defendant its non-public, planned products, without any confidentiality, non-competition or other assurance that the defendant will not use this information to benefit itself or harm the supplier. Provision (c) entitles the defendant to establish ''reasonable, objective standards ... for certifying the authenticity and viability of its business'', which standards for some unknown reason the defendant is not now able to articulate, leading to a very low expectation as to the reasonableness and objectiveness of the eventual standards.

Undoubtedly provisions (b) and (c) are intended to prevent Open Source projects, which to date form the sole serious competitor to the defendant over its range of products, from claiming any rights specified in the Proposal. Generally Open Source developers program for the challenge and joy of expression, rather than as part of a ''viable business''. As Open Source software is free, the defendant could quite rightfully argue that the developers do not have a ''viable business''. Yet from the perspective of a software user, it hardly matters what the developers'' motivation is; in fact a user might prefer software that is developed under the Open Source model rather than for profit.

Finally, provision (d) permits the defendant to deny any request unless the party making the request in essence submits all its trade secrets and intellectual property to a ''third party''. Since this ''third party'' (not to be confused with ''independent party'') is selected in the defendant's sole discretion, and since there is no provision assuring the confidentiality of any data submitted or that any party reviewing the information—including this ''third party''—itself satisfies the criteria of Section III.J, any requester will have to assume that all the submitted information will be carefully reviewed by the defendant.

No Protection to Consumers

The Proposal also does not provide any protection to consumers. While some indirect protection is provided via the limited protections afforded to OEMs, large consumers (such as Fortune 1000 companies) receive no protection. For example, nothing in the Proposal appears to prevent the defendant from raising prices on software to, for example, General Electric if General Electric elects to deploy KDE in its offices. In effect, the defendant is free to retaliate freely against large companies, governments, universities, and other institutions which elect to employ competing products in some but not all of their computer systems. No Protection for ISVs/Developers on other Platforms As recognized by the trial court, both by the defendant and the plaintiff, Open Source clearly represents the most viable competitive threat to defendant's monopoly. Nevertheless, the Proposal does not provide any means for this competition to compete fairly with the defendant.

For example, the defendant's obligation to release Documentation and APIs under Section III.D does not extend to document formats (such as MS Office formats or video/audio ''codecs'' used in multimedia applications) or network protocols used by the defendant to maintain its monopoly, nor does it prevent the defendant from pursuing patents or other exclusive legal rights on such formats and protocols solely or substantially for the purpose of preventing competition from software vendors/developers on other platforms. In addition, as noted above, it is far from clear that any of the limited and unenforceable restrictions in the Proposal apply to Open Source businesses and developers at all.

Proposal Language

Much of the language of the Proposal appears to be drafted to permit easy circumvention. This point will be made with a handful of examples, although many more can be identified in the Proposal. For example, Section III.A uses the term ''known to Microsoft'', as opposed to something less stringent (knowledge being very difficult to prove), such as leaving out the language ''it is known to Microsoft that'' altogether or by using the substitute phrase ''it is or should be known to or suspected by Microsoft that''. In addition, provision III.A.2 does not provide protection to OEMs who ship Personal Computers that boots only into a competing operating system. As another example, Section III.C.4 prohibits the defendant from entering into any agreement with an OEM which restricts the ability of the user to launch another operating system from the boot prompt. However, the provision does not restrict the defendant from causing its operating system to delete any boot loader which might provide the user a choice of which operating system to launch. In fact, the defendant's operating systems are well known to so interfere with the operation of other operating systems. In addition, the provision fails to provide that the defendant is barred from requiring OEMs to install a Windows Operating System on all

[11] See Proposal, Section VI.U.

[12] See Proposal, Section VI.K.

[13] See Proposal, Section VI.B.

its products, which has been the case in the past and which forces consumers to pay for a product they either do not want or need and makes alternative operating systems unable to compete with the defendant on the basis of price.

The provisions of Section III.E similarly fall short of the goal of permitting competition with the defendant. In particular, the disclosure of Communication Protocols is limited by Section III.J.1, which broadly exempts any information ''which would compromise the security of a particular installation or group of installations''. While superficially this sounds reasonable, the gaping hole is created by reference to ''any portion[] or layer[] of Communication Protocols''. Of course, it would be difficult to imagine that knowledge of a communication protocol layer could compromise security, and hence the addition of such language by the defendant would strongly indicate its intention to create such layers in order to prevent competitors from interoperating with its products. It is worth noting at this juncture that all the major authentication, security and encryption schemes rely on completely open protocols and that security is afforded solely through an unknown key, token or similar access control mechanism rather than through any portion of the protocol itself. This is true because it is generally considered insecure to rely on aspects of a protocol for security or authentication as they are quite easy to reverse engineer, i.e. defeat, by anyone not concerned with compliance with the law.

Section III.J.2 requires the defendant to permit competition only when a ''Windows Operating System Product'' (which, as noted more below, is a definition entirely within the control of the defendant) launches a ''Microsoft Middleware Product'' (essentially a browser, Java, a media player, a chat client, a mail client or a calendar client), but only if (a) the product is opened in a ''Top- Level Window'', and b) either (i) all of the user interface elements are displayed, or ii) the Trademark of the Microsoft Middleware Product is displayed. Thus, if the product is not opened in a ''Top-Level Window'', the defendant can prevent the consumer from using a competitor's product. Why, might one reasonably ask, would whether or not a media player has a separate ''move'' and ''resize'' button affect whether or not the user should have a choice over the media player? In fact, the definition of ''Top-Level Window'' is entirely obtuse. Technically, any ''window'' can contain ''sub-windows''—even a simple dialog box is composed of many sub-windows (e.g., each text item, each checkbox, each text edit box, etc. is a ''window''). Since this is a requirement, one must assume it means something more. Hence the requirement leaves a tremendous amount of wiggle room for the defendant.

Similarly, clause (c) of the definition of ''Top-Level Window'' permits ample room for manipulation. The defendant can simply ensure that at least the ''user interface elements'', as opposed to the actual functioning of the program, is not under the control of an ''independent process''. It is important to note here that use of the term ''separate process'' would have been much broader; by specifying ''independent process'', the defendant has made it trivially easy to make any top- level window not fall within the definition of ''Top-Level Window'' simply by starting the middleware product as a ''child'' process.

The second requirement also leaves huge amounts of room for avoidance of any requirement to permit users access to competitor products. One easy way to circumvent the requirement is to add a single user interface element which is available when the product is launched from the Start menu, but not when it is launched from the Microsoft Middleware Product. This element could be an element entirely inconsequential to the operation of the Microsoft Middleware Product, such as a trivial status bar, an extra line of text somewhere, an extra menu element, an extra toolbar or toolbar icon, etc.; in fact it could be a single user interface element added solely to the version launched from the ''Start'' menu for the purpose of making it different than the one launched from the Microsoft Middleware Product (and of course this element could be added after the functional and user interface design of the product has otherwise been totally completed).

Of course, it is also trivially easy for the defendant to avoid being caught in subsection (ii) of Section III.J.2. In particular, the definition of the term ''Trademarked'' specifies that:

We start from the premise that adequate relief in a monopolization case should put an end to the combination and deprive the defendants of any of the benefits of the illegal conduct, and break up or render impotent the monopoly power found to be in violation of the Act. That is the teaching of our cases, notably Schine Theatres v. United States, 334 U.S. 110, 128–129.

Any product distributed under descriptive or generic terms or a name comprised of the Microsoft?? or Windows?? trademarks together with descriptive or generic terms shall not be Trademarked as that term is used in this Final Judgment. Accordingly, the defendant could describe its media player as the ''Microsoft Media Player'', or its messenger as the ''Microsoft Messenger'', or its calendar as the ''Microsoft Calendar'', without being caught in subsection (ii). Obviously, no competitor can similarly name its product, so to say such names are not Trademarked defies all reason. In any event, the essence of the argument is that, if the defendant expends just a little bit of effort and (possibly) imagination, Section III.J.2 will not curtail the defendant from eliminating user choice as to the Middleware Product launched by any Microsoft Operating System Product. Similarly, Section III.J.3 does not specify that the user's consent be voluntary (e.g., the consent may be provided as part of a larger question), that the presentation of the request for the consent be non-discriminatory and fair to all products, or that the defendant may only request a switch once, so that it cannot prevail over its competitors by virtue of sheer harassment (such as popping up a dialog every time a Middleware Product is launched or even every time a feature of a Middleware Product is used). Even the time language in provision b) of that Section is a huge loophole, as it is commonplace for OEMs to do the ''initial boot up'' before shipping a PC and hence the 14-day period could have largely or completely expired by the time a user boots up the PC for the first time.

Another example of loophole language from the definitions relates to the term ''ISV''. The term is defined in terms of an ''entity'', rather than the traditional ''person'' or ''person or entity'', thereby preventing Open Source developers from falling within the protections afforded to ISVs. From a competitive standpoint, there is no reason for the government to favor an incorporeal entity over a human developer, and accordingly this definition is unreasonable and against the public interest. No Restitution or Penalties The evidence, upon which the defendant was adjudged guilty of essentially felonious conduct, was mainly based on events of the mid-late 1990%. Since the commencement of this litigation, the defendant's behavior has in the KDE League's opinion become substantially more unlawful and egregious, the whole time right under the government's nose.

Under the Proposal, the punishment for conduct which all judges to hear evidence have uniformly ruled is unlawful appears to be absolutely nothing; even the most generous read of the Proposal would have to conclude that at most it aims to prevent the defendant from engaging in (some) further unlawful conduct.

In fact, no restitution or compensation to the corporate, developer or consumer victims of its legion abuses is contemplated. Not even an injunction against the defendant's recent announcement that it will stop providing security patches for older versions of its product line (which would be similar to a car manufacturer not fixing a serious safety violation and an act which a non-monopolist could hardly get away with), forcing everybody to ''upgrade'' to the much-more-expensive but in many cases much-less-desirable Windows XP/2000 series. Apparently, the government is quite content that the defendant keep the billions in profit it unlawfully bilked from American consumers and businesses.

Moreover, the government's failure to address the defendant's ever-more- egregious conduct provides the public with no confidence that the government would act to enforce the ''slap-on-the-wrist'' restrictions contained in the Proposal. Accordingly, it is imperative for the public interest that any settlement provide remedies for private litigants to enforce their rights under the federal antitrust laws without having to mount a full attack and prevail over the defendant on the core issues of monopolization and abuse of monopoly power.

Patent Abuse

The threat of the defendant using patents to destroy Open Source interoperability with the defendant's technologies is a major obstacle to consumer choice and a competitive marketplace. The defendant is building up a large reservoir of patents, assisted by the USPTO's abysmal software patent review strategy. Even a patent which might be obviously invalid, for lack of

novelty or otherwise, would be extremely difficult for an Open Source project to overcome, as the defendant has a huge hoard of resources to throw at Open Source developers who would in almost all cases lack the resources to respond, let alone prevail.

Just to pick one example of an absurdly broad patent which the defendant could use as a sword to maintain its monopoly was recently issued. See United States Patent 6,330,670 (Dec. 11, 2001). Claim 1 of this patent is for: A computerized method for a digital rights management operating system comprising: assuming a trusted identity; executing a trusted application; loading rights-managed data into memory for access by the trusted application; and protecting the rights-managed data from access by an untrusted program while the trusted application is executing.

This really is something that must be extremely obvious to even a non-computer scientist. It's the equivalent to getting a patent on the following ''process'', employed by a security guard at a top-secret facility: A method for workplace security comprising: assuming a trusted employer; relying on trusted equipment; permitting the protected employee onto the premises; and protecting the premises from access by an untrusted person while the trusted person is working.

While this sounds like a joke, it is actually more sophisticated than this most obvious ''patent'' the defendant has obtained. Unfortunately, an Open Source project like KDE would find it veritably impossible to have such a patent overturned in court should the defendant elect to try to enforce it. Even more unfortunately, the Proposal does not place any restrictions or circumstances on the defendant—such as its status as an abusive monopolist— which might assist its competitors fight such an attack in a legal forum.

Conclusion

In conclusion, the KDE League would like to reiterate its firm opposition to the Proposal. The Proposal does nothing to assist a great many competitors in competing with the defendant, even in markets which the defendant has demonstrably conquered using unlawful methods. And it does nothing to prevent the defendant from unlawfully abusing its most viable competitors, not even a small leg up in pursuing justice in a court of law.

Subject: Microsoft Settlement

Dear Sir or Madam:

It is my belief that the antitrust suit against Microsoft Corporation is the height of government abuse of a great company. It is the direct result of requests by Microsoft's competitors and their political connections (i.e. Novell and Senator Orin Hatch) to level the playing field.

Microsoft is a great company. I have been using their products since the late seventies and I have always received value for my money. Sure, some of their software has a few bugs, but it's still the best available. Microsoft will work on a product until it is the very best available. They created the microcomputer revolution when they introduced Windows 3.0 in the early 90?s. The interface was easy to use and understand, and helped computers to become common fixtures in American homes and small businesses.

Microsoft increased the size of the American economic pie for all of us. Bill Clinton didn't create the robust economy of the 1990's, Microsoft, Intel, Cisco, and other aggressive and innovative companies did. How does the American judicial system repay the genius and hard work provided by Microsoft over the last 25 or so years. It attempts to break-up one of the most successful companies in American history.

Who was damaged other than Microsoft? Did any consumers complain about the products they purchased? Why were the states allowed to join the suite—-— just how were the states damaged. It all appears to be one big illegal feeding frenzy similar to the tobacco suits. It is shameful.

I strongly believe that this suite against Microsoft ignited the collapse of tech markets in late 1999 and 2000 which sucked billions of dollars of wealth out of the American economy. I think the Clinton Justice Department and Judge P. Jackson should be fined and/or jailed over this extreme abuse of judicial power.

This judgment was bought and paid for by Microsoft's competitors!

Very truly yours,
Michael E. Foley

Ms. Renata B. Hesse,
Antitrust Division
601 D Street NW, Suite 1200
Washington, DC 20530–0001

Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough.

Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user.

This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

Sincerely,
Sharon Rondeau

Subject: Microsoft Settlement
CC: moore@cs.utk.edu@inetgw

This letter is intended as public comment, as provided for by the Tunney Act, on the proposed settlement in United States vs. Microsoft. The proposed settlement should not be accepted for the following reasons:

—The proposed settlement does not provide an adequate remedy for Microsoft's abuses of its monopoly position.

—Rather than increasing competition, the proposed settlement appears to be specifically tailored to discourage certain kinds of competition against Microsoft

—The proposed settlement fails to redress the harm done by Microsoft's illegal abuses of its monopoly position.

—The proposed settlement is likely to strengthen Microsoft's position in the marketplace, thereby worsening the situation for consumers caused by a lack of competition.

—The proposed settlement encourages Microsoft to use its monopoly position in the desktop market to obtain monopolies or drastically increase its market share in other markets.

1. The proposed settlement does not provide an adequate remedy for Microsoft's abuses of its monopoly position.

The proposed settlement specifies several prohibitions and limitations on Microsoft's future behavior. However for the most part these limitations are narrowly tailored to provide remedies for specific features of the Government's complaint of May 1998. Market conditions have changed drastically since that time, due in large part to illegal anticompetitive practices by Microsoft.. There are no longer any credible competitors to Microsoft in the market for desktop operating systems for Intel-compatible personal computers. Microsoft's Internet Explorer has largely succeeded in displacing Netscape's web browser and other web browsers. And while Java has proven to be a very useful programming language in many respects, Java's run-time environment has not become a ''virtual operating system'' which could support the same applications on a variety of computing platforms, and which could thereby threaten its monopoly on the desktop. These developments were significantly furthered by Microsoft's anticompetitive actions both before and after the government's complaint was filed.

Conditions in these markets change so quickly that the problems caused by Microsoft's monopoly simply cannot be

addressed after-the-fact, or by specific prohibitions on Microsoft's future behavior that are narrowly tailored to constrain its previous behavior. Furthermore, previous settlements of this type have proven to be ineffective at curbing Microsoft's abusive practices.

2. Rather than increasing competition, the proposed settlement appears to be specifically tailored to discourage certain kinds of competition against Microsoft

The proposed settlement is also inadequate because it appears to be specifically tailored to discourage certain kinds of competition—in particular, efforts by both commercial and noncommercial parties to make alternatives to Microsoft's products freely available to the public. For instance:

—The settlement prohibits Microsoft from retaliating against OEMs for shipping a personal computer which includes both a Microsoft operating system and a non-Microsoft operating system, but it does not prohibit retaliating against an OEM for shipping a personal computer which does not include an operating system, or which includes only a competing operating system.

Computer purchasers who intend to use alternative operating systems (which are often superior to Microsoft's products for certain purposes as well as being available at no cost) are often forced to purchase a copy of a Microsoft operating system, which they never use, with each new computer purchase. Microsoft has effectively managed to impose a ''tax'' on the sale of most new personal computer systems (particularly ''laptop'' computer systems). The proposed settlement does nothing to redress that problem.

—The provision of the settlement requiring Microsoft to disclose APIs and related documentation, presumably via the Microsoft Developer Network (MSDN), allows Microsoft to impose nearly arbitrary conditions on the use of that information, to prevent potential competitors from using that information to produce products that compete with Microsoft operating systems and middleware.

In addition, in the past such documentation as has been provided by Microsoft via MSDN has often proven insufficiently detailed to allow other parties to write equivalent interfaces.

Finally, nothing in this proposed settlement prevents Microsoft from shipping APIs which provide undocumented features, and documenting and using those features at a later time. This would make its competitors'' deployed operating system and middleware products incompatible with programs written to the latter API specification.

Because of these flaws, this provision is unlikely to be effective at furthering competition.

The provision which requires Microsoft to document communications protocols applies to ''client computer[s]'' only. Presumably this requires only that Microsoft document the ''client'' side of such protocols, allowing Microsoft to hold more closely the documentation of the ''server'' side of a protocol, and allowing Microsoft a competitive advantage over providers of servers which communicate with those clients—particularly those using ''open source'' server platforms such as Linux which have provided significant competition to Microsoft products in the server market.

The provision which allows Microsoft to use Microsoft middleware in preference to a competitor's middleware when the competitor's middleware ''fails to implement a reasonable technical requirement (e.g. the requirement to be able to host a particular ActiveX control)'' effectively gives Microsoft license to bypass competitors'' middleware at will, by declaring as part of the settlement that addition of any ActiveX control to a middleware interface is inherently a reasonable technical requirement. For the settlement to be effective, Microsoft cannot be allowed to change its programming interfaces at will.

The requirement to Microsoft to license intellectual property rights ''on reasonable and nondiscriminatory terms'' that are needed to exercise options under the agreement, because of presumptions on what is ''reasonable'', effectively allows Microsoft to set the bar on access to such information high enough to exclude ''open source'' and noncommercial competitors.

—Similarly, the provision which allows Microsoft to require that the licensee of any of its intellectual property have a ''reasonable business need'' would likely allow Microsoft to exclude noncommercial competitors. The fact that the only significant competition to Microsoft in many markets comes from noncommercial parties makes a presumed requirement of ''reasonable business need'' for access to such information inherently favorable to Microsoft and unreasonable as part of a remedy.

2. The proposed settlement fails to redress the harm done by Microsoft's illegal abuses of its monopoly position.

Due in large part to Microsoft's illegal anticompetitive practices, Microsoft has obtained a monopoly in several markets, including desktop operating systems, web browsers, and office productivity software. The harm done is a considerably more than to limit consumer choice, stifle innovation, and artificially inflate prices.

Microsoft's monopoly has also forced consumers to accept operating system and networking software which are dangerously insecure and have been compromised on numerous occasions by computer viruses. Many of these vulnerabilities are a direct result of Microsoft decisions to:

Disregard Internet standards for the labeling of content transmitted over the network, thereby bypassing the requirement for security review that was designed into that mechanism. This was done in order to allow arbitrary content to be interpreted by applications on Microsoft operating systems, and to provide Microsoft with an advantage over competitors'' operating systems that used other means to label content.

Provide a means for their document formats to contain executable content with the ability to perform any function available to any application on the host computer—including the ability to delete and alter arbitrary files and the ability to send network traffic impersonating the computer's owner—in order to give Microsoft applications an advantage over competitors'' products.

—Impose weak means of authenticating users over a network, for the sake of backward compatibility with Microsoft products.

Even if a settlement provided an effective curb on Microsoft's future behavior, to be acceptable it would also need to redress the considerable harm done by past abuses. Injured parties include not only purchasers of Microsoft software (and computers which were supplied with Microsoft software) but also the numerous institutions who have suffered damage due to such vulnerabilities, and operators of public and private Internet networks whose operations have been harmed by the traffic generated by viruses transmitted by Microsoft software.

To be effective, a remedy would need to redress these injuries without further strengthening Microsoft's position in the market.

3. The proposed settlement is likely to strengthen Microsoft's position in the marketplace, thereby worsening the situation for consumers caused by a lack of competition.

By imposing essentially no penalties on Microsoft and few limitations on its behavior, the proposed settlement would signal to Microsoft and its competitors that anticompetitive behavior is largely ''safe''. The proposed settlement would also provide Microsoft with the means to discourage certain kinds of competition, particularly ''open source'' or noncommercial products, allowing it to further limit consumer choice.

4. The proposed settlement encourages Microsoft to use its monopoly position in the desktop market to obtain monopolies or drastically increase its market share in other markets.

By focusing largely on the desktop or client market, the settlement ignores Microsoft's ongoing efforts to leverage its existing monopolies to obtain monopolies in other markets. Furthermore, because different kinds of computers communicate with one another over a network, Microsoft's monopoly on desktop operating system software can be a powerful coercive force over other markets—for instance, media players and mechanisms for protecting intellectual property transmitted over a network.

There is no significant difference between the tactics that Microsoft used to take over the operating system, web browser, and office productivity software markets, and the tactics that Microsoft is currently using to attempt to establish control over other markets.

Any remedy which allows Microsoft to use its control over the desktop to favor its own solutions in any way cannot be considered adequate. For the reasons stated above, I recommend that the Court reject the proposed settlement.

An effective remedy would require

—Microsoft to be pro-actively prevented from future abuse,

Competition to be re-introduced in the markets in which Microsoft has a monopoly and which it has shown abusive behavior,

—Compensation for injuries caused by Microsoft's anticompetitive behavior It is

difficult to understand how such a remedy could be effected without either:

—Active government regulation of Microsoft's behavior, and in particular affirmative prior approval of all new and revised Microsoft products prior to release, and approval of contracts between Microsoft and other parties before they become effective, or

—Structural reorganization of Microsoft into two or more competing entities and without significant financial compensation to injured parties.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft: I have always been proud to be an American, not just because this is the place of my birth, but because I have always known that this nation was unlike any other in the world. We are blessed to be citizens of a country where we have the privilege to live life the way we choose. This is the legacy that was left to us by our forefathers, and this is what we should pass on to our children. I believe the antitrust suit against Microsoft, and other cases like it, compromises the very foundation upon which this nation was built. If litigation like this is continued, this nation will become a shell of its former self, and the glory that is America will be nothing but a memory.

This suit was nothing more than an attempt by the Clinton administration to socialize American business. Our forefathers did not build a nation on the ideals of Socialism. This nation did not become the sole world superpower in a mere 200 years of existence because we allowed socialism to thrive in America; rather we are a nation built upon and made strong by our capitalist roots and our belief in free enterprise. It is the dream of every American to exceed the success of their father and grandfather, to go from rags to riches with nothing more than hard work, perseverance, and an unshakeable belief in America. This suit flies in the face of this dream.

Microsoft is the very embodiment of the American dream. This company started in a garage and twenty years later it is one of America's greatest corporate assets. This litigation sends the message to all future American entrepreneurs that it is okay to become successful, but only to a point, because too much success is forbidden. I am in favor of the settlement that was reached in this case in early November, not because it is a fair settlement, but because it will finally bring an end to this protracted litigation.

The issue in this case is no longer whether Microsoft committed antitrust violations. I personally believe that it did. If that were the issue, they would have been reprimanded and sent on their way a better, more responsible business leader. The issue of this case is whether or not we, as Americans, have the right to engage in free trade, and whether or not capitalism has a place in the twenty-first century. I say that without this right the future of America is bleak. This is probably one of the most important decisions that has ever faced this nation, and it rests on your shoulders, so you had better choose wisely. Thank you for your time and consideration of this issue. I trust you will make the right choice.

Sincerely,

Subject: Microsoft Settlement

To whom it may concern,

I want to voice my objections to the announced settlement between the US and Microsoft. It seems to be lost on those involved on the US side that Microsoft broke a consent decree on browsers to get in this mess in the first place. This company has demonstrated contempt for honesty and for the American business community, not to mention the legal process. In short they cannot be trusted to hold up their end of this extremely weak and ineffectual settlement. This settlement is bad for consumers and US business in general. The settlement is transparently politically motivated and completely undermines any credibility the Bush administration had. I urge you to reject the settlement and vigorously pursue the just prosecution of the case to save countless US businesses and preserve innovation in the market.

Washington, DC 20530

Dear Mr. Ashcroft:

The antitrust lawsuit brought against Microsoft was unjustified and flawed. The dispute in my opinion arose due to competitors'' envy for their own lack of innovation and creativity. Microsoft has been the leading innovator of technology for over a decade. In the 80's when we lagged behind Japan in many industries, Microsoft developed a product that streamlined and made more effective many of our businesses. The company I worked for is a perfect example as it was able to use Microsoft software for its businesses.

The terms of the settlement are harsh and seem to reflect the intense lobbying of Microsoft's competitors. Forcing Microsoft to give up internal interfaces and protocols, making them agree not to retaliate against other vendors, stipulating that they must grant computer makers broad new rights to configure Windows so as to make it easier for non-Microsoft products to be prompted, the settlement also reflects lawmakers and politicians lack of concern for the public. This settlement only aims at giving competition an edge they did not have and could not attain on their own.

Even though I think the settlement is unfair, I must support it because the alternative of further litigation would be too much for our weak economy. I urge your office to take a firm stance against the opposition and stop any further disputes.

Thank you.
Sincerely,

Dear Sirs:

As I see it, you have established as a finding of fact that Microsoft has broken the law. Microsoft is quite apparently lacking in repentance and assured that it can evade justice. Your responsibility is to insure that Microsoft —cannot— continue to break the law. Microsoft has made it clear that it does not understand the crimes it is guilty of, nor does it intend to learn how or why it should change its own behavior, other than as a response to your judgment, and its desire to avoid substantial pain suffered as a result. Please do whatever it takes to stop these guys!

January 26, 2002

Dear Mr. Ashcroft:

The Tunney Act mandates that there be a 60-day public comment period that follows a settlement to an antitrust case when the Department of Justice is involved. The final decision on the proposed settlement is made after this period of review. I would like to go on record as supporting the settlement that was made between Microsoft and the Department of Justice.

I feel that Microsoft is actually being punished for being good at what they do. There is no reason why the federal government had to get involved in this issue in the first place, but since they did, I am glad to see that the dispute has finally been resolved. Microsoft actually has to concede more than they would have liked, but since the lawsuit is over and the economy needs all the help it can get, they agreed to the terms. One of the terms, which seem ridiculous, is the disclosure of Windows'' internal interfaces and other operating technology that Microsoft worked long and hard to develop.

This seems to violate intellectual property rights.

I enjoy the fact that my opinion will go on record, and again, I support the settlement reached between Microsoft and the Department of Justice.

Sincerely,
John Joseph

Date: 1/28/02 5:44pm
Subject: Proposed Microsoft settlement: woefully insufficient

Dear Justice Department,

As a software innovator and holder of several software patents, I have first hand knowledge of how extremely brutal, unfair and bullying Microsoft is to others in the industry. I was involved for five years in negotiation, arbitration and potential legal action against Microsoft which only caused Microsoft to spend incredible resources to deny me and Humanic Systems any just and due compensation for our innovative work.

In my opinion, as President of Humanic Systems, a company that was (above) abused by Microsoft regarding our intellectual property for significant components of Microsoft Outlook, the proposed remedy is extremely inadequate:

1. It does not provide substantial redress for the prior losses caused by MS on others

2. Secrecy provisions undermind the ability to obtain API information and will systematically be used by MS, in my opinion, to continue its monopoly stranglehold

3. There are no structural remedies, and, without those, the ''fascist'' mindset of Ballmer and Gates will continue to dominate the thinking of each and every employee

4. Microsoft's stated opinions about various forms of open software, being a ''cancer'' undermines the ability for consumers to get the maximum benefit for the least cost This position, alone, demonstrates that they want ''all the marbles'' and it is a ''winner take all'' game Consider, for example, a PBS documentary about extreme competition as taught within the Gates family as Mr. Gates grew up This person does not know the word cooperation, and, without extremely directive measures, will never show cooperation to the rest of the software industry that is slowly dying under his ruthless hand.

Very truly yours,

Subject: Microsoft Settlement

As a professional software developer, I find the governments proposed settlement with MS a joke. MS was clearly found to be a monopoly and anti competitive but the government has essentially taken no punitive action. What is even more disquieting is MS continues its illegal activity on a daily basis. It's new products and development languages (.Net) are anti competitive to other database manufacturers. They are using the same tactics over and over.

Splitting MS into OS and application companies is the only solution.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

The purpose of this letter is to express my support of the Microsoft settlement in the federal antitrust case. As a Microsoft supporter, I have followed the case against Microsoft with much interest. I do not believe that the federal case is justified in the first place, yet I welcome any resolution that the enactment of this settlement will bring. Thus, I urge the Department of Justice to enact the settlement at the end of January.

In addition, the concessions made by Microsoft through this mediation process are extensive. Microsoft will now license Windows at the same rate to all computer makers, disclose the internal protocols of Windows to competitors, and redesign Windows XP to provide for easy replacement of parts of it by competing software. Enough is enough. I do not believe that Microsoft could do much more in this dispute, and has been punished enough through the concessions it has already made.

Please enact the settlement reached in November and end this issue once and for all.

Sincerely,
Michael Sharp

This sums it up quite nicely. Please release humanity from the stifling monarchy that Microsoft has created. ''Freedom to Innovate''? Not quite, Bill; ''Freedom to desecrate'' is closer to the truth, but still not quite there.

The effect Microsoft has had on the computer industry is disgusting. Bill Gates and his money have systematically destroyed everything the industry stood for, and all of the individuals on whose shoulders it stands. Bush sold millions of peoples'' ideals right down the river on this one, and something needs to be done. Please be strong enough to stand up to Microsoft, finally ending their blatant laughter in the face of human liberties everywhere. Too dramatic, you say? Think again. Take a look at what this company has truly done TO humanity, and ask yourself if that statement is untrue.

Sincerely,
Damon Miller

It is time to close the doors on the Microsoft antitrust case. We (USA) must think of the globe market place. Microsoft produces products that all sold worldwide. We should let Microsoft get back 100% to their real business. I think we should allow the company to go back and work 100% of their time and money on producing new and improved products.

I oppose the Microsoft settlement. It is bad for the computing profession and bad for long term economic development. I have been a software professional since 1973, and in my personal experience the dominance of Microsoft has had a negative impact on quality and innovation in the software industry. The settlement does not address the practices that have kept Microsoft in power. A continuation of the Microsoft monopoly will only reduce the growth and future utility of the software industry, and keep the general public from reaping the rewards of continued innovation in this relatively young field.

950 Pennsylvania A venue, NW Washington, DC 20530

Dear Mr. Ashcroft:

Over the past three years I have watched the Department of Justices'' aggressive attack on Microsoft. I am so pleased to see that this unwarranted and unsubstantiated antitrust assault on Microsoft coming to close, provided that the government has the foresight to see the beneficial impact from Microsoft's settlement.

The settlement allows for new Windows configurations, giving computer makes and developers greater flexibility in offering non-Microsoft software programs. This will provide consumers with the option to remove and/or reconfigure any part of Windows. This gives the consumer the decision of what they like to use, and don't want to keep. Consumers drive the markets; they decide what it is that makes a company fail or succeed.

Microsoft has successfully proven, time after time, by creating and updating their innovative products, where nothing else compares. This settlement is the right thing to do, for Microsoft, the public interest, the tech industry, the economy, and all of which is vested in consumer purchasing. Keeping Microsoft out of more entangled legal matters, will definitively promote more responsible business decisions from Microsoft right down the line to the customer. Please don't continue this absurd mess of litigious behavior with Microsoft. It is a waste of time and does not serve the best interest of the public good.

Subject: Microsoft Settlement

The Department of Justice should hold to the revised proposed Final Judgment to which Microsoft has tentatively agreed and reject the requests for other and further remedies requested by the states continuing to oppose the judgment.

I am dismayed at the persistence intemperate misrepresentations by those

several key industry leaders who so ardently seek to diminish the dominant role of Microsoft and if possible replace it. They piously attribute their efforts to their interest in the welfare of the consumer, when in fact it is the average consumer, individual and corporate, who would suffer most should Microsoft be greatly diminished or (in the inevitably lengthy interim) should Microsoft be eventually replaced. They also claim that Microsoft makes it more difficult for entrepreneurs to develop and market innovative products when in fact the opposite is true and their real problem is that they seek the dominance that Microsoft now has and cannot keep up with the innovative pace of Microsoft's continuing evolution of its products. The challengers make these representations directly and through the Attorney Generals of selected states.

The claim of harm to Netscape, for example, is particularly false. Netscape deliberately configured its browser so that when it was used within Windows as part of non-Microsoft application software it would immediately take over all web browser functions. (I personally was so irritated by repeatedly having to counter this latter tactic that I finally gave up in disgust and removed Netscape from my system along with the application that required it.) The position of those pretending that Microsoft was the culprit in the demise of Netscape blissfully ignores both the technological character of the industry, the needs of the average individual and corporate user, and the specific technical issues that are relevant to the case and the remedy.

If the continued challenges to Microsoft prevail it will seriously harm the consumer, will undermine the lead role which the United States now holds throughout the world as a result of the proliferation of Microsoft products worldwide, and will thereby decrease the present ease of communication internationally made possible by the software commonality that is a direct result of the widespread proliferation of Microsoft products. The mantra that increased competition at any cost is always better in the long run is a na<ve article of faith that simply does not apply in this particular case where what the challengers are in effect demanding is to cripple Microsoft's ability to innovate in order that they, the challengers, can gain entrepreneurial advantage. They are opposing rather than advocating a level playing field. While I am fully convinced that, in general, greater competition is by far the lesser of two evils, there are clear exceptions and this is one of them. The average individual and corporate user does not want to have to deal with multiple incompatible operating systems and wishes to have basic applications integrated as fully as possible with that operating system. Nor do most of the application developers want to have to deal with the increased costs and complexities introduced by a multiple operating system environment. There is nothing now that prevents a truly innovative developer from designing and marketing an alternative operating system and supporting applications. However, in order for to be successful in the market place the design must be one that will make switching by the consumer cost effective. For that to happen the alternative offered will have to stand out head and shoulders above Microsoft's product so that the considerable costs of the conversion will be justified. So far the alternatives offered have had only modest advantages coupled with distinct disadvantages. This is likely to continue to be the case as long as Microsoft continues to advance at the same rapid pace the technological and functional character of its product. Unable to outrun Microsoft, its would-be competitors seek to hamstring Microsoft in ways that will slow its progress to where it can be overtaken. Microsoft has provided in its operating system a continually evolving, backward compatible, software standard that has been a crucial factor in facilitating the adoption by both businesses and individuals of computing that permits near universal and highly efficient interaction among all participants at steadily reducing costs in user time and money.

I began my career in 1955 as a programmer on the very first of the large electronic computers introduced by IBM. I have worked with computers in one capacity or another (as an analyst, manager, and corporate executive) ever since in the areas of both national defense systems in support of the Air Force and other Department of Defense agencies and in health systems in support of the Centers for Disease Control, the National Institutes of Health, and other health agencies. As a retired professional I work with five desktop computers in my home. What I and many others, whether independent or corporate users, want in our computers is commonality of software among our own computers and those with whom we correspond electronically. We greatly prefer integrated systems from a single source that keeps to a minimum the investment of our time in resolving conflicts between operating systems and applications. Microsoft through constant innovation has done a superb job of meeting that need. It is obviously not perfect but it demonstrated a wiliness to respond to the needs of its users.

The innovative pace that Microsoft has maintained in the incredibly rapidly evolving technological environment could be achieved by another organization only if that organization could displace Microsoft and then become as dominant as Microsoft is now. That dominance is essential if the ordinary user and the average business user are not to be subject to great losses in productivity and efficiency in dealing with multiple operating systems none of which achieves dominance. And even if in time another organization was eventually to succeed in achieving a dominant position, the transition burden and costs, both real and opportunity costs, to users would be enormous.

The loss of compatibility between computer systems, the heart of which is the operating system, is devastating for the small operator and can be incredibly expensive for the average large corporate operator. The idea that seriously shackling Microsoft is going to make things easier and less costly for the consumer is na<ve in the extreme. It will inevitably do the opposite. There are enormous opportunities for innovative software designers to develop programs that work within the dominant Microsoft operating system as is well demonstrated by the proliferation of such ad hoc software. The very fact that the Microsoft operating system is dominant greatly facilitates continuation of such proliferation.

The Department of Justice needs to continue to keep clearly in focus what is in the best short and long term interests of the consumer rather than what will promote the private agendas of the industry warlords, present or aspiring, in their relentless search for greater power and fortune.

Let stand the revised proposed Final Judgment. Terminate these endless challenges, promptly implement the remedies, let the developers and entrepreneurs move on with their evolution of better and better systems within the Microsoft environment, and let us users continue to move ahead with confidence in the continued forward and backward compatibility of what we produce within the present and future computing environment.

Very much needed as a follow-up, is a thorough reassessment of the antitrust laws in the light of the present very different and rapidly evolving technological environment, the critically related pace of innovation, and the character of the related industries and its users

January25,2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to express my opinion of the recent settlement between the US department of Justice and Microsoft. I think the lawsuit has gone on too long and has been a waste of taxpayer dollars. Our government should stay clear of free enterprise and allow companies like Microsoft to innovate.

The terms of the settlement violate Microsoft's intellectual property rights, as they will be forced to disclose interfaces that are internal to Windows operating system products. They also have to grant computer makes broad new rights to configure Windows so that competitors can more easily promote their own products. Microsoft spends vast resources developing their products and services and competitors should not be rewarded for being second place.

I urge your office to uphold American principles and finalize the settlement because that is in the best interests of the

American public. It might be flawed, but further litigation would be far worse. I hope you take the right direction and side with American people.

Sincerely,

c/o Renata B. Hesse
U.S. Department of Justice, Antitrust Division
601 D Street NW, Suite 1200
Washington, DC 20530–0001

Dear Judge Kollar-Kotelly:

The proposed settlement between the Department of Justice and Microsoft in U.S. v. Microsoft is not good enough.

I am a member of the Des Moines School Board, a small businessman and a political activist. In each of these roles, I am concerned about protecting competition in the marketplace. This agreement does not adequately protect the free market and innovation, and does not go far enough to address consumer choice.

The settlement does nothing to deal with the effects on consumers and businesses of technologies such as Microsoft's Passport. Passport has been the subject of numerous privacy and security complaints by national consumer organizations. However, corporations and governments that place a high value on system security will be unable to benefit from competitive security technologies, even if those technologies are superior to Microsoft's. Why? Microsoft controls their choices through its monopolies and dominant market share, and still is able to dictate what technologies it will include.

Enforcing federal antitrust laws against monopolies is not new or novel. Antitrust law has protected free markets and enhanced consumer welfare in this country for more than a century. The Microsoft case does not represent a novel application of the law, but is the kind of standard antitrust enforcement action necessary to insure vigorous competition in all sectors of today's economy.

The proposed settlement allows Microsoft to preserve and reinforce its monopoly, while also freeing Microsoft to use anticompetitive tactics to spread its dominance into other markets. After more than 11 years of litigation and investigation against Microsoft, surely we can—and we must— do much better than this flawed proposed settlement between the company and the Department of Justice.

Thank you for your time.

President

Subject: Microsoft Settlement

To whom it may concern,

I am writing to encourage you, in the strongest terms, to reject the settlement of United States v. Microsoft, that has been proposed by the Department of Justice and Microsoft Corporation. The proposed settlement is not in the public interest and will only serve to give Microsoft Corporation the green light to inflict further harm on consumers, businesses, and the competitive landscape of the Information Technology industry.

Now is the time for our federal government to step up it's efforts to rein in Microsoft and control it's abusive practices. Having rightly found Microsoft guilty of illegally extending their monopoly in personal computer operating systems to other areas of the software industry, the judicial system has an obligation to impose a penalty on Microsoft that is commensurate with the harm they have caused and that will serve to partially restore competition where the defendant's predatory business practices have destroyed it. This is not the time to go easy on them. This is not the time to tire of the fight for increased competition in the software industry.

In spite of what the government and Microsoft now contend, resolution of this case has nothing whatsoever to do with patriotism, ''freedom to innovate,'' or maintaining America's leadership in a flagship industry. On the contrary, leaving Microsoft intact and unshackled will leave a very serious threat to our national security unresolved. The proposed settlement does far too little to restore competition in the key areas of the software industry where Microsoft has eliminated it. In particular, the settlement seems to validate Microsoft's present monopoly in personal computer operating systems. It is this monopoly, which Microsoft maintains by anti-competitive business practices, which has severely compromised the security of the nation's computing infrastructure, which is the very foundation of modern commerce.

Some argue that the personal computer operating system is an example of a ''natural'' monopoly and that the software industry benefits from Microsoft's role in setting de-facto standards. First of all, this argument ignores the observation that the Internet, which throughout most of its formative phase grew up outside Microsoft's sphere of influence and in spite of Microsoft's determined attempts to undermine it, has been the single greatest source of innovation in technology for a generation. Some might say the only source. More importantly, the argument ignores the significant national security and business risks that we are now subjected to as a result of Microsoft's monopoly in operating systems that are used in defense, government and business. Operating systems are the most critical piece of infrastructure which either keep commercial transactions and command and control functions safe and secure, or leave them vulnerable to malicious disruption, theft, and falsification. These vulnerabilities become increasingly clear with each passing week; one need only make a cursory examination of IT industry news to be keenly aware of the risks and costs associated with them.

If we are inclined to be kind to Microsoft we could argue that the risks are inherent in a monopolized market segment, due to the issue of homogeneity. The differences that exist in naturally varying systems mean that only a minority of the population tends to be susceptible to any particular threat. This is borne out by observing the Apple Macintosh community, which is less than five percent of the personal computer population and enjoys essentially all the same capabilities as Microsoft Windows users. While the ninety-five percent of personal computer users with Microsoft Windows have been subjected to over a dozen well-publicized attacks in the form of Internet email worms, Macintosh users (as well as Linux users, who make up an even smaller percentage), have been invulnerable to virtually all these attacks. This proves, on the face of it, that no one besides Microsoft benefits from Microsoft's monopoly.

Furthermore, if we are inclined to be more realistic and less kind to Microsoft, it is easy to establish that Microsoft's chronic lack of emphasis on quality, reliability or security in the Windows operating system has greatly exacerbated the vulnerability that we are now faced with. Microsoft has now, belatedly, admitted this is an issue and pledged to make security their main focus in the future. This is just marketing hype designed to distract us from the magnitude of the risk we are living under. Only the advent of true competition in the operating systems market segment will ever cure this vulnerability.

Microsoft's performance in reference to the Y2K bug proved that they cannot be trusted

to act in the best interests of their customers. Throughout the course of this trial many of Microsoft's defenders have argued that consumers were never harmed in the browser war. This is patently false. Microsoft openly and publicly committed all of their attention and resources to defeating Netscape and embracing (belatedly) the Internet. One need only note the timing of these events to realize that Microsoft was busy fighting the browser war at the precise time that their customers were demanding Y2K fixes, and not getting them. This lack of responsiveness to customer requirements cost American businesses and consumers many billions of dollars, if not more.

During the time of the browser war, I was a director of Information Technology at Fannie Mae, a Fortune 50 company with an IT budget well over $50 million. I had first-hand knowledge of what Y2K abatement cost my company and it was clear that a considerable portion of it, easily several million dollars, was due solely to Microsoft's tardiness in addressing the Y2K issues in their software, many of which were not solved until well past the eleventh hour, well after the date we had targeted to be fully compliant. I am sure that nearly every other American business faced similar issues and the resulting, unnecessary costs they bore are truly staggering. Anyone who believes this was inevitable or even excusable need only note the fact that the Apple Macintosh operating system was never susceptible to any of the Y2K problems that businesses waited until after the eleventh hour for solutions for from Microsoft. Could this possibly be because Apple has never had the luxury of a monopoly position for its products, but has had to compete on their merits? Had Microsoft targeted reliability and quality as major product goals and had they made a reasonable effort at Y2K abatement at the time they began the browser war, I firmly believe (based on first-hand experience in my company) that the price tag that consumers and businesses would have paid for Y2K compliance would have been 30% to 50% less than it was.

I have over twenty years of professional experience in systems integration and IT management. I have carefully observed Microsoft's rise from the start. My seven years at Fannie Mae convinced me that Microsoft's heavy-handed control over my industry is very harmful to corporate IT and to the industry in general. I could go on for many pages to explain to you, with hard evidence, why this is so. However, I believe that has already been established in court. What this industry desperately needs is competition in the segments Microsoft controls, such as desktop operating systems.

Any settlement of this case must not only be fair to Microsoft and to the industry they have harmed, it must be seen to be fair by the public and must be seen as a punishment, if a light one, for the misdeeds that have already been established. This proposed settlement is widely viewed as a stunning victory for Microsoft, witness the majority of reports in the press over the past two months, and that alone is reason enough not to proceed with it. It is not a punishment. It neither guarantees competition nor significantly penalizes Microsoft. The current environment in which Microsoft is seen by most as getting away with murder as a result of their own might and cleverness, and often being lionized for it, is not healthy for the Judicial System or for America, to say nothing of industry.

Microsoft claims that they have a right to compete as vigorously as possible and that they are simply better at it than other companies. However, Microsoft has no awareness of what honorable or gentlemanly competition is all about. In most arenas we do not allow competitors to openly cheat, especially if they are prodigious and unrepentant about it. If we will not allow such behavior in the Olympics, how can we feel comfortable allowing it to continue in Information Technology? The winner must bear a special burden of scrutiny. In addition to numerous abuses that they have not yet been tried for, or are perhaps not technically criminal, Microsoft has been tried and found guilty, upheld on appeal, of severe criminal misconduct. Over the course of this trial, their entire executive staff engaged in numerous, obvious acts of perjury, demonstrating that it is their usual way of doing business. No one seriously believes that they can be trusted to honor the terms of a consent decree.

Given the remarkably high profile of the company, the citizens of this country cannot allow this state of affairs to continue. I want to urge my government, in the strongest terms, to withdraw it's support for the settlement that is on the table. It does not go nearly far enough to serve the public's interests. It is riddled with loopholes, which Microsoft has proven for nearly a decade that they will exploit to the fullest. It sends the wrong messages to the public, to Microsoft, and to whatever would-be innovators may be thinking of trying to compete against Microsoft. It sends a signal to terrorists that we are sanguine about the fact that they have only a single target to concentrate on to take out the infrastructure of America's economy. It gives Microsoft the government's implicit blessing in their continued effort to undermine the free software and open source movements, which represent the only real hope for competition in operating systems and infrastructure technologies.

Please give some consideration to adopting the proposal of remedies put forth by the nine dissenting states. Their proposal, while still inadequate to fully address the threat, is at least a significant improvement over the settlement proposed by the Justice Department.

Yours very truly,

Department of Justice
Attorney General John Ashcroft
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft,

While I believe that the recently negotiated settlement between Microsoft and the Department of Justice has gone too far, I also think that this suit is better settled. It is important for the IT community to move forward again. It is equally important for the IT community to trust that the government would allow the owners their right to enjoy the benefits that our wonderful country was built on, allowing each of us to exercise our skills and make money.

However, some of the terms of the settlement are a bit troublesome. Microsoft should not be forced to release some of its source code to third-party software developers. Doing so is no guarantee that this source code will not be used to develop some sort of Windows-type clone. My company writes applications that work on the Microsoft Windows platform, and we do so without any code from Microsoft that isn't already published. I don't need Microsoft's insight to their operating systems any more than the next developer. If we start demanding code from Microsoft, then Microsoft should be able to demand code from us, and I'm not willing to share mine either.

While innovation is the hallmark of the IT community, simply cloning software that does not carry with it the full expertise that the original software has is dangerous. There are issues like product confusion, reliability and support that may end up causing more confusion in the consumer's mind than did this lawsuit.

The very least that can be said, however, is that the litigation is apparently over, and this is a good thing. I am hoping that there will be no further federal action against Microsoft or any other IT company.

Sincerely,

To US Federal District Court and US DO J,

I am writing to express my support of the settlement reached by Microsoft and the DOJ. I believe that the settlement will allow all of the parties involved to move on to more productive endeavors. Microsoft has been incredibly successful because it has created products that consumers and businesses find useful. Arguably many Microsoft's competitors that decry its behavior would not even exist today had it not been for Microsoft's tireless efforts on behalf of the personal computing industry.

Subject: Microsoft settlement

As a retired citizen of Washington state, I encourage you to accept the proposed settlement in the anti-trust case involving Microsoft. I am neither an employee nor a stockholder in this firm.

This settlement is appropriate and reflects a triumph of the rule of law. Many critics, all with an axe to grind, i.e. competitors and state attorneys-general, call for extreme, stringent restrictions that are totally inappropriate.

These objections ignore the decision of the Appeals Court that reversed much of Judge Jackson's original findings. Objectors not only misstate facts, but deliberately misinterpret the Appeals Courts'' key findings.

In my view there can be no valid objection to this settlement since every major finding of the Appeals Court is stringently addressed with a targeted remedy that specifically prohibits and prevents the conduct in question.

Acceptance of the proposed settlement will send a signal to American industry managements and all thinking citizens that the rule of law is still being enforced appropriately. Any- -thing beyond this settlement would be a victory for those who seek damage and destruction rather than a remedy;. for competitors, litigation rather than innovative, honest competition.

Every person with the most rudimentary understanding of free markets wants the law to protect the markets'' smooth functioning. Can we depend on the fair application of the laws that all participants in the U.S. economy rely on ? I hope your answer is a resounding ''yes''.

Thank you for your consideration.

Attorney General John Ashcroft
United States Department of Justice
Washington, DC 20530–0001

Dear Attorney General Ashcroft:

I am writing you let you know that I am a staunch supporter of Microsoft and I believe that the current lawsuit against the company instigated by the federal government is wrong and perhaps even counter-productive. Nevertheless, after three long, long years of legal wrestling, the settlement reached in November should provide the opportunity to put an end to this issue once and for all. For that reason I urge that you work towards implementing this settlement as soon as possible.

Under this settlement, Microsoft has agreed to design future versions of the Windows operating system to provide a mechanism for users, computer manufacturers and software developers to promote non-Microsoft software applications. Additionally source codes and interfaces internal to the Windows operating system and its products will be freely available to Microsoft's competitors. This is only the tip of the iceberg. As such, this settlement should more than satisfy the Department of Justice, as well as competing companies.

It is time that we concentrate on more important matters facing America. I ask that you work towards putting the November settlement into action as soon as possible and without any more litigation. Thank you.

Sincerely,

Dennis Cassidy

Subject: Public Comment on Microsoft Settlement

I am a university-based research scientist developing software to reduce information overload. My sponsors include the US Army Research Lab, which hopes my software will reduce information overload for tactical commanders in battle, and the Ford Foundation's Community Development Program, which hopes my software will do the same for overworked, underpaid community development workers.

In my research, I am a consumer of computer hardware and software, as are my sponsors, their customers, and the students who work in my lab. In my view, we are all harmed by Microsoft's monopoly, and this harm is not addressed by the proposed settlement.

As a public university, and with government agencies and charitable community foundations as our sponsors, we are acutely aware of the need to save money. One way we believe we could accomplish this is by using free operating systems such as Linux or FreeBSD instead of Windows. We have been stymied in our efforts to purchase computers with free operating systems or no operating systems.

We found that purchasing a computer from a vendor, Gateway, with no operating system cost just as much as to purchase it with Windows and also led to a warranty problem where the computer was not warranted to operate with any particular operating system. We were warned by our vendor, Gateway, that we should have purchased our computer with Windows, then installed a free operating system to coexist with it. For any remedy to be effective, Windows should be an extra-cost add-on to a basic Gateway computer that we purchase or recommend to the military commanders and community development workers who'll use our software.

A second source of harm to me as a consumer comes from Microsoft's secret file formats. The only way my software can reduce information overload for military commanders and community development workers is if my software can read and write the file formats for information with which these workers are inundated. Other vendors and researchers publish their file formats. Microsoft does not. I can not avoid using Microsoft file formats and must spend extra money to try to keep up with changes to them. Through a model called ''embrace and extend,'' Microsoft is able to use its monopoly position to change file formats such as Rich Text Format over time to reduce interoperability among customers and competitors. Only a remedy that forces Microsoft to publish file formats so that they cease to be a monopoly-strengthening tool can provide effective relief for me as a consumer.

A third source of harm to me as a consumer concerns my ability to use the World Wide Web without the requirement that I use Microsoft products. I can not browse certain web pages nor conduct transactions on certain websites because the authors of a free operating system running on my computer do not have access to Microsoft networking protocols. Fortunately, not every web site is forbidden because I have chosen a free operating system, but more sites are denied me every day. Two years ago, I believed that free operating systems like Linux were the wave of the future. In the past year, I have come to realize that Microsoft is working actively to shut down free operating systems by making access to the Internet more difficult for those who fail to access using current Microsoft products. Only a remedy that forces Microsoft to publicly reveal networking protocols such that users of free operating systems have a chance to rewrite their software to visit websites and conduct transactions.

To summarize, I have been harmed as a consumer by Microsoft's monopoly. The proposed settlement does not offer me any relief from that harm and I suggest in this message three requirements that would have to be met to provide that relief: (1) make Microsoft operating systems an extra-cost add-on to computers, (2) compell Microsoft to publish file formats it uses to maintain and extend its monopoly to the desktop, and (3) compell Microsoft to publish networking standards it uses to maintain and extend its monopoly to the Internet.

I have never written to comment on any such settlement before, in part because I never been persuaded of the gravity of such a situation. The proposed settlement shocks me as a consumer and I can only explain it by taking into account the profound effect

that recent events have had on the DOJ mindset about what constitutes the national interest. Possibly DOJ has become less aggressive toward violators during a period of national mourning. Now it is time for cooler heads to prevail and to demonstrate to the public that our government considers the national interest to include what is best for consumers, not merely what is best for corporations. —

Do you plan on dropping the millions of customers? What do plan on doing about the fact that 99% of the government's computers are run by MS? Now that AT&T is a government controlled company their service sucks. I can see how making MS a government entity would create so many issues for consumers and hurt our economy worse.. Anything federally regulated and funded sucks. Have you ever had a speeding ticket or tried to get a different phone company? MS actually provides good support.

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am submitting the following comments for your review as regards the Microsoft antitrust lawsuit. I am in favor of seeing this case settled. From the lawsuit's inception, I have been frustrated by the fact that Microsoft is being punished merely because it has produced an outstanding operating system.

Despite my disagreement with the wisdom behind filing this suit, in my opinion, the terms of the settlement agreement are fair. In response to the allegation that Microsoft has engaged in unfair business practices, Microsoft has agreed to give up many things. Microsoft has agreed to disclose portions of its code to their competitors. They have also submitted to making it easier for consumers to change the configuration of Windows. This will allow consumers to run programs made by Microsoft's competitors, while using Windows. Additionally, Microsoft has agreed not to take retaliatory actions against those who distribute or promote software that competes with Windows. Fair competition will be restored as a result of the concessions Microsoft has made. Nothing else should be required of Microsoft beyond the terms of the settlement agreement.

Thank you.

The courts are punishing Microsoft, a winner and rewarding the losers who have inferior products in my estimation. What is wrong with winning? I don't see Be on every desktop and Oracle is so expensive and cumbersome that only foolish bureaucracies run this software. There are no gains for the general population which this lawsuit pretends to ''protect''. Very clearly the courts are protecting a very few major corporations and their interests, not us little guys. And guess what ? should anyone be surprised—There are several technical references about computer systems and software that are grievously incorrect in the court documents.

Since when does any company have to get approval from the courts to bring a product to market? Courts have to get out of the market place. Let winners win, and losers lose. Get Bin Laden and others like him. Get bad guys not a company like Microsoft whom we all should be proud of. We should put a statue of Bill Gates right next to the Abe Lincoln monument.

Our future is in our children. Any court settlement (not), if there has to be one should benefit our kids.

To Whom It May Concern:

Please register my opposition to the proposed government settlement with Microsoft. Despite the fact that I am a Microsoft shareholder, I believe the company needs to be restrained in its anti-competitive practices.

The case, in my opinion, goes well beyond the so-called ''browser wars.'' The list of companies that Microsoft has harmed as it incorporates additional functions into its operating system software is lengthy. To name just a few: Eudora—email program Adobe—imaging program Symantec—utilities programs Ipswitch—FTP program Real Networks—multimedia programs It is reasonable to ask what the ability to edit photographs, for example, has to do with a computer operating system. The only purpose for including such programs in Windows at no charge is to drive competitors out of business. This represents classic anti-competitive behavior that must be curtailed.

Subject: Microsoft Settlment

Attorney General John Aahcroft I encourage the United States Justice Department to accept the recent anti-trust settlement it reached with Microsoft. I'm for anything that will get the matter behind us so Microsoft can get back to the business of making good software. To open up the market and make it more competitive, Microsoft has agreed to grant computer makers the right to change Windows so that Microsoft product can be removed and competing, non-Microsoft produts can be installed. This will allow small developing software companies to get their feet in the door and compete on an even level. This will also create a competitive environment that will encourage all parties to improve their produts and services. Microsoft has further agreed to not take any action that could be perceived as retaliatory against those computer makers who choose to do this, nor will Microsoft retaliate against computer makers who develop or ship operating systems that compete with Windows. A Technical Coommittee made up of three software experts will be overseeing compliance and assisting in any dispute resolution. Based on these facts, I encourage you to support this good settlement that will benefit Microsoft, competitors, and most iimportantly, consumers who buy these products.

Re: Microsoft Settlement

Pursuant to the Antitrust Procedures and Penalties Act, 15 U.S.C. § 16, the Center for the Moral Defense of Capitalism respectfully submits its evaluation of the proposed Final Judgment resolving U.S. v. Microsoft Corporation (Civil Action No. 98–1232) and State of New York ex. rel Attorney General Eliot Spitzer, et al., v. Microsoft Corporation (Civil Action No. 98–1233).

The mission of the Center for the Moral Defense of Capitalism is to promote the social welfare of the nation by presenting to the public a moral foundation for individualism and economic freedom based on a philosophical analysis of humanity and human nature. Specifically, we seek to apply Ayn Rand's philosophy of Objectivism to the understanding of human action and human relationships.

As the cornerstone of a free, capitalist system, we argue that human life requires thought and effort and that the free market springs from the trade of one's thoughts and efforts with others. We make the argument that human minds and bodies must be left free of coercion, that all human interaction must be voluntary and that the initiation of physical force must be banished from human relationships. We see a proper government as the agent of its citizens, charged with one mission: the use of retaliatory physical force in defense against the initiation of physical force.

Our organization has followed the Microsoft antitrust case from its initial filing—we have opposed the case from the outset, seeing it as an abridgement of the freedom of production and trade and an interference with the right to acquire and possess property. We disagree with the essential factual component of this case that Microsoft's integration of its Internet Explorer Web browser with its Windows operating system was a coercive act against Microsoft's competitors and customers. Instead, we see a company that according it its evaluation of the marketplace saw the commercial value of product integration and acted accordingly. In exercise of Microsoft's right to control its property, the firm set terms for the sale of that property that it believed was in its own self-interest. Microsoft's subsequent commercial success after this integration affirms the wisdom of Microsoft's actions—Microsoft's customers themselves chose to reward the firm with increased sales and increased market share. Rather than serve an impediment to the free market, Microsoft's actions personified them.

The Center for the Moral Defense of Capitalism
4901 Seminary Rd. Ste. 1320
Alexandria, VA 22311–1830
Office: (703) 625–3296 Fax: (815) 327–8852
E-mail: info@moraldefense.com

Yet, obviously, Microsoft's success has made it into the target of the government's wrath via the current antitrust case. Our organization closely followed the District Court case, writing several published evaluations of the case and its subsequent rulings (see Appendix 1 & 2). Our organization also participated in the US Court of Appeals for the District of Columbia Circuit appeals proceedings as an amicus curie. Our amicus brief relied on two major arguments in opposing the government's case: 1.) that the antitrust laws are unconstitutional laws that fail to provide with clear and concise guidance necessary to avoid sanctions under the law; and 2.) that the antitrust laws are unconstitutional laws because they require the government to initiate force against innocent citizens.

Today, our view of the Microsoft antitrust case and its proposed settlement is as follows: While we respect the desire of the parties to seek a resolution to this case, particularly that of Microsoft, which has had to endure a 3 1/2 year crusade against its property rights and its right to conduct its business in a profitable manner, we are wary of any settlement that legitimizes any aspect of this unjust assault against a successful, innovative business. We consider the case against Microsoft to have been defective at every level, from the fundamental claim that the entrepreneurial actions of a successful business are a threat against others, to the claim that a monopoly can exist where there is no legal barrier to entering a market, to the claim that the citizens of the United States are too ignorant or incompetent to exercise their individual power of choice when in the marketplace and therefore require the government to make their personal choices for them. We consider it a failure that the court saw no distinction between the earned success of a business in the free market and the coercive power of a government favorite and we consider it a failure that the court did not ultimately throw out the case against Microsoft.

Considering that this case was initial brought not at the insistence of individual consumers or with Microsoft's business partners, but at the insistence of Microsoft's unsuccessful competitors, this entire case reeks of business failures asking the government to step in and give them the commercial success they could not achieve in the marketplace. Failed businesses must not be allowed to set the rules for the markets in which they failed. In evaluating the proposed settlement, we find that it specifically threatens the right to private property. A key component of the proposed remedy is a requirement that Microsoft make its source codes available to a government-sanctioned oversight committee, which in turn is supposed to ensure these same source codes are made available to non-Microsoft ''middleware'' producers, so that these companies can create products to compete with Microsoft. Since under the proposed judgment, the United States would retain the right to determine and enforce the scope to which these source codes are to be made available, the final judgment constitutes a de facto seizure of private property—the source codes—and its subsequent conversion to a public good. Such a taking is wholly incompatible with the Constitution of the United States. Accordingly, we reject the notion that this settlement serves the public interest, or that any punishment of Microsoft for its business practices will be of benefit to any consumer. Eroding Microsoft's property rights serves no one. We hold that no antitrust case, including the Microsoft case can withstand rational scrutiny, and we ask that no sanction be placed on Microsoft as a result of its antitrust conviction.

Appendix 1:
Judge Jackson's Findings of Fiction
By Dr. Edwin A. Locke, Ph.D.
Senior Policy Analyst
The Center for the Moral Defense of Capitalism

Judge Thomas Penfield Jackson has released his ''findings of fact'' in the Microsoft antitrust case. While his report did contain some correct information—such as the truism that a successful company tries to defeat its rivals—the central claims of his report are blatant falsehoods. Let us examine five of these fictions.

Fiction #1: Microsoft is a ''monopoly.'' There is no such thing as a private monopoly. Only the government can forcibly prevent competitors from entering a market. Microsoft has attained dominance in the software industry, but dominance is not monopoly. Market dominance has to be earned through a long struggle, by providing better products and better prices than anyone else. Dominant companies who falter (as did Xerox, IBM, General Motors and Kodak) will find their market share eroded, sometimes very quickly. There is no threat from these dominant players so long as their competitors are legally permitted to enter the field, invent new products, and combine with each other to gain the needed market power.

In a free market, a dominant position can only be sustained by continually providing new products and services that are better than other firms'' products. Paradoxically, Judge Jackson recognizes this fact but

condemns it. Microsoft's innovation, its continual product upgrades, its millions spent on research and development, are cited by Jackson, not as evidence that Microsoft has earned its position, but only as evidence of a conspiracy to ''stifle'' its competitors.

Fiction #2: Microsoft's ''monopoly power'' allows it to ''coerce'' its customers. A private company has no power to force consumers to do anything. Did Judge Jackson find that Microsoft threatened to beat people up or throw their bodies into the East River if they bought the wrong Web browser? Of course not. The only ''leverage'' Microsoft has is the leverage it has earned by producing a product that people want to buy.

This economic power, the power of voluntary trade, is fundamentally different from political power, the power of the gun. Yet Judge Jackson is eager to erase this distinction. Thus, such actions as upgrading a product to match the features offered by a competitor, distributing a product for free, or negotiating favorable terms with business partners—all of them normal and beneficial business practices—are presented by Judge Jackson as if they are a nefarious, mafia- like conspiracy to oppress the public.

Fiction #3: Microsoft harmed consumers. This is certainly news to the millions of people worldwide who value Microsoft products enough to make the company and its founders rich.

Most bizarre is Judge Jackson's claim that Microsoft harmed consumers by giving away its Web browser, making it unprofitable for other firms to sell their browsers. Any sane consumer would be delighted to get a product for free rather than paying money for it. To speak of receiving free software as a ''harm'' is Orwellian doublespeak.

Fiction #4: Microsoft is a threat to consumers because it ''could'' raise its prices. Under this criterion, anyone could be prosecuted for anything. Do you own a kitchen knife? Then you might stab somebody—so should the government put you in jail?

Microsoft has the right to sell its product for any price it chooses—but anyone familiar with the history of business and with Economics 101 knows that market leaders have a selfish interest in keeping their prices low. Why? Because they make a lot more money by creating a mass market than by creating a product only the rich can buy. Henry Ford understood this. So did Bill Gates. Clearly, Judge Jackson does not.

The only basis for his conclusion is the caricature of the successful corporation as a vicious ''Robber Baron'' which, even if it is not ''exploiting'' consumer now, is merely waiting for the opportunity to do so. Fiction #5: Blocking Microsoft's ability to compete will foster greater industry innovation. A private company, with no power over consumers but the power conferred by offering a useful product, is branded by Judge Jackson as dangerous. But far-reaching government intervention in the software industry, including the massive use of force to shatter Microsoft and control its business practices, is presented as an attempt to spur innovation. Only those who believe AI Gore invented the Internet could take this argument seriously.

What Judge Jackson really objects to is the fact that Microsoft defeated its competitors, i.e., that it was successful. The real meaning of his ''findings of fact'' is that the best brains must be crippled, so that lesser brains will not have such a hard time succeeding. He and the government prosecutors whose arguments he is echoing do not want to foster innovation; they want to sacrifice the best and the brightest in the name of egalitarianism. They want the playing field leveled by coercion so that no one can rise to the top.

What consumers need is an antidote to the fictions peddled by Judge Jackson: the recognition that businessmen have a right to succeed by trading their products in a free market. Dr. Edwin A. Locke is Dean's Professor of Motivation and Leadership at the Robert H. Smith School of Business at the University of Maryland and is affiliated with UMD's Department of Psychology. An internationally renowned behavioral scientist, Locke's work is included in leading textbooks and acknowledged in books on the history of management.

THE CENTER FOR THE MORAL DEFENSE OF CAPITALISM

Appendix 2:

Altruism in Action: An Analysis of Judge Jackson's Finding of Fact and the Antitrust Assault on Microsoft

by Adam Mossoff

Policy Analyst

The Center for the Moral Defense of Capitalism

United States District Court Judge Thomas P. Jackson is crystal clear in his recent ''findings of fact'': Microsoft is marked for destruction. But why does Judge Jackson want to punish one of the most successful corporations in American history? Because Bill Gates proclaimed that he wanted ''to prove that a successful company can renew itself and stay in the forefront'' i—and he proceeded to do just that.

By the early 90s, Microsoft had gained a dominant position in the software industry by creating Windows, the first commercially viable graphical operating system that could be used on PCs. But in the mid-90s, Gates realized that the Internet represented the next step in the ongoing computer revolution; thus, he created a business plan to ''stay in the forefront'' of this revolution. In so doing, he set into motion the same technological and commercial innovation that had led to Microsoft's leading market position in the first place.

Microsoft began by investing a staggering $100 million each year in Internet research and development, and in four years the company expanded its Internet division from only six people to more than one thousand. These investments, in the words of Judge Jackson, paid ''technological dividends.'' ii (Paragraph 135) Microsoft developed a Web browser called Internet Explorer, and ''after the arrival of Internet Explorer 4.0 in late 1997, the number of reviewers who regarded it as the superior product was roughly equal to those who preferred [Netscape's] Navigator.'' (Paragraph 135)

But Gates took Microsoft even farther. He integrated Internet Explorer into Microsoft's Windows operating system so that it would be easier to incorporate the fast-growing Internet into all aspects of personal computing. In fact, Judge Jackson partly acknowledges the groundbreaking work performed by Microsoft in this regard:

The inclusion of Internet Explorer with Windows at no separate charge increased general familiarity with the Internet and reduced the cost to the public of gaining access to it, at least in part because it compelled Netscape to stop charging for Navigator. These actions thus contributed to improving the quality of Web browsing software, lowering its cost, and increasing its availability, thereby benefiting consumers. (Paragraph 408) Concurrent with its technological innovation, Microsoft put into practice novel business services and licensing arrangements. Just one of many examples addressed by Judge Jackson is the Internet Explorer Access Kit (IEAK), a service that permits an Internet access provider (IAP), such as America Online or Earthlink, to accept a license agreement on the Web and then download and customize Microsoft's Internet software. When Microsoft began offering this service in September, 1996, it was the first time an Internet access provider could create a distinctive identity for its service in as little as a few hours by customizing the title bar, icon, start and search pages, and ''favorites'' in Internet Explorer. The IEAK also made the installation process easy for IAPs. With the IEAK, IAPs could avoid piecemeal installation of various programs and instead create an automated, comprehensive installation package in which all settings and options were pre-configured. (Paragraph 249)

More than 2,500 access providers—representing more than 95% of the Internet subscriber market in the US—used Microsoft's IEAK service. (Paragraph 251) Notably, Netscape did not create a similar service until nine months after Microsoft introduced IEAK, and Netscape charged almost $2,000 for something Microsoft offered for free. (Paragraph 250)

Microsoft blended technological innovation with business acumen and thus offered its business partners an integrated package of new technology and new business opportunities. In exploiting these opportunities, Microsoft often offered ''valuable consideration''—such as special discounts— to companies like Compaq, IBM, and Intel as an incentive to adopt its Internet Explorer and other Microsoft technology. In fact, Judge Jackson uses the term ''valuable consideration'' eight times to describe Microsoft's business agreements with other companies—leaving the honest reader to conclude that Microsoft's dealings were not some form of coercion but rather value-for-value trades.

For instance, Microsoft beat Netscape in developing a special type of browser that America Online (AOL) required for its Internet service. As a result, the two companies entered into several agreements in 1996. In exchange for AOL's commitment to use Microsoft's Internet software, Microsoft promised to provide AOL with unprecedented access to Internet Explorer source code, extensive technical assistance, ''free world-wide distribution rights to

Internet Explorer,'' an assurance ''that future versions of its Web browsing software would possess the latest available Internet-related technology features, capabilities, and standards,'' and the placement of an AOL icon in a special folder on the Windows desktop. (Paragraph 288)

This relationship has been advantageous to both parties. Overall usage of Internet Explorer has risen dramatically, and as a result of this agreement AOL registered almost one million new users in a single year—11% of its total membership—through its icon on the Windows desktop. This fact alone prompted AOL to state in 1998 that its business arrangement with Microsoft was an ''important, valued source of new customers for us.'' (Paragraph 302) Microsoft's achievements should be held up as a model of how to create and maintain a highly productive, innovative company. Yet Judge Jackson is unable to view any of these facts in a positive light. While Judge Jackson recognizes many of the concrete facts that demonstrate Microsoft's productive achievement, he is incapable of praising the innovation and business acumen that led to Microsoft's success.

Instead, his descriptions are clouded by slanted, inflammatory terms that attribute vicious motives to Gates and his company. When Microsoft created new technology to compete with its rivals, Judge Jackson describes the company's motivation as ''fear'' and ''alarm.'' When Microsoft offered incentives to its business partners, Judge Jackson decries this as the ''quashing'' and ''stifling'' of rivals. When Microsoft licensed its products only under conditions favorable to its long-term success, Judge Jackson describes these actions as ''threats'' and ''force.'' (Judge Jackson uses variations of ''threat'' no fewer than twenty times and of ''force'' no fewer than sixteen times to describe Microsoft's actions.) When Microsoft refused to support its competition, Judge Jackson calls this ''punishment.'' When Microsoft ingeniously melded technological and business strategies to convince consumers that its products were the best, Judge Jackson sees the company as ''seizing control'' and trying to ''capture'' the market.

Even worse than his slanted terminology are his substantive arguments, in which he sets up impossible standards according to which no successful business could escape prosecution. For example, Judge Jackson writes early in his ruling that:

It is not possible with the available data to determine with any level of confidence whether the price that a profit-maximizing firm with monopoly power would charge for Windows 98 comports with the price that Microsoft actually charges. Even if it could be determined that Microsoft charges less than the profit-maximizing monopoly price, though, that would not be probative of a lack of monopoly power, for Microsoft could be charging what seems like a low short-term price in order to maximize its profits in the future for reasons unrelated to underselling any incipient competitors. (Paragraph 65) (Emphasis added.)

Judge Jackson admits that it is not possible to tell whether Microsoft is in fact charging a monopoly price. Yet he dismisses this lack of evidence as irrelevant because Microsoft could simply be using low prices today in order to ''capture'' the market and charge exorbitant prices at some future date. In other words, Microsoft is a monopolist if it charges prices that are deemed ''too high''—but it is also a monopolist if it charges prices that are too low. By virtue of its dominant position in the industry—that is, by virtue of its success—Microsoft is damned if it does and damned if it doesn't.

Judge Jackson's visceral antagonism to business is also revealed by his condemnation of Microsoft for winning the browser battle against Netscape when ''superior quality was not responsible for the dramatic rise [in] Internet Explorer's usage share.'' (Paragraph 375) Note the implicit premise in this condemnation: If Microsoft hasn't produced a product that is technologically superior, then only commerce can explain its success. Jackson is repulsed by the notion that successful computer companies require both technological savvy and business skills; in his ideal world, Silicon Valley would be populated solely by computer scientists with nary an ''alarming'' venture capitalist or ''threatening'' businessman in sight. Judge Jackson's praise for innovation, however, might seem to contradict his overall attack on successful businesses. Technological innovation is a source of business success, is it not? Although Judge Jackson recognizes that technological innovation causes businesses to succeed, he believes that this innovation has another, more legitimate, function. He writes:

In many cases, one of the early entrants into a new software category quickly captures a lion's share of the sales .... What eventually displaces the leader is often not competition from another product within the same software category, but rather a technological advance that renders the boundaries defining the category obsolete. These events, in which categories are redefined and leaders are superseded in the process, are spoken of as ''inflection points.'' (Paragraph 59) (Emphasis added.)

Innovation appeals to Judge Jackson not because it leads to the creation of wealth, but rather because it tends to tear down the market leader. He argues that the emergence of the Internet in the mid-90s was one such ''inflection point.'' (Paragraph 60) Thus, the nature of his support for innovation explains his disgust with Microsoft's defeat of Netscape: By introducing its browser product sooner, Netscape should have replaced Microsoft—if only Microsoft had not engaged in the ''vicious'' commercial competition that ensured its continued leadership in the computer industry.

These beliefs ultimately lead Judge Jackson to conclude that Microsoft's ''monopoly power'' has ''harmed consumers in ways that are immediate and easily discernible.'' (Paragraph 409) What are these alleged harms? Judge Jackson claims (wrongly) that the integration of Windows 98 and Internet Explorer does not allow employers to block employees from surfing the Web. He asserts that vast ''confusion'' reigns among consumers—but beyond one or two offhand references throughout the ruling, he never explains this vague allegation. Moreover, he claims, the integration of Windows and Internet Explorer has created slower computers with more bugs—as if computers are slower and less dependable than they were two years ago! One might regard such mythical ''harms'' as the laughable allegations of a Luddite—if they did not come from a judge who wields the coercive power of the federal government.

Regardless of how trivial these alleged harms may be, Judge Jackson seems sincerely to believe that Microsoft is acting as a vicious monopolist. Why? He answers this question in the last few sentences of his ruling: ''Microsoft's past success in hurting such companies and stifling innovation ... occur for the sole reason that [other companies and their innovations] do not coincide with Microsoft's self-interest.'' (Paragraph 412) (Emphasis added.)

It takes Judge Jackson more than 200 pages, but in the end he names the essence of his disgust for Microsoft—and the essence of the antitrust laws. In so doing, Judge Jackson exposes the fundamental moral premise dictating his factual distortions, his fallacy-ridden arguments, and his illogical conclusions: a hatred for any form of self-interest.

The morality of altruism or self-sacrifice is often presented as a form of benevolence, as if it simply means being nice to other people. But the actual meaning of this philosophy is a hatred of success. Under this morality, anyone who achieves some extraordinary wealth or distinction owes it to his fellow men to sacrifice what he has earned—including giving away his whole fortune, as and when it is demanded by others. (This is essentially what has been demanded of Bill Gates.) But what about those who have not achieved anything? They are entitled to welfare programs, private charities, protective legislation, and a host of other unearned benefits to be paid for by those who have succeeded. In this system, anyone who earns success through his own effort is to be punished, while anyone who hasn't exerted any effort and hasn't attained any success is to be rewarded.

Far from standing for benevolence or good will, such a moral outlook stands for destruction. This code of sacrifice demands an assault on a Microsoft or a Bill Gates. By amassing so much money and achieving so much success, they must be shirking their duty to sacrifice to others. But it does not demand the destruction of the Netscapes of the world because, by* virtue of having faltered, they are the ''have-nots'' who are entitled to benefit from the sacrifice of their more-successful competitors.

Note that the ultimate standard of this moral outlook is not the well-being of the poor, the weak, the downtrodden; has the welfare state ever achieved these aims? Instead, the goal is the sacrifice of the rich, the strong, and the powerful—not to achieve any positive aim, but simply to punish them because they are rich, strong, and powerful.

The altruist connection to antitrust is evident in the mere fact that Judge Jackson could have applied the antitrust laws against Microsoft without finding any harm at all. Although the ostensible purpose of antitrust

is to ''protect consumers'' from alleged ''monopolists,'' court decisions consistently belie this fiction. In one of the first cases defining the doctrine of antitrust, a large railroad trust defended itself against prosecution by arguing that its price-fixing plan resulted in lower prices for consumers. Since the stated purpose of the 1890 Sherman Antitrust Act was to protect consumers, and since consumers actually benefited in this case, the defendant logically concluded that the antitrust laws should not apply to its practices. The Supreme Court rejected this argument and ruled that the railroad trust was guilty. In an illuminating statement, Justice Peckham declared: ''In this light it is not material that the price of an article may be lowered. It is in the power of the [monopolist] to raise it.'' iii

(Interestingly, Justice Peckham was an ardent conservative who was one of the principal advocates of ''freedom of contract'' in the 19th century—just as Judge Jackson was a Reagan appointee. This proves once again that conservatives are not reliable friends of freedom.) Continuing to apply the underlying anti-success principle of antitrust, the Supreme Court ruled in 1968 that a newspaper company violated the Sherman Antitrust Act when it fired a distributor for charging rates above an allowable maximum price. The Court found that the newspaper ''would not tolerate over-charging'' of its customers, and that it even agreed to rehire the distributor if he ''discontinued his pricing practice''—-that is, if he charged lower prices. Nonetheless, the Court held that the benefit to consumers was irrelevant in finding that the newspaper company acted in ''conspiracy'' with its other distributors to set prices—thus its actions were ''an illegal restraint of trade under Section 1 of the Sherman Act?

Harm to consumers has nothing to do with the purpose of antitrust. The antitrust laws are intended only to punish ''power''—but since economic power is earned on the free market, this means that the purpose of antitrust is to punish successful business practices. Antitrust case law is replete with examples of companies being punished, not for any alleged harm, but simply for having the acumen to remain successful in their industries. A ski resort in Aspen, Colorado, was not only found guilty in 1985 of violating the antitrust laws because it successfully competed against its only rival; it was also held to a ''duty under antitrust law to help a competitor.'' v In the famous case against ALCOA in 1945, Judge Hand declared that ''the successful competitor, having been urged to compete, must not be turned upon when he wins.''

But he contradicted himself in the very next paragraph, concluding that ALCOA insists that it never excluded competitors; but we can think of no more effective exclusion than progressively to embrace each new opportunity as it opened, and to face every newcomer with new capacity already geared into a great organization, having the advantage of experience, trade connections, and the elite of personnel. vi

ALCOA's ability and success, by Hand's reasoning, was the deciding factor for finding it guilty of violating the antitrust laws.

Given this legal context, Microsoft was doomed before it even set foot in the courtroom. The media, in an anti-Microsoft feeding frenzy, often highlighted mistakes made by Microsoft's counsel during the lengthy (and ongoing) trial. Yet Microsoft's attorneys could have performed flawlessly, and Judge Jackson would still have produced the same ruling.

The reason is that Microsoft is an extremely successful company; Gates is a unique combination of technological genius and businessman, reminiscent of earlier American giants like Thomas Edison. Thus, it was irrelevant how hard Microsoft's attorneys worked, or how much intellectual vigor they brought to their legal briefs and courtroom arguments. These things were irrelevant because no army of lawyers could hide a single, essential fact—the only fact necessary for applying the antitrust laws: Microsoft succeeds at what it does.

The punishment doled out for success is paralysis. Judge Jackson makes it clear that Microsoft must not be permitted to capitalize upon its well-earned success. Because it has created values, it must now relinquish them. Does it matter that Microsoft has earned its success by producing a better product, by offering better incentives to its business partners, and by providing better service to software developers and Internet access providers? No.

Such facts do not matter to a man who believes that a successful company has a moral duty to sacrifice to its lesser rivals—-especially when that man has the legal power to coerce the company to obey its alleged duty. With every slanted term and with every absurd conclusion, Judge Jackson practically screams his unstated moral premise: Since Microsoft is a leader in the computer industry, it must sacrifice the values it has created because it has created them.

In his ruling, Judge Jackson claims to set out the objective facts underlying his impending application of the antitrust laws to Microsoft. But the only thing he manages to establish is his own animosity towards commercial success. What drives this animosity is the underlying moral justification for antitrust: altruism's hatred of success.

The basis for Judge Jackson's ruling is not any ''monopoly'' allegedly controlled by Microsoft; it is the monopoly commanded by the morality of altruism over our culture. That monopoly can be seen, unfortunately, in Bill Gates's sanction of his own destruction in a comment immediately after the ruling, in which he declares that ''because of our success, we understand that Microsoft is held to a higher standard, and we accept that responsibility.'' vii As long as this moral monopoly remains unchallenged, legal doctrines such as antitrust will continue to punish successful businesses.

Subject: Microsoft settlement

As a retired citizen of Washington state, I encourage you to accept the proposed settlement in the anti-trust case involving Microsoft. I am neither an employee nor a stockholder in this firm.

This settlement is appropriate and reflects a triumph of the rule of law. Many critics, all with an axe to grind, i.e. compeitors and state attorneys-general, call for extreme, stringent restrictions that are totally inappropriate.

These objections ignore the decision of the Appeals Court that reversed much of Judge Jackson's original findings. Objectors not only misstate facts, but deliberately misinterpret the Appeals Courts'' key findings.

In my view there can be no valid objection to this settlement since every major finding of the Appeals Court is stringently addressed with a targeted remedy that specifically prohibits and prevents the conduct in question.

Acceptance of the proposed settlement will send a signal to American industry managements and all thinking citizens that the rule of law is still being enforced appropriately. Anything beyond this settlement would be a victory for those who seek damage and destruction rather than a remedy;. for competitors, litigation rather than innovative, honest competition.

Every person with the most rudimentary understanding of free markets wants the law to protect the markets'' smooth functioning. Can we depend on the fair application of the laws that all participants in the U.S. economy rely on? I hope your answer is a resounding ''yes''.

Thank you for your consideration.

U.S. Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I cannot help but think that this settlement recently reached between the Department of Justice and Microsoft is a good thing. Since the court case was as contentious as it was, there was very little progress being made.

The terms of this settlement, however, accomplishes a great deal without all the controversy. Most consumers will immediately benefit by being able to choose different software combinations without fear of compromising their installed operating systems, and most computer makers will benefit by being able to offer a wider variety of options to their customers.

All in all, this settlement is a great benefit to all and I am writing to express my support for it. Thank you for the hard work you put in to reach this settlement, and your continued support.

Sincerely,
Lisa Klanoff

From: Maureen Baskin
To: Microsoft ATR
Date: 1/28/02 6:07pm
Subject: Microsoft Settlement

I apologize for sending this via email, I've tried several times to FAX this to you today from a local office store, but the line has been busy each time.

Respectfully,
Maureen J. Baskin
January 24, 2002

Dear Attorney General John Ashcroft,

Please consider my request for an immediate approval of the pending settlement between Microsoft, the Department of Justice and nine states. I worked for Microsoft from 1989 to 1996 in sales. Prior to Microsoft I worked for small and large corporations, including Bank of America and Dun and Bradstreet. I have never worked for a company where the employees were so bright, motivated, and empowered. There are so many strengths I would like to share, but in the interest of brevity I will highlight Microsoft's generosity to employees, customers, community and charities.

There were less than 5,000 employees working at Microsoft when I began work there. Excel had less than 11% of the spreadsheet marketplace and Windows was not yet graphical. Through the careful design by management, programmers, marketing, usability testing and sales people, Microsoft went from a company I had rarely heard mentioned from ''84 to ''89 (while teaching PC classes on the East Coast) to a household name today.

I encourage you to settle this case and commend Microsoft for going beyond the requirements stated by the Court of Appeals ruling. The products Microsoft offers have enriched the lives of so many.

I remember reading an article about Bill Gates'' Mother one time and I've never forgotten it. She was calling for him (perhaps it was to dinner), over and over again, but there was no response. Finally when she asked what he was doing, he said, ''I'm thinking!'' I'm glad he couldn't see the negative in the future, for he may have stopped in his tracks before starting Microsoft.

Let us highlight bright companies and businesses that stretch their imaginations and build superior products. Microsoft was not always such a big company, thousands have worked very hard to bring about it's success. They have worked consistently for developers, resellers, consumers and corporate customers, to build products needed in their world. Please do not allow jealous competitors to side track the industry, government and the economy on this matter any longer. Thank you for your time and consideration,

Respectfully,
Maureen J. Baskin

United States Department of Justice:

I am writing to oppose the proposed settlement with Microsoft. I have read the original complaint of United States and the several States, the proposed settlement, the Competitive Impact Statement at, in addition to many other sources including the findings of fact. I feel that the proposed settlement falls far short of rectifying the damage which has been done to myself and other consumer by Microsoft through years of abuse of their monopoly, and that the enforcement provisions do little to dissuade Microsoft from continuing such practices in the future.

While some of the settlement provisions are a good start, there are many loop holes, and several places where it falls short. The trial should be allowed to proceed, so that a stronger remedy without loop holes, and with stricter enforcement and actual punishment for past wrongs can be enacted. I will leave some of the other problem topics to others, but wish to address a limited set here.

The stipulated parties who are protected from anti-competitive acts are ISVs, IHVs, IAPs, ICPs, and OEMs. This list is much too exclusive. The general public and especially Open Source software developers must also be protected. In the recent past, one of the only viable responses to Microsoft's hegemony has been Open Source software developers. These people have *donated* millions of hours of their time to produce a software platform—a feat which would not have been possible if they were a strictly commercial entity in competition with Microsoft. These people must have the same access to information as commercial entities, or one of the few viable responses to the Microsoft monopoly will be stymied by the settlement.

All of the API, format, and protocol standards which Microsoft uses to propagate its monopoly should be opened. Microsoft has repeatedly leveraged its monopoly position along with rapidly changing or secret formats to lock competitors out of their market. Due to the substantial network effects involved in computer software, it is very hard to function when using alternative software since users will be unable to interact with others as soon as Microsoft releases the next revision of a product.

The central reason that Microsoft has maintained and extended its monopoly is not due to the superiority of its product, but through ''lock-in.'' Once one's data and software on secreted away within the Microsoft platform, it is extremely painful to switch to a superior platform. This not only directly hurts consumers, but stifles innovation in the computer industry. The provisions in the settlement do not do enough to make Microsoft open these standards to all parties interested in being compatible and do little to dissuade foot-dragging on Microsoft's part. Microsoft's APIs, file formats, and protocols should be fully standardized, documented, publicly published, and an accessible compatibility laboratory formed. This allow other software vendors to compete on a more fair playing field. This would be a start, but as others will surely describe in other comments, a fair distribution channel, free from punishing bundling agreements must be enforced.

I ask the DOJ to reconsider the decision to settle and to continue with the matter at trial. Microsoft has repeatedly show a willingness to flout the law. The remedies do not go far enough in punishing past illegal behavior or dissuading similar new behavior. The proposed mechanism of enforcement does not seem to have teeth, and Microsoft will likely attempt to break it soon after enactment. There is little deterrent to their doing so.

Sincerely,
Benjamin Thomas, Voter

Subject: For the proposed settlement

Hi!

While you may discount this, I would like to state my opinion that the proposed settlement in the Microsoft Anti-trust case is both a valuable and useful resolution to this court battle that continues unwarrantedly.

While it is unfathomable to me how the United States government, along with several State governments can conceive of punishing a successful company for being successful, I can see how some of the stated actions attributed to Microsoft could be considered inappropriate for an open marketplace. I do agree that many of the settlement terms implement procedures that Microsoft should have (and sometimes did) put into place many years ago. As such, I believe this settlement should go through substantially as proposed.

I also would like to see our court system spend time and money on anti-trust issues that have actual, demonstrated customer harm at their core, rather than the supposed harm to competitors that tripped up in the course of their own business and have failed to produce products that customers would continue to use over the course of years.

Re: The Microsoft Settlement

I am writing to you about the proposed Microsoft settlement as both a private consumer as well as a human resources professional. I am very concerned as a consumer that I continue to have a choice in the software I purchase without having to be concerned with interoperability issues.

As a human resources professional and personal user of Microsoft, I want to maintain open computer systems that will facilitate communication and training materials.

Openness is paramount to maintaining competition, but openness is not what Microsoft wants. And it is not what this settlement, as it is currently written will guarantee.

I support including additional remedies as proposed by the dissenting Attorneys General, including the AG form my own state, Tom Reilly (no relation). Those remedies would ensure consumer choice, competition and interoperability of software. Specifically, I support the following: .

Microsoft should offer an alternative, basic version of Windows to personal computer manufacturers. This alternative version would have no Microsoft ''add-ons'', such as Internet access software, media players, or email applications, included.

2. Microsoft should provide the software code for Internet Explorer to competing software developers so that Microsoft cannot monopolize the Internet access or browser markets.

3. Microsoft should develop some mechanism to allow competitors to produce non-Windows based versions of the Office software suite.

Sincerely,

Colleen Reilly

Microsoft believes the terms-which have met or gone beyond the findings of the Court of Appeals ruling-are reasonable and fair to all parties involved. This settlement represents the best opportunity for Microsoft and the industry to move forward.

I ALSO AGREE WITH MICROSOFT

(This ruling will unnecessarily keep Microsoft from reaching the public with improvements for the computer industry)

The settlement is flawed. It will not foster competition in any way. In fact by requiring Microsoft to donate their software to schools will have very much the opposite effect, helping the Microsoft monopoly to weaken Apple, the sole remaining competitor in making Operating Systems.

I sincerely hope that the settlement will be completly rejected, thereby restoring the hope that the rest of the computer industry will florish once again.

Washington, DC 20530

Dear Mr. Ashcroft:

I am in support of the settlement proposed in the antitrust case between the Department of Justice and Microsoft. The settlement offers terms that I feel are beneficial to technology users and sufficient enough to end all of this litigation.

I think that the internal interface disclosure, licensing of Windows products, and technical committee in the settlement all open the doors for increased competitive behavior. If the government alleges that Microsoft was involved with anticompetitive behavior, then the problem is rectified.

We need an end to drawn out legal proceedings. It is time to allow Microsoft to get out of court and get back to business. Support the antitrust settlement.

Sincerely,

Joan Stupler

I believe that the microsoft settlement is bad for american business. I have seen the future of Microsoft operating system software in XP and I do not want it. It is horrid to use. I went out and got a older version of win 98 to replace it.

If Microsoft maintains its freedom to abuse its consumers, my business will suffer. The only real punishment is to break up the company or to require much of the secret stuff in Windows to become public so that the market can punish Microsoft for writing bad, crash prone, stupidly functioning, software. Under the current government proposal, this will not happen.

Subject: MICROSOFT SETTLEMENT

As a Microsoft consumer, employee and shareholder, I felt it my obligation to write on behalf of Microsoft corporation. Our government has spent more time, money and resources fighting Microsoft Corporation than Terrorism! And all based upon allegations

from our competitors and their political supporters. As a tax payer, I question this, as being the best use of tax dollars and government resources and the best place for efforts to be invested.

Microsoft has a passion for the customer and it's products and technology. I've been proud to represent them as an employee and to help our customers succeed and grow their businesses with Microsoft technologies and products. I have over the years, continually had happy customers who felt Microsoft contributed greatly to their success and the growth of the industry and was a true partner in their businesses.

Microsoft is not Big Tobacco, it is not misleading, deceiving or intentionally hurting consumers, which makes the allegations and continued lawsuits increasingly more difficult to rationalize. Why should competitors reap the benefits of this suit?

If consumers and the general public are being hurt, why won't the additional 9 states accept the settlement that proposes to help the consumer and benefit and educate the general public and make technology accessible and available to those who would not have exposure otherwise ?

What I fear, is that the focus has moved away from what is best for consumers, partners, customers and the industry, (not to mention our Nation's economy) by the efforts of competitors and competitive interests, and is aimed at taking down a ''powerhouse'' or ''the richest man in the world''. Is this really as objective a process as it should be?

What is good for ''competitors'' may not be what's good and healthy for innovation and the industry.

Punishing successful companies and entrepreneurs, is creating an environment that destroys the motivation to innovate and improve and invest in new and improved technologies in all facets of our economy. The value placed on Intellectual Property can not be negotiated away. Will you next have COKE, give PEPSI, their recipe? Or throw patents out the window in an effort to level the playing field and stifle innovation all together? There is a difference between Open standards and giving away intellectual property to competitors, then the consumer loses.

And would our competitors willingly give us their source code and intellectual property? If we are leveling the playing field then shouldn't everyone comply?

Based upon the state of our economy, and the recent ENRON scandal, I fear Microsoft is headed in the same direction and thus not hurting the ''Richest Man in the world'' or this big, bad, bully of a company as it is portrayed, but the average American worker and investor in Microsoft in any fund or pension plan nation wide. My pension and retirement funds have plummeted over the last 2 years as this lawsuit ensues and continues. I fear I will end up like the ENRON employees as I watch my 401 K value fall as a result of this lawsuit and the impact it has had on the economy as a whole and the entire tech sector. Over the years, Microsoft has committed to changing it's business and licensing practices multiple times to comply and paid over $600M last quarter relating to the lawsuit. At what point can we all resume business and our competitors and special interests be silenced?

Why are other States, not accepting the proposed settlement and accepting the terms of the settlement , whatever happened to torte reform?

Can't this battle be fought in the market place and not in the court room?

Thank you,
Jana Marie Goodwin

The current settlement made by the DOJ, failed to meet the changes hoped for by myself, and I'm sure many others. A quick settlement was reached, but no real punishment was delivered to the company, and it seemed as if the DOJ quickly gave up. Hopefully a better agreement can be reached in the future with the last states that have kept their claim against mircosoft, and I hope futhermore that this case if ever brought before a judge in the future by the DOJ, I hope they can further persue their goals in the case, and not give up so quickly. Microsoft continues to show practices which prevent competition. They continue to dominate areas of markets without it seems any hope for future competition with the settlement that has been reached. Hopefully something can and will be done about this one day.

January 27, 2002
Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

I am acutely dismayed that our government has decided to insert itself into the affairs of private businesses. I do not believe it is the responsibility of the government to regulate business. The Microsoft antitrust case is just another example of the state pandering to petulance. Companies can and should have the ability to stand on then own feet. I am disgusted that every time a conflict arises in business, it is acceptable to run to the government for protection instead of toughening up. This whole suit has been a colossal waste of time and money not only on the part of the government, but on Microsoft's part as well. They should have been putting their resources towards innovation, not litigation. I believe the government should back off in this case. There is absolutely no need to federalize what is simply the inability of companies to take their licks and keep moving in a fiercely competitive atmosphere.

I do not claim that Bill Gates is a saint. He is a tough competitor, and I understand how companies can feel daunted by Microsoft's prowess in the market. But I believe consumers are able to judge for themselves what is good and what is not, and are capable of regulating big business through purchase and support of products. The government has no fight to take that privilege away from consumers. The settlement requires Microsoft to disclose source code from its Windows operating system, allowing competitors the ability to work within Microsoft's operating system instead of having to develop a quality operating system on their own. It also requires Microsoft to refrain from retaliation when software is put on the market that directly competes with Microsoft software, but this just makes companies weaker by reducing the severity of competition in the market. Restrictions breed contempt, and contempt is not productive. F.A. Harper* wrote, ''Human goodness can only grow in a climate of liberty.'' If liberty is removed from the technology market, the government cannot expect goodness to remain.

The companies and states who are continuing to pursue litigation are opportunists. They are the result of an education system that has indoctrinated them to believe that it is acceptable to steal from one's neighbor as long as one has the government do it for them. They take privileges for granted and claim them as rights. It is nothing but political whoring. It is wrong. The litigation needs to stop now, before this kind of behavior is reinforced any longer. It is a total waste of creative and productive energy—and of the resources that would otherwise support these essential elements of a health economy and prosperous society.

Sincerely,
Joanna Parker

I am writing to give my support to Microsoft in the recent Department of Justice v. Microsoft antitrust case, and ask that you approve this settlement. I have Microsoft products and approve and agree with what Mr. Bill Gates has been trying to do—and has succeeded—in doing so by making softwear available to the average person, of which I am one, and at an affordable price. Just what is it that he has done that is contrary to law? I have always thought that by making a superior product with a reduction in price you would be serving the public. Personally, I think it is ''sour grapes'' on the part of the competitors of Microsoft who run crying to the government that what he has succeeded in doing, and doing so well, comes under antitrust. Also the attorneys-general who have refused to enter into a settielement always have been able to appoint ''high powered'' law firms to represent their state which, of course, calls for huge fees—not

fees, as far as I am concerned, but ''pay offs.'' I do not know the technicalities of the settlement nor would I be able to understand the testimony in the actual trial.

I am merely an average citizen, with an average education with a family to support who is interested in justice for the average person and want to pay a fair price for a product which, to me, is outstanding.

What is it that Shakespeare said about lawyers?

I wish to comment on the proposed Microsoft settlement. The Court of Appeals affirmed that Microsoft (MS) has a monopoly on Intel-compatible PC operating systems, and that the company's market position is protected by a substantial barrier to entry, and that Microsoft is liable under Sherman Act 2 for illegally maintaining its monopoly. According to the Court of Appeals ruling, ''a remedies decree in an antitrust case must seek to ''unfetter a market from anticompetitive conduct'', to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future''.

Like all those found guilty of a crime, Microsoft need to be punished for their actions—ideally in a way that attempts to restore competition and undoes the damage inflicted on the consumer by their anticompetitive behaviour. MS has profitted greatly from their behaviour, and the fruits of their illegal actions must be denied to them.

Previous court ordered remedies have shown that Microsoft willfully ignores and attempts to circumvent any restrictions placed on them by careful selection of the language used in these remedies, and stalling with continued appeals such that by the time a resolution occurs, there is no surviving competition. Microsoft show no signs of remorse or attempts to change their pattern of behaviour. Indeed, while conceding certain points on existing Operating Systems (OS), they are careful to ensure that applications (such as Microsoft Office Suite) and future products such as .NET are excluded from any restrictions. It is clear from their pattern of behaviour that they will attempt to monopolise these markets, and that nothing but the most severe restrictions on their behaviour will have any effect.

Since many of the companies adversely affected by Microsoft are no longer operating due to the illegal monopoly, it is hard to make reparation to them. Rather, the remedy must seek to redress the harm done to the consumer, and to prevent Microsoft continuing to use its illegaly gained market dominance to monopolise new markets. It is apparent that Microsoft traditionally gains dominance in a new market buy tying sales of one product to sales of another— for example, the bundling of Microsoft Office with Windows, and the intimidation of Original Equipment Manufacturers (OEMs) to ensure that this continues to the exclusion of competitors. Their willful circumvention of previous court restrictions, which violate the spirit if not the exact letter of the agreements, indicate that MS must be given no latitude in which to avoid punishment. The only option remaining if this is true, is a structural remedy.

Structural Remedy:

The existing MS corporation must be split into at least 5 separate companies, each of which is barred from operating in the other 4 areas or joining with one of the other compnaies for a period of not less than 10 years. The company should be split along the following lines:- Operating Systems, Computer Programming Languages (must include .NET and C#), Applications (such as MS Office), Hardware (including XBox), and Internet Services (MSN etc).

Microsoft continually use their monopoly position in each of these sections to dominate others—and must be denied the opportunity to do so in the only method it appears that will work. It is imperative that the .NET be split from all other services, since it is clear MS intends to use this to tie in future applications and services and ''lock out'' competing products. Previous anti-trust cases which have resulted in large corporations being split extensively detail prohibitions on these individual companies.

It is clear that despite all evidence pointing to a structural remedy as being the only solution, the courts are unlikely to impose such a remedy. Whether or not this is implemented, the following aspects of MS illegal behaviour must be addressed.

Consumers Overcharged and Require Compensation:

In addition to monopolising markets, the consumer has been harmed by Microsoft products being overpriced than would have occurred had competition been available. Once again, Microsoft must be denied any profits from their illegal activities. The consumer must be recompensed for this, and so a substantial cash fine should be levied against MS, which would then be divided amongst all registered users of Microsoft products. This fine should be no less than 1 billion US dollars—note that MS currently have cash reserves of over $35 billion and this is increasing rapidly—it is a small fine to MS.

Should this not prove to be practical, then MS should still be fined, but with the money going to the purchase of computer and computer related hardware for schools, colleges and charity groups. MS should not be allowed to provide software for these systems, and alternatives such as Apple computers or free software such as Linux must be used instead. This will not only return some benefit to the consumer, but prevent further harm done to MS Competitors.

Applications Barrier to Entry:

Significant barriers exist to competing products in the marketplace due to Microsofts illegal monopoly. These must be eroded and removed in the following ways:

By forbidding retaliation against OEMs, Internet Access Providers (IAPs), Independent Software Vendors (ISVs), and Independant Hardware Vendors (IHVs) who support or develop alternatives to Windows.

All APIs and file formats (MS Word, MS Excel, MS Access, MS Powerpoint, MS Outlook and Outlook Express, WMP—the Microsoft Middleware Products) should be available to ISVs and HSVs. File formats should be open and available for public viewing at no cost. Any changes made to APIs and file formats must be announced and specified a period of time must have passed before these changes are implemented (e.g. 180 days for APIs and 90 days for file formats). Current definitions of APIs allow MS to avoid releasing documentation on many important interfaces. File formats, while an important barrier to entry, are currently not included in the proposed settlement and must be publicly disclosed.

Wording of the licence agreement for ISVs accessing APIs and documentation shall state that it will solely be for the purpose of interoperating with a Windows Operating System Product or with application software written for Windows. Current phrasing limits this to OS only.

Definitions of requirements for companies or individuals to access APIs should be publicly available and independently enforced—MS should have no say in this part of the decision process.

All patents covering the Windows APIs must be disclosed. Currently those ISVs producing Windows-compatible operating systems are uncertain if they are infringing on Microsoft software patents.

Wording of the current proposed final judgement should not prevent ISVs using released APIs to make alternative OSs compatible with Windows based OSs. Forced Upgrades Must be Stopped:

MS abuses its monopoly postion by forcing consumers to upgrade from older products to newer ones, at substantial cost. Since there is now no effective competition due to the illegal actions, the consumer has no alternative but to go with MS products. By altering file formats in latest releases that are incompatible with older versions, and by removing older products from sale, MS force the consumer to upgrade.

To prevent this, file formats for all Office Applications and WMP must be publicly available at no cost to allow alternatives to be developed. This is mentioned in detail above.

To prevent the removal of older products that are still viable applications, Microsoft must continue to support older products for at least 15 years after their introduction. MS may choose not to support the software during this time citing that it is not a useful product, in which case it is allowed to do so but must make the entire MS source code to

the application publicly and freely available. Under these circumstances, users may maintain and compile the software themselves. This will apply to operating systems as well as middleware and applications.

Prohibiting practices towards OEMs:

In addition to current restrictions in the Proprosed Final Judgement (PFJ), Microsoft must be restricted against reprisals for OEMs that sell PCs with a competing OS but no Microsoft OS.

The PFJ requires Microsoft to license Windows on uniform terms and at published prices to the top 20 OEMs, but says nothing about smaller OEMs. This leaves Microsoft free to retaliate against smaller OEMs if they offer competing products. There should be selected ''groups'' of OEMs of varying sizes, for example OEMs 1–20, 21–100, 101–1000, 1001+, and in those bands prices must be uniform and published on all MS OS, Applications, and Middleware products. Market Development Allowances (discounts) to OEMs must be fully disclosed in public. Discounts may not be given in one product (e.g. Office Applications) due to sales in another product (e.g. OS). This will prevent MS using its OS dominance to move its monopoly into other areas.

Enforcement:

MS will attempt to circumvent all remedies to the best of their ability. Strong, independent and effective supervision of MS is necessary, and a panel of several industry experts (chosen by the courts and complainants, with minimal input by MS) must be allowed full and unfettered access to MS documents. They will be provided with support staff, and be paid for by MS at competitive rates given their experience. This panel should have the ability to force release of MS documentation and source code, and delay the release of products until compliance is complete. Any undisclosed APIs discovered should result in a large cash fine. Current proposed enforcement allows no incentive for MS to comply with the remedy.

Some of the above stated remedies may seem extreme, but given the magnitude of the MS corporation and the extend to which it has broken the law, the remedies must be of a similar magnitude. As stated in the first few paragraphs, the intent of any remedy is to restore competition, terminate the monopoly, deny the benefits of the illegal actions, and prevent such abuses from ocurring in the future. Due to the uncooperative nature of MS, the remedy must be decisive and strongly enforced.

While MS has already done considerable harm to the consumer by its illegal actions, there are many future markets in which MS can gain a further monopoly—and exacerbate the problem. They must be prevented from doing so. If an individual commits a crime where the public have been illegaly overcharged that individual will be fined, and perhaps imprisoned—and certainly would be if he was a repeat offender shown to ignore previous court orders. Microsoft must be no different, or justice will not be done, and will not be seen to be done.

John Hossack

Dear Ms. Hesse,

One thing that sets America apart from almost every other country is our free market system. Recently, however, this system has been in jeopardy. What I have witnessed over past few years between Microsoft and the United States government is infuriating. You would think that the federal government would have learned from the IBM case—that the high-tech industry moves at a pace far greater than that of the federal government bureaucracy.

This case has become a political football and as a result the Nasdaq has plummeted, America's international technology leadership has been compromised, and taxpayers'' time and money has been wasted.

The fact is, no consumer harm by Microsoft was proven in this case—which was the basis for the suit in the beginning. Therefore, Microsoft has been persecuted for making a better product and using aggressive marketing to promote it better than its competitors.

The settlement that is before Judge Kollar Kotelly would do what should have been done long ago: end the federal case against Microsoft. The settlement, in my mind, is more than fair to the government— keeping Microsoft under review for a period of time and making it tougher for them to compete. I support the proposal for the simple reason that it will bring closure to the case.

I hope that you will keep my comments in mind as you review your position on the settlement to the Microsoft case.

Sincerely,

Washington, DC 20530

Dear Mr. Ashcroft:

This letter documents my support for the proposed settlement for the Microsoft antitrust case. This case has been active for over three years. I would like to see this case finalized as soon as possible. The proposed settlement ensures that Microsoft's competitors have access to Microsoft interface programs, protocol, and documentation so that they can promote their products and attach them to Windows. Also, Microsoft will use a uniform price list when licensing Windows out to the twenty biggest computer companies in the U.S. Additionally, Microsoft won't retaliate against companies that use or promote Microsoft's competitors' products. Clearly, the terms of this settlement are not too easy on Microsoft.

IF MERGEFIELD PARA2 But clever people like me who talk loudly in restaurants, see this as a deliberate ambiguity. A plea for justice in a mechanized society.<> ..... This settlement should be adopted at the earliest opportunity. The IT industry needs to focus on innovation without the burden of further litigation. Thank you. IF MERGEFIELD PARA4 Ecce homo ergo elk. La Fontaine knew his sister, and knew her bloody well.<> IF MERGEFIELD PARA5 But is suspense, as Hitchcock states, in the box. No, there isn't room, the ambiguity's put on weight.<>

Dear Mr. Ashcroft:

I appreciate the opportunity to comment on the proposed settlement between Microsoft and the federal government in the antitrust case.

I believe it is in the public interest to end the case and accept the settlement that is on the table. The case has been pending for three years, and if you go back to Court now it might take at least that much time to reach an outcome. The settlement agreement negotiated by your Department with Microsoft, with the help of a court-appointed mediator, offers the opportunity to end the case now and help the economy.

Microsoft has made a number of concessions, but its primary concession, once implemented, will offer immediate opportunities for growth in the software industry. Under the settlement, Microsoft has agreed to allow competition within its Windows operating systems from non-Microsoft software programs upon finalization of the settlement. This will provide non-Microsoft software designers and manufacturers the chance to step up and compete within a very short period.

I hope you see the wisdom of accepting this agreement rather than continuing in Court. Thank you for allowing me the chance to offer my point of view.

Sincerely,
Claude Holland

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers’ dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies. Thank you for this opportunity to share my views.

Sincerely,
Daniel Clifton

From: Bruce Umbaugh
To: Microsoft ATR
Date: 1/28/02 6:18pm
Subject: Microsoft Settlement.

I wish to comment on the proposed settlement of anti-trust litigation United States of America versus Microsoft.

First, I am surprised that the government would agree to terms that do not penalize Microsoft for its past conduct. Having been found in violation of federal law, with a record of apparent disdain for proceedings against it, and as I understand the facts manifestly having violated the strictures of previous such agreements, I would think that Microsoft would be expected to pay some penalty for its corporate misdeeds. Not to penalize Microsoft for its conduct seems unjust, unfair, and I am sure quite unlike the results individual citizens would expect if found similarly to have violated federal law.

Moreover, I believe that this result undercuts respect for law generally in the popluation (''it only matters how much money you have,'' people will say) and undercuts respect for anti-trust law in the corporate world in particular. I think that Microsoft should have to pay a penalty for its years of misconduct and apparent bad faith in dealings with the government, with manufacturers, competitors and those who license Microsoft products, and with consumers and citizens.

Third, in addition to the need for a penalty, I see a need for some structural remedy, not just an agreement about future conduct. Given the particulars of this agreement, as I understand it, Microsoft has far too much latitude to avoid doing the right thing while still arguably conforming to the consent agreement. Microsoft is at liberty, largely at its own discretion, to withhold information crucial to interoperability from competitors it deems ''inauthentic.'' Microsoft can, as I understand the agreement proposed, withhold information from those working to make software available under the GPL as threatening Microsoft's intellectual property. What little oversight is called for is to happen largely in secret, at places of Microsoft's choosing, under terms Microsoft sets, and conducted in part by parties appointed by Microsoft. With what I understand about Microsoft's past record in these matters, it is hard to expect that Microsoft will be a ''good citizen'' in its future dealings and behavior. To my mind, this makes structural rather than conduct remedies necessary.

Finally, if this agreement is settled largely as proposed, and if the state attorneys general fail to sustain their action against Microsoft—one of the richest corporations we might ever know, able to carry on litigation indefinitely far into the future—what might we reasonably expect? If the future is like the past, we should expect Microsoft to try to leverage its desktop-operating-system monopoly into a server operating system monopoly, to try to disenfranchise on the Net content providers not partnering with or otherwise paying tribute to Microsoft through its .Net and Hailstorm undertakings, to try to stigmatize competitors in the media display space by limiting interoperability and exploiting its exisiting monopolies and choke points. Some action on integration of Windows Media Player would help here. Action on browser technology would help here. Any plausible action on ''middleware'' would benefit consumers and benefit competition. Without such remedies—ones that do not require continual maintenance and political will on the part of overseers and that do not require the goodness and ongoing acquiescence of Microsoft—there is every reason to think that the result will be something like an Internet controlled by Microsoft.

An Internet world controlled by Microsoft—or any similar entity—is a frightening prospect. The Internet became so amazingly valuable because it has been, in the words of the Court of Appeals in the Communications Decency Act decision, ''the most democratic medium the world has known.'' The ''gift economy'' that drove the development of the Internet, and in which the real value of the Net still resides for many users (whether they know it or not), would be badly threatened if Microsoft could extend its monopoly to control media distribution, for example, or to control authentication and personal identification through its new Passports strategy.

I wrote about these issues for a popular audience when this antitrust litigation was at an early stage: ''So it's up to consumers like us, and the government that represents us. It's up to us to prevent what has been history's most democratic medium from being trivialized and demeaned. It's up to us to keep the Web from going down the same path as TV itself.'' (''Tailoring the Web for Profit,'' St. Louis Post-Dispatch, June 15, 1998, and Computer underground Digest, June 1998. http://www.webster.edu/bumbaugh/net/tailorweb.html)

I hope that my government will do better than has been proposed. I hope for a good outcome in this case, for justice that punishes the evildoer and takes away its ill-gotten gains, for remedies that will send the right message to individuals and corporations considering misconduct, and for remedies that will benefit all of us today and future generations.

Thank you for the opportunity to comment.

Subject: Microsoft Settlement

I have been a resident of the United States since birth and a user of Microsoft products for some twelve years.

I believe that you should withdraw your consent to the revised proposed Final Judgment settlement.

This settlement will not provide a sufficient influence on Microsoft to abandon its monopolistic practices.

Microsoft should NOT be allowed to use its popularity to limit choice among computer manufacturers and therefore, computer users across the world. Here's why:

There are several good operating systems out there today. Each has its own strengths and its own weaknesses. None of them are the perfect solution to every problem. I believe that we all do ourselves a great disservice by forcing users to grow accustomed to the fact that Microsoft (and maybe Apple) is all that there is. Manufacturers should be allowed to provide, NAY! encouraged to promote, side-by-side operating system comparisons on the same machine. For better or worse, let the people decide!

So again, please rescind your agreement. Make Microsoft act properly.

Besides, I doubt that it's going to break them!

Sincerely,

William McKenna

Subject: Microsoft Settlement

I really don't understand the settlement that the 9 states made with Microsoft and DOJ. Looks like, it is just a slap on wrist. What ever monitory damages DOJ is assessing against Microsoft, Microsoft can get that money from the consumers by just raising the price of Windows $2–5. Here are my arguments and suggestions.

. We all know now that Microsoft is a monopoly. One of the main reasons is that there is no competing windows operating system. Just like AT&T was broken into pieces and every piece was able to deliver similar services, you are not going to solve the problems. I think, the company should be broken down into 4 main companies—

. Divide it into 2 competing Windows companies, one may sell NT type operating system and the other selling for homes. Let them compete and bring the price of windows down. If you look at the price of Windows product, it has kept on going up through out the decade. They don't even provide any books or training material with it. Again, they provide only 60 days guarantee and that is nothing.

. 3rd part of the company should be Application systems and other software, like office, mapping, etc. Now, if this was an independent company, they will provide software for other platforms to compete with other companies. Also, this company will not get any privileged information any time sooner than the other competing companies.

. 4th part of the comany should be hardware, gaming area.

. Force Microsoft to reduce the price of the operating system every year for the next decade.

.Force them to give 1–2 year warantee.

.Operating system should include only the functionality needed for the operating system. It should not include all type of other packages like Internet explorer, Video player, etc. Every time, Microsoft cannot compete against a company, they start bundling the software. They don't lose any money. They just increase the price of Windows. Also, if you look at the history of TCP/IP products offered by 3rd party companies like NetManage/Chameleon, they were were superior products.

When Microsoft bundled it in Windows 95, not only they made the whole connection as a rigid environment but also they caused problems for the other comanies. Other companies could not offer the same flexibility they were able to offer even in Windows for work groups.

. All government contracts should be bid with 2 vendors with compatible products, so that the government can compare them easily from the initial cost, maintenance (which has been a nightmare with Microsoft software), compatibility, upgrades, etc. If these kinds of guide lines are there,

To whom it may concern,

The settlement of the Microsoft antitrust trial is entirely inadequate, clearly favoring Microsoft.

It is difficult to enforce and easily evaded. I do not believe the DOJ's settlement offer is a serious attempt to fairly resolve this major antitrust issue.

I am writing you today to encourage you and the Department of Justice to accept the Microsoft antitrust settlement. The issue has been dragged out for over three years and it is time to put an end to it. A settlement is available and the terms are fair. I would like to see the government accept it.

In order to reach a settlement, Microsoft has made many concessions. They have agreed to give computer makers the flexibility to install and promote any software that they see fit. Microsoft has also agreed not to enter into any agreement that would require any computer maker to use a fixed percentage of Microsoft software. Also, Microsoft has agreed to license its software at a uniform price to computer makers no matter how much they use it. Microsoft and the industry need to be able to move on. The longer that this suit goes on, the worse it will be for everyone. Microsoft has agreed to many terms to reach a settlement. The settlement is fair and should be accepted. Please accept the Microsoft antitrust settlement.

Sincerely,
DOLORES HANSON

Microsoft Settlement
U.S. Department of Justice-Antitrust Division
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers’ dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
john waszewski

Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough.

Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user.

This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

Subject: Re: Please, Don't Settle with Microsoft.

Dear Attorney General,

Thank you for not just giving the Microsoft settlement a ''rubber stamping'' of approval. I do not believe the Federal Government's proposed settlement with Microsoft, in its current form, is adequate and that stricter measures must be imposed on the company to prohibit such anti-competitive tactic from being used in the future.

As a programmer and a system administrator, I have used a wide variety of hardware and software over the last dozen years including MVS, OS/2, many flavors of DOS, several versions on UNIX and even some Windows machines too. It saddens me when an individual with whom I have a kindred sprit goes astray... hell, just goes bad. It was unnecessary for Microsoft to engage in the practices it did but that does not mean it should not suffer as a result of its actions.

And their ways continue. Select your favorite HTTP browser and search engine and look for the phrase ''Microsoft outlaws Perl'' from the July 2001 timeframe. Also, you may find this an interesting read: http://www.zdnet.com/intweek/stories/news/0,4164,2781638,00.html.

Contrary to arguments by Microsoft that their products encourage competition, I believe the opposite is true; that Microsoft's marketing strategies actually discourages competition and stunts technological growth.

I applaud your efforts to seek stricter measures and encourage you to stand your ground.

Regards,
Kirby Thornton

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

As a Microsoft shareholder and user, I am writing to express my opinion about the recent antitrust settlement between Microsoft and the US department of Justice. While I am glad to see that Microsoft will not be broken up, I feel strongly that the penalties are still too harsh.

I am a firm believer in private enterprise being unconstrained by government agendas. And in this particular case state governments have no right to be continuing on with litigation. Microsoft has developed new products and services more rapidly than its competitors and it has been a pillar of strength for our economy during the recession.

I hope sincerely that your office urges the nine states withholding to discontinue their actions and let Microsoft begin focusing on what it does best. This is what is in the best interest of the American public, and what is good for the economy.

Sincerely,
Timothy R. Chilson

Subject: Microsoft Settlement

In paragraph 4 of the complaint, you should have mentioned that the reason there is no potential threat to Microsoft's operating system monopoly from direct competition by existing operating systems is that Microsoft has already eliminated any competing operating systems on the Intel platform from the market by it's anti-competitive practices. Check and see if you have any comments from Gary Kildall formerly of Digital Research.

Time does not permit me to present a detailed history of the events, but a short history shows that Microsoft has been engaged in business practices of questionable ethics since the early 1980s.

When the group at IBM who designed the original IBM PC was looking for an operating system, they were in talks with Gary Kildall of Digital Research to port his CP/M (Control Program for Microprocessors) from the Intel 8080 and Zilog Z80 platform to the Intel 8086/8088 platform for the IBM PC. One version has it that they were in final negotiations with DR when Gary Kildall left for a skiing vacation with the understanding that things would be finalized at a meeting the following Monday. The folks at IBM called to get in touch with Gary over the weekend and couldn't get a hold of him. Bill Gates found out about this because IBM was negotiating with him for a version of his MBasic to use as a basic interpreter in their system ROM. IBM told them of their problems with getting in touch with Gary Kildall that weekend. Bill Gates told them he had an alternative O/S waiting in the wings. This was not, in fact, the case; but he knew that a small company called Seattle Computer had already ported CP/M to the 8086 so that they could have an O/S for their computer. The story goes that Bill Gates bought Seattle Computer for $10,000 or $15,000 and sold the O/S called SC/DOS to IBM as MS/DOS and entered into a license agreement with IBM that allowed Microsoft to sell the O/S as MS/DOS while IBM sold the O/S as IBM/DOS. When Gary Kildall arrived in his office the following Monday, he called IBM only to find that they had already licensed the rights to modify and use MS/DOS from Microsoft. Digital Research marketed CP/M86 and C/Basic86 for use as an alternative O/S for the IBM/PC but it never got very much market share because IBM/DOS was part of the bundle shipped with every PC and a version of MS Basic was burned into every system ROM.

Later, about the time that Microsoft was shipping MS/DOS version 5, Digital Research released a competing product called DR/DOS 7. At the time, Lotus, Intel and Microsoft had published a memory specification called LIM/EMS which allowed Lotus 123 to use more than the 640 megabytes of main system memory on an IBM PC or clone to store data. A little company called Quarterdeck had

figured out a way of intercepting LIM/EMS system calls to use the Extended Memory available on a 80186 or 80286 system as LIM/EMS memory. At the time, Microsoft did not worry much about Quarterdeck shipping a memory manager as an add-on to MS/DOS but when Digital Research figured out how to incorporate those features (and others) into DR/DOS 7 something had to be done. Microsoft entered into agreements with companies like Compaq Computer that they would ship MS/DOS exclusively with their products. If Microsoft found that any vendor was shipping products with any competing O/S then Microsoft would charge them the retail rate for every copy of MS/DOS that the company shipped with their computers. DR/DOS enjoyed a strong after-market with hobbyists and systems integrators who wanted a superior Operating System but it wasn't enough to sustain their business in the face of the competition from Microsoft's exclusive agreements with the hardware vendors. Now, I think you will find that both Quarterdeck and Digital Research are not much more than footnotes in the history of the Personal Computer.

Another Digital Research product, Gem, was a Graphical User Interface (GUI) that was once used by one of the two leading Desktop Publisher software packages as the user interface. I don't remember the details of this case, but this software vendor was convinced that they would have greater market share if they converted their package to work with Microsoft Windows 2.0. After that, Gem was no longer bundled with the Desktop Publishing software and Gem dropped out of site.

One can only speculate on what the state-of-the-art for personal computing devices would be now if Microsoft had not created this monopoly market for it's operating system products. We are only now beginning to see enhancements such as voice and handwriting recognition technology. These are just two examples of technology that would have been in widespread use years ago if Microsoft had had competition in it's markets. I believe that every consumer of electronic devices such as telephones, personal computers and other consumer electronic devices has been harmed by the lack of choices and innovation in the markets of Operating Systems and productivity software over the last two decades. To give Microsoft significant market share in one of the few areas they have not been able to gain market share on their own, the educational market, is not a fair settlement.

Also, if you look at where Microsoft has focused it's strategy since they were brought to trial, you will see that they have shifted their restrictive licensing policies from the manufacturers to the end-users. The press is filled with many examples of complaints from Corporate IT executives about the restrictive enterprise licensing agreements that Microsoft is forcing them into. Microsoft has also designed their latest Operating System, Windows XP, so that you must supply them with a hardware ''signature'' in order to continue using that software beyond the introductory period. This feature also restricts you from installing this software on more than one computer. Microsoft is also engaging in litigation to prevent a competing O/S said to be capable of running some software designed for older versions of Microsoft Windows from ever coming to market. There seems to be very little in the settlement to prevent Microsoft from continuing these anti-competitive practices that have stifled the market.

Again, I wish that I had more time to substantiate some of the history that I have recalled or to suggest areas where the settlement could be improved but I work in a corporate IT department supporting Microsoft's products. The complex, buggy nature of these products takes up so much of my time that I have not had time to make a better comment before today's deadline. You may find that there are many other people in corporate IT that wish Microsoft didn't have the monopoly in the markets they do have so that they could choose better software for their companies.

Sincerely,
William A. McQueen

From: Marc Schuette
To: Microsoft ATR
Date: 1/28/02 6:28pm
Subject: Microsoft Settlement

Dear Sir/Madem:

I would like to exercise my right to comment on the proposed Microsoft settlement. I have been involved with the deployment of technology in private businesses for the last seven years and have been involved in the technology industry for the last 15 years. I am currently a Network

Administrator at a private company involved in the wholesale plumbing industry. During my career I have come across situations where system incompatibilities causes by what I feel is poor quality programming on the part of Microsoft. When I searched fro answers to these problems more often than not I came across comments that basically said ''Microsoft believes it should be that way so that the way it is and because they control the operating system it cannot be changed''. Open standards such as JAVA which Microsoft ''broke'' and then when caught in a lawsuit with Sun Microsystems simply refused to include in future versions of the Windows operating system even though the JAVA language held a good chance of easing the burden of portable of software across different platforms (operating systems). Also Microsoft has continually ''tinkered'' with the SMB protocol causing headaches and downtime for any company or person running the open source program SAMBA which allows a company to implement a robust and heterogeneous network. Under Windows 2000 Microsoft modified a version of Kerberos and then called it Microsoft Authorization Data Specification v. 1.0 and required strict disclosure agreement to see the format of the version they had released which had broken networking features that had previously worked.

Programmers were caught between a rock and a hard place because how could they repair the damage if they were not allowed to use the information Microsoft was asking them NOT to disclose?

By ''breaking'' or ''extending'' these current standards Microsoft makes it difficult if not impossible for new entrants and innovators to truly compete in the marketplace. Microsoft has too great of a hold on our desktop operating systems at the current time. The world has seen time and time again that because of the homogeneity of these networks a single virus can move through and cause huge amounts of damage. So why can't network operators move to a more heterogeneous network? The main reason is the limited compatibility between Microsoft and other vendors.

One might say well Microsoft just puts out a better product and the others cannot keep up so don't penalize Microsoft. That statement though could not be farther from the truth. How can anyone compete with a monopoly? If Microsoft can't compete then it simply tweaks the operating system and now a competing vendors product seems to perform far worse than a similar Microsoft product. Isn't it the place of the government to facilitate the marketplace? If so then how can the government or court overseeing this case accept this settlement and believe that acceptable public good was done? Please reject the current settlement and place much tougher restrictions or concessions on Microsoft that open the marketplace to the true innovators and loosen the grip of the incumbent, proprietary solution provider. I could go on and on and on but I think the message I wanted to get across has been made—don't approve the current Microsoft settlement and don't approve any settlement that falls short of facilitating the marketplace. Thank you for your time and consideration on this matter.

From: Vinson, Danny
To: ''microsoft.atr(a)usdoj.gov''
Date: 1/28/02 6:34pm
Subject: Regarding the dispensation of justice

Although no lives were lost in the actions of the Microsoft corporation, I feel that they have flown in the face of legality, ethical business behavior, and quality of workmanship for far too long.

Allowing this company to continue to control how the people in our market, and in the greater world, access information is dangerous, both for the immediate business environment and the longer term information economy. We are still dealing with the decisions made ages ago, when Roman engineers build roads to accommodate two horses pulling a two-wheeled chariot, in the sizes of our cars and space shuttle booster motors (which must be transported by rail, which is based on those same measurements).

The stage is set for us to establish an open environment, where ideas and information can flow free from corporate control—this is the fertile environment from which innovation comes, not from the domination of a single corporate entity.

Please don't allow this settlement to take place with only a token nod that Microsoft has strayed from the path of ethical behavior. Definitely don't allow them to propagate uncontrollably by giving schools their over-valued software and hardware resources—that will only breed a higher degree of market domination, no matter how nice it may seem that they would give things to children. Hold to the intention of this legal action, and remove their ability to subjugate smaller companies to their clearly greedy intentions.

Thank you for your time.
-Danny Vinson

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers? dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
ALAN WUNSCHEL

Washington, DC 20530

Dear Mr. Ashcroft:

Being in the data processing industry and witnessing first hand the valuable addition Microsoft has made to the industry, I am writing to support the November antitrust settlement between Microsoft and the US department of Justice.

The settlement is fair, as it requires Microsoft to make concessions that will facilitate competition within the industry without breaking the company up. I am glad to see that Microsoft will be able continue to do business as usual and grow at a rate consistent with its past performance. It is ironic that the states filing suit are dependent on Microsoft's technology.

Microsoft's innovation has set the standard for my industry and I look forward to seeing the settlement finalized so Microsoft can once again lead our nation's IT sector to its position of dominance in the global technology market.

Sincerely,
Kevin Faaborg

To: Judge Kollar-Kotally,

I am Phil Miller with an MBA. This is to request you to file my objection to the proposed settlement before the court in Microsoft vs. US.

As a daily user of Microsoft's products, I would like to have more options from its competitors. The Proposed Final Judgment allows a government sanctioned monopoly which is bad for all computer users and American business. The proposed agreement violates the three required standards from the courts, and is not even enforceable. It threatens all Microsoft competitors, and I object to this special treatment.

appreciate your your kind consideration.

Repectfully

Phil Miller

Microsoft is certainly not harming the consumer. I am a consumer and I love their products and the decent prices.

Many of these states and companies which are suing Microsoft are not doing it to benefit the consumers, but to get as much as they can. I attended a Jesuit University, Gonzaga U in Spokane. I find the people intent on getting money from Microsoft are just out to get their hands on some dough. Surely the justice department has more important things to concern itself with. Please, let's move on.

Subject: Microsoft anti-competitive history

The US Department of Justice must not settle with Microsoft on the proposed basis. I have spent 20 years in the venture capital and computer industry during which time I have personally observed Microsoft steal secrets, be duplicitous in its dealings, and through its dominance of the operating system force acceptance of other Microsoft products.

At least two companies of which I have been an investor and a director have directly been harmed by Microsoft monopoly practices. One (Stac) won a $100 Million judgment against Microsoft for stealing patented information. The judgment was no more than a slap on the wrist of the economic juggernaut. The other saw its premier product line integrated into Microsoft products and effectively given away contributing significantly to the company ultimately withering away..

As a personal user, I have wasted hours, even days, of my time dealing with dysfunctional Microsoft products, products that in a more competitive environment would have been driven from the marketplace or forced to upgrade in quality.

What other company can delay, or miss a promised introduction date for a new product by 6 or more months and not suffer competitive penalties? None other but Microsoft. Not General Motors, not General Electric, not United Airlines, not IBM, not ATT.

The time is here when the Federal Government, for which you have some responsibility, can be severely crippled by Microsoft business decisions and for which the Federal Government—along with the rest of us—can find no relief in competitive products or services.

The proposed remedies for the Microsoft antitrust case are a sham and sellout on behalf of the American people and hundreds of thousands of workers in the computer industry. Core ethical values are at stake in this matter.

Thank you.

The settlement terms as they are now do nothing of substance *except* to give Federal approval for MicroSoft's illegal behavior by stipulation! Microsoft ends up with a ''Get Out of Jail Free card''.

The pressure to cave in from the White House, Microsoft and Microsoft's friends must have been tremendous. It is the belief of the people that if any branch of the Federal government will stand fast against backroom dealing, it is the Justice department.

The same belief must have been held at DoJ, and perhaps still is, but has been and is being crushed by the sheer weight of Microsoft. Microsoft's contempt for the law and the judiciary is public knowledge, but it is as much or more the sheer size of it that threatens the very economy of which it is an important component.

This size will stifle innovation and cheat the American people out of the best that they might have in the future. But most important is that Microsoft's success in the settlement marks the end of the government's ability to create and maintain a true free marketplace. Other corporations will follow the precedent. And that will be the end of our economy as we know it. Please, please, do what you can to resist this behemoth.

I feel that any judgment against Microsoft is unfair and bias. I have been using Microsoft products for the past twelve years. I have tried other computer products such as Netscape and Wordperfect. These products do not even match the quality of Microsoft Internet Explorer or Word. The CEO's of Netscape and Wordperfect enticed the government to try and destroy the best Computer Program Company and destroy the quality of Computer Programming. Microsoft has raised the level of Computer Programs and their technical service that other companies do not want to raise their companies to that level. Other companies want to send out products that do not meet the expectations of the buyer and user.

If the government wants to penalize Microsoft for excellence in the field of Computer Programming than they should do the same to IBM, which has been fighting Microsoft for their Operating System for decades. The other companies that should be penalized is Ford, GM, and any other Car Manufacturer and electronics company.

When something that works so well the government wants to destroy it, why? Or, limit or lower the quality of the products that Microsoft produces that the rest of the industry does not want to rise to.

Sincerely,
Rodney J. Petersen

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

UNITED STATES OF AMERICA,
Plaintiff, MICROSOFT CORPORATION,
Defendant.
Civil Action No. 98–1232 (CKK)

MICROSOFT SETTLEMENT COMMENTS SUBMITTED BY

The Telecommunications Research & Action Center
National Black Chamber of Commerce
National Native American Chamber of Commerce

January 28, 2002

TABLE OF CONTENTS

I. INTRODUCTION

The Tunney Act (Antitrust Procedures and Penalties Act, 15 U.S.C. * 16) requires the United States District Court for the District of Columbia (Court) to hear comments to determine whether or not an antitrust settlement was reached in the public interest. In the case of the United States of America v. Microsoft Corporation (Microsoft), the undersigned individuals and organizations all agree that without significant modification, the Microsoft-U.S. Department of Justice settlement (proposed Final Judgement, November 6, 2001) is far too weak to restore competition to the software industry and, thereby, bring the benefits of such competition to consumers. Therefore, without additional provisions, such as those proposed by the nine state Attorneys'' General and Corporation Counsel who are pursuing further litigation, the settlement is decidedly not in the public interest.

II. STATEMENTS OF INTEREST

The Telecommunications Research & Action Center, is a non-profit, tax-exempt, membership organization based in Washington, DC Its primary goal is to promote the interests of residential telecommunications customers by helping them make informed decisions regarding telephone services. However, given the recent convergence of telecommunications, Internet, and other high technology products and services, TRAC is also concerned with consumers'' welfare as it is affected by applications, including computer software, which will shape communications in the 21st Century. TRAC is governed by a Board of Directors. Its funding is primarily (95%) from member contributions and the sales of its publications. TRAC is not affiliated with any corporation and does not accept revenues, other than from the sale of its publications, from industry sources.

A nonprofit, nonpartisan, nonsectarian organization, the National Black Chamber of Commerce (NBCC) is dedicated to economically empowering and sustaining African American communities through entrepreneurship and capitalistic activity within the United States and via interaction with the Black Diaspora. The NBCC

represents 64,000 Black owned businesses and provides an advocacy that reaches all 640,000 Black owned businesses. The businesses that the NBCC represents are both consumers of computer software and competitors in a market that has been shaped and dominated by the Microsoft Corporation. The NBCC joins these comments today in an effort to restore competition to this vital economic sector.

The National Native American Chamber of Commerce (NNACC) is organized to provide a coordinating forum to service Native American business, government, and civic organizations for community development. The efforts of the Chamber are also to provide services and benefits to Native Americans to assist them in competing in business and in government. The nationwide businesses that are members of the NNACC already face enormous challenges in competing in the New Economy. Monopolistic players such as Microsoft, who also engage in illegal business practices, make these efforts at competition nearly impossible. Accordingly, we join in offering these comments to the Court.

III. SUMMARY OF ARGUMENT

The proposed U.S. Department of Justice settlement contains inadequate enforcement provisions to protect consumers from Microsoft's monopolistic overpricing in the software market. Accordingly, the Court should adopt the more stringent settlements as proposed by the nine states Attorneys'' General and Corporation Counsel from the District of Columbia.

A. Microsoft as Monopoly

As a monopoly in the software market, Microsoft produces more than 90% of all of the software operating systems in personal computers (PCs) and approximately 90% of all of the software suites (including Internet browsers, word processing, spreadsheet, and presentation programs) used with those operating systems. From the beginning of this case, the Court has rejected Microsoft's defense that the nature of the software market in which it competes naturally leads to the dominance of one player. As one consumer advocate has noted, ''If a monopoly were really the natural state of affairs in this market, then Microsoft would not have had to engage in so many unnatural acts to preserve it.'' 1

The unanimous decision of the United States Court of Appeals for the District of Columbia affirmed that Microsoft has used its leverage to repeatedly engage in anticompetitive behavior and, in the process, has committed numerous violations of antitrust law. According to the Competitive Impact Statement issued by the U.S. Department of Justice, the Court of Appeals found that Microsoft:

(1) undertook a variety of restrictions on personal computer Original Equipment Manufacturers ''OEMs''); (2) integrated its Web browser into Windows in a non-removable way while excluding rivals; (3) engaged in restrictive and exclusionary dealings with Internet Access Providers, Independent Software Vendors and Apple Computer; and (4) attempted to mislead and threaten software developers in order to contain and subvert Java middleware technologies that threatened Microsoft's operating system monopoly.

As a result of Microsoft's actions, not only have consumers suffered from the immediate effects of higher prices for the company's software products and the continuous cycle of upgrades i Statement of Dr. Mark N. Cooper on ''The Microsoft Settlement: A Look to the Future,'' Before the Committee on the Judiciary, United States Senate, December 12, 2001.

required for their systems to function properly, they have also been adversely affected by the decline of choice, quality and innovation in the marketplace.

1. The Damage to Consumers

An amicus brief filed with the Court in 1999 estimated that monopoly overpricing by Microsoft has cost consumers an estimated $25 to $30 billion. 2 Other estimates put this figure at $10 to $20 billion. 3 In either case, the high and steadily increasing prices of Microsoft's products stand in stark contrast to those of personal computer systems and hardware, which as a result of fierce competition have plummeted in recent years. To some extent, Microsoft's strategy of bundling its products and the overall reduction in new computer system prices have also hidden these high prices from consumers.

The full cost of Microsoft's anti-competitive actions in squeezing out competing operating systems, Internet browsers, word processing, spreadsheet, and presentation applications from the marketplace is difficult to quantify. It is impossible to calculate how, without Microsoft's illegal business practices, competing products might have forced down software prices or brought new innovations to consumers. Such applications might have offered consumers additional choice on how they wished to equip and configure their computers. This de facto homogenization of the PC by Microsoft has led to other problems such as the acceleration of the spreading of viruses. For example, if one computer becomes infected, many become infected, as they share the same programming code with identical loopholes. 2 Remedies Brief of Amici Curiae, United States v. Microsoft, 84 F. Supp. 2d 9 (D.DC 1999)

(Nos. CIV. A. 98–1232, 98–1233). 3 Mark Cooper, ''Antitrust as Consumer Protection in the New Economy: Lessons from the Microsoft Case,'' pp. 847–851, Cooper Hastings Law Review, 200106, November 27, 2001.

Microsoft is now pursuing online applications in banking, news, travel, advertising and other areas. Of paramount concern is the fear that Microsoft will use its Internet browser and these applications to dominate the online business world in the same manner as it leveraged its operating system to control the PC desktop. This cannot be allowed to happen. The success of the Internet and those who do business on it depends largely upon freedom of access through a multitude of competitive applications. Such a vision would not likely be realized were Microsoft to become the Internet's sole gatekeeper.

B. An Inadequate Settlement

In their Proposed Final Judgement, the Court of Appeals recognized Microsoft's culpability and rightly called for ''prompt, certain and effective'' remedies for consumers. The Court is specific in describing these provisions. Among them are requirements that computer manufacturers have the freedom to make ''middleware'' decisions regarding what software they choose to offer to consumers as standard on their machines. Manufacturers are to be able to sell and promote Microsoft and non-Microsoft products equally, and customize their systems and software as they choose, with licensing agreements to reflect this and without fear of retaliation. The Proposed Final Judgement also frees other software and hardware developers to work on applications for the Windows platform, and requires Microsoft to disclose the technical information needed for them to do so.

Consumers would no doubt benefit from the decrease in price and increase in choice in the software market if the U.S. Department of Justice settlement with Microsoft supported, and made enforceable, all of the Judgement's provisions. Unfortunately, the settlement falls short of this goal, as it contains many loopholes. For example, while Microsoft is required to share technical information to ensure compatibility with other companies'' software, it has no obligation to do so if Microsoft determines that the disclosure would compromise security or damage licensing agreements. Microsoft, alone, should not be given the right to make this determination.

The Court of Appeals found Microsoft's ''commingling of code,'' the process by which Microsoft inextricably links the programming of its other applications to Windows and effectively ''locks out'' competitors, to be illegal. Yet, the proposed settlement conspicuously omits mention of an enforceable remedy. The settlement also gives Microsoft the power to unilaterally determine what is defined as a ''Window Operating System product.'' Based on its previous behavior, Microsoft is likely to have an inclusive definition. The company now dominates the Internet browser market, as its Internet Explorer application has become an integral part of the Microsoft operating system.

In yet another example of how consumers gain little from the settlement, Microsoft is also granted a loophole through which it can continue to pay other vendors when ''reasonably necessary'' not to develop or distribute competing products. As a result, innovation will continue to be stifled and consumers will not see or be able to choose products that Microsoft has paid to keep off of store shelves. Rather than fostering an environment that encourages entrepreneurship, growth and healthy business competition, the settlement will reinforce Microsoft's dominant role in the industry.

C. Additional Remedies Needed

In an attempt to address the settlement's shortcomings, nine states and the District of Columbia have offered remedial proposals. These proposals are now consumers'' last

chance at true reform in this case. Unlike those included in the settlement, the proposals will, if enacted, contribute to reduced software prices and ensure that consumers are at minimum given the option of making choices when equipping their computers. Specific proposed remedies would require Microsoft to:

Offer a stripped-down, unbundled version of Windows. Without built-in software such as the Internet browser, media player, or email applications, consumers will be able to better custom order PCs with only the installed applications which they choose to purchase. Share its code for its Internet browser with other software developers, thereby allowing for new products with new innovations and ensuring that consumers do not rely on Microsoft as the predominant way to the Internet.

Auction the right to create different versions of its Office software suite for use on other operating systems, such as Linux. Again, this provision eliminates Microsoft's application barrier to entry and gives more choice to consumers.

Include ''middleware'' software in Microsoft's latest operation system, Windows XP. This will enable software applications to universally, across non-Microsoft platforms, expanding interoperability of products and consumer options.

Consumers also support the nine Attorneys'' General and Corporation Counsel's efforts to advocate for a court-appointed master with real enforcement abilities. The U.S. Department of Justice settlement proposed a three-person technical committee to oversee Microsoft's compliance with the settlement. The findings of this committee would neither be made public nor revealed to the Court. In contrast, a court-appointed master would be able to more effectively respond if Microsoft violates the terms of the settlement.

Finally, the settlement offers no effective punishment to deter Microsoft from acting in bad faith. As it stands, the penalty for non-compliance with the agreement is only an extension of the monitoring period. The litigating states have proposed an alternative punishment with far greater consequences: the revealing of Windows'' source code.

Together, these steps are needed to effectively oversee and enforce any agreement with Microsoft, a company that has leveraged its dominance in the market to get what it wants at the expense of its competitors and consumers.

V. CONCLUSION

The proposed U.S. Department of Justice settlement alone does not remedy or address the finding of the Court of Appeals. It is not complete in its breadth, nor does it contain adequate enforcement provisions. For millions of consumers who rely upon a personal computer in so many facets of their lives, this agreement, as it stands, is decidedly not in the public interest. It will not make Microsoft's products more affordable or reliable. It will not give consumers greater choice of what software they wish to run or flexibility as to how they wish to configure it. It will not encourage innovation and competition in the software industry and allow consumers to reap the benefits.

Many on both sides of this case have complained about the length of the trial and the settlement process. An effective solution now appears to be within reach. We urge the Court not to allow a settlement that does not live up to the Judgment of the Court of Appeals and settle for settlement's sake. We urge that the Court consider and adopt the proposals put forth by the litigating states and the District of Columbia as a much more thorough and enforceable solution, one that will bring all of the above benefits to consumers who represent the public interest.

To whom it may concern, regarding the proposed settlement of the microsoft case.

I am not a lawyer, and have no sound legal advise to offer, and the time has past for that. I have been an employee of a number of companies who have found it impossible to compete with Microsoft because competing with them had little to do with quality of product and everything to do with control.

You do not have to look far at all for many overt acts that I think any reasonable person would call criminal. This is because of the high- pressure eminating from the top of the company, to win at any costs.

In my 20 years developing products across many operating systems and corporate structures, I have worked for WordPerfect corporation, Novell, and Corel, among others, and it has become increasingly obvious that quality has nothing to do with winning in the marketplace.

It is all about who controls the information patterns of the masses, whether it be Movies, Software, News, or Advertising.

This is not a new phenomenon. Once the Catholic Church controlled these things quite effectively with systems that greatly resembled the ever-expanding copyrights and patents on things today. Today, Martin Luther, sneaking out of the Vatican with his biblical transcripts would be hunted down as the latest Napster-ite, who thinks that works which interweave themselves so deeply into the roots of a population should not be controlled by a power-hungry entity such as a Church or a Mega-corporation. This does not mean that those who produce them do not deserve profit, but see what the billions paid for Windows every year buys us: In significant cases, less than what the remaining competition now gives away for free, because Microsoft has such a lock on the market. The profits are squandered every year on power.

There are dozens of competing products that could have easily taken that position had they controlled the power they had in their times as unscrupulously as Microsoft does. Corporate survival and hunger for power and profits are the reason we have antitrust laws. In this case, the public shame is greater, because it is the Copyright laws—an artificially- granted government monopoly—that establishes the Microsoft Monopoly.

If it were possible to still compete in this market against that Corporation, you would clearly be seeing much lower prices—the Microsoft take increases, but somehow the economies of scale in software production never lowers the price of the software, and there is never even consideration that you paid for dozens of versions you can no longer use because Microsoft has made them incompatible.

Microsoft is not an indispensible part of the market. If they vanished, within 5 years, there would be no trace left, and there would be competition for a little while until another corporation showed that it was the most vicious of those remaining and consolidated power.

I and thousands of people like me have started writing new software that is not susceptible to this overbearing corporate eternal ownership—which I have to believe is extremely different from what the framers of the Constitution thought they were doing in granting limited copyright and patents.

We have the technology to design around the original intent of these laws, and it is time that you look at seriously reigning in the moster that has evolved. Law of the mega-corporation, by the mega-corporation, and for the mega-corporation is not in anyone's best interest long-term, even if the mega-corporate advertising of today has the same persuasive power as the mega-Churches of old over the masses, tribunals, and courts of law.

The case against Microsoft was poorly made, and hardly justified, not that there wasn't a huge case to be made. But your remedies are worse than ineffective. They will do more harm than good. You have overturned the breakup, which might have had some effect, but likewise didn't get at the root of the problems, which I have tried to describe here. It is not Microsoft that is wrong but <insert any company> which succeeded by such viciousness would be just as bad, and I would be just as sorry to see Sun, Oracle, or even my own company AOL Time Warner be in such an abusive position.

I think that when a company abuses the public trust of its granted monopolies as badly as Microsoft has, the appropriate and natural action is to revoke their monopoly, which in this case is their copyright. With that arrow in your quiver, it would not be difficult to convince companies in the future to act more in the public interest. Short of that, please abandon your current pursuits and admit honestly that the corporation has won and the country has lost. It is really

rubbing salt in our wounds to offer something that hurts more than it helps and claim you have acted in our behalf.

Human rights are more important than copyrights or corporate rights. Many technology companies go under every year. It would be better, though if there was a better connection between profits and service. If you do not, the next revolution is on the horizon. You cannot lock up everyone for violations of intellectual ''property'' any more than the Church could, however much the corporations want to control everything. And corporations do not need an absolute eternal copyright as much as they might claim.

And America will become the ''old world'' while other countries such as Russia have their patriots thrown in prison in America for crimes of conscience by the dozens of new FBI/DOJ departments created for this new opression — certainly not for any overt act depriving a corporation of it's profit in the recent Sklyarov case. Do you really want to be the ''Department of Justice'' which presided over such a debacle? Where is justice for we, the people?

Subject: Microsoft settlement

Spending any amount of time on an computer one cane encounter MANY areas of UNDUE influence by Microsoft.

This now even extends to websites such as STARBUCKS. I had an account with them until they formed a partnership with Microsoft and redesigned their (Starbucks') website based on Microsoft Passport! My old account is no longer valid.

And, even more, one cannot even approach or get onto or even contact the Starbucks site unless one accepts Microsoft Passport cookies! Not even being allowed on the site without Microsoft's surveillance! I consider this WAY TOO MUCH POWER AND INFLUENCE! And this is only one example!

I've sent several emails to Starbucks * * * finally got to them through Planetfeedback* * * and still no getting near the site.

Microsoft is extending it's web of power and influence AND CONTROL into so many areas of public and private communication. MSNBC. Newsweek. Just to name a few. This may, now, look rather harmless, but* * * they what about the future. One company should not have so much control over so many facets of our daily lives. And the government, in this matter, doesn't look to clean in this case, either. I remember seeing news footage of Gates in Washington set to meet with government officials WHILE MICROSOFT'S CASE WAS BEING HANDLED BY THE GOVERNMENT! I the, immediately, thought about CONFLICT OF INTEREST! Talk about impropriety!!!

Microsoft seems to have no qualms whatsoever about tossing around their incredible weight and thumbing their nose in the air at us regular Americans* * * and for that matter, the laws of this great country!

There's no remorse. No head bowed seeking the government's forgiveness. Does this tell you anything!

It's in your court now! Don't shame the rest of us HONEST Americans by holding Microsoft and it's bullying practices up to a different standard of law than the rest of us!

Thanx for listening!

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

I am writing to express my support in the recent settlement between Microsoft and the federal government. It is with sincere hope that this is the end of any litigation on the federal level. Considering the terms of the agreement, Microsoft did not get off easy at all. In fact, due to this agreement, Microsoft has to make several important changes to the way that they handle their business.

For example, Microsoft has agreed to disclose and document for use by its competitors various interfaces that are internal to Windows'' operating system products. This alone is a first in an antitrust settlement.

Microsoft has also agreed to make available to its competitors, any protocols implemented in Windows'' operating system products that are used to interoperate natively with any Microsoft server operating system.

With the many terms of the agreement, I see no reason for the government to pursue further litigation on any level against Microsoft. Not only would it be a waste of time, but a waste of money as well. I fully trust that you would agree. Thank you.

Sincerely,
Lydia Rich

Microsoft Settlement
U.S. Department of Justice-Antitrust Division
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers’ dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies. Thank you for this opportunity to share my views.

Sincerely,
Viki L. Williams

Subject: Microsoft Settlement

To the Department of Justice:

I am writing to express to you my horror (and I use that word deliberately) at the proposed settlement to the current Microsoft antitrust case. I believe the proposed remedies are in no way commensurate with the crimes of which Microsoft has been found guilty.

Almost all of the subsections under the Prohibited Conduct section contain gaping loopholes. For instance, one subsection provides for the removal of references (on the Desktop and in menus) to Microsoft applications, but in no way provides for the removal of the application itself. Such an application could still be activated by other means, and, by its presence on the system, could interfere with the proper operation of non-Microsoft applications. Microsoft has already proven itself to be very adept at exploiting such loopholes and a truly fair and effective Final Judgement must seek to close them.

At —best—, the remedies in the PFJ will help to slow the growth of Microsoft's monopoly, but will do nothing to diminish it. At worst, such a Final Judgement would actually help to protect Microsoft from further legal action if they continue their anticompetitive practices. And it would be foolish to believe that they would not do so.

In our society, criminals theoretically are supposed to serve jail time and/or compensate their victims for their suffering. This settlement requires neither of Microsoft.

Microsoft has over the years repeatedly raped OEMs, ISVs, consumers, and others, all the while thumbing its nose at America's laws and system of justice. Now it is time for Microsoft and its corporate officers to pay the price. I am counting on the Department of Justice to see to it that the American people are properly protected and compensated.

I believe that the AOL suit against Microsoft is not warranted and is doing Microsoft an injustice by prolonging this litigation. I could very well use Netscape as my browser, but prefer Internet Explorer which is an excellent product. AOL and the other companies that are seeking this suit know that Microsoft has cash and are just trying to get some of it into their own pockets. It would be better if they stopped this nonsense. They should get down to the business of running their own companies better and using innovations of their own to produce better software and not trying to blame Microsoft for their own mistakes and problems

To: Microsoft ATR
Date: 1/28/02 6:52pm

Your Honor,

I know there is a deadline for comments and I am not the most eloquent arguer on short notice, but here are some of the reasons I feel Microsoft must be severely punished.

Microsoft is not a company we can trust with our technological future. They have a history of ''thumbing their nose'' at the legal system through an expert legal team of ''loophole finders.''

Netscape was only one in a long line of Microsoft casualties. Remember when Lotus 1–2–3 and Word Perfect were king?

What Microsoft is good, perhaps even ''innovative'' at: bundling their products for competitive advantage, giving them away, either for free or a ridiculously low price, then once the competition is gone, and/or their stranglehold on the market is secure, they charge customers hideous prices for marginal upgrades. (Mostly over-rated ''bug fixes''.) Several years back, Microsoft shrewdly invited everyone with pirated copies of their various office product to become ''legal'' though a free registration. The amnesty plan worked, and the now legal owners, feeling they had ''one up on Microsoft'' happily paid for the never-ending upgrades.

In general however, Microsoft is most definitely NOT a technologically innovative company. With few exceptions, (the ''talking paper clip'' for one) their announced ''innovations'' are directly copied from others. For specific examples, see http://www.vcnet.com/bms/departments/innovation.shtml . Bill Gates, often cited as some ''genius'' rather than the megalomaniac that he is, did not even see the relevance of the internet until he saw Netscape's market penetration.

I personally recall purchasing a Netscape browser upgrade several years ago. (My first copy was in my starter kit when I joined Earthlink—and I assume Earthlink paid a license for the privilege of distributing the browser, as it was not free at the time.) Once Microsoft ''woke up and smelled the internet'' they began giving Internet Explorer away to eat away at Netscape's market share. The effect was immediate, and Netscape had no choice but to follow suit. I would also add that at the time Microsoft began giving away their browser, Netscape had the technologically superior product, which had already incorporated the ability to handle javascripts. At the time Microsoft made their infamous deal with AOL, Internet Explorer still did not handle javascripts, which is one of the reasons people used to hate browsing through AOL. I also recall how I complained to AOL about their tactics—they would ''nag'' me at log-on and log-off to download the IE browser—obviously part of the contract.

But that wasn't enough for Microsoft. Their version of innovation was to force Netscape and every other browser into obsolescence by ''welding'' Internet Explorer into the Windows operating system so that it cannot be deleted. While I'm sure that there are many in the pro-Microsoft camp that will give very impressive reasons for why this is necessary and innovative—I don't believe a single one. I consider myself to be a fairly savvy computer user, versed in both PC and Mac platforms, but I have yet to find a single benefit to the consumer that was created by tying these two products together. To be specific, I cannot see any difference in functionality between the bundled Internet Explorer on the Windows computer I use at work versus running Internet Explorer on the Mac I use at work for graphic development. Both programs work as they are supposed to, opening HTML pages and connecting me to the internet. There is only one reason that Microsoft bundled these products* * * to wipe out Netscape and dominate the internet.

And what will Microsoft gain? Well, look at where they are focusing their energy today. Now they are forcing anyone who buys their recent upgrade packages to apply for their internet ''Passport'' account. $400 Rebates/incentives are driving consumers to sign up for MSN as Microsoft takes aim at AOL's market domination. Microsoft has one aim, to control every exchange of personal, consumer, and financial information. Since I have watched a never-ending stream of examples of unethical and anticompetitive behavior from this company, I can say this without reservation: This is not the company I want peeking into my wallet and tracking my visits on the internet. This company is Big Brother incarnate.

Respectfully yours,
Mary L. Paul Stewart

Subject: Microsoft Settlement

I, as a member of the computing and electronics industries for more than 20 years, am completely opposed to the proposed Microsoft settlement, which will do nothing, in my opinion, to open the marketplace to competition nor innovation.

My definition to a satisfactory settlement will be the lowering of market prices for Microsoft operating systems and associated applications to ''reasonable'' levels for businesses and consumers. $450 for a word processing package, per computer, which a consumer has to buy to maintain interoperability with professional standards? $350 for an Operating System?

This pricing level is ridiculous, and Microsoft's margins reflect this! They can only command this price because of monopoly. Microsoft's margins are not a reflection of their innovation—Microsoft software quality and security is known to be among the worst ever in the marketplace and they've only ''innovated'' when forced—but of their sheer market saturation and the need for people to have compatible products in order to exchange information successfully.

The dynamic of the software marketplace is much different from, let's say, automobiles, as the key for marketability is interoperability. If you cannot exchange information in standard formats, such as between word processors of different authors, the application is useless. Microsoft has obtained a monopoly on many aspects of operating systems and applications through brute force and interoperability with Windows features, which they control.

The settlement does not address two key areas neccessary for success—splitting of the Microsoft OS and Applications divisions, and complete opening of internal OS APIs such that compatible and interoperable applications AND operating systems can be easily built. The dynamics of launching a competitor to Microsoft applications like Office would be formidable without drastic measures to equalize the marketplace, so unless those measures are taken, we will continue to be held hostage to Microsoft's monopoly. All the other measures of the settlement, such as educational software donation, are completely self-serving to Microsoft, which wants to overcome Apple's penetration in education anyway. Someone in Redmond will be congratulating themselves if this settlement is adopted. The rest of us lose* * *

Sincerely,
Dave Medin

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA
UNITED STATES OF AMERICA,
Plaintiff,
VS.
MICROSOFT CORPORATION,
Defendant.
STATE OF NEW YORK ex rel.
Attorney General ELIOT SPITZER, et al.,
Plaintiffs,
VS.
MICROSOFT CORPORATION,
Defendant.
Civil Action No. 98–1232
Civil Action No. 98–1233
WEB COUNSEL, LLC'S
COMMENTS ON DOJ'S REVISED PROPOSED FINAL JUDGMENT

Web Counsel, LLC is an interactive marketing company that will be harmed if the Proposed Final Judgement agreed to by the Department of Justice and Microsoft Corporation is approved. We believe that the proposed judgement is not in the public interest, and while not perfect, the dissenting states proposal is much closer to the remedy that the U.S. Supreme Court has required to ''unfetter a market from anticompetitive conduct,'' to terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''

We fully support the remedies proposed by California, Connecticut and the other dissenting. Their comments are incorporated herein by reference and the material set forth below is meant to complement and extend the remedies proposed by the dissenting states. WE THEREFORE, submit these comments as allowed by the Tunney Act.

Microsoft will push the limits of any judgement and will not be cooperative with any voluntary enforcement mechanism.

Microsoft has shown a history of not living up to the spirit of their prior settlements and agreements. As examples:

1. Microsoft's first settlement with the Justice Department included a two word phrase that Microsoft used as a loophole to totally gut the settlement's effect in the marketplace. The proposed DOJ/Microsoft settlement is replete with phrases such as ''provided that'', ''except that'', ''so long as'' etc. Microsoft will certainly use these phrases to thwart the few significant restrictions in the proposed settlement.

2. The Tunney Act provides that Microsoft is to report all contacts with government officials. Microsoft as usual has taken a very narrow reading of this requirement and not reported many contacts, particularly with legislative branch official.

3. Bill Gates'' was very uncooperative in his deposition. What should have taken a day stretched to 3 days. He did his best to avoid answering questions, by arguing such things as the definition of the word ''is''.

4. Microsoft fabricated or was grossly negligent in presenting their evidence. At several times in the trial, they had to retract testimony after DOJ's counsel was able to show that the facts did not comport with the Microsoft witness'' testimony.

5. Microsoft's first browser was not created by Microsoft, but rather licensed from Spyglass, a small innovative software company. The license required Microsoft to make licensing payments to Spyglass, but Microsoft held up these payments, which were vital to Spyglass to continue developing its browser. Only when Spyglass made it clear that it would no longer actively develop its browser did Microsoft make the payment it was contractually required to make.

II. Web innovation has stalled since Microsoft got a monopoly in web browsers

Prior to Microsoft entering the market for web browsers Netscape and many other companies, such as Spyglass, were developing innovate new features and services in their browsers. The first casualty of the Microsoft monopolist entering the browser battle was not Netscape, but the many smaller innovators, that had been pushing Netscape to make its product better.

Microsoft created a concept called ''embrace and extend'', which should be more properly called ''copy and crush''. Microsoft at its option will copy another company's software, buy the company or license the software. It then adds a few features and uses its monopoly profits and tie-ins with its other monopoly products to crush the competitor. The result of this process is that the monopolist dives the small innovators out of the market. As a result innovation is stifled.

The Microsoft browser illustrates the monopolist's lack of innovation. Anyone who uses Microsoft's Internet Explorer software will find dozens of things that need improvement or that would normally motivate a user to switch to a competitor, but there are no viable alternatives. To illustrate some of the many areas in which Microsoft has failed to innovate set forth below are only some of the problems with the Microsoft browser. IE is unreliable and insecure. IE crashes more often than any other software on our computer. The lost work and wasted time costs the U.S. billions of dollars. IE is unreliable, because Microsoft as a monopolist does not have abide by industry standards. It creates its own standards and changes them, regardless of the costs imposed on third parties. The browser is also very insecure and is constantly having to be patched. Were Microsoft not a monopolist of the OS, the browser and the office suite, many organizations would have rejected it for these reasons. This lack of security has now risen to the level of a national security issue. Hackers, terrorists and foreign governments can exploit this insecure product to the detriment of the U.S. government, its economy and its citizens.

Micropayments—Micropayments are crucial for websites that sell information, both text and images. People will pay from 10 cents to $2.00 to read an article or look at an image or chart, but there is no widespread payment system to make these small payments. The Microsoft payment systems is clunky and invades a user's privacy, as a result, few people use it and even fewer buy articles. Because, Microsoft has kept third parties from accessing the necessary APIs and other parts of the system, the Microsoft monopoly has a has put thousands of web content providers out of business. These content providers can not sell their valuable material, because Microsoft wants to control any micro-payment system. As a result web content providers could only rely on advertising revenue, even though they could sell millions of articles and graphic images with a proper micropayment system. The necessary APIs have to be made public and barriers to the use of non-Microsoft payment systems with Microsoft software have to be removed at both the browser level and the O/S level.

Page editing is difficult—Billions of additional dollars are wasted every month, because web pages are so difficult to create. The difficulty of creating pages for the IE browser increases sales of Microsoft's page editing program, Frontpage. Typical of Microsoft's efforts to exclude competitors, Frontpage is designed to write proprietary codes that can't be read by other browsers or that causes these browsers to crash.

Bookmarks work poorly—The IE browser bookmark feature (called ''Favorites'' by Microsoft) is cumbersome, requiring a multi-step process. Bookmarks can only be to a file, not a spot in a file, so finding information in very long files can be very time consuming. Others have better bookmark systems, but MS has no incentive to incorporate them or improve its bookmarks. While a minor point, this functionality, like other cumbersome features in IF.. is used billions of times each day world-wide, so even a small improvement would huge amounts of time when added together.

Integration of the browser with other functions & with XML—Microsoft has discouraged efforts to easily move information, between web pages and other applications, except where Microsoft products are involved. Extensible Mark-Up Language (XML) has been around for several years, but since Microsoft has a monopoly in browsers they need not worry about a competitor developing this technology, due to the barriers to the entry found by the trial court. At the present time, browsers can display text and graphics, but humans have to organize the information displayed. XML is like the West Key System organizing information into categories for easy retrieval and use. MS is trying to monopolize this standard also and with their three monopolies is likely to succeed.

Browsers on non-PCs—Microsoft has tried to force variations of IF. browser onto personal digital assistants (e.g. Palms) and cell phones, even though they are not suited for these devices. As a monopolist Microsoft has no incentive to develop a different type of browser for non-personal computers. If a company does develop such a non-PC system, Microsoft can move quickly to stop them, as they did with Web TV. Because of its huge monopoly profits, Microsoft was able to pay an extremely high price for this system that displayed website on TV. Once it controlled this potential competitor, Microsoft efforts to further develop this system fell short of the level expected when a non-monopolist invests that amount of money.

Printing sophisticated pages—Printed web pages and web pages on computer screens do not look the same. This causes tremendous

difficulties for Web Counsel and other web developers. Web developers are restricted to basic layouts, even when there would be significant advantages to a more sophisticated layout. The primary solution in this area is a non-Microsoft solution, Adobe Acrobat .pdf files. Microsoft does not see this system as a threat, because .pdf files are very difficult to create and use. Microsoft efforts to make printing web pages is minimal.

Customizing feature—Microsoft makes adjusting and customizing the Internet Explorer browser very difficult. If a company creates a browser based service that needs a customized browser, they must hire expensive programs and even then, customization is very limited. MS restricts API information, uses restrictive licensing and insists on maintaining IE's appearance.

From the individual's user perspective, finding the places and understanding obscured references such as ''Use TLS 1.0'' or ''Show Friendly URLs'' means that most people will have to use their browsers the way Microsoft wants them to use it.

Microsoft, like all monopolists, does not innovate, because they have no economic incentive to do so. Microsoft used to add innovative features to its browsers, albeit mostly copied from other companies, principally Netscape. Microsoft stopped making significant improvements once Netscape stopped innovating. Netscape stopped innovating, because Microsoft had used its monopoly to make sure that there was no money to be made in browsers.

Microsoft already owns the browser market, why should they try to do something innovative, when their market share is much more likely to go down, than up.

Ill. Microsoft's monopolies prevent fair competition and must controlled

Microsoft has monopolies in not only the OS and the browser, but also in the Office Suite software. (This claim was originally made in the state's complaint, but later dropped to harmonize its complaint with the DOJ complaint.) These inter-locking monopolies give Microsoft even greater power than a normal monopolist.

Microsoft's confidence in the power of their monopoly can be seen from their bail-outs of their competitors. Microsoft invested millions of dollars in Apple, the only significant operating system alternative, (although Apple's OS won't run on Intel processors.) Microsoft claimed it was an investment to support Apple, whose users bought Microsoft Office suite software for their Apple Macintoshes. While unlikely, Microsoft's true motivation became evident when they tried to prop-up Corel's WordPerfect office suite. Microsoft's effort to co-opt this competitor was so blatant, that regulators opposed Microsoft's investment and Microsoft withdrew there offer.

Microsoft's competitors know that the Microsoft's monopolies have created a $36 billion treasure chest of monopoly profits. They also know that Microsoft will use these funds and the unlawful tactics outlined by the trial court to oppose anyone that should try to compete with them in their monopoly areas. These funds and Microsoft's hardball tactics scare away potential competitors and innovators. If the DOJ/Microsoft proposed settlement is accepted the perverse result will be that potential competitors will be even more discouraged, because they will see that Microsoft got no monetary penalty and was rewarded with a monopoly for using unlawful tactics. Even now venture capitalists reject out of hand any business plan that Microsoft might see as competing against their core monopolies.

Since Microsoft has 3 inter-locking monopolies, the remedies must be more comprehensive and certain, particularly, since Microsoft has shown that they will not live up to the spirit of the settlement language and are likely to violate the actual letter of the settlement. While I support all of the relief requested by the nine dissenting states, I believe that Microsoft should also be subject to a substantial fine so that they do not benefit from, nor use their ill- gotten gains to unlawfully further their monopolies.

IV. Enforcement

The proposed Microsoft/DOJ enforcement procedure will do little to prevent improper actions by Microsoft. The voluntary dispute resolution procedure will not work. Microsoft will either not volunteer to be punished or more likely they will drag out such procedures and Microsoft will win because of the delay.

Microsoft traditionally comes out with a major new OS about every three years (e.g. Windows 95, Windows 98, Windows XP [2001]). The success of these systems are determined in the first year, so as we have seen Microsoft has tried to constantly delay the present litigation and it has succeeded. The original complaint was filed by DOJ in May of 1998. In the meantime, Microsoft has come out with the minor OS upgrades Windows ME and Windows 2000 and the major new OS, Windows XP. None of these OS's have been restricted, by the DOJ and during this time Microsoft has continued to make extraordinary profits even during the recent down economy.

The new Windows XP has several features that continue to unlawfully leverage Microsoft monopolies, e.g. the Passport system. While it is theoretically possible to run Windows XP without the Passport system, the average user will not be able to figure this out and the software repeatedly demands that the user sign-up for the Passport system and provide their private information to be put under Microsoft's control.

If the court wants to do justice now, the final settlement must have a quick and certain arbitration procedure. Failure to include such a provision will result in Microsoft complying with the orders, but only after they are irrelevant. A clear example of this is the ''concessions'' that Microsoft has made as to the web browser in the proposed DOJ/Microsoft settlement. Microsoft made the concessions because, its unlawful acts have won the browser battle. Microsoft is happy to concede, here and in other areas of the proposed settlement, points that don't restrict what it actually wants to do or that are irrelevant in the marketplace.

Not only is speed essential, but the enforcement procedures must provide a way to expose Microsoft's efforts to intimidate third parties. Microsoft is notorious for threatening not only its competitors, but its customers, something that only a monopolist can do (e.g. threat to Compaq to cut off sales of Microsoft operating systems, see trial courts finding of facts.) Enforcement must include an anonymous reporting feature and substantial penalties swiftly enforced, otherwise Microsoft will continue its intimidation and accept its conduct penalty, if any, many years later after it is irrelevant.

V. The DOJ/Microsoft proposal will only lead to more litigation

Microsoft and its abuse of its monopoly have injured many parties, and regardless of how you rule, there will be substantial litigation as evidenced by the recent action brought by AOL/Time Warner against Microsoft. The AOL suit, however, also illustrates what will happen if the court adopts the proposed DOJ/Microsoft proposed settlement. Litigants, as has AOL, will move to further restrict the monopolist's actions; litigants will bring actions in the courts instead of through arbitration and Microsoft will delay this litigation for years. The resulting uncertainty will hurt the United States leadership in software at all levels.

The software industry is not prone to litigation, but companies will be left with no options to protect themselves, if this court does not provide an adequate enforcement mechanism and fair settlement, that is perceived to be fair.

VI. Java should be required

The public interest and competitive fairness require that Microsoft provide a quality Java interpreter with every copy of their web browser. Much of the functionality, that we and other web developers have built into their websites is based on the Java language. If Microsoft gets away with not providing Java support in their browser, as they have already done with Windows

XP, the results with not be in the public interest: tens of billions of dollars that have gone into programming sites in Java will be wasted tens of thousands of website will lose some or all of their functionality, and Microsoft will have another monopoly, this time in web languages. If nothing else, the DOJ/Microsoft proposed settlement, must be amended to require Java support.

WE, THEREFORE request that you reject the revised proposed final judgment by the U.S. Department of Justice and Microsoft Corporation, and that you adopt the proposed judgement by California, Connecticut and the other dissenting states, that you impose a substantial monetary penalty on Microsoft for their unlawful acts, and that you grant such other relief as is requested herein and you may determine to be in the public interest.

Subject: Microsoft Settlement

Microsoft has lost focus on the best interests of consumers. The company now places its own ends above those of the consumer. With some companies, this is often understandable and acceptable. However, Microsoft, as ruled by the court, monopolizes an integral component of the computing industry, an industry that has become a primary driving force in the national economy. Consequently, until Microsoft's monopoly is either no longer in place or is no longer viable, the interests of the consumer public must take precedent, and it is up to the government, as representatives of the people, to ensure that the best interests of consumers are pursued. And, while the current settlement agreement between the Department of Justice, nine state Attorneys General, and the Microsoft Corporation, does take some significant strides, it contains multiple loopholes that would cause little to no adjustment in the tactics of Microsoft, a company that has been proven to abuse the monopoly it holds and has been seen to exploit such ambiguities often with brazen disregard for the intent of the agreement in which they reside. One significant loophole, the failure to adequately define what is and what is not an operating system, is the focus of this letter.

Computing and Commodities

Commodities. They are the foundation of the computing industry. However, based on context, they can often go by other names such as objects, standards, and libraries. Simply put, commodoties create an environment in which something can be reused multiple times and interchanged easily. They are the cornerstone of the success of the IBM PC, the World Wide Web, object-oriented programming, and grid computing. They enable competition and promote innovation, often at amazing speed. They form the basis for the goal of permitting any device to work with any data at any time at any location and the hope of writing a program one time and have it run anywhere and on any device.

When an individual goes out to purchase a personal computer, that person can choose from multiple PC vendors including Dell, Compaq, IBM, Hewlett-Packard, and Sony, to name a representative few. More often than not, he or she does not have to worry about whether or not the printer they purchased or the scanner they already own will work with the new PC in which they are investing. That is because the PCs from all of these manufacturers are based on a common, open architecture. The open architecture of these machines ''commodotizes'' the machine itself, allowing them to be interchanged easily. This allows for a large degree of competition between the vendors, lowered prices for consumers, and expedited innovation. In fact, according to the Department of Commercel, PC prices fell 26 percent per year between 1995 and 1999 due to this rampant competition. When that individual is examining those PCs, they can choose between processors from both Intel and AMD. Generally speaking, he or she does not have to worry about whether or not the spreadsheet program they purchased or the service provider they are using to access the Internet supports the processor they are examining, as long as the Windows operating system supports it. In this case, the Windows operating system ''commodotizes'' the processor. Once again, the consumer benefits from intense competition between the processor companies yielding lower prices and greater innovation. Processors run faster and cheaper now than ever before, and the bar seems to be raised by this competition on almost a weekly basis.

When most people think of the Internet, they are actually thinking about only one component of the Internet, the World Wide Web. The success of the web is based on universal standards for the delivery and access of information. These standards ''commodotize'' the sender and receiver of that information. If the standards are followed, the end user, the consumer, does not have to worry if the server he or she is accessing is running Microsoft Internet Information Server (IIS), Netscape Enterprise Server, Lotus Domino, IBM WebSphere, or Apache. The standards ''commodotize'' the web server. This enables significant competition in the web server space, allowing the buyer, the presenter of the data, to choose from any number of servers. And, thanks to this ''commodotization'', the growth of the Internet, in terms of individuals accessing it since the inception of the web, has increased faster than any other medium preceding it, truly yielding immense consumer benefit.

The PC Operating System Commodity

Following the same logic, there is no reason that consumers cannot realize the same degree of consumer benefit and innovation from competition in the PC operating system market. The PC OS can be ''commodotized'' in the same way as the open PC hardware architecture, the PC processors, and the web servers mentioned above, yielding the same benefit to consumers and accelerating innovation. The methodology for sending data to and from a PC OS can be standardized following the same patterns as those detailed in the examples. When a consumer wants to run an application such as a word processor, speadsheet, or personal finance manager, he or she should not need to be concerned about the underlying operating system any more than he or she is concerned about the brand of the underlying PC or processor. It is an unnecessary level of complexity. This approach does not preclude competition in the PC OS space any more than it does in the PC, processor, and web server markets mentioned in the examples. In fact, it promotes it.

However, while such ''commodotization'' of the PC OS yields the greatest consumer benefit in lowered prices, increased competition, and accelerated innovation, it does not allow Microsoft to retain the monopoly grasp on that market that it currently holds and the resultant high profit margins. Consequently, rather than working in pursuit of this goal on behalf of consumers, Microsoft continually works in opposition of it actually working to undermine it, leveraging its monopoly and using tactics such as ''application integration'' to thwart this goal resulting in reduced consumer benefit, slowed innovation, and maintainence of artificially high prices.

Achieving PC OS ''commodization'' is pursued in two different ways: (1) the development of middleware and (2) the restriction of what is and what is not a component of the operating system. Middleware is software that sits between the application and the operting system. Software developers write their applications to the middleware rather than to a particular OS. This allows an application to be written a single time and run on any operating system supported by the middleware. However, as the advantage of middleware is to allow portability of applications across operating systems, it is imperative that the middleware be separate from the OS. Examples of middleware are Java and the Internet browser. Applications written in Java or to the browser, should be accessible on multiple operating systems without needing rewrites. However, as mentioned, such an approach, while benefiting consumers and application developers, does not benefit Microsoft. Consequently, Microsoft has strived to undermine the former and control the latter. Bill Gates,

himself, realizes the benefits of middleware and articulates the intent of Microsoft to undermine it when he states in an email in January 1997, the following in regards to Java support in Windows. ''To avoid middleware taking over an operating system you have to make sure the integrated services are different from the middleware—otherwise the middleware approach has no disadvantages and it wins. I think the path we were going down of building on [Java's Abstract Window Toolkit (AWT)] was a sure disaster—it was creating a situation where pure 100% Java applications would look just as good as pure Windows applications which we have to avoid.'' So, while pure Java applications looking as good as pure Windows applications would be a boon to consumers, it was undermined by Microsoft to protect its monopoly. An internet browser that could run on any operating system would present a universal platform for application development and a universal ''client'' for the consumer. However, such a universal client would undermine the Windows monopoly. Whereas Microsoft could have adjusted the OS to utilize the universal client, maintaining a separate browser client that could be ported to multiple operating systems, Microsoft chose instead to modify the browser client to accomodate the OS, thus eliminating the universal promise of the browser and destroying the resultant consumer benefit it would bring. These tactics could only be successful in an environment where there is no competition for the OS. Otherwise, consumers would flock to the OS that benefits them the most. In today's environment, Microsoft decides what is and what is not beneficial to the consumer. The consumer has no choice.

Inter Alia, Among Other Things

The current settlement agreement concentrates on addressing the middleware issue. However, it avoids addressing the second requirement of reaching the ''commoditized'' OS, a situation that is exploited by Microsoft in an increasingly frequent manner showing no indication of abating. To reach the goal of the ''commoditized'' 0S, a strict definition is needed of what is and what is not part of the operating system. Without such a definition, with its monopoly in place, Microsoft can continually ''integrate'' what is generally deemed as application software into the operating system in the same manner they have done with the browser. Two words in the text of the settlement agreement permit this tactic of Microsoft to continue unabated to the detriment of consumers. ''Inter Alia''. They are found in the definitions section of the agreement within the definition of an ''Operating System'' (Section VI, Paragraph P.). With these two words in place, Microsoft can ''integrate'' anything and everything it sees fit into the operating system. This is easily seen in the latest iteration of its Windows operating system, Windows XP, where Microsoft has ''integrated'' its version of media ''application'' software into the OS. While there are benefits of integration, they are shortsighted and self-serving and do not present the greatest benefit to consumers. For instance, a manufacturer could produce a part that works specifically on a 2002 Ford Thunderbird. The benefit is that the part works wonderfully on that one car, as it is custom-made for that vehicle. However, how much better off is the consumer if the part is made to work on 50 different vehicles as opposed to the one? Immensely. Integrating application code into the OS is no different and yields the same results. Consumers benefit only in the short term and only as long as they continue to use the one OS to which the application code has been welded. Is the integration necessary? Not at all. Is it self-serving to the OS owner? Most definitely. Is it in the best interests of consumers? Not a chance.

Not only is the integration unwise from a usability perspective, it also leads to higher prices. How much cheaper can a single part be mass-produced for 50 different vehicles as opposed to a custom part for each one? The custom, integrated part is always more expensive. However, in this case, the consumer is blissfully ignorant of these unnecessarily higher prices for no other reason than we are all driving Thunderbirds, and the excessively high price of the part is ''integrated'' in the cost of the overall car. To date, the measuring stick for allowing Microsoft to integrate code into its OS is whether or not the integration benefits consumers. This is the wrong approach. As we have seen, there will always be an argument for how the integration benefits the consumer. However, the question should be, ''Of all of the options available, does the integration option present the best option for consumers?'' Using this question as a guide, forced integration into an OS will rarely, if ever, be the best option for consumers.

With the above in mind, a specific definition of a PC operating system is necessary. I am not presumptuous enough to believe that I am capable of providing such a definition. However, I would envision that a group of experts taken from multiple areas of the industry could generate such a definition given the task. Undoubtedly, such a definition would require modifications to Microsoft's existing operating systems or could be enforced for all future versions. However, having such a definition in place, along with the allowance of middleware, could open the door wide for true competition in the PC OS space while setting the foundation for immense, long-term consumer benefit, benefits that will easily fall by the wayside without it.

Subject: Microsoft Settlement

To Whom It May Concern,

The remedies for the Microsoft Settlement must be fair but not so disruptive that competitive innovations would have no platform to work from. If the government kills off Microsoft the cost will be tremendous for everyone to switch to ????? The ''unfair competition'' seems inherently a part of the nature of these relatively new technologies. If there were not basic uniform operating systems the information technology business would not exist. If Microsoft was more aggressive and kept a ''closed system'' similar to Apple Computer where would competition be? Apple has a significant share of the PC market. Where are the others? If Microsoft were not innovative and added features we could still using Visacalc and be playing Pong.

Many of the software companies calling foul should have approached this business problem with a different tact. Their efforts to tag along behind the leaders will always be a disadvantage. The government must not punish the leaders of an industry just to help the weak companies that are just along for the ride. In the beginning I was a very strong Apple supporter, but I needed integrated products that could be used economically so I switched to PCs and Microsoft software. The need for uniformity and connectiveness breeds the necessity to be able to work across different platforms. Users need products that work and are also convenient. (To save time and expense.)

January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to express my full support of the recent settlement between Microsoft and the US Department of Justice. I am glad to see they had reached a settlement and that Microsoft will be allowed to start focusing on business, not politics.

I do believe that the terms of the settlement are fair and will ultimately have a positive effect on the consumer and small businessperson. Microsoft's concessions, such as agreeing not to retaliate against computer makers and software developers who develop or promote products that compete with Microsoft, or granting computer makers broad new rights to configure Windows so that non-Microsoft products can be promoted more easily, should appease all the competitors.

I urge your office to do what is right for the American public. Implement the settlement. Thank you.

Sincerely,
Neal Stobaugh

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to show my support for the settlement in the Microsoft antitrust case. Your efforts in supporting the settlement I gratefully welcome. Microsoft has basically agreed to what was asked of it, as well as agreed to some terms that were not even addresses in the original complaints. Now is the time to move on toward renewed innovation and improvement in the American computer technology industry.

The settlement will lead to Microsoft working more closely with its partners in the software industry than it already does. Microsoft will document and disclose the internal code for the interfaces of its Windows programs some other industry companies can make their programs work more efficiently with Windows. Microsoft will provide computer makers a list of established, uniform terms and prices so everyone will know what the deal is, rather than negotiate privately. A technical committee of software experts will monitor Microsoft to ensure that the terms of the settlement are met. These are big concessions and compromises of Microsoft's legal rights to cooperate with its industry and resolve the court case.

I appreciate, and thank you for, your efforts to see that this beneficial settlement is approved. Your leadership is appreciated.

Sincerely,
Dr. Manuel B. Velarde

Subject: Microsoft Settlement

Thank you for this opprotunity to voice my opinion.

The Microsoft settlement solution offered by the Justice Department is a sham, window dressing to cover a decision to back out of the whole enterprise. The settlement is so weak as to be meaningless. Remeadiation to those who were harmed virtualy non-existant. Enforcement mechanizms are flimsey and will be ineffectual.

The Justice Department tried to enforce an agreement with Microsoft with a weak settlement in the past. They failed because the enforcement mechanizms relied on good faith by Microsoft instead of effective rules and procedures. The result was a further solidification of the Microsoft monopoly, companies and products driven from the market place, and an outrage from the government that was embarassing given that a blind man could have seen it coming.

Don't repeat history. The only effective settlement is one where the remedy fixes the problem and the required remedial actions can be enforced. Enforcement can not rely on good faith by Microsoft, not then, not now, not ever.

Washington, DC 20530–0001

Dear Ms. Renata Hesse:

Please put a stop to the economically-draining witch-hunt against Microsoft. This has gone on long enough.

Microsoft has already agreed to hide its Internet Explorer icon from the desktop; the fact is, this case against Microsoft is little more than ''welfare'' for Netscape and other Microsoft competitors, with not a nickel going to those supposedly harmed by Microsoft: the computer user.

This is just another method for states to get free money, and a terrible precedent for the future, not only in terms of computer technology, but all sorts of innovations in the most dynamic industry the world has ever seen.

Please put a stop to this travesty of justice now. Thank you.

950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am happy to hear the Microsoft case has settled. I urge the Judge reviewing the case to approve the settlement so all parties may focus on more important matters.

While I do not agree with the government's taking action against Microsoft in the first place, I am in favor of the settlement. Its terms are reasonable, and are in the public interest. Consumers will benefit from the settlement, as Microsoft will be free to go about its business producing quality software. Microsoft's competitors will clearly benefit from the agreement. They will be made privy to Microsoft's otherwise confidential operating information. They will also benefit from Microsoft's agreement to make it easier for computer manufacturers to install other company's software on their computers.

The settlement will also provide much needed certainty to the tech industry. This can only help our American economy, especially in a time of recession. I am hopeful this matter will come to a speedy resolution. Thank you.

Sincerely,
Frank Murphree

Attorney General John Ashcroft
US Department of Justice, 950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing to express my support in the recent settlement between Microsoft and the federal government. It is with sincere hope that this is the end of any litigation on the federal level. Considering the terms of the agreement, Microsoft did not get off easy at all. In fact, due to this agreement, Microsoft has to make several important changes to the way that they handle their business.

For example, Microsoft has agreed to disclose and document for use by its competitors various interfaces that are internal to Windows'' operating system products. This alone is a first in an antitrust settlement. Microsoft has also agreed to make available to its competitors, any protocols implemented in Windows'' operating system products that are used to interoperate natively with any Microsoft server operating system.

With the many terms of the agreement, I see no reason for the government to pursue further litigation on any level against Microsoft. Not only would it be a waste of time, but a waste of money as well. I fully trust that you would agree. Thank you.

Sincerely,
Lydia Rich

From: Harlan Wilkerson
To: Microsoft ATR, dennispowell@earthlink.net@inetgw
Date: 1/28/02 7:02pm
Subject: Proposed Settlement (with corrections)

I feel that adoption of the proposed settlement is not in the public interest.

The Appeals Court ordered the District Court to craft a remedy that would ''unfetter [the] market from anticompetitive conduct,'' to ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''

Windows has gained it's market position not by consumer demand, but by Microsoft's almost total control of production. In the past, Microsoft has used exclusive OEM licensing and marketing incentives to pass along the so-called ''Microsoft tax'' to every PC consumer. Most of the top 20 OEMs simply don't offer PC systems without the Windows operating system pre-installed. Microsoft has urged (and rewarded) the OEMs to ''just say no'' to buyers who request a so called ''naked PC'' (a PC with no pre-installed software). This is ironic since the OEM's associated support costs should actually be reduced. The OEMs that do offer alternatives to Microsoft's Windows charge essentially the same price for non-Windows models. This is true even for those with pre-installied versions of absolutely free operating systems e.g. Linux, or the BSDs. These operating systems can be freely downloaded and installed on all of a consumers PCs without any licensing fee whatsoever. Consumers who have opted to install these free operating systems (on their own) are usually frustrated in any attempt to obtain refunds from the OEMs for their unused Windows licenses. This despite provisions for a refund from the OEM that are contained in the Microsoft Windows EULA. It's no accident that consumers can't determine the fair price of a PC under these circumstances. This was highlighted during the trial by a grass roots movement that culminated in a ''Windows Refund Day''. Consumers who purchase Microsoft Windows through an OEM usually have no standing in class action suits brought against Microsoft.

Nothing in the proposed settlement prohibits Microsoft from continuing to offer OEMs existing forms of advertising or marketing incentives (on an equitable basis) to include Windows on every machine, or to decline to sell ''naked PCs''. We currently are in the worst economic recession in at least a decade. It's doubtful that some of todays OEMs will even survive. Nonetheless, many of these same ''equipment manufacturers'' won't sell their equipment at any price without pre-installed software from Microsoft. This is hardly the behavior of an unfettered market. Microsoft should be required to post the costs of it's OEM products on a public web site, and they should be precluded from offerring any incentives to OEMs to curtail the sales of ''naked PCs''.

To paraphrase the Appeals Court by the time this case is resolved the facts will be ancient history, but the effects of the illegal acts will have caused harm nonetheless. The proposed remedy does nothing to ''deny to the defendant the fruits of its statutory violation''. Microsoft staunchly denies any wrong doing in it's public statements, retains billions in capital, and isn't even held liable for the people's costs in prosecuting the case.

In crafting a remedy that terminates the illegal monopoly or eliminates practices likely to result in monopolization in the future it is important that hearings be held to investigate how we got here in the first place. The Federal Trade Commission and DOJ took up Microsoft's trade practices involving OEM per-machine-licensing of MSDOS. During this case a private antitrust suit was brought against Microsoft by Caldera. That suit was settled but provided no relief for the millions of consumers who purchased Digital Research's Disk Operating System. Digital publicly complained that they had sufferred from Microsoft's anticompetitive per-machine-licensing scheme and were wrongly excluded from the Windows 3.1 beta testing program—even though they were participants in beta testing earlier versions of Windows. Digitat's Operating system didn't compete with Windows, but did compete with MSDOS. At the time these were separate Microsoft retail products. The respected magazine and online publication Dr Dobbs Journal revealed that the Windows 3.1 beta contained code that was only useful for detecting Digital Research DOS. This code gave the user error messages or simply halted a users machine whenever Digital Research DOS was detected. Windows version 4 and MSDOS version 7 were eventually bundled into Windows 95 which carried exclusive OEM license agreements that didn't permit OEMs to use or dual boot other operating systems like Digital's DOS. For example, some Hitachi PCs had a hidden copy of the BeOS that consumers could only discover and activate using instructions on Hitachi's web site. Digital, Hitachi and BeOS have since exited the PC OEM and PC Operating system business. For it's part the DOJ has complained publicly that Microsoft violated the first consent agreement. The practice of monopolies denying companies that compete in any software category timely access to APIs, and the practice of bundling separate retail products for anticompetitive reasons, and/or using exclusive licensing agreements to harm competitors is a common and recurring theme. The judge was correct in denying Microsoft's request to limit the scope of the remedies without an evidentiary hearing, and the DOJ was premature in dropping their case in-main on product bundling. Microsoft is engaged in world-wide trade and the DOJ and European antitrust regulators seem uncoordinated and out of step. The European regulators have taken up complaints that Microsoft has withheld access to Windows server software API's that are necessary for interoperability with other network operating systems, and the bundling of Windows Media Player in Windows XP. Microsoft is not so quietly announcing it's plans for a single Internet logon authentication service it's calling ''.NET''. The stated objective of this initiative is to leverage the Windows monoply in order to create a new (Internet) monopoly. While these practices may or may not be lawful, it's doubtful that all of the practices likely to result in monopolization in the future have been eliminated without a single hearing on the issues here in our courts. Most non-Microsoft operating systems provide a boot manager that allows consumers to use several operating systems. In fact, Microsoft includes a boot manager that allows consumers to use multiple (older) versions of Windows e.g. Windows 2000 and Windows 98. The act of installing a Microsoft operating system doesn't invalidate a consumers licenses for a competitors products. Yet installing (or reinstalling) Microsoft Windows will always result in a consumers other operating systems becoming inaccessible. This is anticompetitive behavior. Microsoft should be required to automatically add other operating systems to it's boot manager in the same manner that it adds it's own products.

The DOJ and Microsoft appear to have forgotten that this case is about Personal Computers if a consumer shops for a PC, and makes a purchase based on the software selection, it makes no sense to provide Microsoft the arbitrary right within fourteen days (or some other later date) to delete icons or programs and substitute their own because they have judged the competitors product lacking in some quality or state they deem essential.

Microsoft has stated that their power to innovate or bundle applications into Windows XP is essential to the economic recovery of the PC industry. The PC OEMs have testified that there is no viable alternative to Windows. In the past year alone private business LANs and Internet companies have suffered billions of dollars in damages caused by trojan or virus programs that specifically targeted Windows PCs. The Executive and Legislative branches of the Federal Government have recognized the Internet as a vital piece of our national and international infrastructure. They have established agencies tasked with it's protection. Indeed one reason for pursuing the proposed settlement after September 11 was ''the national interest'' It's hard to understand why much of Microsoft's ill gotten monopoly shouldn't be considered an essential public facility. Certainly consumers have a right to migrate their own itellectual property out of proprietary Microsoft file formats. Microsoft should be required to publish the file format information needed

for other applications to interoperate with files created by MS Office. This is certainly the case with regard to Apple Computer users who have already been threatened with the cancellation of the Apple version of MS Office. In conclusion, the court combined the individual State and DOJ cases. A settlement that doesn't include half the plaintiffs is at best not a settlement.

Sincerely,
Harlan L. Wilkerson

Washington, DC 20530

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers? dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Howard Griffen

Washington, DC 20530

Dear Mr. Ashcroft:

I am in favor of Microsoft and the Department of Justice settling in the case. The settlement agreement the two sides reached in November adequately addresses the concerns raised by the case's plaintiffs. There is really no need to spend any more money on litigating this case.

I really appreciate the way Microsoft has handled itself throughout the case. It has answered the allegations of unfair business tactics by making fundamental changes to key aspects of its operations. It will license Windows to the 20 largest computer-manufacturing companies at the same price and on the same terms. Additionally, Microsoft agreed to grant computer manufacturers the right to change the configuration of Windows. This will allow the manufacturers to replace features of Windows with software programs designed by Microsoft's competitors, which will give consumers a greater choice of products.

The settlement agreement is the appropriate remedy to the complaints lodged against Microsoft, and, in fact, it goes beyond the scope of the original suit. Microsoft has demonstrated good faith in agreeing to the settlement terms. Nothing more will be gained by dragging this case back to the courts.

Thank you for your attention.

Sincerely,
Mary Breivik

Subject: Microsoft Settlement

Dear Sirs:

As an IT (Information Technology) professional for 35 years, I offer the following opinion.

Microsoft has never been an innovator, but always an imitator who targets successful technologies developed by others and then competes with them on the heavily skewed playing field of Microsoft's monopoly control of the PC operating system.

Because of the explosive rate of change in IT hardware so far, there has always been room for innovation by outsiders despite attempts by any entity to control or monopolize any technology. This has created an unprecedented climate of innovation and competition in most IT areas, empowering users with the tools to maximize their output.

However, in the specific field of PC operating systems, this has not happened. Most users have been hobbled with operating systems from Microsoft which are far behind other systems available in ease of use, ease of maintenance, portability, stability, transparency, security, efficiency, etc. This has been possible because of the abuse of the monopoly position that Microsoft has in the PC operating system arena.

If very strong corrective measures are not implemented in the very near future, Microsoft will have achieved a monopoly position over all software used by most PC, Internet, and Communications Device users with the result that competition and thus innovation will be extremely limited, and costs and capabilities will be determined solely by Microsoft instead of the free market.

The current settlement proposal by the USDOJ is not adequate, and should be enhanced to include the original demands made by the prosecutors of this suit.

Dear Attorney General Ashcroft:

I am wish to express my support for the settlement reached in the government's case against Microsoft. It's time to end this this. I want the government to stop hounding Microsoft so they can continue to innovate, create more jobs, provide more innovative products, and otherwise help our economy recover just like President Bush wants us to.

Before Microsoft created the Windows product only the technically adept were able to use a computer not to mention the internet. Lets be fair but let's not overly punish a company for being aggressive and competitive. I urge that the government accept the settlement as it has been drafted. Let's get on with business we certainly have many other important challenges to tackle. Let's work together to improve our economy and keep the United States free of terrorism.

Please help us

Washington, DC 20530–0001

Dear Mr. Ashcroft:

I find it hard to believe that the state of Utah has the time or the money to pursue litigation against Microsoft. Our projected deficit for this year is nearly two hundred million dollars, and no good can come of further time in the federal courts. My state, along with eight more of the eighteen plaintiff states in the Microsoft antitrust case, are currently seeking to overturn a perfectly reasonable settlement in the hopes of making more of a profit for themselves. I am writing to express my dismay, not only that the suit has gone on this long, but also that there is the possibility that it may drag out even longer. Microsoft, the Justice Department, and the plaintiff states are not the only parties that have felt the negative effects of this suit—the economy has declined even further, the consumer has suffered, and progress within certain aspects of the technology industry has lagged. I do not believe that the pursuit of further litigation is in anyone's best interest.

The settlement that Microsoft and the Justice Department have managed to reach is fair and reasonable. Microsoft has agreed, for example, to reformat future versions of Windows so that non-Microsoft software will be supported within the Windows operating system. Moreover, Microsoft plans to document and disclose various source code, interfaces, and protocols integral and native to the Windows operating system to facilitate customizability within Windows and to allow non-Microsoft servers to interoperate natively with Microsoft servers. Microsoft's competitors will be able not only to use Windows as a platform to market their own software, they will also have the opportunity to reconfigure Windows so as to promote their own programs. I believe the settlement is just. I see no need to pursue additional litigation on the federal level. This has gone on far too long already. I urge you to support the settlement and finalize it as soon as possible.

Sincerely,
Carl Schnurr

US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am e-mailing to you today to express my support of the recent settlement between Microsoft and the Department of Justice. After three long years, the settlement is long overdue. As a corporation, Microsoft made concessions above and beyond what was necessary. Although litigation was unnecessary in the first place, it is best to let the issue rest with this settlement.

Again, the settlement sets terms that are beyond the scope of the original litigation. The disclosure of internal interfaces is an example of the generous nature of this settlement on behalf of Microsoft. Under this provision, Microsoft is documenting all of the internal interfaces on the Windows'' operating system products. These documents are being forwarded to competitors of Microsoft for their review. This is unprecedented in any type of antitrust legislation. Further, it is proof of Microsoft's desire to settle the issue. This haste is imperative.

Letting the settlement stand will enable Microsoft, the technology industry, and our economy to recover. In this time of economic unrest, this should be the focus of our government's efforts. I trust that no more action against Microsoft should be taken at the federal level.

Sincerely,
John J Heine

Judge Kollar-Kotally,

My name is Saeed Bhatti and am resident of New Jersey. I came to know through a very close friend about some of the aspects of the Proposed Settlement made by the Justice Department with Microsoft, and I am very unhappy. Firstly, how could the Justice Department grant Microsoft a government-mandated monopoly of the software industry and even worse—other technology markets? Definitely such decision would seriously jeopardize all serious competitors—both now and in the future. We're living in a free and open market society, and one of the advantages of having such a system is that people have the right to choose from among several brands of one single item, and in this case, software. I would want to see a healthy competition of several software companies, in order to make prices competitive as well. Secondly, how could the Justice Department condone Microsoft for violating the antitrust law and even for its illegal conduct e.g. bribing other competitors in order to stop their operation. What is the Justice Department's motive behind this action?

Your Honor, I would want Microsoft be brought to justice upholding to democratic values. Sadly to say that monoplies are the trade mark of monarchs and communist governments.

Very Truly,
Saeed Bhatti

Dear Mr. Ashcroft:

I am writing in full support of the recent settlement between the US Department of Justice and Microsoft in the antitrust case. I feel this case has gone far too long and I can hardly believe what we as taxpayers have paid to have this continued. I believe the terms of the settlement is very fair and certainly does not let Micro- soft off easy. They stipulate that Microsoft will have to disclose interfaces and protocols that are internal to Windows operating system products. They also will be granting computer makers broad new rights to configure Windows so that non- Microsoft products can be promoted more easily.

The nine states that want to continue litigation should be reprimanded and the settlement should be implemented as soon as possible. Please do what is best for the American public by ending this dispute. Thank you.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers’ dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Renate Wilford

To: Renata Hese

I'm writitng this letter in response to the microsoft anti trust case that is still pending. I have to say as a consumer there's no question that Microsoft still has a monopoly on the personal computer and the verdict's established by the DOJ did little to stop microsoft from controlling the OS system market. I really think the DOJ should of done more to protect the consumer from falling into the hands of microsoft's control. My solution to this problem is that law's should be set on how pc computers are sold and what applications can be preloaded so that consumers can have more choice. If you go into a store to buy a pc obviously you going to have to buy MS windows O/S whether you like it or not. Because Microsoft control's the operating system they control the software market. Laws should be set that computers have to be sold with out the Windows system installed so that consumers can purchase the windows software they wan't not what comes on the computer. In the software market if you don't get your product's pre-installed on computers you can't compete in a fair open market. This to me is the solution to the problem and everybody want's to compete in a fair market. I hope this brings some closure to this case and everybody can win from it.

Thank You for your time.

Dear Mr. Ashcroft:

I support the Department of Justice's recent efforts to settle the Microsoft antitrust lawsuit. Continued litigation of this case is not in anyone's best interest. I urge you to take steps to ensure an expedient resolution of this lawsuit.

The terms of the settlement agreement are fair and reasonable. Microsoft has agreed to a wide range of restrictions on the way it conducts business. They have agreed not to retaliate against those who promote software that competes with Windows. They have also agreed to implement a uniform price list for the licensing of Windows and to be monitored by a technical review committee that will ensure Microsoft's compliance with the settlement agreement. The settlement agreement accomplishes the goal of increasing competition. Pursuing this case through more trial will not produce a better result. Accordingly, it is strongly recommended that the Department of Justice approve the settlement agreement.

I am a computer owner for more than twenty years who has used many companies programs in my business and personal activities. I am knowledgeable of the issues involved in this case.

Thank you for considering my comments on this matter.

Sincerely,
Charles Dorian

I am a Microsoft Certified Systems Engineer whose livelihood depends on the continuing success of the company. As such, you'd think I'd be one of the people cheering most loudly for Microsoft to prevail in this long and difficult antitrust case. My own self-interest aside, however, I truly believe that Microsoft has done a great deal of harm to their competitors and the information technology industry as a whole through their insidious behavior. Beyond that, the more I learn about Microsoft's products, the less impressed I am with the quality of their technology. Just because they are the most successful software company in the world does not mean they make the best products. In many cases, their competitors have superior products, but they have so little power in the marketplace that they are struggling to survive in the current economic climate.

It has been proven beyond doubt that Microsoft violated the law with many of their business practices. Many other questionable practices that I have seen them implement over the past five to ten years were not even addressed during the antitrust trial. Microsoft is even now trying to prevent a competing product named Lindows from ever coming to market. Lindows is a new distribution of the open source Linux operating system that will have embedded WINE capabilty, allowing it to run Windows applications in a Linux environment. This is a truly innovative product with the potential to be quite

successful. But Microsoft has filed a lawsuit against the small company that is developing Lindows, claiming that the very name of the product infringes upon their trademarked Windows operating system. Personally, I can see no way this suit can succeed, and I hope the judge who hears the case throws it out as being without merit, but Microsoft has the power and the resources to crush any and all of their competitors. Lindows is a small start-up company with a great idea, but few resources. Microsoft could use its legal warchest consisting of almost limitless money and attorneys to keep the product from ever being available to customers. So much for our freedom of choice.

Moreover, I believe Microsoft has violated other provisions of the Tunney act to lobby the government on its behalf. Last week, I received in the mail a brochure from a group named ''Americans for Technology Leadership'' which urged me to send an email to microsoft.atr@usdoj.gov to support Microsoft against attacks by their competitors. I normally throw these kinds of junk mail brochures in the garbage, but later that same day, I received a telephone call from someone at Americans for Technology Leadership who also urged me to send an email to voice my support for Microsoft and its struggle to ''innovate.'' Now, being a curious fellow, I decided to visit the website of Americans for Technology Leadership at http://www.techleadership.org. I guess I shouldn't have been surprised that the site was cluttered with Microsoft advertisements. This group, a supposedly ''independent'' organization of companies and individuals dedicated to limiting government regulation of technology, is actually funded primarily by Microsoft. I have a feeling that ATL had access to the names, addresses and phone numbers of all Microsoft Certified Professionals and was calling us to rally our support behind the company.

I don't really know whether or not this activity violates any laws, but I resent being used as a pawn in this legal circus. I urge you to take strong action against Microsoft to prevent them from using their monopoly power to prevent other companies from developing and marketing products and services that compete with their offerings. I believe in free minds and free markets and in the long run, I do believe the best products will prevail. If these products happen to come from Microsoft, then they deserve to succeed. But if such products come from Novell, or Red Hat, Caldera, or Sun, or Oracle or even Lindows, then these products at least deserve an equal chance to succeed.

I for one, will be one of the first in line to purchase Lindows if Microsoft will ever allow it to reach the marketplace.

Washington, DC 20530

Dear Mr. Ashcroft:

As a fellow Republican in Rep. Tom Delay's district I wish to express my support of the settlement reached last November between the Department of Justice and the Microsoft Corporation. It has now been 3 years since the Justice Department began the litigation process against Microsoft. During this time countless dollars have gone to court mediators who endlessly debated the merits of this case. In times where budgetary resources are becoming increasingly scarce this action is increasingly appalling. Three years has been too long. I cannot imagine there is anything more to discuss.

Once more, the settlement that was reached contains many concessions on behalf of Microsoft. in an attempt to settle the dispute Microsoft has been willing to agree to these terms despite their lack of guilt in the case. Microsoft has agreed to design Windows XP with a particular mechanism that will allow users to add competing software into the system. This will revolutionize the way our operating systems are configured.

I believe that if Microsoft is willing to make these changes, the settlement should be enacted. I strongly support the settlement and look forward to the end of this case.

Washington, DC 20530–0001

Dear Mr. Ashcroft:

Microsoft has been involved for more than three years in the resolution of its antitrust case. I believe that the time has come to put this matter behind us. I also believe that the current terms serve the best interests of the public. As the settlement agreement stands, the company will be more competitive in the marketplace, and as a result, consumers worldwide will benefit.

It is my understanding that Microsoft has consented to design future versions of Windows that make it easier for software developers to install non-Microsoft programs in the operating system—among many other concessions. Surely this indicates the corporation's commitment to comply with the law and the general needs of consumers and those in the IT field.

I hope that the Department of Justice will see fit to ensure that the agreement remains in its current form, lest three additional years of negotiations become necessary. Thank you for your attention.

Sincerely,

Harry Dullys

I believe America needs closure on this matter once and for all. How long has it been, how much money will it take...and how long will it continue to be?

The Federal Government must state it's case, derive it's penalties, seek resolution, and end it's relentless efforts to drag this matter on any further—perhaps into the next administration. They need to set a time limit. The longer the Justice Department takes to administer it's justice, the public will be thoroughly disgusted, and America once again will receive her enormous share of worldwide ridicule.

This action is a waiste of precious taxpayer resources, and most of us believe the action by the previous administration was politically motivated, fueled by Microsoft's competiton. No one has yet to prove that the American citizen or the software industry has been hurt by the alligations of anti-competive behavior. Is it worth the cost? And, while the Government continues it's aggressive pursuits, we have real serious problems to contend with...such as the Enron case, where thousands of employees and investors were sucker-punched, collapse of a major corporation, lost employment and retirements. That's the real crime. And that's precisely where the Justice Department should be spending it's efforts. The continuous and incessent attacks against Microsoft

I am a Win98 user who is ''fed up'' with Microsoft's bullying behavior. Linux and other operating systems wouldn't be so popular if Microsoft actully ''listened'' to their customers for once. I am all in favor of restoring consumer choice to the computer market. Customers should be allowed to choose what operating system they want on their PCs, not the ''big box'' computer stores, and certainly ''not'' Microsoft!

I strongly urge the Department of Justice to accept the proposed settlement as outlined by the appeals court. This litigation should never have been brought in the first place. I use Microsoft products daily and in no way do I feel they have taken unfair advantage in their business practices. I also use Netscape as my internet browser so I know there is a choice. Please accept the agreement so the country and Microsoft can move on.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers’ dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better

products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Joe R. Wood, Jr.

From: brian215@netscape.net@inetgw
To: Microsoft ATR
Date: 1/28/02 7:18pm
Subject: Microsoft Settlement

The proposed settlement, while appearing to address the anticompetitive behaviour identified in the 1998 complaint, is deficient in several ways.

First and foremost, the complaint itself was, it may be inferred, limited in scope, for the purposes of greater probability of gaining a conviction or settlement, and for the purposes of shortening the proceedings.

As such, there is much, reasonably well documented and widely known in the industry, past behavior of an anticompetitive nature on Microsofts part, which was not included in the complaint. This behavior continues, and should be addressed in any settlement or imposed finding by the court.

Specific activity, which is ongoing, was not identified, and which must be stopped, includes the purchasing of software companies dominant in their specific niche markets and providing multi-platform software; purchasing the companies or ''poaching'' critical assets (eg employees) of companies making development software (eg the Borland, past developers of ''C'' compiler which competed with Microsoft's product, whose entire development staff was hired by MS, effectively crushing Borland); and the contractual tying of distribution rights for Explorer, to the use of Microsoft Software on portal internet sites (among ISPs who operate servers and also supply browser software to customers, effectively falsely boosting server market share as well as extortionary pricing).

Another impact, not addressed, is the potential employment market for software developers. By establishing, through its predatory practices, an unnatural market with uncompetitive salaries, Microsoft effectively established a salary cap in the software industry, which has directly affected every single software developer, as well as limiting the potential market for developers, by establishing a closed market in many software solution areas, as well as ''closed shop'' sectors in further areas and placing high barriers to entry to competitors who might have opened these sectors with enabling software (OS's, languages, middle-ware, and open standards in the Open Source Software areas).

In addition to its bad corporate practices, Microsoft has: established its own bad development practices (via its Certification programs); broken the pre-existing ''mentor'' practice for software development (by hiring, exclusively, college graduates or college students) thus circumventing ''best practices'' indoctrination in the industry; demolished pre-existing ''competitive but cooperative'' market practice among competing products (eg ability to import/export among differing word processing packages); and established ''anti-marketing'', the practice now coined ''Fear Uncertainty and Doubt'' (FUD), synonomous with Microsoft but used in other business sectors. Additionally, the failure to adequately address many aspects of what an operating system is itself designed to handle, such as networking, security, file names, memory protection, etc, have been dismal failures or ignored completely—things which in a truly competitive market would have spelled the end of a company failing at such a basic level. All of these behaviors are anti-competitive. All are harmful to consumers. All have had the effect of reducing competition, raising prices, and limiting or eliminating development of new features. All of these need to be addressed, effectively, in any settlement or consent decree, or other court action against Microsoft.

If the court were to see fit to also impose minimum standards on any software deemed an effective monopoly, be it the operating system, browser, complier, network stack, or similar, the protection of consumer interests and businesses alike would be well serverd.

I hope these comments are useful in the settlement process.

Sincerely,
Brian Dickson

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing on the occasion of the Justice Department's public comment period on the Microsoft settlement. As an objective member of the technology industry with 35 years of experience, working with a competitive platform vendor (IBM) to the Windows operating system, it seems that this case developed as a naive attempt of politicians to placate the complaints of businesses (Sun, Oracle, Apple, etc.) in their districts that have failed to gain their desired market share in the software industry. The ensuing attempt at a break-up was a punch in the face to free enterprise by a government interfering where it doesn't belong, so I believe accepting this compromise would be a major step forward for getting this economy back on track and moving on from this horrible legal charade instigated by envious ''losers''. I have seen this ''looser'' attitude over and over in this industry. Microsoft has set a standard that most competitors don't like to compete against. Though their rivals have mostly been victims of bad marketing strategies and/or mediocre products, Microsoft is planning to take several steps to level the playing field further. I believe they will offer the top 20 computer manufacturers with equal pricing for licenses of the Windows operating system without adding any restrictions on the distribution or promotion of competitive products, while allowing broad capabilities to arrange its platform with a custom combination of Microsoft and non-Microsoft software. They will also provide disclosure of their internal interfaces and server protocols to assist software developers in the design process. As you can see with the above examples, Microsoft is making serious efforts to appease the rest of the marketplace. This is a company that has helped move our economy forward by helping hundreds of millions of consumers join the information age, and that should be respected with a measured judgment. Any further action would be unwarranted and more costly and difficult to implement, so please proceed with this very fair solution. Thank you.

Sincerely,
Dan Lucky

To Whom It May Concern:

I came across today's deadline to comment on the Microsoft settlement quite by accident. I have not been following the case closely and consider myself no expert in these affairs. However, when I did work in the software industry some years ago, Microsoft was well-known for taking the spirit of competition too far. Amusing pranks—such as programmers on loan to competing software developers—purposely embedding errors into software to cause distruption in the competing product's

release. If true, and these stories were widespread, Microsoft has lacked a measure of integrity for a long time. The fact that the company is offering chances at a ''prize'' for writing letters in support of Microsoft and not seeing that in any fashion as a ''bribe'' is typical.

I hope in our efforts to ''promote business'' we do not overlook integrity and honesty and fair dealing.

What's good for Microsoft is not necessarily what's best for America.

Thank you—

Rosemary Motisi

Dear Judge Kollar-Kotally,

I am a concerned citizen writing to you about the Microsoft settlement. I ask that you ensure that the punishment is commensurate with the criminal offenses of which Microsoft has been convicted. Consider the amount of money they made in dealing unfairly and brutally with other industry members in the pursuit of profit. Does the current settlement penalize them to the degree of the profit they reaped? I do not think so.

The current penalty does not seem to have any way of changing the way this company operates. Any corporation that has used unfair sales practices to gain an advantage cannot be trusted to police itself. They have lost the right to be self-regulating by the gross offenses of which a court has found them guilty. Any penalty that does not change the way they do business is nothing more than a 21st century version of jury nullification. Doesn't our pledge of allegiance end with ''liberty and justice for ALL?'' Justice should be executed upon all lawbreakers regardless of how much money they have or even the impact it might have on the economy—as bizarre as that may sound. My fear is that when such crimes go relatively unpunished, it sends the message that there is no justice. Our economy will recover but our values and morals—the bedrock of society—will not recover if the courts refuse to uphold the law. In fact, without commensurate penalty, you are creating the very environment that allows companies like Microsoft to continue breaking the law.

As a judge, you have an obligation to uphold the law. I urge you to do so. Do not nullify the judgment of guilt by meaningless penalties that neither right past wrongs nor ensure future wrongs will not be committed.

Sincerely,
Kirk Okumura

Subject: Is it fair?
Judge Kollar-Kotally

My name is Asmat Khan and I live in New Jersey. I heard about the some aspect of the Proposed settlement made by Justice Department in Microsoft case and I am not satisfied with this proposed settlement. It is not fair to give one company the rights of software monopoly. We are living in a free country and I think same rules applies to the software companies. I believe in the free market where I can choose the product I want offered by different and a competitive price. And it is fair with the software industry.

Your honor, I would want Microsoft be brought to justice upholding to democratic values. Sadly to say that monopolies are the trade mark of monarchs and communist governments.

Asmat Khan.

To whom it may concern.

As a Certified IT professional with 19 years experience in Unix Systems administration, I would offer my comments on the Proposed Final Judgment in the case of the US vs. Microsoft.

First I would like to applaud the DOJ on it's finding Microsoft as a monopoly who has used illegal and unethical practices in order to maintain and increase it's monopoly power. If Microsoft is allow to continue it's current criminal behavior, it will extend it's monopoly into yet other markets. Broadcast communications, Internet broad band services and Personal game consoles are already on the Microsoft monopoly radar. I have read the proposal. I will say it is a good start with a couple of glaring exceptions.

As a Unix systems administrator, I have frequently used an ''Open Source'' application called SAMBA to provide file system sharing services between Unix and Windows machine. This software is written in large by volunteers around the world. Submissions are excepted by a central committee on merit of the submitted code alone. The code is checked for any obvious malicious code. But the backgrounds of the individuals submitting the code is never investigated to see if they have a ''history of software counterfeiting or piracy or willful violations of intellectual property rights.''

A volunteer group of coders does not have the resources to provide such a guaranty. But Microsoft, with a legendary legal department of at least 600 lawyers does. Microsoft would use this as a reason to keep this vital documentation from the only real competition remaining in the Windows File and print services space. And, since the SAMBA group is have to figure out much of the undocumented SMB API's (Much of it is documented, but many key aspects are undocumented), Microsoft could declare that the SAMBA team as a whole are, ''counterfeiting, ...intellectual property''

Another group to which these exceptions apply is the ''WINE'' group. These volunteers are trying to port the Windows win32 API to the Linux and other Unix platforms to enable application written for Windows to run on Linux and other Unix computers. Also, there is nothing in the proposal to hinder Microsoft from extending their monopoly into other areas, for instance Personal Gaming Consoles (X-Box), Set top video digital recorders (Ultimate TV) and Broad band access (see http://news.com.com/2100–1033–277203.html?legacy=cnet)

To this end, I would like to add the following commentary to my own. http://www.kegel.com/remedy/remedy2.html In conclusion, while the DOJ proposal is what I would deem a good first rough draft, there are some issues with it as it stands. It keeps key technologies from the only group of programmers who can currently and readily benefit from them, then return these benefits back to the consumer in the shortest amount of time. And it does go far enough to curtail Microsoft's incursion into other markets. With a $35 billion ''War Chest'' whatever technology they can not Co-opt by anti competitive practices, they will simply buy. As last example I would like to offer the following piece. This has just happened within the last several weeks. This is after the DOJ had made the current proposal. http://www.theregister.co.uk/content/54/23708.html

Subject: Conerns about Microsoft monopoly

I am a software engineer working in Silicon Valley. Over the last 10 years I have worked for 4 start up companies. I'm writing to express my concern about Microsoft and the monopoly it holds in the OS market. In particular, I'm very concerned about the chill Microsoft's monopoly has placed on PC application development. I believe that this market has been stagnant for some time, because investors will not put money into a venture that might compete with Microsoft. Microsoft has squashed competitors to Word, Excel, Powerpoint, etc. Microsoft's products have been sometimes better, sometimes worse, and sometimes equivalent. The point is that they did not win the market and kill all competition in these categories because they were better, they won the market because they bundled the applications with the OS that has a monopoly over the market. I see this as a clear abuse of that monopoly. Why try to create an improved spreadsheet if you can't charge a reasonable price? Why create a new application at all if you know that Microsoft can and will enter the market and undercut your price, forcing users to purchase their product when they purchase

the OS? I've seen folks pitch ideas to venture capitalists and be cut down because they might compete with Microsoft. Please consider this issue carefully! Please think through the long term costs of letting Microsoft be the *only* company developing PC applications.

Subject: Free markets—pretty simple concept
Resource allocation set by producers and buyers

The letter writer who argued for government action as the only method of preserving capitalism by regulating Microsoft sounds like Joel Klein and Judge Thomas Penfield Jackson—misinformed. The Austrian school of economics points out that the allocation of resources in a market economy is determined by the actions of millions of producers and buyers. For any judge or attorney to question this is ludicrous.

Understanding the above, you will also be able to understand that the only monopolies that can possibly exist are government-granted monopolies. The U.S. Postal Service may be the most anti-consumer company in America. Rising costs, slower delivery—that is a monopoly. In this state you need only visit a liquor store (with perhaps inconvenient hours and most likely out-of-the-way locations) to understand how a monopoly can treat consumers. Klein says that he ''will debate any Libertarian, anywhere, anytime'' on the subject of monopolies. As a member of the Libertarian Party, I am proud to say that I share Klein's disdain for monopolies. As the person who is forced to pay both Klein and Jackson, I am outraged that they do not understand simple free-market economics. As a Microsoft shareholder, I hope that the company defends capitalistic freedom with the determination that the Founding Fathers of this country did.

Thomas Hobbes wrote, ''There are few so foolish that they had not rather govern themselves than be governed by others.'' True capitalism can exist only without fools in power. If Klein wants to debate this, bring the fool on.

Subject: Microsoft Settlement

I would like to relate a story that a friend told me a year or so ago. I believe that the setting for this story was ''97 +/- 1 year. At the time, he was working for Intel in a fledgling group for intel's first foray into consumer 3D graphics. At the time, there was really only one 3D graphics standard, SGI's OpenGL.

This story became especially fascinating, because at this same time, SGI independently was interested in extending the reach of OpenGL to the consumer PC. They contributed the software source code for the rendering engine and all library routines that make up OpenGL to Microsoft in the hopes that there might be a place for OpenGL in the desktop operating system.

At this same time, it appears that Microsoft was starting to notice that 3D graphics was becoming an ''interesting market''. I'm not going to second-guess Microsoft thinking, but I will relate the results. OpenGL source code was modified (40 lines) and renamed to Direct3D and then DirectX. Microsoft now had an API for the 3D gaming market, which of course, was incompatible with any other API, including OpenGL. This would not normally be a wise business decision, but this is Microsoft. Since they had a monopoly on the desktop, having a 3D gaming API which was incompatible with any other would turn out to be beneficial. Read on for gory details...

By this time, Intel's 3D chipset for the consumer market was almost ready. All that separated them from a shippable product was Microsoft certification. So Intel takes the new hardware to microsoft, where they learned that it failed certification. Upon inquiry, it was learned that Microsoft had changed the rules for hardware certification, namely that DirectX must be supported and not OpenGL. What makes this especially diabolical is one of the changes made to turn OpenGL into DirectX was a change to the algorithm which determines if a pixel is turned on. This routine is implemented in hardware. The result is that it is impossible to pass the hardware certification with hardware designed for OpenGL. Intel would have to redo their hardware, including producing the chips all over again. Intel would also have to support the new microsoft DirectX API if they wanted to be granted hardware compatability status. So why does Intel care if they receive hardware compatibility status? Easy, because microsoft requires all PC manufactures to only include microsoft certified hardware in PC's they sell. In this way, Microsoft can control hardware companies. Of course, the reverse is true.

Normal rules don't seem to apply to microsoft, and the settlement should reflect this in my opinion.

Subject: Microsoft Settlement. To whom it may concern, regarding the proposed settlement of the microsoft case.

I am not a lawyer, and have no sound legal advise to offer, and the time has past for that. I have been an employee of a number of companies who have found it impossible to compete with Microsoft because competing with them had little to do with quality of product and everything to do with control. You do not have to look far at all for many overt acts that I think any reasonable person would call criminal. This is because of the high- pressure eminating from the top of the company, to win at any costs. In my 20 years developing products across many operating

systems and corporate structures, I have worked for WordPerfect corporation, Novell, and Corel, among others, and it has become increasingly obvious that quality has nothing to do with winning in the marketplace. It is all about who controls the information patterns of the masses, whether it be Movies, Software, News, or Advertising. This is not a new phenomenon. Once the Catholic Church controlled these things quite effectively with systems that greatly resembled the ever-expanding copyrights and patents on things today. Today, Martin Luther, sneaking out of the Vatican with his biblical transcripts would be hunted down as the latest Napster-ite, who thinks that works which interweave themselves so deeply into the roots of a population should not be controlled by a power-hungry entity such as a Church or a Mega-corporation. This does not mean that those who produce them do not deserve profit, but see what the billions paid for Windows every year buys us: In significant cases, less than what the remaining competition now gives away for free, because Microsoft has such a lock on the market. The profits are squandered every year on power. There are dozens of competing products that could have easily taken that position had they controlled the power they had in their times as unscrupulously as Microsoft does. Corporate survival and hunger for power and profits are the reason we have antitrust laws. In this case, the public shame is greater, because it is the Copyright laws—an artificially- granted government monopoly—that establishes the Microsoft Monopoly. If it were possible to still compete in this market against that Corporation, you would clearly be seeing much lower prices—the Microsoft take increases, but somehow the economies of scale in software production never lowers the price of the software, and there is never even consideration that you paid for dozens of versions you can no longer use because Microsoft has made them incompatible.

Microsoft is not an indispensible part of the market. If they vanished, within 5 years, there would be no trace left, and there would be competition for a little while until another corporation showed that it was the most vicious of those remaining and consolidated power.

I and thousands of people like me have started writing new software that is not susceptible to this overbearing corporate eternal ownership—which I have to believe is extremely different from what the framers of the Constitution thought they were doing in granting limited copyright and patents. We have the technology to design around the original intent of these laws, and it is time that you look at seriously reigning in the moster that has evolved. Law of the mega-corporation, by the mega-corporation, and for the mega-corporation is not in anyone's best interest long-term, even if the mega-corporate advertising of today has the same persuasive power as the mega-Churches of old over the masses, tribunals, and courts of law. The case against Microsoft was poorly made, and hardly justified, not that there wasn't a huge case to be made. But your remedies are worse than ineffective. They will do more harm than good. You have overturned the breakup, which might have had some effect, but likewise didn't get at the root of the problems, which I have tried to describe here. It is not Microsoft that is wrong but <insert any company> which succeeded by such viciousness would be just as bad, and I would be just as sorry to see Sun, Oracle, or even my own company AOL Time Warner be in such an abusive position.

I think that when a company abuses the public trust of its granted monopolies as badly as Microsoft has, the appropriate and natural action is to revoke their monopoly, which in this case is their copyright. With that arrow in your quiver, it would not be difficult to convince companies in the future to act more in the public interest. Short of that, please abandon your current pursuits and admit honestly that the corporation has won and the country has lost. It is really rubbing salt in our wounds to offer something that hurts more than it helps and claim you have acted in our behalf. Human rights are more important than copyrights or corporate rights. Many technology companies go under every year. It would be better, though if there was a better connection between profits and service. If you do not, the next revolution is on the horizon. You cannot lock up everyone for violations of intellectual ''property'' any more than the Church could, however much the corporations want to control everything. And corporations do not need an absolute eternal copyright as much as they might claim. And America will become the ''old world'' while other countries such as Russia have their patriots thrown in prison in America for crimes of conscience by the dozens of new FBI/DOJ departments created for this new opression — certainly not for any overt act depriving a corporation of it's profit in the recent Sklyarov case. Do you really want to be the ''Department of Justice'' which presided over such a debacle? Where is justice for we, the people?

Washington, DC 20530

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more

entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Donna J. Fox

Dear Mr. Ashcroft:

I think the lawsuits against Microsoft have gone on way too long. I am glad to see that Microsoft is not being broken up, but I thoroughly believe that this suit has been a personal vendetta from the first place and has been extremely unfair to Bill Gates.

The terms of the settlement do not let Microsoft off easy. Microsoft has to disclose internal interfaces, design future version of Windows so that competitors can promote their own products, and improve their relations with computer makers and software developers regardless of their competitors'' practices, efficiencies, or strategies. These restrictions go against free market economy principles to choose your partners, vendors, and consumers.

At any rate, I think it is in the best interest of the American public to end this lawsuit and finalize the settlement as soon as possible. Our tech sector needs to the brilliant innovation of Microsoft and their workers to jumpstart the industry and help out our ailing economy.

Sincerely,

Velora Upstone

I do not agree with the settlement terms as they exist at this point. I appreciate with Microsoft's contention that they should be free to innovate, but they should be forced to compete with the rest of the industry on a level playing field through the quality of their products, rather than by flexing their monopolistic muscles. Windows XP is a clear indication that they have no intentions of playing by the rules, even after all they have been through. Windows XP is just as unstable as Win2K (both are far more stable than the Win95/98 series), and they have once again bundled their ''cornerstone'' software in such a way that it becomes impossible to separate. You cannot shut down Messenger when MS Office is running, for example. The error message states that ''There are other applications currently using features provided by Windows Messenger.These applications may include Outlook, Outlook Express, MSN Explorer and Internet Explorer''. This is precisely the same thing they did when making IE part of the OS. Clearly they haven't learned their lesson, which means the current settlement terms do not go nearly far enough.

Please make them play fair. That is your job. You are not helping the industry by making it easy on Microsoft, you are hurting it.

An important understanding of *modern* economic models would help in crafting a suitable remedy.

The best lay-persons explanation of what kind of competitive behavior should be encouraged, can be seen in the current movie ''A Beautiful Mind''.

In a bar, John Nash explains to his fellow students the impact of Adam Smith style economics, versus his new model, where it concerns competing for limited resources.

Watch the movie, and apply the concept to any proposed remedy. If there is not more than one happy party, the result is bad for everyone. If both sides (and all parties with a direct interest, including AOL Time Warner, Sun, Oracle, etc, as well as Microsoft) do not praise the result, it is practically by definition, bad for consumers, bad for business, and bad for America and the entire western world.

The current proposed settlement, by this reasoning, is *very* *very* bad.

Sincerely,
Brian Dickson

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to give my thoughts on the settlement between the US Department of Justice and Microsoft Corporation. I want you to know that I support the settlement that was reached back in November. It is in the best interests of the government to accept the settlement, and move onto more pressing matters. I believe we have wasted far too much taxpayer money and government time as it is, to pursue an issue that never was in the consumers best interest.

The terms of this settlement are reasonable, and were reached after a great deal of effort with the help of a court appointed mediator. Microsoft is not getting off easy like it's opponents might lead you to believe. The company has agreed to make a number of specific changes to its business practices that will prevent future antitrust violations. For example, Microsoft has agreed to document and disclose various interfaces that are internal to Windows'' operating system products for use by its competitors.

Also, a technical committee comprised of three software engineering experts will monitor Microsoft's compliance with the settlement, and assist with dispute resolution.

Judge Kollar-Kotally,

The U.S. is giving away the store in the proposed U.S. vs. Microsoft final judgment, and the settlement should be rejected. The proposed settlement has serious flaws. The courts have convicted Microsoft of many anti-trust violations resulting in many billions of dollars of profits, yet the proposed solution would allow the company to keep almost all of that money and would provide no protection against future abuse of Microsoft's power.

Forcing Microsoft to give away software (and even hardware) to schools is barely a punishment, either, as it allows Microsoft to further expand its dominance into perhaps the one market it doesn't yet fully control-the education market. And setting up a structure whereby Microsoft would essentially police itself is entirely the wrong approach to protecting us.

I ask you to reject the proposed final judgment on these grounds.

Dear Mr. Ashcroft:

It is sad that Microsoft has had to spend three years in court in the antitrust case. This is a great American company that contributed so much to our recent economic growth, and could help us get out of this current recession.

That is why I was very happy to learn that a settlement was reached in this case. Microsoft has paid its dues and agreed to a good settlement. The settlement will give non-Microsoft firms access to Microsoft code. With this information, non-Microsoft firms will be able to build better software.

Unfortunately, some with animosity toward Microsoft opposes this settlement, and they should be ignored. It is time Microsoft is released from federal court.

Sincerely,
Merle Sturm

Subject: Microsoft Settlement

Dear Judge Kollar-Kotally,

I am a concerned citizen and software industry employee. I wanted to take this opportunity to let you know that as a silicon valley professional, I don't think the judgement goes far enough in addressing Microsoft's past wrong doings.

I realize that I'm a small voice among large companies and powerful representatives. I am a staffing professional hired full-time by companies to help assist in staffing their organizations on a short and long term basis. As someone working closely with start-ups, I've come to learn that bullying tactics from the industry leader in software technology is not healthy for the diversity of skill set among industry professionals on a domestic and global basis.

Also, the proposed settlement would allow the company to retain almost all of the profits earned from dominant tactics.

There are no guarantees that Microsoft won't continue to break anti-trust laws by bullying competitors as it always has.

Microsoft is left to police itself under the proposed final judgment (conflict of interest by definition).

The proposed settlement would amount to a government endorsement of Microsoft's monopoly. They could carry on as before.

Please do your very best to ensure that future jobs of entrepeneurs within the area are not further affected through industry monopolization and that the high tech industry can be revived and not crushed when the economy makes an eventual turn around.

MTC–00028983

From: Peter Liesenfelt
To: Microsoft ATR
Date: 1/28/02 7:42pm
Subject: Microsoft Settlment

The proposed settlement between the DOJ and Microsoft is grossly insufficient in either penalizing Microsoft for the antitrust issues they have been found guilty of or to provide sufficient protection against further actions by Microsoft. As I understand it (not being an expert in anti-trust litigation) precedents have been established that have identified the standards for monopoly remedies to be of the nature of denying the defendant gains from their illegal acts, protecting against abuses in the future or eliminate the monopoly. The proposed settlement by the DOJ does none of these three things.

As a citizen of the United States I have seen the following occur to my ''practical freedom of choice': My options for a personal computer operating systems has been reduced to one, Microsoft Windows. My options for application software (word processing and spreadsheets) have been reduced to Microsoft Word and Microsoft Excel. My option for Internet browsing is practically eliminated to one, Microsoft Explorer. I DO NOT want to have my choices of Internet hosts to be reduced to one, an Internet connection to one, an Internet media provider to one or an Internet news service to one. This is the path that Microsoft is going toward, to monopolize computing. See Microsoft for what it is, based on their previous actions as to where they are going.

Recently, when Microsoft was planning the release of the Windows XP operating system decided to leave out a function to Explorer that was called ''smart tags''. This function would have allowed Microsoft to essentially ''override'' the content of internet pages and supplement the content with content that Microsoft desired, essentially censoring internet content. Do we want a company that has demonstrated that it abuses its monopoly position in personal computer operating systems to have this amount of power? Do we trust that they will not abuse this type of power? I think not, I hope not, I hope the United States aggressive sees to it that it will not occur. Recently I had a problem with my Windows 2000 Professional system and had to use a backup (much older) pc to try to access Microsoft's Internet site to help determine the problem. But I found out that since it was a machine that had Netscape as a browser that Microsoft prevented me from viewing the information. This is only one example of where Microsoft dictates terms to its customers something that you would expect it would want to serve. Any justifications to such actions is only to further their goals to maintain or increase their monopoly, not to serve their users, not to serve the public's best interest. As an extremely knowledgeable computer user I find Microsoft's tactics to not be in the user's interest, only in their corporate interest. I am not against corporate America, in fact I am a strong proponent of it, but monopolies that abuse their power must be held accountable.

I could, if need be, help architect a remedy to this case. Do I think Microsoft has to be broken up? No. I believe that Microsoft will never agree to a remedy that addresses the precedents that have been established for antitrust remedies. I strongly urge Judge Kollar-Kotelly to not accept the proposed settlement. I fear that the DOJ under the Bush administration will not seek remedies that are sufficient in depth or breath to prevent future abuses by Microsoft and that Judge Kollar-Kotelly will need to independently determine a course of remedies that will.

Date: 1/28/02 7:42pm
Subject: Microsoft Settlement

To whom it may concern:

Yesterday I sent you a brief message stating my opinion regarding the Microsoft case. Today I would like to give you more reasons to leave Microsoft in peace: I use Microsoft products, and appreciate them enormously. I resent the government's stance on the basis that it presumes I am not fit to make decisions about which software I buy, and why. If Microsoft is punished, that means they have been found a threat—how can a succssful company's products be a threat to anyone other than it's competitors. And if the latter is the problem, then the USA cannot claim to be a free market or a free country.

Please bear in mind that consumers did not complain about microsoft, nor any community groups. Its competitors (unsuccssful ones), rather than competing fairly, resorted to seeking government favor to help them. You cannot allow failed companies to set terms that will throttle a competitor just because the former was unable to match up.

Governments should not protect some business at the expense of others. As someone once said—''when politicians determine what gets bought and sold, the first thing to get bought and sold is politicians''. Success, self-made and honest entrepreneurship such as that displayed by Bill Gates, should not be punished, but embraced and ecouraged. Imagine how successful America would be if we had more men like him.... If all of the above is not enough, then look to your constitution. A company, like an individual, has the right to its property. This right is inviolable. Please, for all our sakes, uphold Microsoft's right to compete freely and as it sees fit—do not penalize the good for being good.

Seattle, WA 98103
28 January 2002
U.S. District Judge Colleen Kollar- Kotelly
Renata Hesse, trial attorney,
Antitrust Division,
U.S. Department of Justice

Dear Honorable Judge Kollar-Kotelly:

I have comments about the proposed settlement terms with Microsoft. I think the proposed settlement is very flawed and must be re-written to ensure the public and other companies are not harmed further by the Microsoft's monopoly. The proposed settlement only serves the interests of Microsoft.

Microsoft's unfair business practices must be addressed to protect all Americans and all computer users.

1. Microsoft must be prohibited from giving unfair preference and position for its own products when bundled with its operating system products, especially in deals with PC companies.

2. Microsoft must be prohibited from being able to bundle whatever they want to include as part of their operating system, because current separately sold software products could be bundled with Windows in the future and thus, undercut and eliminate many other technology companies.

3. Because Microsoft is a monopoly, Microsoft must publicly disclose their Windows source code in order to level the playfield for all American consumers and businesses.

Please adopt these 3 proposed terms into the currently proposed settlement terms with Microsoft. My proposed terms are fair, unburdensome to Microsoft and the U.S. Federal and State governments and American public, and will be very effective to correct and reverse the wrongs Microsoft has committed.

Sincerely,
Bruce Miller

28 January 2002
Subject: Microsoft Settlement

To whom it may concern,

I cannot let the opportunity to pass for comment on the settlement with the Microsoft company pass without taking my opportunity to make some public comment. There are many out there who think this suit against Microsoft (aka Microshaft) is simply the vendetta of some bitter competitors. But the immoral, illegal, and greedy acts of Microsoft over the years have come at the cost to consumers of choice, innovation, and affordable software. They decided long ago that if they can't beat their competitors with better quality they would cheat them or beat them into submission.

There should not be an expiration date to this settlement, unless it is more than 30 years. Microsoft management has proven that they don't care about the rules and would be anxiously waiting in the wings for the next attack. They need to be punished for the wrong they have done to the American consumer. If they claim they have not stifled competition, why does Microsoft Office cost $500 dollars. That is NOT a competitive price. I can buy the same functions in ''Apple Works'' for $80. And why is it still so hard to get rid of Internet Explorer as your default browser? At work, I have to get technical assistance to change it. And why, as I just found out, that the default search engine for IE is MSN (as in Microsoft Network). Try seeing how intuitive it is is to pick another search engine, like Google, which is much better. Fortunately, at home, I have chosen to use non-Microsoft products, even if it costs me money. This is, however, something Microsoft presumes most people won't do, and they are usually right.

Microsoft is not a group of school boys to be slapped on the hand with a promise not to misbehave again. They are corrupt, greedy, selfish jerks with nobody's interest but their own here. The public is not passive about this situation. We want fair play and true competition based on market rules and true innovation. Not marketing gimmicks and coercion. I applaud the Justice Department in their efforts to resolve this situation, but Microsoft should have no mechanisms to revive their evil ways. The settlement should be strict and long lasting, not 5 years, or we will be in this same situation again.

Subject: Microsoft Settlement

Dear Mr. Ashcroft:

I am writing you to express my concern over the extended delay in the settlement of the Microsoft antitrust case. I see no justifiable reason to prolong this case. The major parties have reached an agreement on both the nature of the matters at issue and the future remedial steps Microsoft will take to remedy past perceptions of wrongs and alter its present monopolistic-like advantages. I see no reason to prolong this litigation. The computer field has new innovations occurring frequently and rapidly.

Microsoft has agreed not only to forego any future anti-competitive practices but also to actively work to reduce its dominance in its field. For example, Microsoft will now configure its Windows systems in a manner that will allow its competitors to readily use and even exploit its platforms. Microsoft will alter its licensing practices with computer manufacturers so as to encourage the use of non-Microsoft software. Microsoft will submit now to an ongoing review of its practices by a new federal oversight committee. The company has agreed to embrace competition for the benefit of the entire industry.

Please work toward an acceptance of this plan and a cessation of this litigation.

Sincerely,
Terrance J Frost

Subject: Microsoft Settlement

The proposed settlement with Microsoft does the citizens of the United States a grave disservice by failing to protect our rights as consumers. Microsoft has accumulated and abused monopoly power, stifling competition and reducing our choices. The Justice Department should withdraw this proposed settlement. The citizens and businesses of this country deserve an open market, not a market dominated by an unresponsive, self protecting monopoly.

Susan Gilvary

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
L. E. JOHNSON, JR.

Subject: COMMENTS ABOUT THE CURRENT MICROSOFT SETTLEMENT PROPOSAL; MY PROPOSED CHANGES TO IT
Joel Hodgell
12712 Lake City Way NE 3
Seattle, WA 98125
28 January 2002
U.S. District Judge Colleen Kollar- Kotelly
Renata Hesse, trial attorney,
Antitrust Division,
U.S. Department of Justice

Dear Honorable Judge Kollar-Kotelly:

I am writing to you to comment on the proposed settlement terms with Microsoft.

As is, I think the proposed settlement is very fatally flawed and must be written to ensure the public and other companies are not further harmed by the monopolistic practices of Microsoft. The current proposed settlement terms only serve the interests of Microsoft and related special interest groups that gave substantial campaign contributions to the Bush campaign and the GOP party.

Even though I live in Seattle, I believe the unfair monopolistic business practices of Microsoft must be punished and adequately addressed in order to protect all Americans and the U.S. and world economy.

1. Microsoft must be prohibited from giving unfair preference and position for its own products when bundled with its operating system products, especially in deals with PC companies.

2. Microsoft must be prohibited from being able to bundle whatever they want to include as part of their operating system, because current separately sold software products could be bundled with Windows in the future and thus, undercut and eliminate many other technology companies.

3. Since Microsoft is a monopoly, Microsoft must publicly disclose their Windows source code in order to level the playing field for all American consumers and businesses.

Please adopt these 3 proposed terms into the currently proposed settlement terms with Microsoft. My proposed terms are fair, un-burdensome to Microsoft and the U.S. Federal and State governments and American public, and will be very effective to correct and reverse the wrongs Microsoft has committed.

Sincerely,
Joel Hodgell

Attorney General John Ashcroft
U.S. Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am writing in response to the public comment period for the Microsoft antitrust trial. I would like to urge you to please end this lawsuit as soon as possible

The settlement will definitely promote competition in the technology industry, if not hindering Microsoft's own competitive abilities. Microsoft will divulge their interfaces and protocols, and will share it with competitors., and consumers will be given more choices when using the Windows operating system.

This witch-hunt needs to be ended, and our computer industry needs to be restored. Please uphold this settlement.

Attached please find an email that I originally sent to my state attorney general, Mr. Richard Blumenthal, who never even saw to it that I at least received an acknowledgment.

Sincerely,
Paul Speranza
Vice President
All Systems Go, Inc.
CC:fin@mobilizationoffice.com@inetgw

Mr. Blumenthal,

I would like to comment on some of the proposed remedies that you and the other eight states have suggested in the Microsoft anti-trust case. Please bear in mind that I am referring to an Infoworld.com article for the points that I am addressing.

1) Allowing other companies to port Office to other platforms. This is no small feat. That is probably why Microsoft has a separate

Macintosh team that develops Office for the Mac. They have to do this because code running on Windows will not run on the Macintosh or any other platform. Did you know that the Mac version is always months behind the newest Windows version? Since the Mac is a completely different operating system that means that the developers get no help from the core Windows developers (The Chinese Wall?). Here Microsoft has succeeded only because they have the best product of its type on the Mac. There is no way to stop anyone from cloning Office. Good luck to anyone that tries. The product is so massive you would need a small army of developers to do it. There is a clone of Outlook for the Linux operating system from Ximian (http://www.ximian.com). Microsoft has not stopped them from doing so. By the way, this company is cloning Microsoft's new .Net Framework for Linux, and as far as I know Microsoft is somehow lending support.

Why would you want to allow someone to clone software from other companies? Where is there innovation in that? Sun Microsystems offers Star Office for free, developed by open source developers. It is compatible with the Office file formats which Microsoft publishes. Why aren?t companies dumping Office for Star Office in droves when Microsoft charges several hundred dollars? It's because over the years programs like Word have evolved to be much more than a word processor. The programs in Office work together to build entire applications based on all of the pieces. You can open up a Word document and in it could be an Excel spreadsheet that you can update without ever knowing you were using Excel. This has evolved over the years and is by no means trivial to do.

As far as the logic that it is too expensive for companies to change to a free product because of training costs, I?m not buying that. Is that supposed to be Microsoft's fault? In a recent interview, Scott McNealy from Sun Microsystems said that large corporations aren?t using Star Office mainly because it is free and the customers didn?t think Sun would be committed to supporting a free product. So now Sun is contemplating charging for it.

2) Allow for a stripped down version of Windows at a cheaper price. What for? Microsoft spends a lot of R&D time and money developing the extras that they give you for free. So if you got a version without the freebies does this mean Microsoft has to pay for not putting in programs that they are giving away? Here is the problem with including only products from other companies? Microsoft's updates to IE, Media Player, etc. are always free for the downloading. RealPlayer, for example, offers a functional yet hobbled version of their software and then gets you to pay for upgrades and newer versions. So does Opera with their web browser. So where is the consumer winning here? With MS I get the feature complete versions of a browser and Media Player for free, with the competitors what initially is free may not be over time if I want versions with more features.

I think what Microsoft did with the PC manufacturers was a great idea: Include all of their products but put whatever competitor's products you want in also.

3) Make IE an open source product. Why? That browser is still the best browser out there. Mozilla is open source and is free. Why aren't people downloading that in droves?

Here is a little software history for you.

Wordstar was the leading word processor. They got fat and happy with their product and did not update it. Along comes Word Perfect with many new features. Bye, bye Wordstar.

Microsoft releases Windows 3.1. Word Perfect does not create a windows version. Microsoft releases Word for Windows and it is a hit. Word Perfect releases a Windows version 2 years later full of bugs. Bye, bye Word Perfect. Corel owns Word Perfect now. They tried to create a Java version of it so it would run on any computer. You know what they found? Although Java is great for backroom systems, the front end interface that a user sees is way to slow to be usable. Sun Microsystems? Star Office, which works on any computer, still needs to have direct ties to the platform it is running on to be usable. Shame on Microsoft for writing great software that runs on Windows.

Microsoft releases Windows 3.1. Lotus, after being begged by Microsoft to do a Windows version to prove the value of Windows, does not. Microsoft releases Excel for Windows, which was already on the Macintosh for years, and it is a hit. Lotus releases a Windows version 2 years later full of bugs. Bye, bye Lotus 123. Ashton Tare had a program called dbase III Plus. They got fat and happy with their product and did not update it. Along comes Foxpro from Fox software and Clipper from Nantucket software. Bye, bye dbase. Microsoft did buy Fox many years later. Computer Associates bought Clipper. Borland bought dbase, released a lousy version 4, tried to release version 5.

See the pattern yet? Stay with me now.

Netscape releases Navigator, a web browser and sells millions at 50 bucks a pop, gets fat and happy with their product and did not update it. Microsoft releases a better browser called IE 4. Netscape, still fat and happy with their product, does not update it. AOL builds their client software around IE. Microsoft releases IE 5 with excellent functionality and great hooks for developers trying to build browser applications. Netscape, still fat and happy with their product, does not update it but decides to give it away. Netscape gets bought by AOL. Microsoft releases IE 5.5 with even better features and developer hooks. AOL releases another version of their client using IE, not their own. Netscape/AOL releases version 6. Full of bugs and slow as hell. A year later Netscape/AOL releases 6.1, slightly better. AOL client 7.0 released, still using IE I think. Netscape/AOL releases 6.2, finally acceptable.

Oh, and before I forget. Because Netscape 4.x was such a lousy browser, companies waste millions in development costs trying to keep websites and web applications compatible with it and the newer browsers. As for the innovative features and improvements that Microsoft put into their browser, most have been adapted by the W3C standards body. All of the newest browsers support those features. As a matter of fact, the new Netscape boasts that they are 100% standards compliant, but they have implemented a few non standard Microsoft features that they feel are very useful.

Why should they release an open source version of it? Did you know that under Windows developers can build IE right into their applications? That means a developer can use Microsoft's product to enhance their own. Not one of the other browsers does that! You see, where Netscape targeted the consumer, Microsoft targeted the consumer as well as the developer that has to create the applications the consumer uses.

So what has Microsoft done wrong here? Oh, yeah, they gave us a free browser with Windows.

So in closing I would like to say that I think the nine states are really going radical here, and I now think it is a witch hunt. I almost want to compare it to what happened with the tobacco companies. Microsoft is sitting there with 30 billion dollars in the bank and people want some of it. To me the feds have gotten about all that is worth getting. I could go on and on but I won?t. I hope that you will at least consider my comments. In case you didn?t notice, I am a software developer. My experience is mostly with Microsoft products, but I have done development using Sun and Netscape products also. I would appreciate a confirmation that you have received this email. If you would like to contact me please feel free to do so.

Dear Mr. Ashcroft:

As a businessman, I don't understand why the government needed to interfere with the business practices of Microsoft. After all, Microsoft is a solid company that puts out a good product, is vital to the economy, and is vital to the tech industry. If Microsoft is not allowed to stand strong, I am afraid for what effect it could have on the economy.

Microsoft has been more than willing to come to an agreement in order to facilitate this suit. It seems their efforts are futile since no one seems to want to end this case. Not only did Microsoft agree to the establishment of a technical committee that will monitor Microsoft's compliance with the settlement and assist with any disputes, they also agreed that if a third party's exercise of any options in the settlement would infringe on any of Microsoft's intellectual property rights, Microsoft would provide them with a license

to the necessary intellectual property on non-discriminatory terms. That seems more than fair to me.

Let's move on. The economy needs it. Thanks.

Subject: Microsoft Settlement

As a programmer and system administrator, the Microsoft judgement will impact me greatly. I have been working with both Microsoft and non-Microsoft products for over 5 years, and in that time I have seen a trend in the software being used. As a system administrator, the integration that Microsoft offers makes my administrative tasks easier. Setup, as well as maintenance, is easier in Microsoft products than in some of competitors, like Oracle, Sun, Netscape, and Linux. The time savings I gain make me more productive. As a programmer, Microsoft products show a tremendous amount of innovation not seen elsewhere. Microsoft has often been accused of breaking standards, but it should be noted that they typically embrace and extend. They take off where standards fall short, they allow the products I write to be better. To me, that innovation they provide is of utmost importance. Also, when doing web-development, Netscape is a horrendous product to work with. Microsoft didn't kill Netscape, Netscape committed suicide by refusing to improve its product and listen to its customers. On a more personal side, I am often recruited to help out non-computer literate friends and family, they need the ease of use, and pricing of Micorosft. Without Microsoft PCs would not be commonplace, but relegated to the hobbists and professionals. Microsoft has made this a connected world because they have given us what we want.

This whole anti-trust situation that has me greatly troubled, as a consumer, person, and somone who creates. It is that the government has abandoned its duty to protect successful people and their property, and chosen to persecute them. The fact is Microsoft, by its own blood, sweat, and tears created its products, and by right has sole ability to decide what to do with its property. The government has proceeded on a witch hunt led by Microsoft's failed competitors under the guise of ''protecting the consumer'', the only people trying to be protected are lacking competitors who would rather pull success down than actually work for success. I resent the implication made by those arguing against Microsoft that I am a helpless victim incapable of making decisions for myself. I use Microsoft products because they are the best available to me. If Netscape, Oracle, or Linux met my needs I'd use them; but they don't. Microsoft is a company that should be commended for its success and supported by the government, not beaten down by it.

It is because of the above I say, ''Leave Microsoft Alone.'' and do not place regulations or restrictions upon them. They are a company that has made my life better, not worse. The likes of Oracle, Sun, Netscape, Linux, and the other whiners would do well to take a lesson from Microsoft's playbook: Innovate, the consumer appreciates that. America needs that.

Sincerly,

Jeff Beitzel (Concerned American and Consumer)

Dear Ms. Hesse:

I write, as a private citizen, to oppose the Justice Department's proposed Microsoft Settlement, currently under review.. I believe that Microsoft has a history of stifling innovation in computer technology, thus harming individual consumers and the national economy. An atmospher in which witnesses of Microsoft's violations are afraid to inform law enforcement officials of their knowledge, which has existed in this country, is harmful to the computer tecchnological industry, as well as law enforcement and belief in the efficacy of the justice system in our country.

Since the settlement does virtually nothing to protect computer manufacturers and others from Microsoft's retaliation, those who defy Microsoft's behavior and views of the technological world are left to become martyrs to what the legislation prohibiting monopolies was designed to prevent.

Remedies proposed by the nine state attorney generals who are still plaintiffs would genuinely constrain Microsoft from its unfair business practices and liberate the technological industry from Microsoft's shadow of fear. Left unchecked that shadow will grow and expand into other areas—why wouldn't it, if there's nothing to stop it, nothing to challenge the unfair and illegal behavior? The existence of such a monopolistic entity is a threat to the well-

being of all who challenge it in the future, and all who would strive for a different and better industry.

Send a message, that justice in the USA is not dead, a commodity sold to the highest bidder, or a kickback to the highest political contributor. Help us be free of this monstrous, harmful entity. Let innovation flourish in this once dynamic field. By freeing the development and exchange of ideas in the technological field, you will help us all to flourish.

Thank you for the opportunity to present my comments.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am in favor of the Microsoft antitrust settlement agreement. the terms of the settlement agreement are reasonable, and will appropriately address the concerns raised about anticompetitive business practices. Continued litigation will not produce a better result. Addressing the allegation that they have acted in a predatory manner, Microsoft has agreed not to enter into contracts that will obligate third parties to exclusively distribute Windows. They have also agreed not to take retaliatory action against those who promote software that competes with Windows. The net result of the settlement agreement will be a more level playing field for Microsoft's competitirs. additionally, a technical committee will be established to monitor Microsoft's compliance wit the settlement agreement. any party who believes Microsoft has violated the terms of the settlement agreement may lodge a complaint with the technical committee. These types of safety mechanisms will ensure no further violations of antitrust laws occur.

Given the vast array of concessions that have been made by Microsoft, no further litigation is warranted. I am hopeful the Department of Justice will remain committed to settling this case.

Thank you for your time and attention.

Sincerely,
Richard Duncan

Re:Microsoft remedy

As an IT professional I am writing to express my concern about the proposed Microsoft settlement. I work extensively with Microsoft at the local level in Philadelphia, and have given considerable thought to their market position. We depend on their products, and to some extent their good graces, for consulting revenue.

I offer these thoughts:

As an MBA student, I have analyzed Microsoft's channel strategy (document attached). It is clear that market dominance (i.e. monopoly) has led to changes in Microsoft's approach to the channel. The changes are generally not good for those of us on the receiving end. I don?t suggest that this is illegal, but offer it as evidence of the effects of monopoly.

I believe an OS is a natural monopoly ? and product with a decreasing marginal cost of production would be expected to be, and software's marginal cost of production is pennies per copy. So Microsoft's current monopoly position is not necessarily the result of illegal activity. In fact, I would argue that their product positioning, marketing decisions, and coding talent have been the primary source of their success. Those are all admirable traits.

Because the OS is a monopoly I would disagree strongly with Microsoft's critics would argue for a breakup. That would not serve the market or the consumers, and would only postpone the natural monopolistic state. One of the split up firms would win eventually.

But, other natural monopolies are more heavily regulated, such as power delivery. Microsoft should be thoughtfully regulated.

The proposed settlement is very minimal regulation, and not enough to protect the legitimate competitors Microsoft can, by virtue of its OS position, crush at will.

I would hope that regulatory oversight would focus on protecting competitors from bundling that leverages the OS position. Force them to sell products rather than bundle them. Clearly bundling is just a means to defending market power.

Examples of products that could be integrated but ought to be regulated include: terminal services (Citrix), media services (Real Player), offline storage, virus protection, systems management, and others.

Thank you for your consideration of these issues,

Subject: Microsoft Settlement

Dear Mr. Ashcroft:

I am writing during the public comment period in support of the settlement reached in the Microsoft antitrust case.

The options for you are, as I understand them, to accept the settlement agreement reached or to return to Court for further litigation. In light of the state of our economy, continued litigation makes little sense. We cannot afford to keep Microsoft on the sidelines.

Microsoft has agreed to make changes in the way it conducts business, which will be conducive to increased competition within the software industry and to economic growth. Microsoft's agreeing to allow computer makers the right to reconfigure Windows operating systems so as to promote non-Microsoft software should prove to be of immediate benefit to the economy.

Please go forward with the settlement as soon as possible. It is in the public's best interest.

Sincerely,
David Bowman

Subject: Just a few comments about the Microsoft situation

1. If you remove the deterrent from a crime, you might as well declare open-season on that same crime.

2. It is a sad day for the United States of America when, on the day after a Christmas when almost every PC given as a present, is running software that has essentially been declared ''broken'' by the Federal Bureau of Investigation of the United States of America.

3. Let us not forget who ultimately picks up the tab every time one of our major corporations, including the Pentagon of the United States of America and Microsoft itself, is at the mercy of anyone who is willing to take the time to read a book.

4. Isn't it time to do something about this problem when the worldwide monetary damages caused by the vulnerabilities of Microsoft's software exceeds the total population of the world by several billion?

5. Do we really want the future leaders of our country, who are currently coming up through the grades of our educational system, to be using software that has been declared a threat to the infrastructure of our own country by the National Infrastructure Protection Center of the United States of America?

6. Microsoft marketed their latest ''innovated'' product known as Windows XP as the most secure operating system ever. It should be quite evident to you by this time that this is not the case. In fact, this situation is much the same as the proverbial used car salesman who insists that the speedometer has not been turned back. However, the final liability of Microsoft's behavior is yet to be known.

URL's to substantiate the above points provided upon request. Since this is a matter of justice, and the ''J'' in DOJ stands for justice, I find it necessary to remind you that Abraham Lincoln declared that ''All men are created equal'' and that we have a pledge of allegiance to our flag which, although altered a few times over the past several decades, still ends with the phrase ''With liberty and justice for ALL''! Therefore, I encourage you to do your job and enforce the laws of the United States of America with equality and due justice. (Long overdue justice in my opinion). And, unlikely as it might be, it would sure be nice to require the company responsible for all the damage to pay for it (retroactive). If Mr. Gates/Microsoft think they are stimulating a faltering economy, then perhaps their vision is only short-term. In any case, isn't it a great way to erode consumer confidence? What difference is there between capitalism and communism when you are down to only one product and that product is not only seriously flawed, but also a threat to your own national security?

Regards,
Ronald E. Wike

Subject: Microsoft Settlement

Dear Sirs and Madams:

I used WordPerfect from 1987 through 2001 because it was by far the best word processing software available. Beginning sometime in the early to mid-90's, each time I bought a new computer, it came with Microsoft Word. Each time I bought a new computer, I asked if the vendor would send me the computer without Word and give me a small decrease in price. The sales people always said they could not do this. So, I got a computer with Word, and bought WordPerfect to put on it. Even though I tried Microsoft Word each time I bought a new computer, since the computer always had Word installed, I never used it because it was obviously inferior to WordPerfect. However, most other people, particularly corporations who watched their budgets, use the ''free'' Word program. Eventually, because it was ''free'', Word became the dominant word processing software. Then Microsoft began charging for it.

Last year my company was purchased by a company that insisted that everyone use the same word processing software. As a result, I now accomplish about 20% less on the average when using word processing because Word is not capable of easily doing what WordPerfect can do seamlessly. Examples: 1. When you copy something from one Word document in say, Arial font, into another Word document with Arial Font, Word will change the font on you. You then have to highlight and change the font back to what it should be. 2. Paragraph numbering and bullets are so erratic in Word, that no one uses these functions—with word, we regress

back to the 80's for automatic paragraph numbering. For example, when you insert a section in front of a newly numbered paragraph with nothing next to it, Word will attach it to the previous paragraph. When you save a document and reopen it, Word will often renumber the paragraphs in some bizarre way. 3. Word has many automatic functions that change things in the text, without your asking, and these are nearly impossible to turn off. 4. Word has inferior lists of symbols.

The above are just a few of the problems with Word. Yet it is the dominant Word processor, not because it is better, but because of clear anti-trust activity.

I believe that if the Government would do something so WordPerfect or some other word processor could really compete fairly against Microsoft, the productivity of this country would increase about 10%.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Sue & Bill Morgan

Subject: MICROSOFT SETTLEMENT

My wife and I feel that it was a disgraceful waste of taxpayer money to initiate an antitrust suit against Microsoft three years ago.

However, since a settlement exists that will finally end this case, we ask that you continue to support this settlement after the Tunney comment period.

Some competitors and a few in the government are trying to have this settlement withdrawn and Microsoft brought back to court until a finish to this case that satisfies them is reached. Those opposed to the settlement contend the settlement is not harsh enough against Microsoft. However, this settlement will cause Microsoft to disclose more formerly secret design code information than any computer company has ever disclosed to others.

Why, other than for selfish reasons, do opponents of the settlement think that this is inadequate? Why do they want to harm Microsoft? Punishment of success is not the American way! We urge you to ignore the anti-settlement argument.

Three years and millions of dollars later, this case should end now at the federal level.

America has suffered enough embarrassment over this politically-motivated case.

Subject: Microsoft Settlement

I urge the court to reject the proposed settlement reached between Microsoft and the DOJ, and instead proceed with the settlement proposed by the nine states which did not join the DOJ settlement.

I believe the nine states'' proposal constitutes a most reasonable remedy which will dramatically reduce Microsoft's monopoly power and dramatically enhance competition. Personally, I am more concerned about Microsoft's desktop monopoly (Win95, Win98, WinME, Win2000 Prof, WinXP Prof, WinXP Home, etc.) and office productivity monopoly (Microsoft

Office) than the strength of their server operating systems. These two monopolies are tightly coupled, and each helps to preserve the other. Office is so strong that its file formats (.doc, .xls, .ppt primarily) have become de facto standards for exchange of complex information between individuals and businesses. Any company wanting to compete with Office needs to fully support reading, editing, and writing documents using these file formats. However, Microsoft provides little documentation of these file formats, which results in competitors having to ''reverse engineer'' the files to understand how the information is stored.

By simultaneously forcing Microsoft to reveal the details of their file formats, while also making Office available on competing platforms such as Linux and varieties of Unix, I think the states'' proposal would dramatically increase competition in the desktop OS market. Also, other applications would be able to ensure 100% compatibility with Office documents, which would create viable alternatives for creating and exchanging documents using the de facto standard Microsoft file formats.

RE: Microsoft Settlement

In my opinion, the settlement proposed for Microsoft is sufficient. In fact, it is already overkill. It must be kept in mind that the changes in our legal system have not, and cannot keep pace with the rapidly evolving changes in high technology. Microsoft might have somehow been in technical violation of our ''traditional'' anti-trust laws. I'll admit that.

However, had Microsoft been forced throughout its history to restrain itself in a literal sense to these laws, it undoubtedly would have never created all the outstanding computer systems and concepts, which most homes, businesses, medical facilities, schools, etc., in America can now afford.

To punish Microsoft more severally than outlined in the present settlement proposal is analogous to rewarding other companies for their lack of vision, mediocrity, and/or lack of means or desire to compete in an extremely intangible, and risky market. Microsoft is too important an entity to be shackled because others cannot, for whatever reason, keep pace.

Subject: Microsoft Settlement

To the Honorable Judge Kollar-Kotelly:

The Discovery Institute would like to affirm to the court its support for the proposed Microsoft antitrust settlement. Our mission is to ''make a positive vision of the future practical,'' and we believe that while any settlement is far from perfect, this particular settlement is very practical and will contribute positively to economic stabilization and growth in America as well as to technological innovation in the public interest—causes we have advocated from the Institute1s debut 12 years ago.

Microsoft is the leading player in the software industry, and its actions as well as actions against the company will have a substantial ripple effect throughout the technology sector and economy at large. Its success has led the way in a growing and stable market for software products that has carried through the collapse of most dot-com enterprises and contributed to record government surpluses until now. Microsoft1s competitors have the right to challenge its market supremacy with their own products and innovations, but in recent years the nature of their competition has largely revolved around government intervention initiated and prodded on by the competitors. AOL Time Warner lately has invested at least as much time and energy in lobbying Washington as in developing attractive and useful products. It purchased Microsoft1s rival Netscape, which makes a browser that is more expensive than and inarguably inferior to Microsoft1s. It didn1t bother to promote the acquisition to its massive AOL audience, preferring to blame its ineptitude on a rival. This reflects a strategy used by the fallen Enron Corp., which extolled the virtues of a deregulated energy market while lobbying government for legal restrictions on its market rivals. Enron1s demise has yet to show serious economic damage. But the assault against Microsoft, in our judgment, has contributed to the current technology sector depression and to recession in the economy as a whole. It is time to call it off.

Economic success rests not only on prudential government regulation, but on a company1s motivation to continually improve its products and make innovations that will attract more consumers. Software users, whether individuals or business, have gradually been leaving the tech market for the past few years because a lack of innovation has decreased any incentive to upgrade their equipment. Massive discounts on computers and accessories can stem the technology exodus for only so long.

The proposed settlement has been careful to limit the damage to Microsoft while redressing its legal breaches in software design and marketing, and any further litigation is likely to devolve into jockeying for advantage between rival corporations, absent of any public interest. For the sake of both the tech sector and the economy that responds so sensitively to its sways, this practical and evenhanded settlement should be enacted expeditiously.

Subject: Microsoft Settlement

The settlement is, in itself, a reward for Microsoft's anti competitive activities. I hope the court holds Microsoft to a trial to hear the evidence of Damages. The company is unbelievable, as the evidence showed during the trial. If the company can not be broken up it should be punished so severely, based upon it's assets, that no other company will consider doing the same as Microsoft in its aggressive anti competitive actions.

This is just my opinion based upon the many pages of material I read about the trial and my own thoughts as to why some programs like WordPerfect were caused problems by the Operating System while ''Word'' was not.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW Washington, DC 20530

Dear Mr. Ashcroft:

The case against Microsoft has been controversial. As a concerned citizen, I have followed the case against Microsoft with much interest. While I use Microsoft products, I do believe that at its pinnacle Microsoft may have engaged in anticompetitive practices. The settlement agreement reached last November is equitable indeed, and if enacted, will have many benefits for the technology sector. Thus, I urge the Justice Department to enact the settlement at the end of January.

To expand, the terms of the settlement will benefit consumers, developers, and manufacturers in the technology industries. With the interim release of Windows XP, users of the operating system will be able to reconfigure their desktop according to their own needs. Thus, users will be able to delete Microsoft software from Windows and add competing software at their own discretion. In addition, developers will benefit from the information disclosure of the protocols and interfaces internal to Windows. This information enables developers to produce software that is more compatible with the Windows operating system. Further, PC manufacturers will be given broad new rights to market competing software without fear of Microsoft retaliation.

Much, then, will change with the implementation of the settlement. Given the decline in the technology markets in recent years, I believe that this settlement will encourage confidence in the markets once more. Again, I urge the Justice Department to enact the settlement. Thank you for your time regarding this issue.

Sincerely,
Marilyn Baldwin

Why does a Microsoft Certified Professional oppose the proposed Microsoft-DOJ settlement?

[1] Because Microsoft is an unabashed monopolist that squelches competition—and innovation—in a field that I chose to enter back in the ''DOS Days''; when I (still) aspired to be affiliated with a company that ''demystified'' personal computers, and helped to bring them into small companies and people's homes at an affordable price. Sadly, those days are long gone...

[2] I could write a LONG list of the companies and products that died in the Microsoft stranglehold, but I believe DOJ already has that information in hand from the legal proceedings.

[3] I urge DOJ to force Microsoft to make all of it's API and related code information for Windows 98 / Me / 2000 / XP open to developers; or, those code and ''hidden'' API's in the Office 2000 / XP suite that prevent seamless integration with other suites (Corel, Lotus, Star, etc.).

(As an aside, I am so outraged by Microsoft's behavior that I have become a very vocal advocate for open source operating systems and office automation applications, and I run these on every machine that I can. But even the Linux zealots can't overcome the Microsoft ''machine''!)

From: Shiven Malhotra
To: Microsoft ATR
Date: 1/28/02 8:08pm
Subject: Microsoft's Monopoly

To Whom It May Concern:

I have been a Microsoft user since I was ten years old. For th longest time I believed that computers were meant to be used only by those who can understand, or know how to use them. But as I grew older I realised that technology has no place in our world unless it can be applied to our everyday lives and to do that technology has to be accessable to those who don't want to understand how the technology achieves the outcome.

I switched to the Macintosh Operating System once I reached college. I realised that Microsoft has never been an innovator in

computer technology but it has always known how to market its products well. But marketing an inferior product is not illelage PREVENTING COMPETITION IS!!

Innovation comes form those how feel that the status quo is not meeting the needs of the common man. Innovators give us a brand new way at looking at ideas and concepts. When a company comes uo with an idea that threatenes the status quo, the status quo tries to prevent the spread of the idea. Microsoft achieves this by crushing the competition, or just making the competitive product incompatible with the Microsoft Operating System.

In Saudi Arabia a years ago WordPerfect was going to release an arabic version of its word processor that was far superior to Microsoft Word. Microsoft decided to preempt WordPerfect by releasing its version of Word in Arabic first. The only problem was that though the box of the software was in arabic, inside THE VERSION WAS IN ENGLISH. Microsoft provided a slip for a free version of the arabic software once it had completed it. BUT it took nearly 3 years for the Arabic version to come out!!! People bought the software believing that the software inside was in their native language but were deceived!!

In Bill Gates book, ''The Road Ahead'', in the original version he believed that the Internet was insignificant!! Yet when Netscape posed a real challange to Microsoft, Mr. Gates went on the offensive by making the Netscape browser less compatible with the Microsoft Operating System, while its browser was brought to the market.

Mr. Gates says that WindowsXP is the ''most secure Operating System'' that Microsoft has ever built, yet hackers have proven him wrong at every turn. Hackers even hacked into Microsoft's ow website. The FBI issued a statement that the Microsoft Operating System was not to be used, because of security concerns.

Competition breeds quality in products deliverd and services rendered. I am originally from India. I have been witness to the changes in the quality of products and services in my country. The lack of competition had made our companies compalicent. The level of services the monopoly companies provided was the only level of service the consumer experienced. There is no surprise that the consumer believed that the level of service was good. After all SOME SERVICE IS BETTER THAN NO SERVICE!!!

Today competition is starting to flourish in India. This has woken up these sleeping giants. They now have to compete with the innovators and new entrants into the market, or become part of history. The consumer, once given a choice will go to the supplier he or she feels best meets their needs. But they will not have this option if they cannot see past the one supplier market!!

Microsoft's main aim is to sheild the consumers from ever seeing any other possibilities in the market, and from preventing these possibilities from ever materialising.

This brings to mind a picture of a dragon protecting a bridge. One one side are the innovators and the competition and the other side are the consumers. To get to the consumers the innovators and competitors have to survive the dragon's displeasure. Even if they manage to get past the dragon, the state in which they get past no longer makes them viable competitors who can make a material difference in the the market.

Microsoft is an innovator is an OXYMORON!!

Throughout history people in power have been scared by new ideas. They have tried to discredit the idea or discredit the person with the idea. Gallalio discovered that the Earth goes around the Sun. He was burned at the stake for sticking to the truth.

PLEASE DON'T LET MICROSOFT PREVENT REAL CHANGE FROM COMING THE INDUSTRY!! THEY HAVE FINANCIAL POWER, DON'T BACK THEM UP WITH LEGAL FREEDOM!!

''Nothing in this world is so powerful as an idea whose time has come''—Victor Hugo

It's time we let Microsoft know that their Monopolistic Strategies will not be tolerated by the United States!!

Thank You,

Shiven Malhotra

The Honorable US District Judge Colleen Kollar-Kotelly,

I wish to express my concern over Microsoft's initial proposal to satisfy its antitrust penalty by providing second hand computer hardware in schools and then its own operating system and associated software applications.

This is pathetic of them to believe that the judicial system as well as the public would believe that this is fair. Rather, it only furthers their monopoly both in the schools and the future job market, where these ''Microsoft schooled'' students will know of no other choices.

Let Microsoft provide hardware (either PCs, or MACs), and let them provide the hardware for providing networking to the schools. Let the schools choose the operating system (MAC, Linux, or Microsoft). I encourage you to seriously consider the offer by Red Hat's president to provide the free Linux OS to all schools.

The United States is synonymous with the idea of choices, a democracy provides for choices.

Microsoft has one choice: theirs. I urge you to reject the proposal put forward by Microsoft in this antitrust settlement.

Respectfully,

MTC–00029032

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers? dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry.

It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more

entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

W R Jackson Jr

From: Michael Robertson
To: Microsoft ATR
Date: 1/28/02 8:08pm
Subject: Microsoft Settlement
Statement of Michael Robertson, CEO,
Lindows.com, Inc.

1. I am the Chairman and Chief Executive Officer of Lindows.com, Inc. (''Lindows.com'') and have been employed in that capacity since the company's inception in 2001. I have previously served as founder, CEO and Chairman of MP3.com, an Internet-based digital music storage, management, delivery and promotion company MP3.com, since March of 1998. MP3.com was sold to Viviendi/Universal on August 29, 2001. I have personal knowledge of the facts set forth herein and, if called as witness, I could and would competently testify thereto.

2. Lindows.com, Inc. is a software company currently developing a new personal computer operating system (''OS''), called LindowsOS, that has the ability to run applications written for both the Linux and Microsoft Windows operating systems. Before LindowsOS, a Linux application would run only on a Linux-based operating system, and a Microsoft Windows-based application would run only on a Microsoft Windows operating system.

3. In cooperation with the many open source community programmers, Lindows.com's software engineers have developed a Linux-based operating system with over ten million lines of code, which will incorporate the performance, stability, and secuirty of Linux while being able to run popular Microsoft Windows-compatible applications, as well as all Linux applications. LindowsOS is the commercial culmination of years of computer science research by Lindows.com and other software companies, seeking to harmonize use of the two most common, but incompatible, computer operating systems.

4. Computer and electronics hardware and software cannot function as standalone products. They are integral pieces of a complex environment that businesses and consumers use to be productive, connected, or entertained. Each piece is required to interoperate with the other to be useful to a computer user. Microsoft's software dominance over the last ten years has taken what was once a rich ecosystem of software and hardware innovation and homogenized it as competitors have been legally and illegally put out of business. This ''ethnic cleansing'' of computer software has left Microsoft and its Win-32 based language, the universal operating system to which any company hoping to penetrate computing OS markets must conform. In other words, for a software company to compete they must speak ''Microsoft'' If steps are not put into place now to allow others to obtain a dictionary of the language AND be able to speak it without suffering repercussions, there will be no competition to Microsoft for the foreseeable future. If companies other than Microsoft are allowed to speak this language, there will be a resurgence of competition and innovation in computer and electronic software and hardware.

5. This ''dictionary'' which Microsoft maintains is not the source code to its operating system or middleware, but rather the blueprint for communicating with those products—the APIs. Microsoft's knowledge and control unpublished APIs has allowed it to exert enormous control over how well applications running on a Windows-based platform work. For instance, Microsoft's ''Word'' word processing program now dominates the word processor market simply because Microsoft itself had nearly exclusive access to its own APIs for years, giving it an advantage in designing its products to perform well with its operating system. It has exercised this same ''API control'' strategey with many other applications, dominating, for instance, the spreadsheet (Excel) Internet browser (Explorer), presentations (PowerPoint), and media player (Media Player) applications.

6. Even though Microsoft today publishes a tiny number of APIs, it continues to maintain an advantage over competing operating system manufacturers such as Lindows.com and software developers because it fails to disclose information sufficient to allow competitors to design software which fully supports the APIs of the application software, disk formats and file formats. As a result, competing operating system software manufacturers are forced to engage in an expensive process of blindly attempting to decipher Microsoft's APIs through trial and error. Most companies abandon the process after costly investments and the few that have produced products are very limited in their functionality.

7. Microsoft also exerts enormous anti-competitive influence over OEM hardware manufacturers'' configurations of their own hard drives which are controlled by Microsoft's operating system. Since the vast majority of computers shipped over the last 10 years have Microsoft Windows operating system preinstalled, the accompanying hard disks are configured with either vfat or NTFS configurations. The specifications for NTFS and vfat are not published and known only by Microsoft. As with the APIs, because only Microsoft has access to and dictates the specifications for controlling the hard drives installed in these computers, competing operating systems are effectively blocked from information critical to designing effective and stable systems.

8. To restore competition, the ''Microsoft dictionary'' should be made public. If the language is secret, potential competitors will not be able to speak the common language used by computer hardware and software, and Microsoft alone will continue to exert enormous influence by selecting who can (and can't) know this language. Microsoft must not be able to gain advantage by delaying publication of the common language, so that competitors will have fair opportunity to meet Microsoft to market with products. Full disclosure of all current and future proposed file formats (including VBA scripting language for full PowerPoint compatibility), as well as future updates in advance of commercial releases are necessary to restore balance.

9. Requiring Microsoft to share the language its interfaces use does not dilute the value of what Microsoft creates, as Microsoft is allowed to maintain the proprietary nature of the code for its various programs. Requiring Microsoft to disclose the common language its programs use to interact with other programs and with computer hardware permits independent companies to use this common language to create innovative applications which can fairly compete with Microsoft in the open marketplace, avoiding excessive government monitoring and entanglement.

10. While Microsoft argues that it is continuing to innovate, the fact is that all operating systems vendors are innovating, but because Microsoft controls 95% of the market already, and has been held to have consistently abused that market power to maintain its monopoly, Microsoft is the de facto standard regardless of the comparative benefits of its product. Indeed, recent lapses in the security of Microsoft's XP products have spotlighted just one of the many

comparative deficiencies of Microsoft's operating system. Yet, despite the fact that Linux-based operating systems are more secure, more stable, and more affordable for many applications, Microsoft's system continues to dominate. This can only be due to the absence of fair market conditions.

11. Ultimately consumers will benefit as they see enjoy more product choices, which will control pricing through natural market forces. The open source community developing applications for the Linux operating system is a prime example of the myriad of programs and applications which interface sharing can inspire. Thousands of programs currently exist in this environment, created by individuals and major corporations alike, all of which are designed to enhance the functionality of computing.

12. I strongly urge that Microsoft required to publish the specifications for file formats, hard disk formats and programming APIs. With advance and complete disclosure of the Microsoft programming APIs, file formats and disk formats, and with the requisite protection to implement them in the course of building a business, it is possible to restore competition to the computing environment.

I declare under penalty of perjury that the foregoing is true and correct. Executed in San Diego, California, this 28th day of January, 2002.

Subject: Microsoft Settlement

The National Black Chamber of Commerce (NBCC) promotes the interests of the more than 64,000 Black-owned businesses in the United States. We have 201 affiliated chapters located in 40 states, including Kansas, and eight countries.

Although NBCC generally supports allowing the market to sort out competitive issues between corporations, we believe that in this case it is simply too late for self-regulation. Microsoft has stifled competition at every turn in its history. It is time for a change. Unfortunately, the proposed settlement between Microsoft and the Department of Justice will not effect this change. It is far too weak ? its requirements are not expansive enough and its enforcement mechanism is not strict enough.

We agree with Attorney General Carla J. Stovall's position that more must be done to rein in Microsoft's anti-competitive behavior. Specifically, to promote competition and innovation, and provide alternatives to consumers, Microsoft should be required to:

* Offer competing developers a stand-alone, unbundled version of Windows without built-in software

* Share the code for its Internet browser, Internet Explorer, with other software developers.

* Auction to potential competitors the right to create the Office software suite to operate on different operating system platforms.

* Include Sun Microsystems? version of Java software in its latest operation system, Windows XP.

Finally, we believe that the court should implement an effective means of imposing punishment in the event of noncompliance and that empower a court-appointed master to oversee the settlement. As it stands now, there is not only no effective punishment mechanism, there is no one even there to enforce the settlement!

In closing, I would just like to reiterate our support for these additional measures to be included in the final settlement.

Sincerely,
Harry C. Alford

To Judge Kollar-Kotelly and whom it may concern,

I have been Microsoft Certified Professional since 1993. I've used many Microsoft products in that time. I will continue to do so; either by personal choice or corporate mandate. I'm finding that my non-Microsoft choices are less and less each year.

I work for a Fortune 500 company, using Microsoft's Outlook email client, the number one propagator of modern computer worms, viral or not. I am forced to use the very product that causes myself and my company's resources so much energy to clean up after, time and time again. Although Outlook Express is included on my personal system, I have no such worries about email worms at home as I choose to use a non-Microsoft mail package outside of work.

The proposed settlement does nothing to curb Microsoft's future actions, certainly does nothing to reprimand past actions, and the proof of both is that even in light of Judge Jackson's findings, and the proposed settlement, it hasn't changed any of it's illegal monopolistic leveraging. That alone should be proof that the proposed settlement is entirely un-enforceable, and in-effectual. Without stronger measures Microsoft will continue down the course they've successfully navigated in the past, namely; Embrace, Extend, and Extinguish. Another concern I have with the PFJ is language which addresses competing ''commercial'' vendors. The fear of many is that this language fails to protect not-for-profit software projects from anti-competitive behavior. As not-for-profit computing has been equally harmed by Microsoft's anti-competitive practices, the PFS must explicitly grant not-for-profits equal remedy and protection.

Regards,
Robert Johnson

Your Honor,

As a computer fanatic, student, and professional, I have watched Microsoft's practices with interest over the years. In 1995, Netscape was the superior browser and held the lion's share of the browser market. I feel that it is still the superior browser, but do to some shady tricks and arm-twisting by Microsoft, the market share has been reversed. As the complaint states, this is because Netscape and its support for applications that are not OS (operating system) dependant could threaten Microsoft's monopoly hold on the operating systems market. Operating systems like Linux Red Hat and Apple could actually gain a respectable share of the market, if not an even one.

I actually like a lot of the products that Microsoft puts out. But I have watched other products that I like as well become victims of (what I believe to be) illegal contractual arm-twisting to prevent manufacturers of hardware from offering any ''rival'' software. I hope that you will be able to do something about this injustice, as this country became great on the concept of competition. The industry as a whole would progress at a substantially increased rate, and consumers would also benefit from competitive pricing and an increased number of choices. I hope that you can reach a decision that will strengthen this country's historical commitment to fair and open market competition, something that this proposed settlement does not accomplish.

Thank you for this opportunity to express my opinion,

Robert H. Mellor, II

Subject: Microsoft settlement

As chairman of Citizens Against Higher Taxes, a Pennsylvania public-interest group, I'd like to offer a brief comment on the proposed Microsoft settlement. I am a long-time user of Word Perfect and despise Microsoft Word; it really gripes me that Word has run rings around Word Perfect in the marketplace. I'm sure millions of other users of non-Microsoft products feel as I do. But we lost, fair and square, in the marketplace of consumer choice. Just because Microsoft is a successful company and produces an operating system and software that most people want to buy, is no reason to punish that success and hurt consumers.

I have looked over the proposed settlement terms and it certainly seems to me that they clearly meet any reasonable standard of curbing potential anti-competitive actions while still preserving relatively free consumer choice.

I would hope that the settlement is upheld, so an innovative and successful company can go about the business of providing ever-newer and better products that appeal to many people (though not especially to me).

10 Red Oak Court
Voorhees, NJ 08043
January 25, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing you today to express my opinion in regards to the Microsoft antitrust dispute. I support Microsoft in this dispute, and I feel that the litigation that has gone on for three years is expensive and will negatively impact consumers. I support the settlement that was reached in November as a means to end this dispute.

This settlement will serve in the best public interest. Microsoft has agreed to all terms of this agreement, including: sharing information with competitors regarding certain internal interfaces included within Windows and any protocols implemented in Windows. Microsoft has also agreed to design future versions of Windows to make it easier to install non-Microsoft software. This settlement will benefit the entire technology industry.

During these difficult times, one of our highest priorities should be to boost our lagging economy. Restricting Microsoft will not accomplish this end. Please support this settlement so we can focus on more important issues. Thank you for your time.

Sincerely,

Francis Clark

MTC–00029044

From: Joan Eslinger
To: Microsoft ATR
Date: 1/28/02 8:13pm
Subject: Microsoft Settlement

I am writing to express my opposition to the proposed settlement to the ongoing antitrust case between Microsoft and the U.S. Government. I obtained a B.S. in engineering from the University of Illinois in 1981. I've worked in the computer industry in Illinois and California for most of the time since then, with experience in operating systems, networking, security, applications, and standards compliance. I'm currently employed by Silicon Graphics (SGI) as a software engineer. I have also followed this antitrust case with great interest, reading the various documents made available to the public including the findings of fact and findings of law, because I have observed Microsoft's effect on the computing landscape for the past several years.

I believe the proposed settlement will do nothing to deter Microsoft from any of its business practices which have already been proven to be predatory and to maintain and extend their monopoly. I can't imagine what possessed the USDOJ to agree to such a thing.

The settlement does not address the most important point for the survival of other operating systems: interoperability. One key way Microsoft maintains and extends their monopoly is related to the file formats produced by Microsoft's Word and Excel applications. Almost every business in this country has found itself forced to use these applications (and others) to interact with other businesses. (I understand there are also government agencies contributing to the monopoly by requiring documents be submitted in these formats, and by disseminating information in these formats). And Microsoft makes deliberate changes to the applications and their file formats periodically, often disabling backward compatibility ''accidentally'', to drive widespread upgrades. The best way to defeat this monopoly-maintenance mechanism would be to require Microsoft to publish these file formats so that other companies can write applications that will correctly read and write Microsoft Office documents. This does not mean Microsoft has to expose any of their source code. I know many people have called out to require Microsoft to make their source code available. I don't believe that is a useful remedy, and Microsoft has made clear they would never agree to such a thing. Publishing file formats is nothing like opening up source code. The TCP/IP protocols that the Internet is built on are described in plain English (with some specialized jargon), and many companies have used that English description to write networking code that works with everyone else's networking code. I believe the government could make a big difference in the world of document exchange merely by specifying that all correspondence be done in

openly-documented file formats. I believe this is one of the most important requirements the goverment could insist on in this case.

The second most important problem is the secret and not-so-secret deals Microsoft makes with hardware manufacturers to ensure Microsoft products (and only Microsoft products) are available to consumers by default. One way this comes about is that almost every contract Microsoft signs with another company contains a non-disclosure clause. Microsoft uses Operating System pricing as the key in such contracts. If a company agrees to lock-out Microsoft competitors, Microsoft will lower their cost to purchase Windows. The uniform licensing terms of the proposed final judgement are a good start, but do not go far enough. There is nothing to prohibit Microsoft from making other deals that lead to a vendor receiving cash or goods or services from Microsoft if it just happens that the vendor does not offer any products from Microsoft's competitors. I'm not an accountant, but I expect it would require analysis of not just Microsoft's accounting records, but also those of the vendor's to detect such a scheme. Frankly, I don't think anything will ensure uniform pricing other than having the hardware vendors publish the cost of Microsoft's software as a line item visible to the consumer, in addition to giving the consumer the right to request a machine with no Microsoft software for the cost of the machine without that line item. Vendors will be less likely to lie about the cost of Microsoft software if they know a consumer can knock that full amount off the price when buying a machine with no OS.

There are many, many loopholes in the agreement that I'm sure other people are writing in about, so I won't go into them in detail. The DOJ should know, however, that Microsoft is famous in the industry for writing contracts they can wriggle out of.

One such loophole I haven't seen discussed concerns the three-person Technical Committee. The committee members are required to be ''experts in software design and programming.'' They are not required to know anything about accounting, business practices, contract law, or criminal investigation. They are permitted to hire staff members, but they also must be software experts. Several sections of the final judgement have nothing to do with software but with contracts and business relationships. Why are there no lawyers or accountants on this committee?

Here's just a short list of some of the problems I've seen in the settlement:

Microsoft is allowed to retaliate against vendors who ship a Personal Computer with no Microsoft software.

Microsoft is allowed to make extra payments to vendors who comply with any unofficial rules they may have (III.A.), as long as it takes the form of a payment for positive action (promotion) rather than a negative action (withholding marketing funds). Intel and Microsoft have both used the marketing funds budget over the years to promote their monopolies. The current form of the Technical Committee is unlikely to be able to police this effectively.

Why are vendors not allowed to advertise non-Microsoft Middleware more prominently than Microsoft Middleware (III.C.3.)? Vendors should be free to configure the systems they sell any way they wish. III.F.2. is worthless. Most companies that work with Microsoft are at a severe competitve disadvantage if they don't sign up for co-marketing agreements. The co-marketing agreements will effectively cancel this provision.

Microsoft should not be permitted to poison existing and future standards. Microsoft is currently investing a lot of money in network protocol design. The obvious inference is that they plan to replace the open protocols of the Internet with their own proprietary ones.

III.H. gives Microsoft permission to pre-empt non-Microsoft middleware if there is a feature missing. Microsoft can always arrange for Microsoft Middleware to have new features not available in competitor's products (and some features, like ActiveX, deliberately avoided by other products due to security problems). By the time an ISV could add support for the new feature, the damage would already be done. This clause will not change anything. Microsoft can always refuse to document an API by claiming it is security-related. By the time a Technical Committee member is able to view the related code, Microsoft can change the API so that it actually does implement some security function. The free operating systems Linux and BSD, currently Microsoft's competition, will not be able to license such code.

The definitions of ''Microsoft Middleware'' and ''Microsoft Middleware Product'' are such that Microsoft can easily work around any restrictions on them. In three years the problems will not center around ''Internet Explorer, Microsoft's Java Virtual Machine, Windows Media Player, Windows Messenger, Outlook Express and their successors'' or ''Internet browsers, email client software, networked audio/video client software, instant messaging software''; they will center around elements of .Net and new applications.

With the new subscription software model, the definitions of OS revisions, upgrades, alpha and beta periods, and distribution will change radically, to the extent that parts of the proposed final judgement will not make any sense (and will no longer apply to anything).

I hope you will take these comments under consideration when evaluating the appropriateness of the proposed settlement. I do not believe this settlement to be in the best interests of consumers or the future of computing.

TO : Renata B. Hesse, Antitrust Division, US Department of Justice
FROM : Robert Santore, Concerned Citizen

Please disregard my previous letter, as that was a draft and not ready to be sent. I accidentally pressed the wrong button. So here are my thoughts: I believe the Justice Department and America needs closure on this (Microsoft) matter once and for all. How long has it been, how much money will it take...and how long will it continue on?

The Federal Government must state it's case, derive it's penalties, seek resolution, and end it's relentless efforts to drag this matter any further, perhaps into the next administration. The Government needs to set a time limit. The longer the Justice Department takes to administer it's justice, the public will be thoroughly disgusted, and America once again will receive her enormous share of worldwide ridicule.

This action is a waste of precious taxpayer resources, and most of us believe the action by the previous administration was politically motivated, fueled by Microsoft's competitors. No one has yet to prove that the American citizen, or the software industry has been hurt by the allegations of anti-competitive behavior. Is it worth the cost? And, while the Government continues it's aggressive pursuits, we have real serious problems to contend with, such as the Enron case, where thousands of employees and investors were sucker-punched....collapse of a major corporation, lost employment and retirements. That's the real crime. And that's precisely where the Justice Department should be spending it's efforts. The contentious and incessant attacks against Microsoft must stop.

Remember that old saying, ''it's the economy.....''? I believe the actions of President Clinton and his administration, the Democratic Congress, the raising of interest rates by the Federal Reserve, the Justice Department versus Microsoft, the collapse of Enron (and other big business), the lack of security in the airlines and the attacks of 9/11 are the result of America being diverted from really serious issues. ''It's the Government.....!!!''

It's the Government which is creating an unhealthy economic environment. It's the Government that knew our airlines and airports were vulnerable. And it's the Government which will ultimately drag the country into a deepening recession. Let's end this obsession with Microsoft, let the Government fuel the market and get this economy going again. Let's rock.....

Sincerely;
Robert J. Santore

RE: Microsoft Settlement
Dear Mr. Ashcroft:
We understand that the public comment period on the proposed settlement agreement between the Department of Justice and Microsoft closes today, January 28, 2002. We are writing to cast our votes in favor of settlement. Given the record of accomplishment so far in this case, it makes no sense to continue litigation when you have the chance to conclude the case in a manner beneficial to the economy. The primary complaint against Microsoft was that consumers who chose to use Windows operating systems for their computers were precluded from utilizing non- Microsoft software programs for such services as Internet browsers and messaging services within Windows. Microsoft has agreed to end this practice, and open its Windows systems to such competition. With the major complaint answered, there is no need to further litigate. Please end this case, and put Microsoft back to work. The country needs to heal. Thank you for your kind consideration in this matter.
Sincerely,
114-&A 0. Lester A. Taylor Cpa''@

Dear Microsoft Settlement:
The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.
Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.
Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.
Thank you for this opportunity to share my views.
Sincerely,
Joe De Fazio

Dear Mr. Ashcroft:
I think the anti-trust lawsuit filed against Microsoft Corporation should finally be closed and satisfied. The suit charged Microsoft with unfair business practices that limit competition, but really the issues were new ground. The technology industry is continually producing new products and procedures that challenge the rest of the world to keep up, including legislation.
Moving forward, Microsoft has agreed to change their policies and procedures to conform to the agreed terms of the settlement of the lawsuit. They have actually agreed to more conditions than were at issue in the lawsuit, and they did so to get the lawsuit behind them and to resume business.
I think Microsoft has shown their intent to conform to the ruling and the terms of the settlement. No further court action should be taken against Microsoft Corporation.
Sincerely,
Brandon Wright

Dear Attorney General Ashcroft and his Colleagues,
How do you do? My name is Carina Flores*, and I would like to present MY Views on the Microsoft Settlement:
1. Microsoft has SIGNIFICANTLY contributed to the Gross National Product of this Country and to the direct and indirect Livelihood of MILLIONS of people even beyond these patriotic shores;
2. Microsoft has GENEROUSLY contributed to MANY Charitable and Educational Agencies dedicated to uplifting the lives of MILLIONS of people in this country AND in this planet;
3. Microsoft has dramatically ALTERED the landscape of Democracy by making it possible for information technology to be more accessible to a greater number of people and helping us make MORE informed Decisions in the process;
4. Microsoft KNOWS how to keep its Employees happy, productive and instrumental in FUELLING the Economy of this Society, and Microsoft, don't you ever doubt, is in it FOR THE LONG HAUL;
5. Mr Bill Gates of Microsoft IS one of the most ADMIRED people in this Country and in the World, and he and his Colleagues HAVE set NUMEROUS, fine examples of Ingenuity, Wealth-building AND Wealth-Creation for the Youths of Today, and the MANY more Generations to come;
6. This beloved country of ours is admittedly FOUNDED on upholding the Law and discouraging unethical AND illegal behaviour, but NOT —- repeat —- NOT on

punishing Success, which is what Microsoft's Detractors WOULD like to happen because they are counting on you NOT to make that Distinction.

7. This Country and the World IS, by far, BETTER OFF, because Microsoft exists today. Thank you, and may right be done.

Sincerely
Carina F Flores

Dear Sirs:

I fully support the proposed settlement of the Microsoft antitrust action. Microsoft, for all its faults, continues to be the one standardizing force in a market that easily fragments into many special segments serving only cognoscenti of that segment. Microsoft is aggressive and competitive and deserves the restraints imposed by the settlement, e.g., I should be able to by a computer from anyone without an operating system if I want it.

Please bring an end to the hectoring of one of two or three great U.S. companies providing inexpensive computing to virtually anyone with a job.

Sincerely,
George and Valerie Pease

Dear Mr. Ashcroft:

It is unfortunate that some states wish to push for further litigation against Microsoft. In my estimation, the states'' representatives on this case are spending more time listening to money-hungry Microsoft opponents than looking closely at the factors in the case. I have never supported Microsoft to the exclusion of competition. They have in no way done anything that has negatively affected me professionally or personally. I have worked in the computer industry for over thirty years, and Microsoft is a true leader. I currently am a satisfied user of AOL/Time Warner's ?Roadrunner? cable service to the exclusion of MSN. I did choose Microsoft's ?Internet Explorer? product after a disappointing experience with ?Netscape?. Microsoft's support and development programs get my vote, However, one does not need to be an expert in the computer field to see all that Microsoft has done for the computer industry. Another factor that proves Microsoft's high caliber has been their willingness to cooperate throughout this lawsuit and to comply with the terms of the proposed settlement. They have agreed to give their competitors access to Microsoft codes and protocols in order to facilitate competitiveness. In addition, Microsoft has agreed to have their compliance to terms of the settlement monitored by a technical committee. Any person who has a dispute with Microsoft may make their complaints known to this committee.

I am truly hopeful that your office will remain determined to resolve this matter. I thank you for all the work you have done

thus far and for keeping the public's interest at heart.

Dear DOJ Group

Thank you for this opportunity to share some thoughts about this settlement. It is not often that we are asked or have opportunities such as this.

As far as the details of the settlement I cannot be specific but in summary I would say that this particular solution is allowing one conglomerate to sidestep the law. Not only sidestep the law but to impinge on fair trade for other systems. If a company has a superior product that product should not be sabbotoged just because the larger more well funded company wants that market share.

Let's be realistic for a moment in a fair trade arrangement, meaning all companies have equal opprotunities, there would be a better competitive market. Just look at what the IBM suit brought about, PC's on every desk and much more.

I've began my teen life as a programmer at the age of 14 and though that is not my vocation today I have always felt that there were better systems out there. Allowing one company to monopolize one or more markets is certainly not giving the public the tech growth opportunities that are truly out there.

Think for a moment how the FDA handles products that are ingested by humans. Why is it so difficult to see that we are stunting the growth of other products by allowing MicroSoft such an easy out.

Sincerely,

Sheevaun Moran

From: Nick Parlante
To: Microsoft ATR
Date: 1/28/02 8:22pm
Subject: need for competition

I'm writing to express my concern that Microsoft's current position is a frightful drag on innovation and investment in computer science, and that the proposed remedy falls far short of fixing the situation. The obvious concern is that Microsoft can use the market power of its monopoly operating system to achieve dominance in other domains—such as with the Netscape browser, or the Real and Quicktime media formats. Obviously, we want microsoft to compete on price and features in those new domains, rather than leveraging its existing dominance.

Rather than repeat those arguments, I would like to come at the point from a new direction.

What is the most exciting and valuable technology to come about in computer science in the last 10 years? The Internet! At the time the Internet burst on the scene, roughly 90% of the world's computers were using Microsoft operating systems to run Microsoft applications to produce and exchange microsoft formatted files. If Microsoft controlled the operating systems and the applications and the document formats, why did the Internet not develop as a Microsoft feature? Why did the measly other 10% come up with the best technology

of the last decade? There are two answers to this question:

1. Microsoft position has created, inevitably, an atmosphere of complacency. The result has been a series of overpriced, insecure, and just generally crummy products with high prices. It always stuns me how breathless the marketing prose is for these things when they are patently so lame. Or rather, how low our standards have become for the price/performance of software. We have become accustomed to lack of competition. Look at PowerPoint today vs. 5 years ago. Compare that to a domain where there is competition, such as hard drives, or databases.

The rest of computer science proceeds through ruthless competition, and the contrast to the Microsoft products without competition is stunning. With competition, PowerPoint would be far cheaper now than it was 5 or 10 years ago. The atmosphere of complacency inhibits something as useful as the Internet from being developed inside of Microsoft—it threatens the status quo.

2. Microsoft develops products to strengthen its monopoly—each product tries to tie in to the other Microsoft products. Using such ties, both technical and marketing, the Microsoft products lock into each other to protect the franchise from a product that might compete in a single domain. From a technical point of view, the practice enables some neat features, but also a series of disastrous security holes. From a marketing point of view, it has been entirely effective. For example, PowerPoint could never stand on its own in the market with its price/performance ($314 street price, Jan 2002), however bundled with Word and Excel it does ok.

Besides all that, the habit of linking products together exactly prevented Microsoft from developing the Internet. The Internet is all about any-any connections. This works by having a freely available standard, such as TCP/IP or HTTP, and having all systems implement the standard in a non-discriminatory way. So A PC can make a web (HTTP) connection to a Unix machine, or a Macintosh, or whatever. In the early 90's, Microsoft created technology for PC-to-PC networking, but it goes against the Microsoft linking strategy to create good PC-Unix, PC-Mac etc. versions.

The Internet is the philosophical opposite of Microsoft's ''linkage'' strategy. Because Internet connections are based on standards, they lead to —competition—. If you don't like the brand X HTTP server, you can swap in the brand Y HTTP server and it still works since the two are following the HTTP standard. Looking back at the development of the Internet, one of the key technical themes is: standards promote competition which leads to continuous improvement in price/performance. The emergence of the Internet is exactly a peek at what the world would look like without Microsoft domination. The Microsoft domain is so leaden, so stationary, that the tiny, non-profit driven standards projects, such as TCP/IP or HTTP or HTML, created whole new domains while Microsoft stood still. This reflects both the great dynamism that competition creates as well as the sodden rule of a monopolist. (That Microsoft would like to bring these new domains under its control is, of course, the topic of the trial.) The point I would like to emphasize, is how vibrant, how amazingly innovative and valuable computer science can be when prompted with a competition. We are so accustomed to the Microsoft hegemony, that we think of it as high tech and innovative, whereas the Internet showed us that the Microsoft domain is stationary compared to a real competitive domain. Computer science has so much potential to create value when pressed with competition. I fear that Microsoft's monopoly will weight down that potential to look more like the pathetic history of PowerPoint.

I would recommend that Microsoft be divided into three parts: Operating systems, applications, and internet applications. Each part should have to compete in its domain on its merits, without technical, financial, or marketing ties to influence the competition in the other two domains. Disclaimer: I own Microsoft stock. I think if forced to compete, they would do fine on their merits.

Ms. Renata B. Hesse
Antitrust Division
United States Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001

Dear Ms. Hesse:

As a consumer advocate and consumer, myself, of computer products, I am compelled to file my comments concerning the proposed settlement agreement in the Microsoft case. This case, which as taken years of government resources and much of the public's attention, is at its most important juncture. It is in the public interest for the Department of Justice, Antitrust Division, to uphold the spirit of competition by requiring changes in Microsoft's business conduct. These requirements should be swift and specific, ensuring free competition in the computer sector, not creating further outlets for Microsoft's anti-competitive behavior. I believe that sustaining a company like Microsoft in the current economic climate is useful for empowering the American economy and foreign economies to which the company is attached. However, there must be a reasonable approach to the problem of its monopolistic behavior.

The proposed settlement appears to ignore the barriers to entry issue that was at the heart of the entire investigation and resulting lawsuit. To eliminate or minimize the barriers to market which Microsoft is guilty of would provide more freedom of choice for consumers and would open competition for other manufacturers to provide ways to run existing Windows applications on different operating systems. Creating a way to allow other manufacturers to develop new products will have a profound and lasting effect on the US economy, as they compete to produce better products with the consumer in mind, and then in turn, distribute them through the chain of distribution of their choosing. This will further affect the economy as new businesses spring up to handle the increase and variety of new products.

Furthermore, requiring that Microsoft share its technology with industry participants will give the power of choice to consumers and remove Microsoft from single-handedly dictating use of information technologies. The handling of Microsoft can have implications in many areas of our way of life, such as allowing for the expansion of markets and promoting consumer choice, two things that consumers like me look to the Department of Justice to ensure.

Dear Mr. Ashcroft:

Let me start off by saying that the government had no business bringing a case against Microsoft in the first place. That having been said, I appreciate everything that has been done to end this case quickly and get on with business as usual. The settlement is fair; Microsoft will take steps to increase competition in the marketplace by allowing its competitors to place their own programs on the Windows operating system.

Now, more than ever, we need companies like Microsoft back at full strength, helping the economy. Stop punishing them and let them help get us out of this recession. I'm sure that there are more important things for the Justice Department to be worrying about right now as well.

Thank you for taking the time to listen to my opinion on this and I hope it will have some effect.

Washington, DC 20530

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Joyce M. Kelly

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

Microsoft and the Department of Justice have come to an agreement ending the three-year-long antitrust case against Microsoft. This came after round-the-clock negotiations ordered by a U.S. District Judge. I feel this agreement should be honored. The two parties agreed to this settlement, the federal judge accepted this decision, so why should there be any further discussion? I do not think it is in the best interests of our country to endlessly review these decisions. Why do we have courts, after all?

Further, Microsoft has been more than fair in its settlement. Microsoft has agreed to design future versions of Windows with a mechanism to make it easier for computer makers to promote non-Microsoft software; Microsoft has agreed to release important internal information about Windows so that developers can more easily write competing products. Enough is enough.

I ask that you approve this settlement and let our country get back to business.

Sincerely,
Scott Brennan

Subject: Microsoft Settlement

Gentlemen:

I strongly object to the proposed settlement with Microsoft. It's less than a rap on the knuckles to the company which has been completely stifling competition in user software for over a decade.

Microsoft's anti-competitive approach to its business is most clearly shown by it's abhorence of internet standards. The company line is that they are ''improving the standard and making the products better for consumers.'' This is total nonsense. They know that open standards promote competition and make for a more level playing field. This is anathema, of course. What they want, and have so far been able to achieve for the most part, is to make all common data formats Microsoft proprietary. The way to do this is to make their internal data formats as complicated and difficult to understand as possible. This makes it more difficult for potential competitors to make their products compatible with Microsoft products.

One technique in particular which they use to obfuscate very effectively is executable content. Like all their other so-called ''innovations'', this is yet another attempt to prevent other software developers from marketing compatible products. It has also turned out to be a security nightmare for the internet. This detestable policy of purposefully over-complicating data formats by including executable code is by far the single most significant security problem on the internet. It has enabled worms and viruses to proliferate ad nauseum. It has cost business and industry billions of dollars.

The latest strategy is to try to dominate the web by inducing developers to use Microsoft web development tools which, of course, generate web pages which only work with Internet Explorer. This simultaneously puts the other browsers out of business and forces the remaining developers to pay big bucks for the Microsoft development tools.

There is zero benefit to consumers in all of this, Microsoft's pious claims to the contrary notwithstanding. The company must be broken up and its monopoly power eliminated once and for all.

Very truly yours,
David M. Goldschmidt

Dear Mr. Ashcroft:

As someone who works in and is extremely familiar with the computer industry, I am writing you to express my opinion on the Microsoft settlement issue. I believe that this settlement is long overdue, and I am relieved to see this dispute resolved.

With the economy faltering and the IT industry in retreat on many fields, I feel it is best to allow Microsoft to devote its resources to designing innovative software. This settlement allows all of us in the industry to get on with the business designing and providing IT services. Even with the heavy sanctions this settlement places on Microsoft, sharing of technical information, government review committee, etc., Microsoft will still be able to be the leading force in the technology sector.

Thank you for settling with Microsoft. I believe we should devote our time and energy to more pressing issues at hand.

Sincerely,
Larry Seel

To Whom It May Concern:

It is my hope that the Department of Justice will reconsider the decision to settle the Microsoft antitrust lawsuit and follow the lead of the nine state attorneys general who have rejected the decision to let Microsoft off with a slap on the wrist. I am proud that my state's Attorney General, Tom Miller, rejected this Microsoft agreement. I believe that he and the other eight state attorneys general recognize the many problems with this agreement.

The decision to prematurely end litigation against Microsoft is a real error in judgment. A real opportunity exists for the Department of Justice to take a stand and protect our free market society and its consumers. Further litigation could effect real change. Please continue to pursue Microsoft.

Sincerely,
Scott Brennan

Subject: Microsoft Settlement

I oppose the currently proposed Microsoft settlement as being one that does not further the ordinary citizen's future interest in having the best computer software available at the best price. If the Microsoft settlement allows the installation of used and refurbished computers with Microsoft operating systems into schools it will provide Microsoft with an otherwise unavailable market destination for disposing of old PC equipment and a monopoly for Microsoft to provide technical support and operating system software.

Further it will enhance Microsoft's ability to require the use of computers using the Microsoft operating system by children at an early age based on a forced environment rather than based on a selection of systems having the best overall value.

Ted

Subject: help consumers, stop persecuting a productive US company

Dear Sirs:

I am writing in support of the Microsoft positions in the Justice Department lawsuits.

I have been a professional programmer for 37 years. Microsoft has done the most of any software provider to lower the costs of useful software for consumers. There is just no honest refutation of this fact.

I have personally seen $12,000 price tags on developer's toolsets for Sun Microsystems Solaris operating systems, at the same time as Microsoft charged less than $2,000 for a toolset that included not only a comparable developer's tool, but also a complete database system.

I urge the Justice Department to settle or drop its suits against Microsoft as soon as possible, for the benefit of us consumers. Antitrust laws written to stop abuse of fixed land-based distribution of commodities like power, telephone service, and fuel just do not make sense for software which is easily distributed.

Regards,
Bruce A. Bernott

Dear Attorney General Ashcroft:

As a small business owner, I strive everyday to accomplish what Microsoft has in the past fifteen years. I have never agreed with the government's pursuit of Microsoft for its successes. I am satisfied that this settlement will bring the lawsuit to an end.

This settlement, and its several provisions satisfy Microsoft's, the American IT industry's, the government's and most importantly, the American public's interest in this matter. The agreement creates a non-hostile competitive environment for other companies besides Microsoft and fosters innovation by requiring Microsoft to make available its intellectual property and source code on reasonable, non-discriminatory terms.

This agreement is the product of three years and three months of a judicial debacle and this should be the end of it. I strongly urge your office to accept this settlement and take no further federal action.

Thank you.
Sincerely,
Danny Fischer

Ms. Hesse,

Under the Tunney Act, I wish to comment on the proposed Microsoft settlement. I agree with the problems identified in Dan Kegel's analysis (on the Web at http://www.kegel.com/remedy/remedy2.html), namely:

1. The PFJ doesn't take into account Windows-compatible competing operating systems

2. The PFJ Contains Misleading and Overly Narrow Definitions and Provisions

3. The PFJ Fails to Prohibit Anticompetitive License Terms currently used by Microsoft

4. The PFJ Fails to Prohibit Intentional Incompatibilities Historically Used by Microsoft

5. The PFJ Fails to Prohibit Anticompetitive Practices Towards OEMs system.

6. The PFJ as currently written appears to lack an effective enforcement mechanism.

I also agree with the conclusion reached by that document, namely that the Proposed Final Judgment, as written, allows and encourages significant anticompetitive practices to continue, would delay the emergence of competing Windows-compatible operating systems, and is therefore not in the public interest. It should not be adopted without substantial revision to address these problems.

MTC–00029087

From: Maynard Sipe
To: Microsoft ATR
Date: 1/28/02 8:37pm
Subject: Microsoft Settlement

The Microsoft settlement proposed by the Dept. of Justice is totally unacceptable and should be rejected by the court. It does not go far enough in any of its provisions. It allows Microsoft too much room for self-determination over whether it is meeting terms of the agreement, it fails to sever the link between pre-market loading of Microsoft's OS and it's Internet Explorer web-browser, and it does not take any affirmative-action type steps to reestablish some competitiveness in the marketplace which is essential.

It is clear that innovative companies with products far superior to Microsoft's have been driven out of business or had their share of the market reduced significantly by Microsoft's uncompetitive practices. The obvious example is Netscape. Because Microsoft could spend almost limitless funds developing Internet Explorer and then induce PC manufacturers to carry Internet Explorer, they were able to practically destroy Netscapes market share. This would not have been possible without the use of unfair and anti-competitive business practices.

Another example is Be. The BeOS was superior in almost every way to Windows, but Microsoft used their market strength to effectively prohibit PC manufacturers from even offering BeOS as an option.

Worse yet, Microsoft is continually attempting to further its monopolistic position by asserting dominance over the internet by using standards in its software not compatible with open standards (HTML, SHTML, Java, etc. Web sites must support the Microsoft applications. Since other companies do not presently have the means to compete with Microsoft, allowing Microsoft to continue to do this threatens to give undue control over the internet to Microsoft. This is extremely serious for the nation's welfare and that of almost all private businesses and industries.

The fact that Microsoft acts in violation of anti-monopoly laws has been established. The proposed settlement etween the Dept. of Justice and Microsoft is patently against the public interest and should not be accepted by the court. No settlement will be effective unless it completely severs any link whatsoever between packaging and distribution of Windows OS and Internet Browser; requires dual-boot OS on ALL pcs marketed with Microsoft OS; and applies affirmative obligations on Microsoft to remedy its past actions. (Such as requiring Microsoft to make the necessary proprietary codes fully available to competitors such as Netscape).

The best remedy would be a break-up of Microsoft into three separate companies. Failing that, any remedy should have proactive measures to restore competitive balance in software markets, particularly for web-browsers (such as requiring dual-boot on all pcs marketing with Microsoft OS); bar Microsoft from packaging its web-browser with its OS; and provide for continued oversight by the Dept. of Justice or better yet, the court.

Thank you for considering my comments,
- Maynard Sipe

I wish to express my support for Microsoft and my disgust and disappointment in a government that seeks to punish a successful business for its very success.

Microsoft undertook to make the benefits of the computer and internet available to the average citizen. This was good for the buyer, who 10 years before could not have afforded to own such a system, and it was good for Microsoft, who generated a larger customer base. Historically, this is the way the world has benefited from new inventions and novel applications (the Model T Ford, for example). Someone finds a way to make the new invention inexpensive enough for the average man, who snaps it up eagerly.

The excitement when Windows 95 was launched demonstrated this eagerness to enhances one's life. Windows has streamlined and enriched my own life immeasurably. I freely made this choice and will continue to control what I put on my computer. Microsoft (or any other company) has the right to offer its wares and the rest of us, to purchase them or not.

There has been no damage to consumers. We have received a boon! We each freely chose to buy these products for our own reasons. In a free society, the sight of one person's success should inspire a redoubling of effort on the part of every other worker, not envy and a wish to destroy the innovator. Our Constitution guarantees protection of our property rights. Where is the protection for Microsoft? Can any of us feel confidence in our government in the face of such a blatant misuse of power? I do not wish to live in a country that penalizes our best minds. It is time for us to wake up and recognize the uniqueness of our Constitution and the superb moral mechanism of the free market system.

I only wanted to add one wee voice to the heavyweight voices already writing you. Please work to have the Windows Operating System separated from the applications side. I don't need Office ported to Linux or any such silliness but having the operating system so strongly biased toward in-house applications seems to be the root of the many problems. It is unfathomable to me that I had to give up using Netscape (which I was more familiar with and preferred) because the owner of the OS wants me to use Internet Explorer. I am only an average PC user but I can remove most programs from my computer without mishap except Outlook Express or Internet Explorer. Removing either of these causes the machine to develop serious operating problems. This is wrong. Where will it end? By having Windows will I eventually be required to discard other programs when Microsoft decides to enter a new market?

I personally really like the idea of separating into two companies—OS and applications. It seems there is enough demand to keep two companies healthy and thriving. I believe that we would even see real advances in OS rather than the superficial changes brought about by many ''new'' versions of Windows. If the OS company were truly separated we wouldn't see programs like Outlook having freedom to couple so closely; hence, some of the horrendous security problems would be overcome. Applications like IE, Outlook and Office should need to work with the operating system through the same interface as non-Microsoft programs.

I know you must get tons of email so let me boil it down to ''No favoritism for in-house products''.

Thank you for your time.

Sirs:

Please allow the proposed settlement reached by the Justice Department and Microsoft to be the final act of this farcical suit. The Attorneys General of these states that wish to continue the harassment of Microsoft for their small groups of constituents should not be afforded any more time or monies. Stop these proceedings NOW!

Microsoft has brought a tolerable environment to personal computing, one that did not exist until there was a market force as large as Microsoft to enforce de facto standards. Without these standards, personal computing would be only a small fraction of the pervasiveness it enjoys today. Get off Microsoft's back, and let the consumers reap the benefits of stable, standardized computing environments. Perhaps then the technical sectors of our economy will return to their previous stature.

Thank you for considering this opinion.

Dear Mr. Ashcroft:

I am writing you today to voice my opinion in regards to the Microsoft settlement that was reached in November. This issue has worn out its welcome, and it is time to resolve this issue permanently. The settlement is a decent and realistic alternative to another three years of litigation, and it provides the benefits that Microsoft's competitors feel they need to compete. That is why I support this settlement, and I sincerely hope there will be no further action against Microsoft at the federal level.

Among other things, the settlement gives software companies like Sun the protocols and interfaces to redesign their products to run more efficiently on the Windows operating system. Microsoft is literally giving away the sorts of codes that made them known all over the world. Moreover, hardware companies will be able to reconfigure Windows after they receive their licensing agreements, and Microsoft cannot prevent them from changing the ''desktop'' software or cannot take any retaliatory action, so consumers will ultimately dictate what sort of software they will want on their computers before the computer is sent. This settlement does something for everybody interested.

Microsoft is a company that has done so much to impact our society and the technology industry. Microsoft has made it easier for the average consumer to afford and use software, which in turn has made it easier to conduct business. This company should not be stifled or restricted for following the American Dream. Please support this settlement and work in the best interest of the public.

Sincerely,
Debbie Schinnell

Dear Renata Hesse,

Fearing my letter might not reach you in time I decided it might be wise to send an email.

I appreciate this opportunity to speak out, regarding Microsoft. For me, the domination of Microsoft in the software industry has been a disaster. I consider myself an above average computer user, and yet I could not sufficiently combat the tide of instability caused by the poorly written software developed by Microsoft. I have lost countless hours to troubleshooting crashes caused by the companys products. Worst of this breed of overwrought catastrophes is Internet Explorer. Not a day would go by without this application bringing my entire system to a screeching halt. I often wonder what the face of the industry would be had the company not been able to use their monopoly power on the OEMs to muscle Netscape and other competitors out of the picture. A bully is still a bully, at any age. I shudder to think of the consequences of raising a new generations of kids to rely on inferior tools in their own schools, thanks to the marketshare being handed to Microsoft by their own proposed Seattlement. There is just too much complacency, too much power, and too little brains going into the products at Microsoft for the company to justify the monopoly its established by its frequent use of political leverage and scare tactics. But beyond my own animosity for the company, there is a genuine and immediate need for changes in the balance of power in the technology industry. In my opinion, the answerthe only answeris intervention on the part of a higher authority to remove the advantage that has trapped the computing populous in a seemingly endless cycle of unintended brand loyalty.

Thank you for taking the time to read this.

Sincerely.

Subject: proposed Microsoft settlement

Dear Sir or Madame:

I would like to request that you revisit your proposed settlement with Micrsoft on the question of penalties for their behavior. Recent actions by Microsoft (their new licensing ''agreement'' and their Product Activation) seem to be more of the ''same old, same old''.

While I do not think a breakup of the corporation is called for, I do beleive that it will require far more stringent measures to reform Microsoft. Their well-document corportate culture is one of ''win at all costs'', and part of the cost has been a marketplace with true alternatives to their products. While there are Unix, the Apple Macintosh and the Open Source movement groups, the fact is that Microsoft operating systems are on over 50% of the servers and over 90% of the desktops in the US. Their browser and various office automation products control similarly extreme shares. While I am a free market supporter to the point of Libertarianism, this is not the sign of a healthy market. It is the sign of a market that has been skewed by the power and money that Microsoft controls. From my point of view as a network administrator and IT manager, Microsoft is the embodiment of the old ''800 pound gorilla'' joke.

Please come up with a settlement with some teeth, or we will be doomed to travel this same road again in the future.

Bill Seward

Subject: Microsoft settlement

Dear Mr. Ashcroft:

With a potential settlement in the Microsoft case, I wanted to voice my position of support on ending further litigation by completing the deal. The antitrust lawsuit was misguided from the start,caused by rivals who only have themselves to blame for their lack of headway in the industry. The growing pattern of government intervention in the business community was evident with the tobacco lawsuit, where states joined a giant money-grab because they dont like the results of people's individual choices. This time, people have made the choice of Microsoft as their preferred software maker and delivered them with a dominant market share, so the government sees an opportunity to make money by punishing a company in the name of competition. The deal offers computer makers oopen access to selecting the software providers of their choice and will be constantly monitored by a group of experts, so Microsoft's rivals should declare this a victory and start creating products that consumers want.

I ask that you go ahead with this proposal and let Microsoft continue to be a strong advocate for innovation in the PC industry, as our economy and financial markets coujld definitely use the boost. It is time to leave government on the sideline and let the litigation be ended. Thank you for hearing my feedback.

Sincerely.
Joyce Smith

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Raymond Best

Dear Mr. Ashcroft:

I am writing you in support of Microsoft's antitrust settlement with the federal government. They have spared us the taxpayer of a lengthy and costly legal battle.

This settlement is very reasonable. Microsoft agreed that if any third party's exercise of any options provided for by the settlement would infringe any Microsoft intellectual property right, Microsoft will provide the third party with a license to the necessary intellectual property on reasonable terms. Also, the settlement establishes an oversight committee to monitor its compliance with the settlement and assist with dispute resolution. Additionally, Microsoft has agreed not to retaliate against software and hardware developers who develop or promote software that competes with Windows or that runs on software that competes with Windows.

Microsoft has and will continue to be a good corporate citizen. I think this settlement shows that the consumer interest has been addressed. I urge you to approve this settlement, so Microsoft can get back to work.

Sincerely,

Kim E. Ogden

From: Austin Gonyou
To: Microsoft ATR
Date: 1/28/02 8:47pm
Subject: Please be more stringent on Microsoft.

Please be more stringent on Microsoft. They need to inter-operate with the rest of the world, not vice versa. Any judgement which is passed that, in any way, allows Microsoft to expand it's grasp of the desktop, server, embedded, or other markets, I would consider a mis-carriage of the law.

The main reason I'd feel that way is because Microsoft has been anti-competitive for far too long. They have stifled the creativity of individuals, development communities, and other corporations. That in itself, since they have been found guilty of in fact being anti-competitive —and— being a monopoly, warrants harsh punishment that should reflect in the following ways:

1. Monetarily—Micorosft Corp.'s bottom line.

2. Opened Sources without fear of:

a. forced compensation to MS under penalty of law.

b. lack of future products not being inter-operable with older products, from MS, after sources have been opened.

3. Shame—MS has no shame, and they should. Imagine the following:

a. If your car broke down as often as windows, you'd be upset.

b. If an airplane ran on ''Windows(tm)'' alone.

c. If you woke up and everything you owned was in fact owned, operated, and distributed by a single company.

4. Not only Opened Sources, but licensing which accepts liability, and possibly damages, for the company's lack of integrity due to it's poorly designed software and practices.

Thank you for your time.

Subject: Microsoft Settlement
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to voice my opinion on the settlement between Microsoft and the Department of Justice. I don't see how this case has benefited anyone. Microsoft has run a successful business and contributed a great deal to our society. Why is the government wasting our money punishing a company for fulfilling the American dream?

I am a Network Engineer and use a variety of software products in my job. I obviously use Microsoft, but I also use their competitors'' products and have never had any problems in doing so. It is not Microsoft's fault that their competitors couldn't create products that were equal or better. There is a reason that consumers have repeatedly chosen Microsoft's products over other companies''.

Nonetheless, the proposed settlement is a very reasonable agreement that could end this pointless lawsuit. Although Microsoft is giving up way more than should be expected, the settlement would certainly bring on stronger competition in the computer industry. Microsoft is giving away their source codes and server protocols that are integral to the technology they've taken years to create. This will make it easier for competition server systems to interoperate with the Windows operating systems and Microsoft server systems.

Please accept this settlement for the benefit of our struggling economy. The computer industry contributes so much to the economy. Upholding this settlement will strengthen the entire computer industry and will be a benefit to consumers.

Sincerely,
Ranvir Floura

Subject: Microsoft Settlement

I believe the settlement proposed by the DOJ has more the feel of a Microsoft promotional document than a serious attempt to prevent Microsoft from further abusing its monopoly. I feel it is completely inadequate to protect other markets from the same abuse that Microsoft placed upon the web browsers. I feel it does little or nothing to keep Microsoft from continuing to enjoy the benefits of past abuses. I cannot believe that the very limited enforcement possibilities included in this agreement will have any hope of materially changing the behavior of Microsoft. Microsoft has ignored or broken many agreements in the past. I would fully expect Microsoft to interpret this agreement as allowing them to do practically anything they wanted to do. I am particularly dismayed by the inclusion of clauses that would allow Microsoft to use security as a pretext to withhold API information, or to prevent OEM's from unbundling Microsoft middleware. I certainly do not feel accepting this agreement would be in the best interest of the general public.

Sincerely,
Fremont Smith

Dear Mr. Ashcroft:

Now that the economy is in a recession, with massive layoffs all over the US, and the NASDAQ is way down with no relief in sight, why pursue additional litigation with Microsoft? Let the settlement stand the way it is. It is more than fair for the competition.

Microsoft went out of its way to reach an agreement, beyond what would be expected in any antitrust case. They agreed to everything from disclosing various internal interfaces to making it easier for computer companies, consumers and software developers to promote their software within Windows. I do not know a lot of software companies that would risk their proprietary information and their business, unless they really wanted to settle their antitrust court cases.

Let's get our economy back in shape and quit running after Microsoft.

Thanks for your attention to this matter.

Sincerely,
John Spilker

From: Jim/Marcia Bennett
To: Microsoft ATR
Date: 1/28/02 8:57pm
Subject: Microsoft Settlement

I am writing to express my opposition to the proposed settlement between the U.S. Department of Justice and Microsoft. This arrangement would, I firmly believe, let Microsoft off much too easy. The seriousness of the violations of law, and the clear anti-competitive effect of Microsoft's practices warrant a correspondingly severe set of penalties. If the Department of Justice lacks the will to perservere in reaching a truly just solution, then I look to the judge who has jurisdiction to make a properly effective ruling.

I am writing as a concerned citizen and consumer, who looks forward to a future where competing technologies can have a chance to contend on a level playing field, which has not been the case in some of the markets dominated by or targeted by Microsoft.

Thank you for your consideration.

Sincerely,

James A. Bennett

Dear Mr. Ashcroft,

It is with great pleasure that I write to you today regarding the Microsoft antitrust settlement. After three years of litigation, the case is finally closed against Microsoft. I believe that the case was unwarranted to begin with, yet I am pleased to see its end.

Microsoft has made many concessions throughout the process. Microsoft has agreed to disclose the internal interface designs of Windows. It has also agreed to license Microsoft at a uniform price to computer manufacturers. These developments come at great cost to the Microsoft Corporation. Why is Microsoft willing to do so? Because it is in everyone's best interest that this matter be resolved.

Sincerely,

It is time for this to end. I am not a politician, lawyer, lobbyist, employee of Microsoft, etc. I am just a computer user and systems engineer who has been involved with the computer industry for over 30 years and the micro-computer phase since its beginning. In all those years I have used many varieties of software products, both Microsoft and non-Microsoft. I was never met by armed Microsoft police preventing me from purchasing ANY and ALL pieces of software that I wanted at the time. Through the years, Microsoft has tamed the wild west that micro-computer systems had become and gave us a STANDARD that made a significant increase in the productivity of computer users world wide in general and the United States in particular. The nine states (plus AOL, ORACLE, SUN, and other envious competitors of Microsoft) that reject the DOJ—Microsoft proposed settlement are creating an unnecessary burden on computer users and the economy. In my opinion, bring this to an end.

Subject: microsoft settlement

The Microsoft settlement should remain in place. One of the most successful and prosperous businesses in the US should now be permitted to continue to prosper and innovate for the millions of consumers that owe their new knowledge and way of living to this great American corporation.The settlement is faair for all parties. It is not the consumer who is instigating further litigation. Look to the lawyers and conpeting corporaitions wanting to increase their own fortunes with less effort or innovation.

Hope you take this small voice into consideration.

Subject: Microsoft

I am writing to express my utter feelings of shame at the way our government has gone after Microsoft. In times where it seems capitalism are under attack, it is imperative that it is understood that the very freedoms we enjoy in this country are what are responsible for the success companies like Microsoft, J&J, the big three, Pfizer, McDonald's, and even Flowers.com. I mention varying types of companies because all had the freedom to dream, to plan for the dream and to follow through.

Microsoft was the victim of a government body gone mad over the American dream. Microsoft has no monopoly. If they had a monopoly, there would be no other way to run a computer than with Microsoft software. Any body else can develop their own software and market it. If they succeed, great as that is the American way. If they fail, it is either through poor design, marketing or product support, which, in a way, is also the American way. From a government that has gone mad over tobacco, it is clear that what speaks is the almighty dollar. If tobacco were so bad, make it illegal. The government will not do that because there is too much money in it. Microsoft is being penalized for being successful. Period.

I am ashamed of the Reno DOJ and the Clinton administration for their shameful attacks of Microsoft and the way it continues. If somebody can build a better mousetrap than Microsoft let them. Where is the incentive to try to build a product people want only to have it all destroyed because of success? That is NOT the American way.

I implore this entire mess to be dropped, not only for the continued success of Microsoft (in which I have NO financial interest, other than possibly a mutual fund which I've not checked), but also for the future Microsofts of America on the horizon.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Carol Enright

Subject: Microsoft Settlement

I do not feel the settlement UNITED STATES OF AMERICA vs. MICROSOFT CORPORATION is a fair one. Over the year Microsoft has settle their disputes only to begin encroaching on the same area there agreed not to do. Even now Microsoft is eating up parts of the market, muscling out the competition by the market power they have as the provider of the OS. Other parts allow for access to Microsoft internal, but only for those who won't disclose them. The open source world (their primary competitor) would not benefit from this agreement. They would have no access to the internal, because the writing of their application to interoperate with Microsoft code would be a violation. So to would people who derive their income from supporting open source be crippled by this ruling.

I would like to see Microsoft force to publish the APIs/internal, so that they can not restrict their competition. I believe also that Microsoft's power as a OS and application leader (which they gained illegally) is too great a power for a company that has a history and continues to use strong arm tactics to crush their completion. Thus putting small businesses and other completion at risk.

Neal

ATTENTION—THE FOLLOWING EMAIL IS FROM A SOCCER MOM WHO VOTES!!! micro$oft is a monopoly—plain and simple. When you go to buy a computer you have no choice what operating system you get on your computer even though there are others (that work better) Linux, Solaris.

You have no choice but to use microsoft products, internet exploder, they have pretty much wiped netscape out. And the scary, scary thing is the future. People who are as technically savvy as I are going to be registering with microsoft and their ''passport'' program. This will track everything this unsuspecting people do on the web. And as far as microsoft saying they will donate stuff to schools, that is just another way for them to hook kids! My children use Apples, Unix and windows.. Unix is not platform specific. They use shared code. All games, all software should be able to be used on any computer regardless of the operating system. Micro$oft doesn't allow this. They say—use us or don't use the others. This is wrong, wrong, wrong. You people have a very important decision in front of you. Do the research, don't rely on what microsoft tells you (even if they offer to pay you), find out what it is like with Solaris, Apple X, Red hat... don't let microsoft own everything. Let the people have a choice, even if they don't know the difference between a keyboard and a mouse...This country is about choice and right now, we don't have one as far as Operating Systems are concerned. Check into the claims that microsoft is tracking peoples'' usage. It is a well known fact in the IT business that they keep tabs on who is running their software, what they do online and where they go. Can you say, ''invasion of privacy''???

Don't take my word for it...and don't roll over for them. Thank you for doing the right thing.

Subject: Microsoft Settlement Comment

I appreciate the opportunity to comment on the proposed settlement. I oppose the proposed settlement for two reasons:

1) It provides no controls that will prevent Microsoft from engaging in illegal business practices in areas that are beyond the original charges. The computer software and Internet industries have changes quite a bit since the original antitrust case was filed, and Microsoft is clearly changing it's business plans to engage these new business opportunities. Will the proposed settlement provide any means to control Microsoft's business practices in these new areas? No. This is a major flaw in the proposed settlement.

2) The proposed settlement assumes a business model where all of Microsoft's ''competition'' comes from for-profit businesses. However, in reality Microsoft is being threatened by the developers of the Linux operating system and other open source programs. The proposed settlement does not recognize these open source projects as competitors, and provides no requirement for Microsoft to disclose technical information to the developers of these open source projects. This, again, is a major flaw in the proposed settlement.

I appreciate your consideration of these comments.

I would like to go on record as stating that I believe Microsoft should be severely punished for its anti-competitive activities. A break up of the company into separate groups seemed most appropriate. The remedy worked out between MS & DOJ is totally inadequate, and in fact rewards MS by allowing them to write off hardware & software ''donated'' to schools as a remedy. Most elementary schools use Apples or Macintosh products. Rather than eliminating monopolistic behavior, it will literally put Apple out of business in favor of ''free'' PCs & Microsoft software.

Further, schools that receive this ''gift'' will end up paying exorbitant amounts on subscription and maintenance fees after the ''remedy'' period is over. This is a travesty. The company has not changed. It's licensing costs are sky-rocketing, and customers have lost any ability to retrieve any damages due to defective software released by MS. I have used their products for almost 20 years now. In my opinion, they are out of control, and only the strongest of remedies, i.e. breakup of the firm, will stop their deceitful, predatory business practices.

Subject: MICROSOFT SETTLEMENT

I am a computer programmer and instructor at a community college.

I resent the way that Microsoft has conducted itself with regard to the antitrust settlement. This company continues to disregard this country's laws, and should receive appropriate penalties.

Their ''settlement proposal'' to donate software to schools is ludicrous. A piece of software with a retail price of $600 or more costs about $10 in packaging and materials. Microsoft proposes to spend a few million dollars (in real cost), donate this to schools, and then not support the hardware or software in the future. (Thus creating future licensing fees for itself in the future from the same schools.)

The computer industry in general has shown much more good will to the US than many others. In the past, many computer scientists shared information, algorithms, etc., in the hope of advancing the art and technology. Microsoft has dominated an industry, and uses that position as a bully pulpit. They are destroying the previous trends of goodwill within the computing industry.

I do not think that the people in Redmond should be let off with a slap on the wrist. As a corporation, Microsoft should be penalized for their monopolistic and illegal practices. And personally, I do not feel that their proposed gift to schools comes close to being an appropriate punishment for misconduct.

Dear Mr. Ashcroft:

I am greatly pleased to hear that a proposed settlement has been reached in the Microsoft antitrust case.

This case has endured for over three years and should be brought to quick finalization. Microsoft has agreed to all terms of this proposed settlement and they have agreed to design future versions of Windows to allow competitors to easily attach their software products. Additionally, Microsoft will use a uniform pricing list when licensing Windows out to the twenty largest computer companies in the United States. Microsoft has also agreed to allow their progress toward compliance with all provisions to be monitored.

As the terms of this agreement far exceed the issues originally raised in the suit over three years ago, I feel the case should be closed soon. Thank you.

Sincerely,
Joseph S. Minnie

Dear Ms. Hesse,
I am quite concerned that the Department of Justice (DOJ) has moved to settle with Microsoft (MS) in a manner that leaves consumers inadequately protected. I have found MS information technology (IT) stifles outside innovation and inter-operability, and hope you will provide a resolution of the MS case that maximizes competition and consumer in the best public interest.
Minimally, I believe that Windows applications should run on other operating systems without modification; should be transparent to other software, so that it would be able to exchange files, data, and services with any MS product; should be able to run properly on computers with different microprocessors. Otherwise, consumers will continue to face unnecessary costs, limited choices, operational complexity, and reliability problems. Enforcement provisions in the proposed settlement are also inadequate and could very well allow MS to continue to stifle competition, creativity, and cost-effectiveness. I urge the DOJ to announce public proceedings at the earliest opportunity as provided by the Tunney Act so that concerned consumers can speak to these issues.

Subject: Microsoft Settlement
Final Judgment for a variety of reasons. I shall briefly expound on but a few of them:
1) The potential breakup of Microsoft should be maintained as a future remedy to insure Microsoft's compliance.
2) Lack of punitive damages. Lacking provisions for an evolving industry, the Proposal seems focused on limited measures for a future that is only a simple extrapolation of yesterday's market. There are no penalties for Microsoft's outrageous conduct in the marketplace and before the Court. This sends the wrong message to anyone considering similar behaviour.
3) The Termination of the Decree should NOT occur before ten (10) years from date of entry. Further, the length of any extension should be five (5) years, rather than two. Given that the present proceedings before the Court have consumed almost four (4) years with no action, it is not inconceivable that Microsoft could similarly delay and obstruct a three person panel for the proposed five (5) years.
4) The construction of the Technical Committee (hereafter, TC) is faulty. Potentially, two of the three members of the TC will be answerable only to Microsoft and not to the Plaintiffs. This provides a majority which could veto any action or decision of the TC. The TC should consist of a minimum of five (5) persons, none of whom is appointed by Microsoft. The Defendant's interests could be represented by a non-voting, non-directing liaison to the TC. Also, the TC should be composed of persons with significant experience as auditors or inspectors general, who will be assisted by software experts.
5) MOST IMPORTANT. According to Section IV.D.4.d of the Stipulation, no member of the TC may direct any findings to any other tribunal. This is UNACCEPTABLE! The Congress, other Courts and other States cannot be constrained by this Proposal in any of their future proceedings. In particular, this Section would disallow a member of the TC from informing authorities of a violation of law, including, but not limited to, the Sherman Act.
The Proposed Final Judgment is seriously flawed and should be withdrawn from consideration. DOJ should rejoin with Utah, et al and use their proposals as a starting point for further negotiations.
Sincerely,
David Rhoads

Subject: proposed monopoly settlement inadequate
The current proposed Microsoft monopoly settle does a completely inadequate job of protecting consumers from future abuses by Microsoft. In particular,
* Open source and free software concerns are ignored; which will allow MS to tighten its software monopoly by licensing it to public institutions.
* Microsoft is not required to open up the details of its file formats, which harms interoperability with other software and thus prevents competitors from getting a toehold into markets that Microsoft already monopolizes.
* Nothing prevents Microsoft from retaliating against OEMs that ship PCs with a competing OS (but not Windows). Please do not accept the existing settlement proposal.
Thanks,
Dan Mosedale

Ok, enough is enough, let's move on and accept the settlement with Microsoft. Then go after someone that is really in total control and unfairly taking advantage of the consumers. The Cable companies! It's just plain usury what the cable companies charge for what they provide and now they are doing the same with the cable internet access. If it weren't for Bill Gates and Microsoft we wouldn't be communicating by email because most of us couldn't afford to own a computer much less have the software to use it to it's full advantage. I've been

around since mainframes were the only thing and pc's weren't even in the realm of home use. Gates made it all affordable and even today his software is affordable and the best to be had. Dragging this thing on just hurts our economy more that it is already hurting. So put it to rest and look into why the money from the tobacco companies settlements isn't going to where it was meant to go. Get involved with issues that really effect the population.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Washington, DC 20530–0001

Dear Mr. Ashcroft,

I am writing to express my opposition to the antitrust lawsuit against Microsoft. Although I realize that the lawsuit is no longer an issue, what is before your department is the court mediated settlement that can end this debacle. Millions of taxpayer dollars have been used in what essentially is a needless persecution of a competitive company. What is before your department is an exhaustive settlement that has terms that extend well beyond the products and procedures that were originally at issue in the litigation. Microsoft has agreed to these terms in the interest of servicing the

public good and allowing for a fair, agreeable end to this process.

This settlement, which has been reached by the Department of Justice, and approved by nine of the participating states, contains several provisions that extend significant restrictions and changes to how Microsoft does business. The settlement requires Microsoft to improve its relationship with computer and software manufacturers, by ensuring that Microsoft will not retaliate against manufacturers who ship non-Microsoft products and to create uniform pricing, allowing consumers to get the best price for the product. Additionally, the agreement allows any of Microsoft's competitors to file a claim against Microsoft in federal court if they believe that any part of the settlement has been violated, thereby forcing Microsoft to be in contempt of court.

I strongly urge the Department of Justice to view this settlement as having served the public interest and to end this litigation. Nine states have approved this, and with the federal government's leadership, this process may finally be over. In the overall public interest, please cease any further action at the federal level on this matter.

Sincerely,

John Russell

Dear Mr. Ashcroft:

The three-year lawsuit against Microsoft has been continuing for too long. I am amazed and appalled that the Government would attempt to bring litigation against its strongest asset in the tech sector. Microsoft creates jobs and wealth for our nation and does not deserve to be a victim of federal and state litigation.

The terms of the settlement do little to protect consumer rights. In fact, they just give Microsoft's competitors an edge that they could not attain through innovation. Of particular interest to me are the terms by which Microsoft has agreed to disclose interfaces that are internal to Windows operating system products. This is a first in an antitrust settlement and a violation of Microsoft's intellectual property rights. Although flawed and unjustified, I urge your office to finalize the settlement because it is in the best interest of our economy and technology industry to end this dispute.

Sincerely,

Tyson Murray

Dear Renata B. Hesse,

I am writing to register my opposition to the proposed Microsoft Settlement with the Department of Justice. My reasons for this are many, but I will list just one for the purposes of this letter. Microsoft is a convicted monopolist and allowing them to donate $1 billion worth of software to schools is ''not'' a punishment. First, $1 billion to Micrsoft is not a lot of money. Recently, Microsoft had $30 billion in cash on hand. Second, Microsoft will experience years of benefits in sales from this deal as schools will seek to upgrade their aging ''free'' MS products. Also, when children learn software in school, parents have a compelling reason to purchase the same software at home. This settlement is a dream come true for Microsoft.

Please, reject this settlement offer.

I thank you very much in advance for your time.

Subject: Microsoft Settlement

To whomever it may concern,

I am aware of the settlement agreement for Microsoft and agree that the settlement is fair for all parties involved. To assume that all end users are so uneducated that can not make an educated decision for themselves is disturbing in the first place. Even a teenager knows that if he purchases a car and does not like the speaker system that comes preinstalled on the vehicle that they can purchase a new speaker system from a variety of vendors. But then perhaps the older you get the less aware you are... This settlement has more than enough covenants in it. Let's not go overboard on the restrictions.

We live in an age where the computer industry is a thriving industry. More people than ever are using computers on a daily basis. People know that Netscape is out there. I have IE and Netscape on my PC and use them interchangeably. So, where have my choices been limited? Nowhere! This topic really makes me mad.

Microsoft is a good company. I do not understand why people feel like they should go after a company that is turning around and contributing so much to our society. Mr. Gates distributes his wealth to a multitude of charities. People like that are very hard to find. Thank God for someone who is doing something to help people that truly need it in our troubled society.

Sincerely,

Erika Neumann

950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing to you today to express my support of the recent settlement reached between the Department of Justice and Microsoft. After three years of litigation, the settlement marks an overdue end to the litigation battle.

While the antitrust dispute was unnecessary in the first place, it is great to see this period come to an end. It is time for Microsoft, the IT industry, and the American economy to focus on productivity again.

The settlement reached is more than equitable for Microsoft competitors. Microsoft has been more than generous throughout this process.

Most important among these concessions is Microsoft allowing for the establishment of a regulatory committee. The technical oversight committee, which will be run by three people, assures that the stipulations mandated in the settlement are carried out. This shows Microsoft's willingness to appease its competitors in their commitment to put this issue at bay.

Thus, it is important that this settlement stands. It is time for Microsoft and the larger IT industry to return to business as usual.

Dear Mr. Ashcroft:

I think the antitrust case filed against Microsoft should finally be settled.

I wonder why this case is being dragged on. Not only has Microsoft made bold concessions in order to get back to business, they have also promoted a more unified IT sector along the way. This settlement clearly promotes a technology industry that works together which will allow the US to maintain our position in the global market.

Microsoft has made many concessions within the settlement that include changes in product design, licensing and marketing. The terms are meant to open competition to non-Microsoft software while still allowing Microsoft to prosper. The settlement promotes a teamwork environment in the technology industry and allows all to prosper in the process. Microsoft's efforts to end the litigation should be applauded.

I strongly urge that you close this case. The longer we wait for a settlement, the longer we stray from focusing on innovation.

Sincerely,

Dear Renata B. Hesse,

I do not believe that the so called ''Antitrust'' laws are constitutional except, perhaps under the constitution of the now defunct U.S.S.R. or The Talibans of Afghanistan.

Although I do not believe that Microsoft is clean of all possible charges, the process followed under this law is and should be unproductive and futile. I've niether seen nor heard of any real evidence. I've only heard accusations.

If Microsoft has broken a law, it should be charged with fruad or theft or some real crime and not for persuing it1s inalienable right to persue commerce and make money. Doing business better than your competetors is a pure American ideal and should be encouraged instead of picked at like a bunch of spoiled children fighting over candy.

Get on with the real work that the taxpayers pay you to do and get to Enron and/or Anderson where the evidence of wrongdoing is apparent.

Sincerely,
Bob Essman

Subject: Microsoft Settlement

As a consumer and individual investor who owns stock in many Tech. companies, including Microsoft, AOL Time Warner, Sun microsystems, etc., I have followed the developments of the government's case against Microsoft, and the complaints filed by individual States and Microsoft's competitors. I continue to believe the settlement already reached between Microsoft, the Justice Dept., and several States Should be the final judgement on the matter. No one, especially Microsoft's competitors, has yet demonstrated any injury to consumers by Microsoft's business practices. Although Microsoft successfully won away customers from AOL's Netscape by giving their Web Browser away for free, one can hardly say this ''injured'' consumers. Getting a superior product for free is not what I would call being abused, nor is this an example of being deprived of choice. There was a choice, and consumers took the superior choice. Most savvy computer professionals agree that Internet Explorer is far better than the Netscape browser, and the Netscape browser cost money, it was not offered free. Also, Microsoft has always striven to establish standards in its software which would ensure its interoperability with many different applications and prevailing programs. Netscape's product could not boast the same attributes.

Also, today, as in the past, there is ample competition for Microsoft, in operating systems such as Unix, Linux, Java, etc., and in internet applications and access providers such as AOL time Warner, Earthlink, and many others. Microsoft is not a monopoly in my view, it is instead a great American success story which has driven the local and national economy, provided thousands of high-paying jobs, and has given much back to the community in raised living standards and charitible donations.

Please bring this legal challenge to a close, as it is not helping to protect consumers, it is not helping our economy to rebound, and it is not justified by the sour grapes failures of Microsoft's inadequate competitorswho seek the government's aid in doing what they were unable to do in fair business competition.

Sincerely,
Baron Borrelli

Dear DOJ,

With billions of dollars at its disposal, a fine would be insignificant to Microsoft (although highly recommended). Any settlement which includes the distribution of Microsoft products would just worsen their monopoly. Please open up the arena to allow other vendors software programs (applications and operating system utlities, including Web browsers) to be substituted for Microsoft products and force Microsoft to unbundle their software to permit equal access. This would allow fair competition in the marketplace and benefit all consumers.

Thank you.

From: Mark Donohoe
To: Microsoft ATR
Date: 1/28/02 9:25pm
Subject: Microsoft Settlement

To whom it may concern,

I am writting this e-mail to let you know that as a consumer I feel frustrated, boxed in and limited by Microsofts monopoly. I have little or no choices when it comes to operating systems or applications to use on my home PC. This lack of choices limits my use of the PC and causes daily productivity loss.

In the application area, there are few if any choices in word processors, speadsheets or other applications. This is simply not right in our competitive and free society we claim to have in the U.S.A. I was hoping the goverment would do something but feel less so in light of the recent actions by the goverment. The doj could help by imposing the following on Microsoft.

1. Force them to publish and keep current the api's to their applications and file formats for those applications. With the published API's, others could write competing applications that could convert existing microsoft files into the format used by the competing application. Today this is not possible or is twarted by MS.

2. Stop microsoft from further integrating features like browsers, media players and the like into the operating system. I use windows 98 now, and don't use IE, except when I have to. BUT, I can't really remove it from my system without permantly damaging the operating system.

3. Stop Microsoft from pointing me to microsoft companies. When I got my pc, it insisted on bootup, that I either cancel the window or login to the microsoft network. This was not only annoying, but unless I sat and watched the machine boot and closed the window, the machine would not complete booting. It took my quite a while, and with some risk, to get this feature disabled.

4. All of the above would not be so bad, if it all worked, but it doesn't! I must reboot my home machine very often, and must reboot my system at work at least once a week to keep things functioning. This is not to mention all the e-mail viruses and the like that plague MS software.

Thank you for your time. Please help us consumers get this monopolist out of our hair and allow real innovation in the computing world.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Sandra J. Bottorff

Judge Kollar-Kotally-

I am a scientist at a small biotechnology company involved in developing therapeutics to help people. I am writing this letter in protest of the proposed Microsoft settlement. We use Microsoft products because we are forced to. For the research we do, computer applications are often only generated for the Windows platform because no other operating system has enough market share to justify development. In itself, this is not a significant problem. However, there are so many problems and issues with the Windows operating system and Microsoft Office that we have been forced to hire a full time Information Technology employee for a staff of only 15 people. This expense, in conjunction with software and hardware costs forced by Microsoft compatability issues, costs us more than $200,000 dollars a year. This is a huge expense for a small business.

The proposed settlement seems like a government endorsement of the Microsoft monoplay. This will only make our situation worse, with no competition to control inflation of prices. I hope you will reconsider and take a tougher stance against Microsoft.

Sincerely,
Dave Garman, Ph.D.

Introduction

Microsoft illegally maintained its monopoly over Intel-compatible personal computer ''PC'') operating systems by acting to undermine the distribution and commercial appeal of alternative computing platforms like Netscape Corporation's Navigator browser and Sun Microsystems, Inc.'s JavaTM technology.[1] By eliminating the ability of alternative platforms to compete with Windows, Microsoft has not only maintained its monopoly over PC operating systems, it also has dramatically increased the economic power that it derives from that monopoly, such that Microsoft now has the power to control competition in a number of adjacent and downstream markets as well. In the emerging world of networked devices and services, the commercial appeal and success of adjacent or downstream devices and services such as servers, personal digital assistants (''PDAs''), telephones, video game systems, television set-top boxes, and web-based services are in very large measure dependent on their ability to interoperate with PCs via the Internet or other networks. Microsoft's expanded monopoly power over PC operating systems and web browsers affords it the power to deny competing devices and services the same ability to interoperate fully and completely with PCs as Microsoft's networked devices and services enjoy. Microsoft is in fact exercising the power it derives from its PC monopoly in just this way to exclude competition in each of these adjacent markets. Unless and until that power is effectively checked and ultimately eliminated, Microsoft's past practices and insatiable ambition demonstrate that it will continue to destroy competition in each of these enormously important markets.

Unfortunately, the Revised Proposed Final Judgment (''RPFJ'') does little or nothing to eliminate the unlawful monopoly maintained by Microsoft over PC operating systems. Nor does it redress the harm that Microsoft's illegal acts have caused to competition in that market. And while the RPFJ apparently recognizes the threat to competition posed by Microsoft's exclusionary behavior in adjacent and downstream markets, the remedies it proposes to redress this threat are plagued with so many loopholes and ambiguities that there can be no assurance that Microsoft's anticompetitive conduct will stop. A. Competition in the market for PC operating systems must be restored

The adjudicated facts establish that Microsoft illegally maintained a monopoly over the market for PC operating systems by undermining the ability of rival software platforms to compete in that or closely related markets. By offering consumers the ability to run compelling applications on operating systems other than Microsoft's Windows operating system, the Navigator browser and Java platform threatened to reduce or eliminate the applications barrier to competition that sustains Microsoft's monopoly.[2] Microsoft fully recognized the threat these middleware platforms posed to its continued monopoly over PC operating systems and contrived to maintain that monopoly by restricting consumer access to these and any other non-Microsoft middleware platforms.

The commercial appeal of any computing platform is dependent in very large measure on the numbers of consumers who own or use the platform. The greater the number of users, the greater the demand for applications capable of running on that platform. The greater the demand for applications, the greater the number and variety of applications developed for the platform.

And the greater the number and variety of applications developed for a platform, the greater the consumer demand for a given computing platform.[3] Once started, this ''feedback'' effect can and will sustain the adoption and commercial success of platform software, such as Microsoft's Windows operating system, Netscape's Navigator browser or Sun's Java platform. The key to successful competition in platform software is thus distribution.[4] Unless a platform enjoys widespread and sustained distribution, such that large numbers of computer users have the platform installed and available for use on their computer systems, the feedback cycle of application development and platform adoption will not take effect.

As the District Court found, and the Court of Appeals affirmed, Microsoft engaged in a series of illegal acts to choke off the distribution channels for the Navigator and Java platforms.[5] By restricting and disrupting the distribution of the Navigator browser and the Java platform, Microsoft sought to limit the numbers of computer users with access to these alternative platforms and thereby also limit the demand for, and economic incentives supporting, application development on the Navigator and Java platforms. By decreasing the distribution of non- Microsoft platforms, such as the

[2] United States v. Microsoft Corp., 84 F. Supp. 2d 9, § 68 (D.DC 2000) (''Findings of Fact'') (explaining how middleware technologies such as the Navigator browser and the Java platform have the ability to weaken the applications barrier to entry).

[3] See Findings of Fact, 84F. Supp. 2d. at §§ 39–40.

[4] See Microsoft III, 253 F.3d at 55–60, 60–61, 70–71; findings of fact, 84 F. Supp. 2d at §§ 36–52, 143–144.

[5] See Microsft III, 253 F.3d at 61, 72, 75–76; Findings of Facts, 84F. supp. 2d at §§ 357, 395–402.

Navigator browser and the Java platform, Microsoft knew that it could also decrease the number and variety of applications developed for such platforms, and thus their relative commercial appeal to consumers.

But for Microsoft's unlawful attack on the distribution of the Navigator and Java platforms, the installed base of these alternative platforms would have been very different today. So too would the economic incentives and choices of consumers and software developers.

Consumers would have had the opportunity to choose among a variety of competing platforms— not just Microsoft's Windows platform—based upon performance, cost or personal preference.

Developers too would have had the opportunity to choose among a variety of competing platforms on which to develop applications with the features, performance and cost that consumers demand.

Indeed, because the Navigator and Java platforms were ''cross-platform''—that is, ran on top of a variety of operating systems, not just Microsoft's Windows operating system—consumers would have had the ability to run applications written for the Navigator browser and Java platform on anyoperating system, not just Microsoft's Windows operating system. By dramatically lowering the cost to switch applications from one operating system to another, the Navigator and Java platforms directly attacked the applications barrier to competition that protects Microsoft's monopoly over PC operating systems, and greatly reduced the cost to consumers and developers alike of switching away from Microsoft's monopoly platform. In short, but for Microsoft's anticompetitive conduct, consumers today would have enjoyed far greater freedom, at far less cost, to choose among competing operating systems based on their comparative features, performance, and price, rather than simply the number of applications they support. B. Microsoft's unlawful power to exclude competition in adjacent and downstream markets must be stopped and eventually dissipated

By disrupting and eliminating the distribution of competing platforms, Microsoft has not only maintained its monopoly over PC operating systems, it also has increased the economic power that it derives from that monopoly. By secretly manipulating the interfaces and protocols needed to interoperate with Windows, Microsoft can control which products and services in adjacent or downstream markets are capable of interoperating with PCs. Not only does this permit Microsoft to enhance the relative appeal and functionality of its products and services at the expense of its competitors, it denies consumers the benefits of competition. Instead of choosing a server, telephone, application, or web service based solely on its competitive merits, Microsoft is increasingly forcing consumers to purchase such products and services based upon their ability to interoperate with its unlawfully monopolized platforms.

Microsoft is now abusing the power it has over PC operating systems and web browsers by seeking to extend its control to embrace any device, application, or web service that seeks to interoperate with Microsoft's monopolized PC operating systems or browsers. Microsoft's unbridled monopoly over a critical node on the digital network—PCs—provides it the power to allow only such servers, PDAs, telephones, television set-top boxes, videogame systems, or web services that implement Microsoft's proprietary interfaces and protocols to interoperate effectively with Microsoft's monopoly products. By illegally exploiting its PC operating system monopoly to acquire and utilize a chokehold over networked connections to PCs, Microsoft is dramatically expanding its power to deny consumers the benefits of choice and competition in adjacent and downstream markets as well.

C. The RPFJ fails to remedy the monopoly illegally maintained by Microsoft

In the face of this record, the law requires that any remedial decree ''terminate'' the monopoly, ''unfetter'' the market from anticompetitive conduct, ''deny to the defendant the fruits'' of its illegal acts, and ''ensure'' no repetition of such abuse in the future.[6] Measured against this standard, the proposed settlement between the United States and Microsoft reflected in the RPFJ falls far short.

Rather than act directly to restore competition to the market for PC operating systems, and redress the harm to competition inflicted by Microsoft's past misconduct in that and adjacent markets, the RPFJ actually accedes to Microsoft's monopoly, and does little or nothing to eliminate or check the enormous power it provides. Incredibly, the RPFJ barely proscribes behavior already held to be unlawful without remedying the far-reaching and continuing anticompetitive effects that have been caused by that behavior.[7] Even though Microsoft effectively destroyed competition for web browsers and blocked the distribution of upgraded, compatible versions of the Java platform for the PC, the RPFJ fails to remedy directly these anticompetitive acts or disgorge Microsoft of the power it now enjoys as a result of those acts.

Instead, the RPFJ relies on Microsoft's partners—PC manufacturers—to indirectly undermine Microsoft's monopoly by distributing non-Microsoft middleware. Relying on Microsoft's distributors to achieve the Department's goals is fundamentally flawed, since the PC manufacturers have little or no economic incentive or ability to work with Microsoft's competitors, absent fundamental changes to the competitive landscape in the PC operating system market, which the RPFJ fails to seek.[8] At best, the RPFJ will marginally increase the opportunity, but not the ability, of competitors to compete at some future date with Microsoft's middleware products. It does nothing directly to dislodge Microsoft's PC operating system monopoly or to restore the market for PC operating systems to the competitive dynamics the market would have possessed ''but for'' Microsoft's illegal conduct.

While promising in principle, the disclosure remedies in the RPFJ (Sections III.D. and III.E) are likely to fail in practice to achieve the procompetitive objectives identified by the United States Justice Department (the ''Department'') in its Competitive Impact Statement. Key provisions in the RPFJ contain critical loopholes and glaring ambiguities. Given Microsoft's past disdain for compliance with the strictures of its prior antitrust consent decree with the Department, these ambiguities will likely lead to future litigation, particularly since Microsoft has repeatedly refused to answer any questions regarding whether it agrees or disagrees with the interpretations of the RPFJ proposed by the Department in the Competitive Impact Statement. Instead, it is clear that Microsoft's strategy is to say as little as possible about the meaning or application of the RPFJ prior to entry of judgment, hoping that any ambiguities in the language will ultimately be interpreted in its favor. In order to protect the public and ensure that the Department has actually secured a settlement that is consistent with its representations to the Court, the Department must force Microsoft to identify any disagreements that it has with the Department's interpretations prior to entry of the judgment. Unless such minimal steps are taken, the RPFJ will certainly fail to secure even the modest objectives it seeks to attain.

The RPFJ is further flawed because it allows Microsoft to profit from its illegal acts by exacting royalties as a condition for making interoperability disclosures. Moreover, it gives Microsoft far too much discretion about how it will ''comply'' with the RPFJ. Given its past record of anticompetitive conduct, a remedial scheme which relies on Microsoft acting ''reasonably'' is doomed to fail. After having successfully prosecuted its case against Microsoft, that there exists no commercially viable alternative to which they could switch in response to a substantial and sustained price increase or its equivalent by Microsoft.'').It would be tragic for the Department to shirk its duty under the law, and through entry of the RPFJ, allow Microsoft to maintain and expand its monopoly power. II. Sun Microsystems'' Interest Regarding the Terms of the RPFJ''

Since its founding in 1982, Sun has been propelled by an innovative vision—''The Network Is The Computer.'' TM Sun is a leader in the design, manufacture, and sale of computer hardware, software, and services. Sun directly competes with Microsoft across a wide variety of markets including operating systems, ''middleware'' platforms, software development tools, office productivity suites, directory services, and enterprise software.

Sun's experience and expertise place it in a unique position to assess the true

[6] 6 Microsoft III, 253 F.3d at 103.

[7] See Schine Chain Theatres, Inc. v. United States, 334 U.S. 110, 128 (1948) (concluding that injunctive relief which merely ''forbid[s] a repetition of the illegal conduct'' is legally insufficient because defendants would ''retain the full dividends of their monopolistic practices and profit from the unlawful restraints of trade which they inflicted on competitors'').

[8] Findings of Fact, 84 F. Supp. 2d at § 54 (stating that ''[w]ithout significant exception, all OEMs pre-install Windows on the vast majority of PCs that they sell, and they uniformly are of a mind. loopholes in the RPFJ must be eliminated and its important ambiguities clarified

competitive impact of the RPFJ. As one of Microsoft's leading competitors and as the creator and licensor of the Java platform, Sun was a prime target of the anticompetitive conduct at issue in United States v. Microsoft. In addition, because Sun designs, manufactures, and sells a wide variety of products and services that must interoperate with Microsoft's products and services, Sun's real- world experience regarding the difficulties and barriers to effective interoperability with Microsoft's products affords Sun unique insights into whether the various technical disclosures and licensing practices mandated under the RPFJ will actually achieve the results intended by the Department.

Sun's comments on the RPFJ are not intended to be exhaustive. Instead, the comments focus on key shortcomings or problems with the RPFJ, which most directly impact Sun, its distributors, developers, and customers. Others, including trade organizations of which Sun is a member, are likely to raise additional problems with the RPFJ, which should be addressed prior to entry of the judgment. By omitting such subjects from its submission, Sun does not wish to convey to the Department the impression that it believes the remainder of the RPFJ is satisfactory to Sun. Rather, Sun has merely focused its comments to highlight particular areas of concern.

III. The RPFJ Fails To Remedy the Continuing Harm to Competition Caused By Microsoft's Illegal Acts

A. The RPFJ fails to dissipate Microsoft's monopoly power in the market for PC operating systems

A remedies decree in an antitrust case ''must seek to unfetter a market from anticompetitive conduct, to terminate the illegal monopoly, deny the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''[9] The market over which Microsoft has unlawfully maintained its monopoly power is the market for PC operating systems. It is that market—the market for PC operating systems— that must be restored to competition, and in which Microsoft's power must be eliminated.

The RPFJ, however, fails to serve this fundamental objective. The first and most important flaw in the RPFJ lies in its failure to do anything to restore competition in the market for PC operating systems. But for Microsoft's anticompetitive conduct, the market would today provide consumers and software developers with the benefits of competitive choice among at least three alternative computing platforms for desktop computers: the Windows operating system, the Navigator browser, and the Java platform. As a direct result of Microsoft's anticompetitive conduct, consumers and developers today effectively enjoy no such choice. Rather than restore the market to the state it would have enjoyed but for Microsoft's illegal conduct, or even attempt to dissipate Microsoft's illegally maintained power over that market,the RPFJ accedes to and accepts Microsoft's monopoly over PC operating systems, and does nothing to directly and immediately restore that market to competition.

Indeed, the RPFJ does not even focus its principal remedies on the relevant market: the market for PC operating systems. Instead, it focuses its principal remedies on entirely different markets: the market for distribution of Microsoft operating systems and the market for middleware. In light of the record established and affirmed in this case, the Department's reliance on Microsoft's own distributors -entities whose commercial viability is dependent on and inextricably tied to Microsoft's success—to promote non-Microsoft middleware products capable of threatening Microsoft's monopoly position is misplaced at best, and foolhardy at worst.

1. The Department previously acknowledged that an effective remedy had to eliminate the applications barrier protecting Microsoft's monopoly In recognition of the Department's obligations under the law and the extent of Microsoft's misconduct, the Department originally set its remedial objectives much higher than those proposed in the RPFJ. In fact, both the Department and the District Court concluded that a combination of structural relief and conduct remedies was necessary to lower the applications barrier to entry and to restore competition in the market for PC operating systems.[10] As the Department itself acknowledged, conduct remedies, by themselves, are likely to be insufficient in this case to remedy the past harm to competition:

[C]onduct remedies can do little to rectify the harm done to competition by Microsoft's illegal conduct in the past. For example, the evidence shows and the Court found that Microsoft's illegal conduct prevented Navigator and Java from eroding the applications barrier to entry ''for several years, and perhaps permanently'' because they could not facilitate entry unless they became almost ubiquitous and thus became attractive platforms for ISVs. A conduct remedy cannot undo the demise of Navigator and the concomitant rise of Internet Explorer, nor can it ensure that there will be other middleware threats comparable to Navigator in the future.[11] According to the Department, ''[c]ompetition was injured in this case principally because Microsoft's illegal conduct raised entry barriers to the PC operating system market by destroying developments that would have made it more likely that competing operating systems would gain access to applications and other needed complements.'' [12] Thus, ''the key to a remedy in this case is to reduce Microsoft's ability to erect or maintain entry barriers.'' [13] To achieve this objective, the Department originally sought to divide Microsoft into an Applications Business and an Operating Systems Business in order to ''create incentives for Microsoft's Office and its other uniquely valuable applications to be made available to competing operating systems when that is efficient and profitable—in other words, in response to ordinary market forces—instead of being withheld strategically, at the sacrifice of profits and to the detriment of consumers—in order to protect the Windows operating system monopoly.'' [14]

But now that the Department has reversed its prior position and seeks to rely solely on conduct remedies, the remedies it has proposed are even less likely to rectify the harm done to competition than the interim conduct remedies previously adopted by the District Court. The conduct remedies of the RPFJ are simply not tailored to rectify the continuing harm or lower the barriers to competition for competing operating system vendors. For example, the RPFJ does not even attempt to redress the competitive harm caused by Microsoft's interference and disruption of the distribution channels for the Navigator browser or the Java platform, even though Microsoft correctly perceived that widespread distribution of these platforms would lower the barriers to competition protecting its monopoly. Nor does the RPFJ take any direct steps to loosen Microsoft's chokehold on the PC operating system market and facilitate the development of applications from both Microsoft and others that could run on competing operating systems. If, as the Department previously contended, the ''key to a remedy'' in this case is to reduce or eliminate Microsoft's ability to create and maintain barriers to competition, the RPFJ does not attempt to serve, much less achieve, that remedial objective.

Although the Court of Appeals vacated and remanded the District Court's divestiture order, it affirmed the central liability findings against Microsoft. Rejecting Microsoft's numerous challenges, the Court of Appeals concluded that Microsoft had monopoly power over the PC operating system market, that Microsoft's monopoly was protected by an applications barrier to entry, and that Microsoft engaged in a panoply of illegal acts to maintain that monopoly in light of the competitive threat posed by the Navigator browser and the Java platform? Furthermore, it set forth the legal standard against which any remedy for such violations should be measured.[16]

While the Department certainly had discretion to choose not to pursue a divestiture remedy on remand, the Court of Appeals' affirmance of the core liability findings against Microsoft provided no excuse for seeking watered-down conduct remedies that are likely to be even less effective than the interim conduct remedies previously ordered by the Court. This is not a case where the Department entered into a

[9] Microsoft III, 253 F.3d at 103 (internal quotations and citations omitted). Although the Department acknowledges the required remedial objectives under the law, it fails to achieve them in practice. See Competitive Impact Statement (''CIS'') at 24 (''Appropriate injunctive relief in an antitrust case should: (1) end the unlawful conduct; (2) ''avoid a recurrence of the violation'' and others like it; and (3) undo its anticompetitive consequences.'').

[10] United States v. Microsoft Corp., 97 F. Supp. 2d 59 (D.DC 2000), aff'd in part, rev'd in part, and remanded, 253 F.3d 34 (DC Cir. 2001).

settlement with a defendant in lieu of trial. Here, the District Court held, and the Court of Appeals affirmed, that Microsoft violated the antirust laws. By failing to remedy the effects of Microsoft's illegal acts, disgorge Microsoft's ill-gotten gains, and attack the barriers to competition protecting Microsoft's monopoly, the Department has shirked its duty under the law.

2. The RPFJ fails to address the effects of Microsoft's distribution power

Any remedy designed to restore competition in the PC operating system market must account for the economic realities of software platform development. Distribution is the key to competitive viability in the market for PC platform software? The applications barrier to entry which forms a ''positive feedback loop'' for Microsoft and a ''vicious cycle'' for Microsoft's competitors was a centerpiece of the Department's case: the number of installed units of a platform determines its commercial appeal to applications developers; the number and variety of applications available for a platform determines its commercial appeal to consumers; and the commercial appeal of the platform to consumers in turn drives its installed base and market share.[18] As the Court of Appeals concluded, ''[b]ecause the applications barrier to entry protects a dominant operating system irrespective of quality, it gives Microsoft power to stave off even superior new rivals.'' [19] In large measure, the Navigator browser and the Java platform threatened Microsoft's monopoly because they had achieved widespread distribution on both Windows and non-Windows platforms, thereby becoming a potentially more attractive platform for application development than Windows. If developers increasingly chose to develop their applications to the Navigator and Java platforms, rather than the Windows platform, consumers would have greater freedom to switch away from the Windows operating system because they would still be able to run the applications that they desire using competing operating systems.

To restore competition in the PC operating system market, an appropriate remedy should attempt to place the market back in the position it would have been ''but for'' Microsoft's illegal conduct. In other words, an appropriate remedy would ensure, to the extent possible, that alternative platforms achieve the distribution that they would have received ''but for'' Microsoft's illegal conduct. Moreover, an appropriate remedy also would seek to open up Microsoft's distribution channels to expand consumer choice by ensuring that alternative platforms could compete on the merits with Microsoft's products, rather than having Microsoft's illegally maintained distribution powers effectively foreclose such choices.

To evaluate the potential efficacy of the RPFJ, one must compare the competitive landscape before and after Microsoft's illegal acts. Prior to Microsoft's acts, the marketplace was undergoing dramatic changes as a result of the nearly simultaneous emergence of both the Navigator browser and the Java platform. By easily connecting consumers to resources across the Internet and providing a new platform for software development, these new, widely- distributed platforms threatened Microsoft's monopoly power because they afforded consumers the ability to run applications on many different operating systems, not just Windows. Customers could chose between different browsers as well as different implementations of the Java platform. They were not reliant on a single vendor for their platform software. At this inflection point in the market, the barriers to competition protecting Microsoft's monopoly looked increasingly precarious.

Microsoft's internal documents demonstrate how serious that threat really was. Despite its dominant market position, Microsoft believed it was necessary to engage in a campaign of illegal conduct to crush this competition. As a result of that conduct, consumers no longer have any real competitive choices for browsers for PCs, other than Microsoft's Internet Explorer. As a practical matter, PC consumers also have been denied access to the latest, compatible versions of the Java platform as a result of Microsoft's conduct. Instead, Microsoft first offered an incompatible version of the Java platform, and now seeks to roll-out their ''knock-off'' middleware runtime, the .NET Framework/Common Language Runtime, that copies many of the features of the Java platform with one critical difference—it runs only on Windows.

The question that should be asked regarding the RPFJ is whether it will disgorge from Microsoft the fruits of its illegal acts and restore a competitive marketplace where consumers will have the ability to choose their platform software from an array of competitive choices. A critical review of the RPFJ makes plain it does not. 3. The RPFJ does little more than attempt to enjoin Microsoft from continuing to engage in the conduct already found to be unlawful

Rather than attempting to undo the damage to competition resulting from Microsoft's actions and pry open the PC operating system market to competition, the RPFJ is purely forward- looking, focusing primarily on the precise Microsoft conduct already found to be unlawful.

Injunctive relief which simply ''forbid[s] a repetition of the illegal conduct'' is insufficient under Section 2 because it would allow Microsoft to ''retain the full dividends of [its] monopolistic practices and profit from the unlawful restraint of trade which [it] had inflicted on competitors.''[20] As the Supreme Court has made plain, an antitrust remedy ''does not end with enjoining continuance of the unlawful restraints'' but must also seek to undo the effects of the illegal acts and ensure that they do not reoccur. [21]

Most of the RPFJ is oriented towards prohibiting a narrow set of future illegal conduct by Microsoft. For example, the RPFJ contains provisions which would prohibit Microsoft from:

* retaliating against distributors of or developers for Non-Microsoft Operating Systems and Non-Microsoft Middleware (Sections III.A and III.F);

* entering into certain restrictive agreements relating to the distribution of or development for Non-Microsoft Operating Systems and Non-Microsoft Middleware (Sections III.C, III.F.2, III.G); or

* preventing end-users and OEMs from enabling non-Microsoft Middleware Products over Microsoft Middleware Products (Section III.H). Although such provisions are certainly appropriate in light of Microsoft's past conduct, they merely enjoin Microsoft from continuing to break the law in the future, and do nothing to repair the damage to competition caused by Microsoft's past acts.

4. The RPFJ assumes that Microsoft's Windows distributors will promote competitive middleware products

Sun questions whether the Department's reliance upon Microsoft's primary distributors, PC manufacturers, to re-start competition in the PC operating system market is fundamentally misplaced. In its Competitive Impact Statement, the Department contends that the RPFJ will ''restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings.'' [22] The Department's assumption seems to be that by giving PC manufacturers greater contractual freedom to distribute non-Microsoft Middleware Products, a rich market of competing middleware products will arise that could eventually give rise to alternative computing platforms capable of undermining Microsoft's application barrier to entry.

The RPFJ, however, does nothing to ensure that such alternative platforms are actually distributed to consumers. If PC manufacturers choose not to distribute such software, consumers will never have the choice that they had, prior to Microsoft's illegal acts, when alternative platforms like the Navigator browser or the Java platform were ubiquitously distributed. The key question then is whether PC manufacturers will aggressively distribute non-Microsoft platforms. Unfortunately, the Department's Competitive Impact Statement offers no explanation or empirical evidence to support this critical assumption.

Given the limited nature of the relief proposed in the RPFJ, Sun is not as sanguine as the Department about such prospects.

First, despite the retaliation restrictions contained in the RPFJ, because Microsoft's market power is left largely untouched and PC manufacturers remain dependent solely on Microsoft for a critical component for their products, it is very likely that, in practice, many PC manufacturers will remain reluctant to risk incurring Microsoft's wrath by supporting competing platforms. Microsoft simply retains too many formal and informal tactics to reward its ''friends,'' and punish its ''enemies.'' One need only look at PC manufacturers'' treatment of Microsoft's Internet Explorer for guidance on how the terms of the RPFJ are likely to be applied in practice. In July 2001, Microsoft announced that PC manufacturers, for the

[22] CIS at 3.

first time, would be free to remove access to Internet Explorer. Since that time, not one PC manufacturer has removed the Internet Explorer icon from retail PCs.

Second, under the terms of the RPFJ, competing middleware vendors are at such a competitive disadvantage to Microsoft that it will remain extremely difficult to secure distribution of these competing products through PC manufacturers. Under the RPFJ, Microsoft's ability to bundle middleware products into its Windows operating system would remain essentially unfettered. PC manufacturers would have the legal right to remove or disable certain Microsoft middleware products, but what commercial incentive will the PC manufacturers have to remove or disable the Microsoft products if they have already paid for such products in order to license the Windows operating system? Moreover, while Microsoft retains the ability to bundle its middleware product (e.g., a browser, media player, etc.) into every copy of Windows (absent an affirmative act by a PC manufacturer to exclude such product), a competitor would have to individually approach scores, if not hundreds, of different PC manufacturers around the world and negotiate a separate agreement with each to achieve a comparable degree of distribution. In addition, because the marginal cost to the PC manufacturer for the bundled Microsoft middleware product is effectively zero, PC manufacturers may be reluctant to pay non-Microsoft middleware vendors a sufficient price to recoup the costs such middleware vendors would incur to make and sell competing products.

Finally, since the vast majority of PC manufacturers are in the business of selling Windows PCs, some manufacturers might believe it is against their own commercial interests to support alternative middleware platforms. For example, if a middleware platform (e.g., the Java platform) truly lowers barriers to entry and allows consumers to run applications on any operating system (e.g., Apple Mac operating system, etc.) that supports that middleware platform, consumers eventually might chose to purchase their computers from vendors other than Windows PC vendors. Thus, the RPFJ fails to account for the fact that many PC manufacturers may derive substantial benefit from maintaining the applications barrier to entry protecting Microsoft's Windows monopoly. B. The RPFJ does not remedy the continuing competitive harm to web browsers

Prior to Microsoft's illegal campaign, Netscape's Navigator browser was the market leading web browser by a wide margin.[23] Today, Microsoft's Internet Explorer browser dominates the market, accounting for over 87% of all users. [24]To achieve this dramatic turn of events, the District Court found, and the Court of Appeals affirmed, that Microsoft engaged in a series of unlawful, anticompetitive acts:

* Exclusionary contracts with OEMs,[25] IAPs,[26] and ISVs;[27]

* Commingling of software code to make it technologically difficult to remove, Internet Explorer from Windows; [28]

* Anticompetitive deals with Apple Computer.[29]

Not only did Microsoft effectively destroy Navigator as a viable alternative platform, by seizing control over the web browser, Microsoft greatly expanded its market power. By dominating web browsers and effectively excluding all competitors, Microsoft secured the power to set and control the protocols and interfaces used for connecting with and communicating over the Internet.

Imagine, for example, that a single company monopolized the manufacture and supply of telephones, such that it supplied 95% of the world's telephones. If that company were permitted to change the dial tone on its phones, or the keypad, in ways that permitted only phones made by it to call and interact with its installed base of telephones, the telephones made and sold by its competitors would have very little or no value, since they could no longer interoperate effectively with 95% of all telephones. And if that company also altered the telephones it made so that they worked best—or indeed only—with the telephone switches and answering machines that the monopoly telephone company also made, then that company would quickly obtain a monopoly over the telephone switch and answering machine markets as well.

Microsoft's control over the browser and PC operating system provides Microsoft with just such unbridled power to dictate unilaterally the interfaces and protocols by which other devices and applications can interoperate with Microsoft's products and services over the Internet. The role played by the browser in communicating with devices, applications, and web services over the Internet is directly analogous to the role played by the consumer telephone in the telephone network.

As a result of Microsoft's illegal acts, Microsoft can now exclude competing products and services from being able to communicate over the Internet with Microsoft's browser, or Microsoft can mandate interfaces and protocols which favor its products over competitors'' products. Thus, by virtue of its anticompetitive conduct, Microsoft has secured the power to potentially appropriate a public asset of immeasurable value—the Internet—through use of proprietary interfaces and protocols.

Control of the browser also was essential to protecting Microsoft's PC operating system monopoly. By controlling this ''killer application,'' Microsoft can determine which competing operating systems, if any, will be able to run Internet Explorer. Without first-rate browser support capable of communicating with the content available across the Internet, competing PC operating systems simply will not be able to attract consumers away from Microsoft's monopoly operating system.

Finally, control of the browser was important in order for Microsoft to be able to control a key distribution channel for middleware that potentially threatened Microsoft's monopoly. Browsers have been a vital distribution channel for a variety of middleware products, including the Java platform, media players, instant messaging products, etc. If Microsoft did not control this distribution channel, competitors could have continued to use competing browsers as a vehicle for distributing non-Microsoft middleware.

Consequently, the continuing competitive harm flowing from Microsoft's unlawful conduct is substantial. The RPFJ, however, does nothing directly to address it. Instead, it leaves Microsoft to enjoy the spoils of its illegal conduct. At best, the RPFJ attempts to make it easier for PC manufacturers to now distribute competing browsers. But given the dominant position that Internet Explorer has now achieved, who will develop and market a competing browser? Because Microsoft bundles Internet Explorer with its monopoly operating system, a competitor would have to compete against a product with a marginal cost to PC manufacturers and consumers of essentially zero, since Microsoft can recoup its costs from its monopoly products. Even if the competing browser were technically superior, Microsoft can regularly introduce new interfaces and protocols to interfere with the competing browser's ability to compete, forcing the competitor to chase each new proprietary standard Microsoft announces.

Unless Microsoft is first stripped of the fruits of its illegal conduct, real competition in the browser market is unlikely to occur. Absent such remedial relief, it is akin to holding a 100-yard dash in which Microsoft has an 87-yard lead after jumping the gun and intentionally tripping all of its competitors. Consumers are directly harmed as a result. Instead of a marketplace offering many different browser choices, consumers are increasingly faced with only one choice -Microsoft's browser. C. The RPFJ does not remedy the substantial harm to competition caused by Microsoft's illegal acts against the Java platform

The District Court found, and the Court of Appeals affirmed, that Microsoft engaged in numerous anticompetitive acts directed against the Java platform:

* Exclusionary ISV deals;[30]

* Anticompetitive threats to Intel to stop Java platform development;[31]

* Deceiving developers into using Microsoft's incompatible implementation of the Java platform;[32 33 34]

* Blocking distribution of Netscape Navigator—a prime distribution channel for the Java platform to PCs?

Prior to Microsoft's anticompetitive acts, Sun had secured two major distribution channels for delivering the Java platform to PCs—Netscape's Navigator browser and Microsoft's Internet Explorer browser and

Windows operating system. By its illegal acts, Microsoft effectively blocked the distribution of compatible, upgraded versions of the Java platform through both channels, and substantially slowed the development of desktop applications written to the Java platform.

First, by blocking distribution of Netscape Navigator and dramatically reducing its market share, Microsoft effectively closed this alternative channel for distributing compatible versions of the Java platform to PCs. Second, by developing and distributing its own incompatible version of the Java platform which was tied to Windows, Microsoft fragmented the Java platform in order to re-create its applications barrier to entry, ensuring that PC consumers only had Microsoft's version of the Java platform. By refusing to distribute compatible upgrades of the Java platform, Microsoft effectively froze desktop development for the Java platform by continuing to distribute an ''old'' version of the technology, which did not have the richer set of functionality available in later versions. Finally, by means of exclusionary deals, threats, and incompatible developer tools, Microsoft attempted to either deceive or coerce developers away from developing compatible applications written to the Java platform that could run on operating systems other than Windows.

Since the trial, Microsoft has continued to attack the Java platform to the detriment of consumers. In its most recent version of Windows, Windows XP, Microsoft no longer included even the old version of the Java platform which it previously had been shipping as part of Windows in accordance with the terms of a settlement agreement with Sun. As a result, millions of consumers purchasing Windows XP will no longer be able to access web pages that contain applications written to the Java platform unless they engage in a time-consuming download of the entire Java platform.

In addition, Microsoft recently unveiled its own competing middleware runtime—the .NET Framework—as part of its .NET initiative. During the time that Microsoft effectively halted the development and distribution of the Java platform for the PC for several years, it simultaneously was busy developing its own middleware runtime that copied the design and architecture of the Java platform with one glaring difference—the .NET Framework runs only on Windows. Thus, not only did Microsoft's illegal conduct allow it to blunt the competitive threat which the Java platform posed to Microsoft's Windows monopoly, it also allowed Microsoft the time to try and catch up with many of the compelling features that, at the time, only the Java platform offered.

The RPFJ, however, does not seek to remedy the continuing competitive harm caused by Microsoft's actions. For example, the RPFJ does nothing to attempt to put the marketplace in the position it would have been ''but for'' Microsoft's conduct—ubiquitous distribution of an upgraded, compatible Java platform on top of every Windows operating system as an available, alternative platform for software applications. Nor does it account for the time-to-market advantage that the Java platform lost as a result of Microsoft's conduct, particularly now that Microsoft will attempt to compete against the Java platform with its .NET Framework.

Instead of attempting to undo this damage to competition, the RPFJ would allow Microsoft to bundle its competing .NET Framework with Windows, while forcing Sun and its licensees to try and re-create the distribution channels that Microsoft unlawfully destroyed.

Absent real remedial relief, Microsoft will continue to reap the benefits of its unlawful conduct, and consumers will have no meaningful alternative computing platform available on PCs that is not controlled by Microsoft. IV. Critical Terms In The RPFJ Are Undefined or Ambiguous A. Significant ambiguities in the RPFJ must be cured to avoid further litigation

The dispute between Microsoft and the Department regarding the prior consent decree demonstrates the need to carefully define technical terms to avoid future litigation and ensure the parties agree with respect to Microsoft's obligations. As the Department is well aware, the 1995 consent decree with Microsoft prevented Microsoft from requiring PC manufacturers to license other products as a condition of licensing the Windows operating system? However, the consent decree specified that this obligation did not ''prohibit Microsoft from developing integrated products,'' though the term ''integrated products'' was left undefined?

In 1997, the Department asked the District Court to find Microsoft in contempt for requiring PC manufacturers who licensed the Windows operating system to also license Internet Explorer. Although the District Court found that the Department's proposed definition was probably correct, the court declined to find Microsoft in contempt because Microsoft offered a ''plausible interpretation,'' and any ambiguities had to be resolved in Microsoft's favor?

Given that any ambiguities are likely to be resolved in Microsoft's favor in any future enforcement proceeding, Sun believes it is essential that any and all material ambiguities be clarified prior to the entry of the RPFJ.

Although the Department offers its own interpretation of some of the RPFJ's ambiguous terms in the Competitive Impact Statement, Microsoft has repeatedly refused to reveal whether it disagrees with those interpretations. For example, following recent testimony by Microsoft's counsel, Charles Rule, before the Senate Judiciary Committee, members of the Committee posed a series of questions to Mr. Rule regarding whether Microsoft agreed with the Department's interpretation of the RPFJ as set forth in the Competitive Impact Statement. Mr. Rule's responses were telling. When asked a series of questions directed to whether ''Microsoft disagree[d] with anything stated in the Department's Competitive Impact Statement concerning the meaning and scope of the proposed Final Judgment,'' Mr. Rule refused to answer the questions directly, instead repeatedly referring to the same ''non-answer'':

Microsoft did not participate in the preparation of the Competitive Impact Statement. The language of the Revised Proposed Final Judgment was carefully negotiated and means what it says. The Department's Competitive Impact Statement has the same legal force and effect in this case as in any other. Beyond that I cannot go in light of the facts that the Tunney Act proceeding is currently under way before Judge Kollar-Kotelly and that the non-settling states are attempting to raise various issues concerning the Competitive Impact Statement as part of the ongoing ''remedies'' litigation also before Judge Kollar-Kotelly. Once that litigation is completed, I may be in a better position to discuss these issues with the Committee.

Microsoft's clear strategy is to refuse to reveal anything about its interpretations of the RPFJ prior to the Court's entry of the judgment, lest it become clear to both the Department and the public that Microsoft's understanding of its potential obligations under the RPFJ is substantially different from the Department's. Then, when disputes with the Department about the scope of its obligations arise, as they inevitably will, Microsoft will be free to argue that the RPFJ is ambiguous, and therefore must be construed, as a matter of law, in Microsoft's favor?

While it certainly is in Microsoft's interest to pursue such a strategy, the Department should not risk being complicit in a scheme that would effectively mislead the Court and the public about the true nature and impact of the RPFJ. The Department should insist that Microsoft identify any and all disagreements that it has with the interpretations offered by the Department in the Competitive Impact Statement prior to entry of the RPFJ. Absent such an inquiry and a record of Microsoft's position, the District Court, Sun, and the public at large have no assurances that the terms of the RPFJ will actually be construed in the manner proposed by the Department in its Competitive Impact Statement. B. ''Interoperate'' and ''interoperating'' must be defined

The key disclosure provisions contained in the RPFJ rely on the terms ''interoperate'' and ''interoperating'' to define the scope of Microsoft's obligations, but these critical terms are not expressly defined.

Section III.D of the RPFJ would require Microsoft to disclose ''for the sole purpose of interoperating with a Windows Operating System Product... the APIs and related Documentation that are used by Microsoft Middleware to interoperate with a Windows Operating System Product.'' (emphasis added).

Section III.E would require Microsoft to: make available for use by third parties, for the sole purpose of interoperating with a Windows Operating System Product, on reasonable and non-discriminatory terms .... any Communication Protocol that is... (i) implemented in a Windows Operating System Product installed on a client computer, and (ii) used to interoperate natively (i.e., without the addition of software code to the client operating system

product) with a Microsoft server operating system product. (emphasis added).[35] [36] [37] [38] [39]

Depending on the definition of these terms, the scope of Microsoft's obligations under these provisions could vary dramatically. Therefore, in order to avoid a reprise of the litigation surrounding the 1995 consent decree with Microsoft, the Department should clarify the meaning of these terms in the text of the RPFJ, particularly since any ambiguity is likely to be construed in Microsoft's favor in any enforcement action brought by the Department.

An explicit definition of these terms is essential because Sun believes the Department and Microsoft likely attach very different meaning to these terms.

For example, in the Competitive Impact Statement, the Department offers a number of broad characterizations regarding the scope of these interoperability disclosures:

* ''[I]f a Windows Operating System Product is using all the Communications Protocols that it contains to communicate with two servers, one of which is a Microsoft server and one of which is a competing server that has licensed and fully implemented all the Communications Protocols, the Windows Operating System Product should behave identically in its interaction with both the Microsoft and non-Microsoft servers.'' [40]

* ''Section III.E. will permit seamless interoperability between Windows Operating System Products and non-Microsoft servers on a network. For example, the provision requires the licensing of all Communications Protocols necessary for non-Microsoft servers to interoperate with the Windows Operating System Products'' implementation of the Kerberos security standard in the same manner as do Microsoft servers, including the exchange of Privilege Access Certificates. Microsoft must license for use by non-Microsoft server operating system products the Communications Protocols that Windows Operating System Products use to enable network services through mechanisms such as Windows server message block protocol/common Internet file system protocol communications, as well as Microsoft remote procedure calls between the client and server operating systems.'' [41]

* ''Section III.D of the proposed Final Judgment requires Microsoft to disclose to ISVs, IHVs, IAPs, ICPs and OEMs all of the interfaces and related technical information that Microsoft Middleware uses to interoperate with any Windows Operating System Product .... Microsoft will not be able to hamper the development or operation of potentially threatening software by withholding interface information or permitting its own products to use hidden or undisclosed interfaces.'' [42]

In light of these comments, the Department appears to be interpreting ''interoperate'' to mean the ability of two different products to access, utilize, and support the full features and functionality of one another. Under the Department's interpretation, the disclosures would be of sufficient detail to allow a non-Microsoft server operating system to implement the Microsoft Communication Protocols in a manner such that the non-Microsoft server operating system could be substituted for a Microsoft server operating system without any disruption, degradation, or impairment of all the features, functionality, and services of any Microsoft PC operating system connected to such non-Microsoft server operating system.

By contrast, in proceedings before the European Commission, Microsoft has asserted a much narrower interpretation of ''interoperate'' than the Department's interpretation. In that forum, Microsoft has maintained it already discloses all information necessary to achieve interoperability between Microsoft's PC operating system and non-Microsoft server operating systems. Since Microsoft contends that they already disclose all of the information necessary to satisfy this narrow definition of ''interoperate,'' if this definition were to prevail, Microsoft will disclose nothing new. Its conduct will remain unchanged.

Under Microsoft's narrow definition, interoperability is a one-way street that is satisfied if all of the functionality of a non-Microsoft server operating system can be accessed from a Windows PC operating system. In contrast to the Department's position, Microsoft has repeatedly taken the position that interoperability does not require a disclosure sufficient to allow a Windows PC operating system to behave identically when connected to both Microsoft and non-Microsoft server operating systems. Moreover, Microsoft has previously claimed that ''interoperability'' relates only to those protocols and interfaces which Microsoft has chosen to document and make available to third parties, and should not include protocols and interfaces that Microsoft reserves for itself to use to connect its PC and server operating system products. Absent an explicit definition of this critical term in the RPFJ, Sun believes the disclosure provisions of the RPFJ are doomed to fail. To avoid future disputes over the meaning of this term and to ensure that the public actually receives a remedy that is consistent with the Department's representations in the Competitive Impact Statement, Sun proposes that the RPFJ should be amended to include the following definition:

''Interoperate'' or ''Interoperating'' means the ability of two different products to access, utilize and/or support the full features and functionality of one another in all of the ways they are intended to function. For example, a non- Microsoft operating system installed on a server computer ''Interoperates'' with a Windows Operating System Product installed on a Personal Computer if such non-Microsoft server operating system can (a) be substituted for a Microsoft operating system running on a server computer connected to a Personal Computer running a Windows Operating System Product, and (b) provide the user of the non-Microsoft server operating system the ability to access, utilize and/or support the full services, features and functionality of the Windows Operating System Product that are accessed, utilized and/or supported by such Microsoft server operating system without any disruption, degradation or impairment in such services, features and functions. C. The scope of Microsoft's ''Communication Protocols'' disclosure should be clarified and exemplified

As a vendor of server operating systems that must connect and communicate with Microsoft's monopoly PC operating system, the disclosure and licensing provisions in Section III.E relating to Microsoft's Communications Protocols are especially important to Sun's business. Although the term Communications Protocols is expressly defined, the RPFJ lacks any explicit examples regarding which Microsoft technologies would currently be required to be disclosed or what the extent of such disclosure would be in practice. While the terms of the RPFJ must be written to anticipate Microsoft's future conduct, there is no excuse for misunderstandings regarding Microsoft's obligations with respect to known, existing interoperability barriers. Because the technical terms surrounding this provision are potentially subject to varying interpretations, the RPFJ would be substantially improved if it gave better guidance on how these provisions would actually be applied in practice.

For example, in its Competitive Impact Statement, the Department identifies some of the specific protocols it believes Microsoft will be required to disclose under Section III.E to the extent such protocols are implemented in Microsoft's PC operating system products, including: protocols relating to Microsoft's Internet Information Services (''IIS'') web server and Active Directory, Microsoft's implementation of the Kerberos security standard (including the exchange of Privilege Access Certificates), the Windows server message block protocol, the Windows common Internet file system protocol, Microsoft remote procedure calls between the client and server operating systems, and protocols that permit a runtime environment (e.g., the Common Language Runtime) to receive and execute code from a server.[43]

Microsoft, however, has refused to say whether it agrees with the Department's interpretation. To avoid future disputes and ensure that the parties agree on the kinds of protocols that will fall within the scope of the term ''Communications Protocols,'' the RPFJ should be amended to identify

[41] CIS at 38–39.

[42] CIS at 33.

[43] CIS at 37–39.

particular examples of protocols that Microsoft would be required to disclose. Furthermore, in advance of entry of the RPFJ, Microsoft should be required to fully detail what it will disclose with regard to existing Communications Protocols that pose a barrier to interoperability. At a minimum, the Department should require Microsoft to identify any disagreements Microsoft has with the Department's interpretation of this provision prior to entry of the RPFJ. Unless the Department and Microsoft go through the exercise of attempting to apply this provision in practice, the public cannot be assured that there truly has been a ''meeting of the minds'' regarding the scope and meaning of this important provision.

Not only should the Department clarify the RPFJ with examples of particular protocols that Microsoft currently would be required to disclose, the Department also should clarify the kinds of information Microsoft will be required to disclose regarding its Communications Protocols. Although the term Communications Protocols appears to be defined broadly in Section VI.B of the RPFJ, in practice, the actual application of these provisions is likely to give rise to many potential questions and disputes. For example,

* Is everything that is shipped with Microsoft Windows server operating system products (e.g., Windows 2000 Server, Windows 2000 Advanced Server, etc.), including Microsoft's Active Directory or IIS, part of the ''server operating system,'' and therefore potentially the subject of disclosure to the extent it comprises a ''Communications Protocol''?

* Are Active Directory, Kerberos security protocol, COM+, Dfs, DLT, CIFS extensions, RPC, the Win 32 APIs, or Passport examples of ''Communications Protocols'' that must be disclosed and licensed pursuant to Section III.E of the RPFJ?

* Where Microsoft has extended an industry standard like Kerberos, will Microsoft be required to disclose both the standard portion of its implementation and its proprietary extensions?

* Will Microsoft be required to disclose the details regarding its proprietary implementation of the Kerberos security protocol in Windows 2000 and Windows XP Professional, including the information necessary for a non-Microsoft server to be able to generate, exchange, and process the authentication and authorization data in Privilege Access Certificates?

* What does ''make available for use by third parties'' mean in practice in the context of Section III.E? Will Microsoft be required to just disclose fields, formats, etc., or will it be required to disclose sufficient information to allow a competitor to create its own implementation of the Communications Protocol that will allow a competitor's server operating system to seamlessly interoperate with the Windows PC operating system in the same manner as a Microsoft server operating system?

Unless such questions are resolved and clarified in advance of entry of the RPFJ, the disclosure and licensing obligations of Section III.E will not provide any meaningful relief. D. The scope of the ''carve-out'' provisions of Section III.J should be clarified

Particularly troubling to Sun is the possibility that the ''carve-out'' provisions of Section III.J might be broadly construed by Microsoft to exclude many of the kinds of disclosures that would otherwise fall within the scope of Sections III.D and III.E. Section III. J. 1 provides that no provision of the Final Judgment shall: [r]equire Microsoft to document, disclose or license to third parties: (a) portions of APIs or Documentation or portions or layers of Communications Protocols the disclosure of which would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital fights management, encryption or authentication systems, including without limitation, keys, authorization tokens or enforcement criteria .... (emphasis added).

In the Competitive Impact Statement, the Department characterizes this exception as a ''narrow one, limited to specific end-user implementations of security items such as actual keys, authorization tokens or enforcement criteria, the disclosure of which would compromise the security of ''a particular installation or group of installations'' of the listed security features.''[44] But nowhere in the RPFJ is the term ''compromise the security of a particular installation or group of installations'' defined. What will this provision mean in practice? With respect to known interoperability problems relating to Active Directory, Microsoft's Kerberos security model, Windows Media Player, or the Passport authentication/authorization service, what portions of those protocols and interfaces can Microsoft refuse to disclose pursuant to this provision? If Microsoft refuses to disclose such information, will competitors be able to fully interoperate with all of the features and functionality of the Windows operating system, or will the value of the disclosure provisions be effectively eviscerated? What steps has the Department taken to ensure that, in practice, this exception will not swallow the intended effect of the disclosure provisions?

Again, unless such questions are clarified in advance of entry of the RPFJ, Microsoft is likely to use this purportedly narrow exception to eviscerate its disclosure and licensing obligations under the RPFJ. E. The definition of ''Microsoft Middleware Product'' should be amended

The definition of ''Microsoft Middleware Product''[45] in the RPFJ is fundamentally flawed because it grants Microsoft discretion to limit its obligations merely based on the way it chooses to trademark its products. For middleware functionality that is distributed after entry of the Final Judgment, except for a small, specified class of middleware applications (e.g., Internet browsers, email client software, etc.), Microsoft's obligations under the RPFJ are not triggered unless it chooses to distribute the middleware product under a trademark other than ''Microsoft??'' or Functionality that Microsoft describes or markets as being part of a Microsoft Middleware Product (such as a service pack, upgrade, or bug fix for Internet Explorer), or that is a version of a Microsoft Middleware Product (such as Internet Explorer 5.5), shall be considered to be part of that Microsoft Middleware Product.

''Windows??.''[46] In other words, after entry of the RPFJ, if Microsoft bundles its new middleware runtime alternative to the Java platform, the .NET Framework (also known as the Common Language Runtime) with Windows, it only would have to make disclosures about the APIs used by the .NET Framework or allow OEMs and consumers to remove access to it, if it chose to distribute the .NET Framework under the trademarked name ''.NET Framework.'' If it simply distributed the product under the name ''Microsoft* .NET Framework,'' its activities would appear to be unconstrained by the RPFJ. To allow Microsoft to evade its obligations under the RPFJ based on arbitrary trademarking practices is absurd.

To avoid this result, the definition of ''Microsoft Middleware Product'' should be amended as follows: the ''Trademarked'' requirement of Section VI.K.2.b.iii should be stricken; the terms ''.NET Framework'' and ''Common Language Runtime'' should be added to Section VI.K.1; and the term ''middleware runtime environment'' should be added to Section VI.K.2.a.

V. Section III.I's Licensing Provisions Allow Microsoft to Profit from Its Unlawful Acts

A. Microsoft should not be allowed to demand royalties as a condition for making interoperability disclosures

The licensing provisions of the RPFJ are fundamentally flawed because they would require the public to pay royalties to Microsoft in order to interoperate with Microsoft's illegally maintained monopoly products. If Microsoft had not engaged in its pattern of illegal conduct, its monopoly would have begun to dissipate, and it would have been unable to collect this ''interoperability'' tax. As the Department itself previously recognized, ''[i]f Microsoft were in a competitive market, it would disclose its confidential interface information to other server software developers so that their complementary software would work optimally with, and thereby enhance the value of, Microsoft's PC operating systems.''[47] It is only because Microsoft has illegally maintained its PC operating system

[44] CIS at 39.

[45] The RPFJ defines ''Microsoft Middleware Product'' as follows: 1. the functionality provided by Internet Explorer, Microsoft's Java Virtual Machine, Windows Media Player, Windows Messenger, Outlook Express and their successors in a Windows Operating System Product, and 2. for any functionality that is first licensed, distributed or sold by Microsoft after the entry of this Final Judgment and that is part of any Windows Operating System Product a. Internet browsers, email client software, networked audio/video client software, instant messaging software or b. functionality provided by Microsoft software that—i is, or in the year preceding the commercial release of any new Windows Operating System Product was, distributed separately by Microsoft (or by an entity acquired by Microsoft) from a Windows Operating System Product; ii. is similar to the functionality provided by a Non-Microsoft Middleware Product; and iii. is Trademarked.

[46] See RPFJ, Sections VI.K and VI.T.

[47] 4/28/00 Plaintiffs'' Memo. in Support of Proposed Final Judgment at 28.

monopoly and wishes to expand its monopoly to server operating systems that Microsoft has an incentive to withhold information from competitors regarding complementary software. Thus, the RPFJ, in effect, authorizes Microsoft to collect a portion of its monopoly rents through this licensing regime.

Furthermore, not only is Microsoft authorized to collect royalties for the ''privilege'' of interoperating with its illegal monopoly, the RPFJ places no limits on how high a royalty Microsoft can demand, other than the royalty must be reasonable. However, since competitors'' products must be able to interoperate with Microsoft's monopoly PC operating systems, they may be constrained to essentially pay whatever Microsoft demands.

To ensure Microsoft does not continue to enjoy the fruits of its illegal conduct, Section III.I of the RPFJ should be amended to require Microsoft to grant any licenses required under the RPFJ on a royalty-free basis.

B. Microsoft has too much discretion over licensing terms under the RPFJ Although Section III.I of the RPFJ places some limitations on the terms under which Microsoft must license its technology to facilitate the disclosure obligations of the RPFJ, Microsoft retains broad discretion, which it is likely to exploit.

For example, Section III.I. 1 requires that all license terms be ''reasonable.''

A reasonableness standard, however, provides little practical guidance, and is a particularly poor choice in the case of a monopolist like Microsoft who has repeatedly broken the law to secure commercial advantages over its competitors. Similarly, the fact that licenses must be ''non- discriminatory'' could actually be exploited by Microsoft to ensure that its strongest competitors are denied access to Microsoft's disclosures. For instance, a small start-up company with no revenues and no existing intellectual property rights might be willing to agree to terms that would be commercially unacceptable to significant Microsoft competitors like Sun, IBM, or Novell.

The terms of the RPFJ also allow Microsoft the ability to substantially delay making any interoperability disclosures. Under Section III.E, Microsoft does not even need to make its Communications Protocols available until nine months after submission of the RPFJ. But since Microsoft can insist that third parties enter into a license agreement before they receive any disclosures, Microsoft can continue to delay making disclosures to key competitors by dragging out negotiations and insisting on commercially unacceptable terms.

Does the Department intend to review ongoing negotiations to ensure Microsoft is taking reasonable positions in the negotiations? How will the Department ensure that Microsoft does not exploit the negotiating process to facilitate delay and disadvantage key competitors? Will Microsoft's competitors be forced to sign license agreements before they know the scope of information that Microsoft will or will not disclose? Does the Department expect that the proposed Technical Committee will be involved in resolving such disputes? If so, will Technical Committee members have the requisite licensing and legal experience to assess whether Microsoft is insisting upon commercially unreasonable terms?

To ensure Microsoft cannot circumvent the intent of the RPFJ, Sun proposes that the RPFJ be amended to include a publicly available template identifying the terms under which Microsoft will license its technology pursuant to the RPFJ. In principle, this approach is analogous to Section III.B which requires Microsoft to have uniform license agreements with OEMs in accordance with published, uniform royalty rates. Requiring Microsoft to identify this license template in advance would serve two important objectives. First, it would help limit Microsoft's ability to evade the intent of the RPFJ through negotiation tactics. Second, it would allow the public to understand the true costs and conditions of licensing under the RPFJ in advance of entry of the RPFJ. Unless the material licensing terms are specified in advance, neither the Department nor the public can accurately assess the actual commercial significance of the proposed disclosure obligations.

C. Microsoft should not be allowed to force third parties to forfeit their intellectual property claims against Microsoft

Section 111.1.5 provides that third parties ''may be required to grant to Microsoft on reasonable and nondiscriminatory terms a license to any intellectual property rights it may have relating to the exercise of their options or alternatives provided by this Final Judgment.'' In other words, Microsoft would be free to infringe a third party's patents or copyrights, or steal its trade secrets, and then by virtue of its monopoly position, force such third party to grant Microsoft a license to do so as the price that third party must pay in order to interoperate with Microsoft's monopoly product. If Microsoft wished to obtain rights to practice or use a competitor's intellectual property, it could do so simply by incorporating that technology into Windows, then insisting on both a royalty and a grant-back license as the consideration that competitor must provide in order to enable its products to interoperate with Microsoft's monopolized PCs.

Indeed, Microsoft's competitors would have to license Microsoft the right to whatever intellectual property Microsoft may have incorporated into Windows even before they know what intellectual property Microsoft has stolen or infringed. No other company has such power, let alone governmental blessing and endorsement, to extort such concessions.

Sun therefore proposes that the RPFJ be amended to strike Section 111.I.5 in its entirety.

VI. Conclusion

The RPFJ fails to remedy the continuing competitive harm resulting from Microsoft's actions, and instead improperly accedes to Microsoft's illegally maintained and expanded monopoly power. The Department should withdraw its support for the RPFJ, and instead pursue remedies that will restore competition to the PC operating system market, prevent Microsoft from expanding its monopoly in that market into adjacent and downstream markets, and redress the harm to competition caused by Microsoft's illegal acts. At a minimum, the Department should seek to remedy directly the specific harm to competition caused by Microsoft's illegal acts against the Navigator browser and the Java platform, which formed the very heart of the Department's case against Microsoft.

Because critical terms in the RPFJ are undefined or ambiguous, the Department also should assure the public that Microsoft is bound by the interpretation of the RPFJ set forth in the Department's Competitive Impact Statement.

Finally, the Department should delay seeking entry of the RPFJ until the completion of trial on the remedies sought by the Department's co-plaintiffs, the Litigating States. Sun believes that the evidentiary record from that trial is likely to demonstrate the substantial flaws and inadequacies of the RPFJ and cause the Department to seriously re-consider whether its support for the RPFJ is in the public interest.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr Ashcroft:

I have been associated with the computer revolution since the early 196's I have seen the growth and witnessed through my work on the Space Program the tremendous things that can be done with the computer My graduate work dealt with many papers, which visualized the many possibilities that computers offered to civilization Re-reading these notes today I see that I did not come close to understanding what the computer revolution held for our society Thank God for visionaries associated with Microsoft who have taken conceptual ideas not dreamed of in the early days of computers and made them into today/Es standards Looking ahead for the next forty years I firmly believe that we will see that we have only begun to scratch the surface of what technology and social development driven by computers can achieve Most of the growth of this revolution has occurred during the past 10 years when Microsoft released the power of the computer and the Internet through the introduction of the Windows operating System pIt would be a crime of the greatest magnitude to stymie this innovation because competitors lack the vision to move with the concepts being developed for our future The government rather than holding back these ideas should recognize that this technology has reached this pinnacle without major government intervention Why start now?

Microsoft is a good company and I was very glad when the antitrust lawsuit filed against them was finally settled There is no need for further litigation in this issue I truly believe that the resolution is both fair and in the interest of the people of this country

The provisions of this settlement are unique to this type of lawsuit This is the first lawsuit ever that requires a company to disclose internal information about its interfacing new software with its current systems The Microsoft settlement also includes provisions that restrict Microsoft from entering into any kind of agreements that would limit competition among software companies This settlement truly addresses all the concerns of the people, and keeps competition viable within this market

But clever people like me who talk loudly in restaurants, see this as a deliberate ambiguity A plea for justice in a mechanized society.

I see no need for further litigation Vast amounts time and resources have already been spent on pursuing Microsoft and I think it's time that no more be used The resolution now on the table is a fine one I urge you to support it and let it stand as is I thank you for your time and I am sure that you will do what you feel is best for people and economy of this country

But is suspense, as Hitchcock states, in the box No, there isn't room, the ambiguity's put on weight.

Sincerely,
Thomas Burke

Renata B. Hesse
Antitrust Division
United States Department of Justice
601 D Street NW
Suite 1200
Washington, DC 20530–0001

Dear Ms. Hesse,

I am writing to comment on the proposed Microsoft/DOJ anti-trust settlement. As a business executive at a company both highly dependent on computing technology and specifically involved in software development, I've come to the conclusion that this settlement is not in the public interest, and fails to remedies the problems that provoked the action in the first place.

The settlement leaves the Microsoft monopoly intact, with numerous opportunities to the company to effectively exempt itself from crucial provisions. The recently proposed ''donation'' to schools is just one example of how Microsoft can turn matters to their own advantage (in this case by decimating Apple's position in the education market).

In addition, the proposed settlement fails to address the critical ''applications barrier to entry'' associated with the installed base of 70,000 Windows applications, enabling Microsoft to maintain an effective ''lock'' on the operating systems market by denying competitors with other operating systems the information needed to run these other applications on other operating systems. Any settlement must make it easier—not harder—for competitors to run the Windows applications.

Consumers, not Microsoft, should decide what products are on their computers. The settlement must eliminate Microsoft's various barriers—business and technical—to allowing combinations of non-Microsoft operating systems, applications, and software components to run properly with Microsoft products.

The remedies proposed by the Plaintiff Litigating States are in the public interest and absolutely necessary, but they are not sufficient without these remedies.

The Tunney Act provides for the Court to hold public proceedings, with citizens and consumer groups afforded an equal opportunity to participate, along with Microsoft's competitors and customers. I hope you will encourage those proceedings, and consider carefully how to proceed in this matter. Your decisions have great significance for the health of the US economy's most vital industries, by eliminating Microsoft's ability to illegal constrain markets and innovation.

Thank you for the opportunity to comment on this important matter.

Sincerely yours,

Gil Friend

From: Steve Mueller
To: Microsoft ATR
Date: 1/28/02 9:28pm
Subject: Microsoft Settlement

Hi:

I'm writing about the proposed settlement between Microsoft and the U.S. government (and some of the states). I am a professional software developer with BS and MS degrees in Computer Science from the University of Michigan, Ann Arbor. My last four jobs over six years have been writing programs for Microsoft's Windows operating system. I am not affiliated with Microsoft or any companies lobbying for responses. I hope it isn't too late to consider my comments; it is still Monday here on the West Coast.

I feel the settlement is inadequate. Microsoft's anti-competitive behavior has been proven in court and upheld on appeal. Microsoft had previously entered into a consent decree with the government in the mid-90s (I believe), and still was found to be anti-competitive. Clearly, this is a company that doesn't learn and doesn't care.

As a professional software developer, I know what an operating system is supposed to do. It is supposed to manage low-level computer resources (memory, files, peripherals, networking, etc.), and it is to provide a platform on which applications can be written. It does *not* contain applications itself, although I have no problems with the inclusion of simple applications to allow the operating system to be useful (such as Notepad, Write, Calculator and Solitaire in Windows).

Microsoft contends, for example, that the Internet Explorer Web browser is a basic part of the operating system. If it is, that is *only* because Microsoft forced it to be. There is no intrinsic reason for the browser to be included as part of the operating system. As a software developer, though, I could easily combine any two functions that are normally not related into one file and then claim that I could not remove one piece without damaging the other, and so Microsoft's protestations to that effect seem disingenuous at best.

In fact, when Windows 95 was first released, Internet Explorer was not part of the operating system, but was included in the Windows 95 Plus Pack, so at one time the separation was possible. If it is not now possible, it is only because the program was intentionally written to make it difficult to remove.

Microsoft could include the low-level functions (the API) to support Web browsing in the operating system without including

the Internet Explorer browser itself as an application. Microsoft is shading the truth if they claim the API and low-level support and the browser application and user interface are one and the same.

Furthermore, not only does Microsoft have a proven monopoly in the operating system area, but they also have a de facto monopoly in office software. Note that even though office software is just as important as Web browsing, Microsoft does not include its Office suite of products in Windows 9x/ME/XP. Why not? Because Office already has a clear market lead and is extremely profitable, so there's no need to bundle it with Windows.

Internet Explorer was a distant second to Netscape at one time, so Microsoft started including it in the operating system, not even in a Plus Pack. This resulted in Netscape losing market share as Internet Explorer was a browser that was good enough for most people.

Also note that Microsoft's Office suite had an example of bundling. At one point, Microsoft PowerPoint was not the leading presentation package (Lotus and Harvard Graphics had superior solutions), so Microsoft bundled it into Office. While you can buy the Office applications separately, it is not economical to do so.

Finally, let me focus on one more anti-competitive move Microsoft— the removal of Java from Windows XP. Java had been included in previous versions of Windows, but has been removed from Windows XP. Doesn't it seem odd that Microsoft can so easily remove Java from Windows XP, but claims that Internet Explorer can't be removed?

This removal has little to do with Java not being useful—many Web sites use Java. It is more likely a combination of Microsoft trying to get back at Sun for losing when Sun sued Microsoft for incorporating non-standard Java features in Microsoft's implementation of Java (contrary to their agreement), and a way to promote using Microsoft technologies for improved browser experiences (ActiveX controls or C#, for example).

Microsoft's Passport and .NET services will rely on C# (and, in fact, I've read that Passport is now bundled in Windows XP, providing yet another source of monopolistic concerns for identity validation on the Internet).

Therefore, given that Microsoft has engaged in anti-competitive practices in the past, continued to do so after a consent decree, and (in my opinion) is still doing so, I believe that Microsoft needs to be punished severely and quickly. I suggest breaking Microsoft into two or three companies—one dealing with the Windows operating system; one dealing with applications, including Office; and possibly one dealing with Internet software and technologies, like Internet Explorer, Passport, WebTV and MSN.

If such a break up is not considered appropriate, the dissenting states'' plan sounds like a reasonable second alternative, although I would add the requirement that the Internet Explorer browser (the application and user interface parts, not the low-level networking and browsing APIs) be removed from all base versions of Windows (Microsoft would be free to sell a ''premium'' version that included Internet Explorer, much like they have Windows XP Home and Professional editions).

Thank you for taking the time to read these comments,

Steve Mueller

Subject: Opinion

I believe the only real ''crime'' Microsoft has committed is producing a product that it is at the same time superior and cheaper than the products offered by their competitors. By punishing Microsoft, we are, in essence, sending the message that it is better to produce an inferior product and then hire a lawyer to force people to buy.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

The purpose of this letter is to voice my support of the Microsoft settlement. As a concerned citizen, I watched the case against Microsoft with great interest. Three years have now passed since the inception of this case. During this time, I have been increasingly annoyed by the amount of money wasted in disputing this issue. The court mediated settlement agreement reached last November is very equitable. I would hope that the Justice Department recognizes this and enacts the settlement at the end of January. Further, I believe that the terms of the settlement will provide for great change in the tech industry. Under the stipulations of the agreement, Microsoft will disclose the protocols and interfaces of the Windows system. The result of this action will be to enable software and hardware developers to design new software that assimilates into the Windows operating system. This should increase productivity in the sector.

Finally, I would hope that the federal government decides to enact the settlement reached in November.

Thank you.

Sincerely,

Gayle E. Gotshall

To Whom it may concern,

I have worked in the information technology industry for 18+ years. Currently, I'm a senior systems analyst with Georgetown University. I disagree with the settlement that the Department of Justice has brokered with microsoft and feel that it does NOT addresscompletely/ restrict the anti competitive practices that microsoft has made extensive use in the past or today.

The fact that the settlement does not remove ANY of the monies or competitive edges that microsoft gained by using anti competitive/illegal practices should be enough to not allow this settlement to happen in its current form.

I believe in free enterprise and competition dearly, which is why I can not agree with this

settlement. Where was the freedom to compete when microsoft used illegal practices to crush young company's that did in fact have innovative products? Where is/was the justice for these former companies and technologies?

There are a number of very serious issues involved with microsofts illegal practices that can not be allowed to continue if America is going to continue to be a/the technology leader in the future.

Please do allow this settlement to stand in the form it is in currently, it will prove devastating to the computing industry in this country in the future I am sure. If you would like more information from me, or if I need to be more specific please let me know and I will be more than happy to.

Tunney Act review

Please accept the following comments in your review:

As a consumer of computer products, I ask that the Court accept the settlement terms as currently presented by the Department of Justice, the states Attorneys General, and Microsoft. Microsoft has provided me, the consumer, with software products that are integrated. This is what I want as a consumer because the alternative, a number of products upon which I would need to do the integration, is not a product I want to buy.

Microsoft has led the drop in prices of consumer software products over the past 10 years. It's competitors have been compelled to follow. This leadership by Microsoft has been an advantage to the consumers. An example most recently is the action which Sun took to drop the prices of its servers to a price point that would allow it to compete with comparable Microsoft products. The consumer is and has been the winner when Microsoft has competed vigorously.

Sincerely,
Faye Bourret

To Whom it May Concern

Pursuant to the Tunney Act, I am writing to comment on the proposed settlement of the United States vs. Microsoft antitrust case. My Background is in software development. I have been a software developer since I ended my enlistment in the Marine Corps. One of the things that disturbs me about the proposed settlement is that it does very little to actually stop Microsoft from continuing to do the things that they have done. I remember a time when it was possible for a person with a good Idea and some programming ability to create something new and begin to package and sell a unique software product . It is still possible to do this so long as you pledge allegiance to Microsoft and pay them exporbitant fees as the price of entry into the professional development communtiy. The productst they make are not the best, they are the only thing out there because so many businesses refuse to build any software product on a non-Microsoft solution. Where are the compilers for Windows applications? They do not exist because software projects that attempted to produce a competing product where cut off by Microsofts changing or not fully documenting their Application Programming Interface (API). Microsoft has repeatedly and unashamedly refused to obey orders given to them by the DOJ. They laugh at the governments power to stop them. They do not respect lawful authority and fair competition. This has got to be stopped. Please count this as a no vote on the proposed settlement and a yes vote to the independent software developers who will be allowed to develop unique non-Microsoft solutions to business problems, and then actually have an opportunity to sell their solutions to corporate America without fear of incompatibilities.

Sincerely,
Doug Needham
Independent Software Consultant.

Subject: settlement Gentlemen,

This case is about money. Make no bones about it. (I only wish I had some of it- the money not the bones.) If there were utopia, we would all be in heaven and not have to lift a finger. Apple, Sun and several others wish they had something they dont- a bigger piece of the pie.

However, since we live in a real world of World Trade Center bombers, I can only say that we can not all start from ground zero and build over again. I think it would be self destructing to believe that we could knock down one of he the biggest symbols of American business like there was nothing to it and not feel some remorse.

I am one for competition and fair play. This has been the cornerstone of the American way of life since before the time I participated in Little League. There were many times that I wished that I had been better than the person that won out at my position. I would have given anything to be as good. However, I found plenty to do and feel good about my place in society wtihout having to be the top dog at what I do (although I still try).

In all due respects to the participants including Big M, life (including business) is complex. To the best interests of this country and the long term picture of mutual cooperation, we should try to meet a level of mutual understanding. However, I don't think that this includes giving everthing away that one has worked so hard for. In some unkown situatons, it may jeopardize one's own existence. After all, today's hot technology is tomorrow's burnt toast (and it doesn't take much).

All do respects and your humble servent,
Browd Owner of a Mac

I want to register my comments on the Microsoft Antitrust Case.

I believe the agreement is reasonable and fair to all parties involved. The settlement is in the best interest of everyone and allows the industry to move forward. I urge the Justice Department to settle this case.

Sincerely yours,
Joseph L. Schwartz

From: James B. Callahan, Orlando, FL (407) 234–3744

I am a Microsoft Certified Systems Engineer in Orlando, Florida. I looked into the possibility of our local school system, Orange County Public Schools (OCPS) receiving software in schools where 70% or more of the students participate in the school lunch program. My concern is that donation of software which can be used as clients does not trigger additional (Microsoft) licensing fees. Specifically, I am concerned about a licensing fee known as ''Client Access Licenses (CAL)'' that might be required if a new computer at a disadvantaged school accesses a centralized server at school board headquarters for file and print sharing (MS Windows 2000 Server) e-mail (MS Exchange), database (MS SQL Server) or thin client (MS Terminal Services).

I would like to see Microsoft CALs explicitly included in the software donation. I would hate to see ''free'' or low cost computers costing the school system thousands or dollars in CAL fees or alternatively, disadvantaged schools missing out on the benefits of centralized school board services. As to the larger question of the suitability of the entire remedy; that depends on what specifically was alleged in court and proven in court. In theory, I could support a drastic structural remedy based on what I have read in the trade press over they decades. As a practical matter most of what was alleged over the years in the trade press; was not alleged, let alone proven, in court.

Therefore, I will try to do the best that I can for our local schools—even through my impression is that the antitrust suit as a whole was a fiasco on all sides.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Peggy Ann Carrick

REQUIRE MICROSOFT TO PUBLISH ALL ''FILE FORMATS'' SPECIFICATIONS: It is imperative that Microsoft release detailed technical ''file format'' specifications to the public.

We, the companies that compete with Microsoft, can do so, if we can build products which work well with the files people currently use (i.e. Microsoft Word documents, Microsoft Excel files, and so forth).

Microsoft should be required to publicly document ''all'' files used by ''all'' of their application. If in fact, WordPerfect corporation had not published their file format specification many years ago, Microsoft Word would have had a much harder time gaining acceptance in the marketplace since WordPerfect files were the defacto standard file format. People may be willing to switch products, but they need to be able to take their data with them. That is the ''real'' way Microsoft keeps people imprisoned.

Thanks for listening,

Greg

Subject: Microsoft Settlement

Hello—

Thank you for the opportunity to express my opinion on the proposed antitrust settlement against Microsoft Corporation.

I sincerely believe that Microsoft has a long and demonstrated history of un-ethical behavior towards its competitors, its business partners, and the general public. To try and stop some of the most egregious of these behaviors, I would recommend:

1) That Microsoft be split into 3 separate companies:

A) Operating Systems

B) End-User Applications (Microsoft Office, Money, TripMaker, games, etc.....)

C) Development Tools (Computer languages, databases, etc...)

Each company should be a separate and distinct entity, with separate management, board of directors, etc. All interface information (API— Application Program Interface) shall be made public to all software development companies. In other words, there shall be no ''hidden'' or ''undocumented'' functions or features which allow one Microsoft company an unfair advantage over any other competitor, due to intimate knowledge of the workings of another Microsoft company's products, which other companies do not have access to.

2) Bill Gates, Paul Allen, Steve Balmer, and other current top-level management should be transferred to the Development tools company. They can own stock in the other two companies, but should be prohibited from ANY other activities in the other two companies for a period of at least 10 years.

3) All Microsoft contracts and agreements which require the second party to either: install Microsoft software products on each and every machine that the second party is providing, or which prohibit the second party from installing Microsoft's competitor's software products on the machines, or any similar contracts which require the use of Microsoft products, should be ordered null and void.

4) Microsoft has a long history of stealing other company's intellectual property (Stack Electronics is a prominent example), of predatory pricing (selling at a loss, or even ''bundling for free'') to drive other competitors from the market (too many companies and products to list), of playing ''dirty tricks'' to ''break'' a competitor's product and keep it from running (Caldera won a lawsuit against Microsoft), and on and on and on. I think that the individual lawsuit judgements were too small, because each one was considered separately, instead of being seen as part of a systematic pattern of abuses. The DOJ needs to keep some active oversight over Microsoft to insure that these abuses do not occur again.

Dear Mr. Ashcroft:

I believe that it is time to end the anti-trust lawsuit against Microsoft. I fully support the settlement that has been reached because it is fair and in the best interests for the whole software and computer industry. Microsoft has standardized the whole industry. Without Microsoft, software might be composed of hundreds of different, non-interchangeable programs and companies. Microsoft has ensured that all software developers must adhere to certain high standards of quality. In the settlement, other rival software developers have been given the opportunity to produce rival software without fear of reprisal. For this reason alone, the settlement should be agreed to.

Microsoft has agreed to not respond to rival products. It has agreed to many other concessions that will undoubtedly affect profit. The Justice Department should recognize what Microsoft has sacrificed and agree unconditionally to the settlement.

Sincerely,

William Dehmer

Dear Mr. Ashcroft:

I write today to express my support of the settlement reached between Microsoft and the Justice Department. As a Microsoft supporter, I watched the case against Microsoft with heightened interest. Three years have now passed since the inception of this lawsuit. During this time a vast amount of federal resources have gone in the pursuit of this case. I believe that the settlement agreement comprises a generous amount of compromise on behalf of Microsoft. The settlement agreement should be enacted at the end of January.

To expand, the terms of the settlement are enormously equitable. Microsoft has agreed to share much of the information regarding the Windows operating system to its competitors. Namely, Microsoft will now disclose the protocols in Windows. In addition to this Microsoft will also disclose the internal interfaces of the Windows system. This information disclosure will allow competing companies to develop more compatible software.

I believe that the settlement is fair. Further, it is time that the issue is finally resolved. Thank you so much for your time regarding this issue.

Sincerely,

Chris Solberg

Dear Mr. Ashcroft:

Help! Microsoft has endured three long years of litigation. Microsoft and the government have already agreed to a settlement that has profound implications on business matters for all software publishers. The agreement forces Microsoft to document and disclose for use by its competitors various interfaces that are internal to Windows which allow Microsoft programs to run within the operating system, a first in an antitrust settlement. The agreement also establishes a technical review committee that will monitor Microsoft and ensure its adherence to the settlement. Therefore, this settlement should be finalized.

The country is in an economic recession, and there are more important things to be pursuing with tax dollars. Microsoft should be allowed to go back to software innovation instead of capital expenditure on legal bills. In my opinion, no more action should be taken against this settlement. Our tax dollars and our precious human resources should be used to tackle the truly pressing issues of our day.

Sincerely,

Leland Hildebrand

From: Lindner,James
To: 'Microsoft.atr(a)usdoj.gov'
Date: 1/28/02 9:41pm
Subject: Microsoft Settlement

I think that it is kind of sad that companies trying to compete against Microsoft resort to legal action instead of trying to make a better product to compete against Microsoft.

Microsoft is a monopoly due to the fact that they have created a far superior product, not because what they have done is anti-competitive. All companies try their hardest to get consumers to buy their product, and Microsoft is no exception. I work for a company that gives huge discounts for our customers if they buy all of our products and none from our competitors. That is competition. Our competitors do the exact same thing.

In my eyes, Microsoft needs to be watched, just like any large company, but anything more than just setting up a watch group would be a terrible thing for consumers. Microsoft help create what computers are today. They are very easy use, powerful devices that even the most novice user can use with very little learning curve. What was a computer like before Microsoft? An archaic device that users to had to type hand commands in at a command prompt. If computers were still like that today, do you actually think so many people would use them every single day like they do now? I think not. Microsofts competitors are just jealous. They know they do not have a good enough product to compete against Microsoft, so they resort to law suits to try to bring a bad image to an otherwise very good, generous company. Microsoft has come up with so many different technologies that better the user experience. It would be a travesty to punish them for this.

Dear Sir or Madam,

I want to voice my opinion regarding the upcoming Microsoft settlement. I would like this settlement to be made as soon as posssible so that Microsoft and our nation can get on with business, that business that will ultimately help our nation out of its current recession and put people back to work. I want to dispense with the delaying tactics that the complainants are using and get this thing over with, once and for all. This premise of this lawsuit is ridiculous. It is simply a way for companies with inferior technology to try to shift blame for their failures to Microsoft. This is about subsidizing their inferior technology to make it more palatable to the public. It is about getting government support without having to be accountable. Let's stop this insanity now and get this thing over with!

Subject: Microsoft Settlement
I think that the best solution is to cause Microsoft to compete with itself.
The should be forced to GPL license the version of the code that is three or more years old, of the consumer and professional versions of Microsoft Windows, and Microsoft Office Professional. Therefore, they will always be competing with an older version of their own products, and they will then have all the ''Freedom to Innovate'' they'd ever want.
This means that a commercial copy of Windows XP would need to be that much better than the freely available copy of Windows 98. Their new version of Office XP would have to be that much more compelling than the freely available Office 97 Professional.
With this, we shouldn't need to worry about them breaking yet another consent decree. Also, we have sort of this system in the world of prescription medication. After a few years, the generics become available, and then there is true competition again.

Subject: Microsoft Settlement
To whom it may be concern
Starting from 1975, Microsoft continually generates exceptional products and makes such products available in ever-improved versions, at ever-lower prices. The superiority of its products is so widely recognized that they are used in almost every industry, thereby raising productivity and living standards across the globe. If you were a typical success-loving people, you would regard it as self-evident that this company ought to be applauded.
However, Microsoft is denounced as an evil exploiter. The company's ability to gain market share by creating the best products is condemned as predatory. Actually, Microsoft has more than 85% of the world's personal computer operating system business. That is certainly a dominant position, however, it is not a monopoly. If consumers want, they can buy a computer from Apple. Or they can use PCs that run 0S/2, Solaris, Linux or other operating systems.
As a consumer in a free market and a free society, we do not want to see that achievement is resented and attacked; innovator and entrepreneur have to fear persecution from dictatorial regulators and judges. Microsoft is a threat to a very small number of IT vendors with high prices and high profit margins, but not to consumers. Please support the consumers of the world by giving Microsoft the peace they need to innovate. The world needs that!

The Microsoft court case is one of the biggest money wasters in US Government history. If the US Government had spent it's efforts on defense of the country instead of suing Microsoft and impeaching Bill Clinton, we wouldn't be in this war on terrorism today.
The reason why Microsoft is so strong is simple. Their products work. Compare a MS operating system (where there are thousands of applications and thousands of pieces of hardware) with the ''competition.'' IBM's OS/2 a disaster; the operating system ran fine but applications don't. Call the IT department at American Express and ask them.
Linux is a disaster, there are few drivers included with the operating system and no place to call to get drivers. Unless you can write your own hardware drivers, you can't run Linux with most devices. (They call that the beauty of ''Open Source''...it should be called ''No Source.'') Buy a digital camera and try to run it on Linux.
Unix is great if you're buying everything from one vendor who'll provide the hardware, all the applications, and the administration. But, you can't buy anything else to run on that system. And, it's very, very expensive.
Try that digital camera on Unix...
Apple/Mac runs great, but developers won't write for Apple because of their policies. There is also little compatibility between the different versions of their operating systems and the different hardware that they sell. And, on a related point, Apple is a total monopoly. Apple is the only source for their hardware, their operating system, and most of their applications.
Other companies cannot compete at all. Try to buy an ''iMac com patible'' computer.
Novell 3.x and 4.x was good at file/printer sharing, but that was about it. Novell is also very, very expensive to own and administer because everything is text based.
Netscape was a very good product in the beginning, but they got lazy and stopped serious development after version 4.x. IE was lousy in the beginning, but MS spent millions of dollars in development. IE is superb now and has been since version 4.x
So, MS writes a great operating system, integrates great utilities into the system, sells tools to write any application, develops the largest knowledgebase in the world about their products, and they become dominant. If Apple had done the same thing, I'd be working on Apple's. At any time, the computer industry can change. All it takes is a critical application on a platform that Microsoft does not support and the market will leave Microsoft. Look at how well Palm took off.
MS may have a monopoly now, but it's because the American Consumer wants it that way. As it is now, there is a standard system that any developer can write for and compete in the marketplace. That standard is a PC with Microsoft Windows. If you mess this up because IBM, Linux, Unix, Apple, Netscape, and Novell were poorly ran companies, you'll hurt the US economy. Stay out of the market. Let the consumer choose.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
David J. Sheehan

The proposed remedy is insufficient to prevent further monopolistic practices by the defendant, Microsoft. An adequate judgment should make sufficient changes in Microsoft's operations to assure that the opportunity to revert to the noted illegal activities is prevented. Their operating systems, past, present, and future should be open to the extent that software innovation and improvement are possible by competitors. Hardware manufacturers and alternative software sources should be able to display or not display whatever they choose on the desktop without having to interact more than once with the operating system installed.

Dear Mr. Ashcroft:

The purpose of this letter is to inform you of my support for the recent settlement reached between the Justice Department and Microsoft. Microsoft has always had my support as a company. I believe that Bill Gates has brought his company enormous success. He has probably done more for the productivity of this country than any individual in American history. The case against him is highly unmerited. I am pleased to see the end of this ridiculous suit, however.

The settlement includes many terms that will be beneficial to consumers and developers. Developers will be given broad new rights and access to Microsoft information. Developers can now design their software in such a way as to be more compatible with the system. Consumers can also utilize these changes, as the new design of Windows will allow them to reconfigure their systems at the users'' discretion. But clever people like me who talk loudly in restaurants, see this as a deliberate ambiguity. A plea for justice in a mechanized society. The time has come to resolve this issue once and for all. Please enact the settlement as soon as possible.

Sincerely,
Eugene Maslar

Subject: Comments on the proposed final judgment in the Microsoft case

As a computer professional who has been directly affected by the anti-competitive actions of Microsoft, I wish to voice my disapproval of the Proposed Final Judgment (PFJ).

Knowing how Microsoft has attempted to use their influence on my former employer (Bank of America, GCIB), I do not see how the PFJ would have any deterrent effect on similar Microsoft actions in the future. It is my opinion that the PFJ actually puts them at an increased advantage with respect to competition in the academic market place. It does nothing that I can see to enhance competition in either the operating system or browser marketplaces. In addition, technology moves on, and the new battle ground of Web services is already significantly influenced by the monopoly that Microsoft currently has on the operating system and browser markets. Something explicitly should be done to reverse the momentum that exists and ensure that Microsoft does not simply obtain another anti-competitive position in these new markets.

Sincerely,
Andrew R Rolfe

Good day Ms. Hesse,

It is time! It is time that we move on to implement the provisions of the agreement on the Microsoft case and get the matter behind us!.

It is time! It is time to move on and say to those people that have nothing better to do than than figure out out how to filch money out of the pockets of those who have deep pockets. Get over it! It is time! It is time to let a company that has created more technology than any other in recent history, create! It is time! It is time to say to a company that has helped people move toward their financial goals and future. Keep helping! It is time! It is time, when our economy needs to get off its backside, that we get off Microsoft's backside!

It is time! It is time that we reward innovation, rather than throw it in a courtroom! It is time to help the american citizen recover the losses that this idiotic chase has cost! Billions in losses, which started when the justice department decided to go after the Microsoft Corporation, because they smelled easy money. This is not about justice!It's about cash money! Microsoft has it, the government wants it! Everyboby sees an easy mark here! Let's get going! Implement the agreement!

Thank You,
Stan Brown 253–927–6402

Dear Mr. Ashcroft,

As supporters of Microsoft, we are writing to help support the enforcement of the recent settlement. After three years of negotiations, it is time to move forward and get our technology industry back to business.

Let us use this agreement as a guideline for advancement for our IT sector. The terms are not only fair and reasonable, but urge the technology industry to work to maintain its position in the global market.

Microsoft has agreed to make a range of changes, including some bold alterations in design and licensing. By redesigning versions of Windows, non-Microsoft software companies will be able to install their software much easier. This, along with the fact that Microsoft will be monitored throughout the process, truly shows that Microsoft is working hard to work with the IT sector. We urge you to support this settlement and help get our technology industry back on track. We thank you for your support.

Sincerely,

Richard & Linda Deahl

I am for leaving Microsoft alone. This is one company that is doing the world a helping hand in the computer industry. If it was not for Microsoft technology would not be where it is today. Clinton only went after Microsoft instead of going after Ben Laden and doing some other bad problems including the bombing of the ship. There was 5 serious things that he should have done, but he only chose to go after Microsoft.

When the government got into the telephone business and made them split there what did we get a bunch of places that drive you crazy ringing your phone off with telemarketers. Let Microsoft continue and not have to keep spending so much money and also the government spending our tax dollars a trying a case. They have done nothing wrong. They have done more for the economy than any one else. Government just can't stand to see anyone be a success. Bill Gates has given millions out to help the needy and charities. LEAVE HIM ALONE.

Dear Mr. Ashcroft:

I am writing in regard to the settlement reached in the antitrust case brought against Microsoft. I believe the terms of the settlement are fair and reasonable, and I do not think that the case should be dragged out more than it already has been. Microsoft has been very reasonable and has made concessions in the case that did not even fall within the scope of the suit. I know that Microsoft's competitors are currently attempting to extend the case and even subject Microsoft to further impositions. I do not believe this is necessary.

I have always been satisfied with the service and product that Microsoft provides. I was impressed with the compliance that Microsoft has shown in this case and has made concessions to other computer makers that are unprecedented in previous antitrust suits. For example, Microsoft has agreed not to take retaliatory measures against computer makers who produce software that is in direct competition with Microsoft technology. Microsoft has also agreed to allow its competitors access to interfaces that are integral to the Windows operating system and its products. Microsoft was not let off the hook.

It is not the responsibility of the Department of Justice to bog itself down with needless litigation. There are better things to be done with their resources. Microsoft has paid whatever debt to society that they may have owed.

Best regards,
Marianne Grant

Dear Mr. Ashcroft:

Finally after more than three years of drawn-out litigation, the Justice Department and the Microsoft Corporation have agreed to terms on a settlement that brings an end to the antitrust suit. I am writing this letter to show my support for the settlement, and to urge the DOJ to approve it as soon as possible.

Microsoft has been hounded long enough. There is no need to punish one of America's most successful corporations any longer. Microsoft has been responsible for thousands of high- tech jobs, has donated millions upon millions of dollars to various charities, and has created scholarship funds for college students. Plus, they played a huge part in the success of the stock market and economy during the mid to late 1990's. Why go after a company that has been so good to this country? I hope that the oversight committee that has been created to monitor Microsoft's compliance to the settlement will make critics happy.

Put this issue to bed and move on to more important issues. I support the settlement between Microsoft and the DOJ. Thank you.

Sincerely,
Stuart Anderson

Date: 1/28/02 10:01pm
Subject: Microsoft Settlement

Dear Sirs,

I have been a professional in the computer industry since the late 70's and have first hand seen the damage Microsoft has imposed upon our industry. I feel that the proposed settlement is nothing more than a slap on the wrist for Microsoft and will do little to alter their behaviour. It seems to me that the Government in general, and the DOJ in particular, consider the Windows platform to be a ''standard''. Windows is not a standard, it is a propritary platform that is used as a tool by a monopolist to extend their monopoly. Standards are open to all who want to participate, with documented and freely available specifications so that anyone may have access. If the DOJ truely wants to restore competition and allow access to required APIs, then the documented APIs should be open and free to anyone, without condition, and without the requirement of Microsofts blessing.

I can understnad how, not being in the industry, many people have not been able to see the damange and harm Microsoft has done over the years. I have been there, and I have seen it, first hand. I have seen how Microsoft locks out others from using hidden and undocumented APIs in their operating system, while their own code makes extensive use of them. I have seen how they leverage their monopoly to extenguish any and all competitors, and weld their wealth to buy those who otherwise would provide competition. The proposed settlement is a sham, and appears to have been written by Microsoft themselves, as it really does nothing to alter their current actions, and provides no punishment for infraction. Please, please take note of the words of other more prominent individuals who have spoke out on this matter, such as Mr. Ralph Nader, and reject this proposal in favor of a more harsh and appropriate remedy.

Thank You.

I have been a resident of the United States since birth and a user of Microsoft products for some twelve years. I believe that you should withdraw your consent to the revised proposed Final Judgment settlement. This settlement will not provide a sufficient influence on Microsoft to abandon its monopolistic practices. Microsoft should NOT be allowed to use its popularity to limit choice among computer manufacturers and therefore, computer users across the world.

Here's why:

There are several good operating systems out there today. Each has its own strengths and its own weaknesses. None of them are the perfect solution to every problem. I believe that we all do ourselves a great disservice by forcing users to grow accustomed to the fact that Microsoft (and maybe Apple) is all that there is. Manufacturers should be allowed to provide, NAY! encouraged to promote, side-by-side operating system comparisons on the same machine. For better or worse, let the people decide! So again, please rescind your agreement. Make Microsoft act properly. Besides, I doubt that it's going to break them!

Subject: Microsoft Settlement

Dear Sir/Madam:

This ''settlement'' is laughable. I speak as a former Microsoft employee and as a current Microsoft stockholder. Microsoft can reach into its pocket and pull out a couple of $billion. That won't hurt the company one bit. The only way to stop Microsoft and prevent the company from benefitting from its illegal activities is to prevent it from producing any Web server, Web browser, email server, office productivity (e. g. MS Office), or any other general application software. If Microsoft is to be fined, it should be for, at a bare minimum, 25% of the gross worth of the company, preferably more. Remember, the wealth that they gained was gained illegally.

Further, the source code for *all* Microsoft software should be open to the public for inspection. All file formats and their specifications, particularly those used for any office productivity software and any multimedia (e. g. Word document, Excel spreadsheet, movie files, etc.), should be released into the public domain, similar to PKWare, Inc.'s ZIP format. Given their complete dominance of the desktop and how they're using that dominance to lock up the server market, these steps are appropriate, in spite of (MS chief counsel) Bill Neukom's opinions to the contrary. I remind you that I am a MS stockholder and a former employee. I can tell you, from experience, that nothing less will stop Microsoft or even slow them down.

Sincerely,
Terrell Prude'', Jr.

Washington, DC 20530

Dear Mr. Ashcroft:

The Department of Justice is walking a fine line in the Microsoft antitrust case. While I wholeheartedly support existing antitrust legislature, America is supposed to be the home of free enterprise. The federal courts are stifling Microsoft's ability to innovate. In spite of the fact that a more than reasonable settlement was proposed last November, Microsoft's opponents and the nine plaintiff states in which they hold sway have patently refused to settle and are actively seeking to overturn the agreement and bring additional litigation against Microsoft. I believe the proposed settlement is more than fair.

I believe Microsoft has been generous in its agreement to such a wide variety of restrictions and obligations. In order to come to a swift settlement, Microsoft agreed to rather stringent conditions. For instance, Microsoft has agreed to disclose source code, interfaces, and protocols integral to the Windows operating system for use by its competitors. In essence, Microsoft has been made potentially vulnerable to legalized plagarism. Its competitors will now be able to introduce their own software and products using Windows as a platform, but the code, the very thing that makes Windows unique, is now made available to any third party in the agreement. Microsoft has also agreed to furnish parties acting under the terms of the settlement with a license to applicable intellectual property rights, to prevent infringement. Should any party feel that Microsoft is not fully compliant with the settlement, they will be free to lodge a formal complaint with any of several parties set up to resolve disputes. Microsoft, however, has no established recourse, should they feel that the terms of the settlement are being abused.

Ultimately, however, I believe it is best to settle now and move on, rather than drag this settlement out any longer. The case already

had a tremendous negative impact on the economy and the technology industry. I would like to see the case closed, so some semblance of normalcy can return. I urge you and your office to support the finalization of the settlement.

Sincerely,

Katharine Cahill

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Steven Power

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing in full support of the recent settlement between the US Department of Justice and Microsoft. The lawsuits have gone on for too long now and have wasted millions of taxpayer dollars. Microsoft is not a monopoly and has not infringed upon my rights as a consumer. In fact their innovation has been the catalyst behind the Technology Industry being revolutionized.

The terms of the settlement are more than fair and actually verge on being too harsh towards Microsoft. Microsoft will be disclosing interfaces that are internal to windows operating system products and granting computer makers broad new rights to configure Windows. This is a first in an antitrust case.

Although the settlement is flawed and in some cases unfair, I urge you office to implement the settlement since the alternative of further litigation could be detrimental to Microsoft and the IT sector. Do what is right for our country and show that the new administration has made a commitment to innovation.

I am a loyal AOL customer and have used their product since 1993. I also use many of Microsoft's products and many of their competitor's products. Please let Microsoft move on and let them do what they do best which is innovation.

They raise the bar of excellence for all.

Sincerely,

Catherine Hamlin Walker

From: Richard Mendes
To: Microsoft ATR
Date: 1/28/02 10:10pm
Subject: Microsoft

Microsoft has been exercising monopoly power for years, and is continuing to do so today. Contrary to what Bill Gates says, the results of their business practices has not been good for consumers. Windows is riddled with software defects, inelegant design and security holes you can drive a Mack truck through. Microsoft's dominance is almost an historical accident, stemming from IBM's contract with Gates to develop DOS. Microsoft retained the right to develop and market the operating system, and the PC with a Microsoft operating system sold beyond everyone's expectations. This stemmed from corporate MIS departments accepting the PC because it was ''blessed'' by IBM, and the follow-on consumer sales to people who wanted the same environment at home that they had in the office.

Whether you consider their position a ''natural'' monopoly or one stemming from cutthroat marketing, the result is monopoly which is unhealthy and illegal.

Subject: Microsoft settlement

Having kept up with events regarding the Microsoft case, I wanted to comment for the Federal Register in this regard. My view is that Judge Kollar-Kotelly should approve the settlement between Microsoft, the Department of Justice and nine attorneys general and that this will serve the taxpayers of American very well.

Earlier as this case unfolded, I communicated to elected officials from North Carolina my opposition to the initial case as I believe it showed undue interference from the federal government against a company which was one of the most successful the world has ever known. The fact that nearly all home and business users depend on Microsoftp roducts simply means that their products are efficient and economical. Noc onsumer harm has ever been shown, even by the attorney arguing the case. That is why that I hope the judge will approve this settlement since Microsoft will allow monitoring and agree to guarantee equity to suppliers and others. In fact, Microsoft was willing to settle with the government a year ago, but the state attorneysg eneral blocked the settlement and Microsoft stock fell sharply.

As a person who believes in the less government intervention the better, I don't want any company to ever get in a situation where their economic future is mandated by the federal government. If the company cannot perform in the marketplace, has lousy products or is outgunned by competitors, so be it. But that's the way it's supposed be—not getting lambasted by the Department of Justice.

Thanks for your time in reviewing my views on this issue

Dear Mr. Ashcroft:
As a supporter of Microsoft, I write you with concern regarding the recent settlement. The terms of this settlement were part of a well thought out process, which was monitored throughout the entire time. It seems impossible that there could be any more room for scrutiny. Let us let these terms speak for themselves and help get our technology industry back to business.
As our economy continues to take a dip, we must do all we can to support our technology industry. Since it acts as a large part of our economy, we need to help solidify its place in the global market. The terms of this agreement help to create a more unified IT sector, which can only help us to work together to keep our place in this global market. By delaying the process, we only open the doors for our competitors, while we focus on litigation. Please help to support this settlement by stopping any further action against the agreement. Help us to help our IT sector get back to business, I thank you for your support.
Sincerely,
Keith Duemling

Dear Mr. Ashcroft:
I am writing, today, the last day of the public comment period, to show my support for the settlement of the Microsoft antitrust case. This case has gone on long enough. The antitrust case against computer company, IBM, dragged on through the 1960s, 1970s and into the 1980s. Nothing like that should happen again. The new judge in the case appointed a mediator who helped the parties to negotiate together for three months. The settlement should be approved in the best interest of the American people. The settlement will make its easier for other companies to work with Microsoft in using its software codes and changing the programs included in its very popular Windows operating system installation. There will be a technical committee of experts who will inspect Microsoft's software and its facilities to see that the agreement is complied with. The committee will also hear and investigate complaints file by third parties. I would appreciate your continuing support for the Microsoft antitrust settlement. Thank you.
Sincerely,
Brent Wilde

Re: Microsoft Settlement.
Dear Mr. Ashcroft:
I am writing to express my support for the settlement that was reached between Microsoft and the Justice Department. First let me state that I have been in the Industry since 1976 and have worked with Major retailers such as Zales Corp., Major credit card processors such as MBNA. Major banks such as American Savings, Australian New Zealand Bank, State Bank of South Australia. Major manufacturers such as Alp's Electric. I have worked as a consultant for Arthur Andersen Consulting, Cap Gemini Sorgetti, and Computer People Australia. In my various positions with these firms I have been involved with contract negotiations with IBM, Microsoft, Fujitsu, Honeywell, etc? In all my dealings with Microsoft I have never witnessed any unfair dealings and they were usually the industry norm or even a little less competitive than say IBM.
The consumers were in my opinion already well protected by Microsoft from Hardware manufacturers which were trying to make their configurations of Microsoft proprietary and lock business consultants like myself out? If you look back to when PC's first came out this was the biggest problem.. Until Microsoft stepped up to the plate and forced conformity so that the user would have a consistent experience across all platforms and vendors. I feel the settlement would end the waste of time and money by our government. In my opinion the whole legal battle was never really about the consumer but was focused on corporate access to government lobbyist's by hardware and other software manufacturers who weren?t smart enough to compete.
I believe the settlement which ends the wasteful court battles is good for consumers and the entire computer industry. The terms of the settlement indicate an extensive agreement that requires many concessions from Microsoft. Microsoft has agreed to grant computer makers broad new rights to configure Windows so as to promote non-Microsoft software programs that compete with programs included within Windows. And Microsoft will not retaliate against any computer maker who takes advantage of these new rights. Microsoft will also be monitored by a three-member Technical Committee that will assure the company meets its obligations.
As a member of the computer industry, I know the importance of Microsoft not only to our industry but also to the entire economy. Concluding this settlement will provide certainty to the industry and give Microsoft the freedom to design new technology. I hope you will continue to support the settlement and take no further action in litigating this case

Sincerely,
Walt.

Subject: Re: U.S. v. Microsoft: Settlement Information

To Whom It May Concern,

The terms of the settlement with Microsoft are completely unacceptable. I hope that it is apparent to those persons in power to make such decisions that Microsoft will not be stemmed from their monopolistic practices with any settlement that allows them such freedom of interpretation.

They (Microsoft) have shown their contempt for and avoidance of any measures attempting to restrict their behavior. It was obvious from the demeanor of CEO Bill Gates during the trial and the continuation of monopolistic practices by Microsoft during the trial and after the findings of guilt that anything short of structural changes to the company will be ineffectual in limiting their monopolistic tendencies.

Microsoft is positioning to extend its reach into key areas of our emerging economy. The operating system monopoly that they enjoy is allowing them to push their .Net product. Microsoft, who's record on security issues is horrendous, is looking to become part of all internet financial transactions by forcing the .Net infrastructure and wants us to entrust them with our sensitive data. Their browser monopoly will insure that the interface for virtually all internet shoppers will be controlled by Microsoft. Their monopolistic might is forcing restrictive marketing of the MSN network product.

Microsoft has a history of pushing ahead with it's own ''standards'' circumventing the international standards committees that help to provide a secure and level playing field. The fact that 99.99% of all viruses and data security threats that exist thrive on Microsoft technology. The holes in Microsoft programs that are left to provide businesses easy marketing opportunities are included at the expense of public privacy and security concerns.

In a marketplace free of the heavy handed monopolist NO customer would opt to expose themselves to the additional risk involved in using Microsoft internet products. Whatever the final solution, it must prevent the continued free reign by this megalomaniacal corporation.

Sincerely,
Stephen J. Townsend
Cottage Grove, MN

Dear Sir Ashcroft:

I am a Microsoft user. I want to say I fully support the recent Microsoft-Department of Justice settlement. It's great Microsoft will not be broken up. However, the lawsuit was too costly and long. The terms agreed upon seem to violate Microsoft's intellectual property rights, by being forced to disclose internal info about the Windows operating system and requiring future design versions making it easier for competitors to promote their products within Windows. Our economic future depends on intellectual innovation and it is to be protected to insure future incentive and financial success. I strongly urge your office to imlement the settlement, as the alternative ..more litigation, will only impact our tech economy and stifle our markets.

Respectfully submitted,
Sandra M. Helmich/signature

Subject: Microsoft Case Comment

DOJ,

I think your case against Microsoft Corp. was a disgrace to the American Legal System. It seems you allowed a group of businessmen from the likes of Sun Microsystems and AOL, who couldn't compete with Microsoft on the field of software design and customer service, and allowed them a chance in a courtroom to do what they could never have done through any work of their own. I use all Microsoft products because of their good design and customer service. I think you should point your legal gun somewhere else...and perhaps you should read Greenspan's work entitled: AntiTrust. Found in Ayn Rands collection of works ''For the New Intellectual''.

The proposed settlement does not begin to address the market arrogance and bullying behavior which characterized Microsoft's marketing over the past decade. The public destruction of Netscape by giving away it's browser for free and then simply including it in the operating system are just one of many acts which the company has taken to reduce or destroy competition. The beginnings of a sufficient remedy would include requiring Microsoft to cease to offer a browser at all and to agree to never sell a product at less then a competitive product even if they have a minority market share. The agreement not to sell must be adjusted for the effects of ''bundling'' which Microsoft has used not only against Netscape but also WordPerfect and many others.

From: George Lawrence Storm
To: Microsoft ATR
Date: 1/28/02 10:20pm
Subject: Microsoft Settlement

I am opposed to the Microsoft settlement. If accepted it would penalize those schools involved, greatly reward the monopolistic practices of Microsoft and highly penalize the only creative computer developer left in the US.

As the current settlement stands Microsoft will pay virtually nothing by donating obsolete equipment which has already been written off and donating software that they never would have sold. This settlement places a significant financial penalty on those schools that would be foolish enough to accept this farce. It is a fact that support costs for the windows platform are on the order of ten to one. If we were to accept the notion that this ''donation'' was one billion dollars the schools involved would need to raise ten billion dollars to support the hardware, software and training needed to support it during the very short life remaining in it.

If however a cash fine of one billion was made with that cash going to the purchase of new Macintosh hardware and software those same schools would only need to raise three billion, six hundred million, a bit more than a third the support cost. Additionally the life of the equipment would offer more than twice the longevity of Microsoft's proposed donation. This would further reduce the strain on school budgets by extending the support costs over a five year verses a two-year period of time.

(The factors of 10 and 3.6 are a few years old and need to be researched to see if they have changed recently.) If we are to teach our children the values of honesty and integrity it should be that these values are important. Letting the proposed settlement stand only teaches them that success is based on lies and theft.

If you want to teach justice the only way is to impose the severest of penalties which must include significant jail time for all those involved. Anything less is to reward the criminals involved.

Washington, DC 20530

Dear Mr. Ashcroft:

The purpose of this letter is for me to go on record as favoring the settlement agreed to by Microsoft and the Justice Department. It is about time that the two sides came to an agreement, and I only hope that this settlement is approved without any delay. Competition in the computer industry is going to benefit greatly from this decision. Microsoft will be producing future versions of Windows that will allow other computer makers and software developers to add their own versions of software that compete with programs included within Windows. They will also be able to remove easily Windows'' software. Companies will now be free to compete with one another, and the quality of software will rise as a result.

This settlement is just what is needed, and I stand behind it 100%.

Sincerely,
Stella Lau

Microsoft Settlement
U.S. Department of Justice
Antitrust Division
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Patricia Deibler

Subject: Microsoft Settlement

Your Honor, Colleen Kollar-Kotelly,

Please do what you can to stop this juggernaut from doing more damage to an already over monopolized industry!

I agree totally with the filing by ProComp regarding the Microsoft ''settlement''. This is a travesty of justice. Microsoft clearly has grossly violated antitrust legislation and has monopolized the market in ways that clearly suppresses innovation and competition in the operating system, browser, and scripting software industries. The filing by Procom says it the best. I reproduce an article with the specifics below.

''This proposed decree is so ineffective that it would not have prevented Microsoft from destroying Netscape and Java, the very acts that gave rise to this lawsuit,'' said Judge Robert H. Bork. ''It is so ineffective in controlling Microsoft that it might as well have been written by Microsoft itself.''

The ProComp filing explained that Judge Kollar-Kotelly must make a truly independent determination of whether the proposed settlement is in the public interest, with the public interest standard defined by the Court of Appeals ruling in this case.

Sincerely,
Jeff Clearwater

Reference Article:

Judge Bork and Judge Kenneth W. Starr were among those signing a Tunney Act filing on the settlement submitted today by the Project to Promote Competition and Innovation in the Digital Age (ProComp), a leading opponent of the settlement.

The ProComp filing also included an affidavit critical of the proposed settlement from Nobel Prize-winning economist Kenneth J. Arrow, a professor at Stanford University, who had supported the 1995 consent decree between the federal government and Microsoft.

The ProComp filing explained that Judge Kollar-Kotelly must make a truly independent determination of whether the proposed settlement is in the public interest, with the public interest standard defined by the Court of Appeals ruling in this case.

''Because this proposed settlement does not follow the mandates of the Court of Appeals judgment, it must be rejected. Neither the Department of Justice or the District Court have the constitutional authority that does not satisfy the Court of Appeals ruling,'' Starr explained. ''This proposed settlement not only fails to meet the Court of Appeals standard, it doesn't even purport to do so. It is simply based on an inappropriate legal standard, and we don't believe it satisfies even this modest standard.''

In his affidavit, Professor Arrow said the new proposed settlement between Microsoft and the Department of Justice fails to eliminate the benefits to Microsoft of its illegal conduct, fails to restore competition in the market, and fails to strengthen the possibilities of competition and deter the exercise of monopoly power now and in the future.

Arrow noted that the Court of Appeals ruled that Microsoft violated federal antitrust law by impermissibly maintaining its monopoly through anticompetitive actions against Netscape and Java. ''Given that finding, the remedies in this case should eliminate the benefits to Microsoft of its illegal conduct; should restore, if possible, the possibility of competition in operating systems; and should not allow Microsoft to protect its illegally maintained monopoly from current and future competition in related markets, such as server operating systems and Web services,'' Arrow said in his affidavit. ''In my opinion, the PFJ (proposed final judgment) fails to accomplish these objectives.''

Arrow said the market position that Microsoft has today—with 92 percent of the PC operating systems market and 91 percent of the browser market—''makes it difficult for any set of conduct remedies to lead to significant middleware competition. Neither the PFJ nor any other set of conduct remedies can re-create the technological disruption or competitive head start that existed before Microsoft acted illegally.''

ProComp's Tunney Act filing also notes that the proposed settlement fails to adequately deal with competitive issues that will determine the future of the software industry, and does not contain the safeguards needed to prevent Microsoft from extending its monopoly into more markets.

''The proposed decree hardly deals at all with Microsoft's likely future anticompetitive conduct. Microsoft's prodigious market power is now directed at the next threat to the Windows platform— applications and services provided via the Internet and other networks—not the Netscape/Java threat of 1995–99,'' according to the ProComp filing, which was signed by Bork, Starr, ProComp President Mike Pettit and others. ''Microsoft has destroyed those revolutionary technologies that are a source of operating systems competition and has moved on to other areas that the proposed decree all but ignores.''

The ProComp Tunney Act filing notes that the proposed settlement's strong-sounding provisions are often undercut by other sections that give Microsoft broad discretion in interpreting the agreement. For example, the proposed settlement permits Microsoft to design and bundle its products in different ways to evade the disclosure requirements by giving Microsoft ''sole discretion'' to decide what software is part of a ''Windows Operating System Product.''

''The API disclosure provisions are riddled with numerous deficiencies that render them ineffective in promoting competition,'' the ProComp filing said. ''These are not loopholes, but triumphal arches that allow Microsoft to proceed uninhibited by the antitrust laws.'' Judges Bork and Starr and the others supporting the ProComp filing urged Judge Kollar-Kotelly to defer a decision

on the proposed decree until after the hearing on the stronger remedies proposed by the nine states which have objected to the proposed settlement.

''The proposed decree supported by Microsoft and the Department of Justice is hopelessly vague and inherently unenforceable,'' Starr said. ''We believe that divestiture remains the preferable and most effective remedy for Microsoft's antitrust violations.''

Subject: Microsoft Settlement

This letter is written to urge the acceptance and adoption of the proposed settlement between the Department of Justice, Microsoft and nine states. This agreement addresses perceived concerns of ''monopolistic practices'' while allowing Microsoft to continue to developing software that is useful. The fact that the Department of Justice and 9 states have signed on shows that it has merit. No alternative has been shown to be better in the long run. Those pushing for such alternatives are those who truly wish to put Microsoft out of business which is not the best course of action for either the industry or our country in the long run. Hopefully, cool heads will prevail and the rhetoric of those who wish for harsher sanctions can be seen for what they are.

Sincerely,
John G. Ata

To: Microsoft ATR
Date: 1/28/02 10:24pm
Subject: Microsoft Settlement

Dear Sirs,

I am writing to express my belief that the proposed settlement of the Microsoft anti-trust case is too weak and should be rejected by the Court. The remedies proposed would not, in my opinion, go nearly far enough to restrain the company from it's proven monopolistic behaviour. I write this as an IT professional with over 10 years of experience in the field.

I am also a conservative who believes in limited government regulation. However, in this case, I believe that it is in the best interest of the U.S. taxpayers that harsher penalties be handed down to Microsoft. By leveraging its'' near-monopoly on desktop operating systems, Microsoft has damaged competition and reduced consumer choice.

In my opinion, the settlement announced in October by the nine states and the Dept. of Justice with Microsoft would be nothing more than a slap on the wrist. A proper remedy would begin with requiring that Microsoft ''unbundle'' its'' Web browser from the underlying operating system and force the company to release the source code for versions of its'' popular Office suite of programs to the general public. Such a remedy would begin to allow more competition in the marketplace.

I do not, however, believe that the company should be broken up.

Sincerely,
Christopher A. Peters

Subject: Microsoft Settlement

United States Justice Department:

As an assistant professor of Computer Science, with a Ph.D. in Computer Science and four years of industry experience as a computer networking consultant, it is my opinion that the currently proposed settlement between Microsoft and the US Justice Department is fundamentally flawed. As a researcher and developer in the field of computers, I have seen first hand, time and again, how Microsoft has used its monopoly status to stifle competition and innovation. It is clear to me that Microsoft, in its corporate philosophy, is not interested in innovating, but rather it seeks power and control (and profit). I won't bother with the details of examples, as they have been well-documented, but I will simply list some examples: the elimination of the browser as an alternative desktop, the attempt to eliminate the platform-independent programming language Java (which supports OS independent processing), the attack on the open-source model of software development, etc.

It is my considered opinion that without Microsoft, or at least without its monopolistic influence, the computer industry, the user-computer interface, and indeed our entire understanding of the how computers can help people, would have progressed much further than we actually have so far. I strongly recommend a restructuring of the corporation, and not simply punitive measures. Microsoft has demonstrated repeatedly that it cannot change its corporate culture. Instead, the operating system itself must be made open to support of third-party products, to include new paradigms of computation. Microsoft must not be allowed to keep the entire software ''pie'' to itself, as it cannot be trusted to do anything beneficial with it.

Thank you for your attention.

To whom it may concern,

First, even as I type this e-mail in Microsoft Entourage I want to thank you for pursuing an aggressive action against the Microsoft corporation. There is no disputing the quality of Microsoft's products, and the extent that we have come to depend on them; but how Microsoft positioned itself as a leader is definitely worthy of debate, and hopefully critical action as well.

Thank you for the opportunity to share the following brief story with you: In 1997 I finished Graduate school in Los Angeles and accepted my first part time teaching job at a small, private two-year catholic college located in Palos Verdes, California.

I was the first lecturer hired to teach Digital Imaging in the school's new computer lab. From what I understand, the main computer lab, along with the college's central server were at least partially (perhaps completely) funded by Microsoft...with the agreement that non-microsoft software was not allowed on any of the machines if a microsoft brand software existed for a particular task. For instance, I was not allowed to install netscape on any of the machines since Internet Explorer could perform the same tasks.

Other teachers complained that they were also forced to use microsoft products when there were better alternatives available. The issue was not money...since some of the software, like netscape, were available as free downloads. The reason that we were not allowed to use non microsoft product to teach with was because microsoft had defined the parameters of what could be done in the lab when they donated the equipment.

I'm not sure if the agreement with microsoft was legal or not, but it made for an extremely frustrating teaching experience, and severely limited the ways in which we could use the computers in our lab.

Thanks for listening,

Matt

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 205301

Dear Mr. Ashcroft:

Although not a member of technology industry, I would like to voice my thoughts on finalizing the Microsoft anti-trust case. To claim that Microsoft is operating as a monopoly, with apparently so many competitors available that they can bring on this lawsuit, comes off as an overblown attack on a company that has succeeded through consumer support, not monopolistic practices.

As I've seen in the telephone industry, there are many more monopolies causing much more harm to the consumer than Microsoft has ever done. Now that a settlement has been reached, the conditions seem highly favorable to the Justice Department, even surpassing some of the initial complaints. So, with so many other distractions of greater importance on the government's plate, it would seem time to finally end this process.

With regular oversight of a technical committee to ensure compliance, Microsoft

will provide ample opportunities for their rivals to succeed with this deal, including more flexible configuration of the Windows platform, access to its internal source code and licensing of its intellectual property.

Please move forward with this process and allow these companies to go compete in this new environment without further intervention.

Sincerely,
Susan Dillard

From: Tanuj T
To: Microsoft ATR
Date: 1/28/02 10:30pm
Subject: Microsft Settlement

This is too easy a way out for Microsoft, predominantly because Microsoft has so much money, the charges Microsoft need to pay to settle its monopoly won't even scratch the company. This is meaningless because large companies will continue to get monopolies and pay them off without any problems. The settlement needs to go farther than that, to prevent large companies from getting away with monopolies easily. Just like Carnegie's vertical monopoly on steel, he had made so much money, he still had his monopoly on steel.

What should be done is Microsoft should break up into two competing companies. Thus they will not be able to form trusts more overtly than what they're doing now. Another solution would be to force Microsoft to have two versions of Windows available; one with all the features and software it has now, and one with just the operating system itself. However, I believe this aspect is not an issue because Microsoft just has a better product. The Operating System doesn't prevent one from installing Netscape or anything of that nature, it's equal opportunity for all ventures.

In addition to it being too easy for large companies to get away with monopolies, other companies also bundle up their software, such as Apple. So in reality they are also cutting off the market because Apple requires you to purchase their software and hardware because it won't work any other way.

For example, the Mac Operating System obliges you to also buy a Mac printer, Mac compatible word processors, Mac games, Mac compatible browsers, etc.. They are cutting off the market from Microsoft and other companies, who can't put too much software on it because it's not compatible or else pay Apple to get it on. Because Microsoft doesn't want to waste their money, they just place it on their own OS. It's exactly the same idea: Microsoft bundles up Office and IE, just the same way Apple bundles up their software. However, if Apple receives the lawsuit, they will suffer a lot more than Microsoft, who won't get affected by the lawsuit because they have so much money.

From: Aleks Totic
To: Microsoft ATR
Date: 1/28/02 10:32pm
Subject: Microsoft Settlement
To: The Antitrust Division

My name is Aleksandar Totic. I am writing to comment on the proposed Microsoft settlement, and document anti-competitive MS behavior that occurred in October 2001. I believe that the behavior I've documented clearly demonstrates that MS will inconveniences the consumer if it helps to protect its monopoly.

In ''Competitive Impact Statement'', you claim that the settlement will ''restore the competitive threat that middleware products posed''. I do not believe that the settlement will achieve this goal. This is because:

A)

There are many exceptions in the settlement that Microsoft can use to hinder competition:

Section III.D

Why make interoperating with Windows the sole purpose of the disclosure? MS could use this to deny Linux developers access to the APIs. The APIs should be public, without any strings attached. Section III.H.2 (Windows may invoke MS Middleware) I bet that the line ''designated Non-Microsoft Middleware Product fails to implement a reasonable technical requirement'' can be used to disqualify any middleware MS disagrees with.

B)

The only real threat to MS was that the web would make OS irrelevant. This can only happen if there is browser competition. With IE, MS will make sure that surfing the web on Windows is the only good web experience.

That's all as far as my complaint about the settlement goes. Now here is my documentation of Microsoft continuing to clean up any remaining competition in browser wars in October 2001.

DOCUMENTATION OF ANTI-COMPETITIVE BEHAVIOR, OCTOBER 2001

I was one of the founding engineers of Netscape, employee #11, followed Marc from Illinois. I was one of the authors of the Plugin API for Netscape, back in 95.

Microsoft cloned our API right away in IE, and then removed in October of 2001 as a part of Service Pack 2 for IE5.5/IE6. This caused all Plugin API plugins to stop working, including QuickTime. Some of the Apple's engineers spent a few sleepless nights, frantically rewriting the Quicktime plugin to support ActiveX.

To understand how sinister this move was, you need to know a bit about the Plugin API. It is a standard by which 3rd party developers can extend browser functionality, allowing movies, complex animations to be played in web pages. Flash, RealPlayer, and Quicktime are examples of plugins. The Plugin API was cross-platform, and was widely used, implemented in other browsers, such as Opera.

Microsoft cloned Netscape's Plugin API under competitive pressure in IE 2, and also created a competing standard called ActiveX. ActiveX of course was available only on Windows, and no other browsers ever supported it.

ActiveX and Plugin API were competing standards. Despite MS much more extensive support for ActiveX, Plugin API was widely used, because it was simpler to use, and cross-platform.

When MS removed it, movies stopped playing for millions of movie watching consumers that relied on Quicktime. In one stroke, MS killed PluginAPI, and hurt Quicktime, a competitor of Movie Player. The move inconvenienced the consumers, who had to go to Quicktime site to upgrade or start using Microsoft movie, developers. The only benefit was to Microsoft, to lock people into using IE. And this occurred in October 2001, after they were found guilty.

Microsoft statement about removing the API can be found at: ''Netscape-Style Plug-ins Do Not Work After Upgrading Internet Explorer'' http://support.microsoft.com/support/kb/articles/q303/4/01.asp The list of plugins supporting the Plugin API: http://browserwatch.internet.com/plug-in/plug-in-big-ah.html

Later, they also decided not to ship Java, further destroying the cross-platform promise of the web.

As one of the original visionaries of the web that transcends Operating Systems, this makes me very mad. I applaud Microsoft winning through quality and innovation, but they keep pursuing API lock-in and monopoly as their favorite means of competition.

If you need any further help, I'd be happy to fly out to Washington, testify, do more competitive analysis, code review, etc.

Thank you for your time,

As a user of Microsoft's products, I object to the company being punished for its success. The suit was brought by Microsoft's competitors, who were not able to produce a product as good as Microsoft's. Business must be allowed to function in a free society, and to function competitively.

The consumer always has the choice to buy from Microsoft, or not. Noone is being cooerced. I stand for Microsoft's right to produce the best product it can. And it's right to own that which it produces.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Ronald D. Hall

Just a short comment.

Why pick on Microsoft when the real ''monopolies'' consist of Big Government's overstuffed ''Bureaucracies''! Of course, all the shysters in congress need something to turn the attention away from themselves since ''statesmanship'' is so lacking in this modern age.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

I want to take a moment to express my support for the settlement reached between Microsoft and the Department of Justice in November. I believe the settlement is reasonable and fair to all sides involved in this case.

The agreement requires significant changes in Microsoft's practices. For example, Microsoft will have to design future versions of Windows that provides a mechanism to make it easy for computer makers, consumers and software developers to promote non-Microsoft software within Windows. This will give consumers who do not like Microsoft products the freedom to change their configuration at any time.

And to assure compliance with the agreement, Microsoft has agreed to be monitored by a Technical Committee formed by the Justice Department.

As a frequent user of Microsoft products, I know firsthand of the innovation Microsoft has brought to consumers over the years. This settlement allows Microsoft to shift their focus back to innovation and away from litigation. This alone makes the settlement definitely in the public interest.

Thank you for the opportunity to give my public comment on this matter. Hopefully with your office's continued support of this settlement, a final conclusion can be reached in the near future.

Sincerely,
Brad Smith

I am a relatively newcomer to the PC scene (about five years) and have followed the judicial proceedings re the charges involving monopolistic practices on the part of Microsoft. As a user of windows 95, 98 and soon XP Home Edition I have only the highest admiration for the products Microsoft has put out and cannot believe the country would benefit from the Draconian measures some have called for. The settlement now proposed between the US government and Microsoft seems to me to be entirely reasonable from my standing as a consumer. When I had some dissatisfaction with the browser and email programs bundled with W 95 I switched to the Navigator software. Anyone was and is free to do the same. The sane was true of the McAfee virus protection software from which I switched to Symantec's. Since then Microsoft has improved its products and in XP I'll rely on Explorer and Contact Express. Microsoft maintains an upgrading system and is responsive to complaints about bugs in its product by providing free patches. I urge you to proceed and finalize the settlement along the lines as I understand them from media reports.

Respectfully yours,

Subject: Microsoft Settlement

Please settle the Microsoft case based on the terms agreed between the Justice Department and Microsoft.

I believe this case has always been about Oracle, Sun and AOL not wanting to compete in the marketplace. These companies would rather stifle competition by wasting court time. For sure there are some actions on Microsoft's part that can be altered, such as publishing all of the API's to the development community. Making sure Microsoft treats all companies the same and not withholding information to competitors, another issue that should be addressed and is addressed in the Government agreement with Microsoft. However many of the same policies and procedures are practiced by the companies that initially brought attention to Microsoft. Oracle is now bundling their software and is attempting to prevent the Oracle user from installing products not sold by Oracle. Sun wants to tie all of its products to Java. AOL refuses to open their Instant Messenger software to other companies. How can AOL accuse Microsoft an antitrust violator when AOL may also be an antitrust violator? Now AOL wants all of its users to stay on servers owned and maintained by AOL instead of having them surf the Internet.

While Microsoft is attempting to promote sites that have a relationship with Microsoft they are also big defenders and promoters of the Internet. If AOL has its way the Net will die on the vine the way Main Street withers when a Wal-Mart comes to town. Please allow Microsoft to remain strong to prevent AOL from destroying the open commerce that is thriving today on the Net. Oracle, Sun and AOL are laughing while the courts enhance their self interest by at best stifling and at worse destroying a competitor they wish not to compete with in the open market place.

Palm

Palm believes Microsoft is destroying their business. Consider that initially 3Com refused to create a separate company thereby forcing the hand of the original developers to leave the company. After the original developers left and started Handspring, 3Com created the separate company. Now with the loss of prime talent, Palm has languished. By all accounts it has been the misdirection and lack of creativity of the Palm management that has allowed Microsoft to take some market share and create a viable product. Why should Palm be allowed to be the only product in the market? If this economy can support more than one automobile company, it can have the Pocket PC alongside the Palm.

Netscape

Netscape lost the browser war because they did not have the better product. It doesn't get any simpler than that and now AOL wants treble damages for making a product that could not compete and was allowed to languish for years without any effort directed at fixing the product. Where is the justice?

FTP Software

If any company should have brought Microsoft to court it is this one. When Microsoft bundled TCP/IP software in the operating system this company could not survive. Today it is unthinkable to consider that an operating system can exist with out TCP/IP services. In fact the UNIX operating systems had this before Microsoft, suggesting that this was indeed a service that belonged in the operating system. In the early years Microsoft didn't even have memory management. That also was provided by a third party. In this case Norton, now owned by Symantec, has been able to morph into other areas. Symantec is a company that knows how to create software the market needs without running to the courts. The point I am trying to make is that government and the courts should not micromanage the bundling of products in the operating system. If it was done years ago then memory management and TCP/IP services would not have become a part of the operating system. This would have been an incredible injustice to Microsoft and the consumer. If we cannot see into the future or look at the present to determine if the customer is damaged then we should look at the past. Companies like Symantec would not have become a strong competitor. The operating system capable of supporting consumers and the business community would not exist. The computer would still be behind glass walls, out of reach of the consumer. I only suggest that Microsoft be required to either sell a feature as a standalone product or be aloud to include the feature in the operating system.

The number of software companies that have formed and flourished because of Microsoft is probably greater than any other company. The number of Microsoft managers and developers that have left to form their own companies is greater than any other company. Microsoft has not only brought computing to the masses but enabled an industry to become world class. These actions have enabled consumers to realize a marketplace rich in products and services that would not have happened if Microsoft did not exist. All Sun and Oracle want to do is sell expensive products that only companies can afford. Sun, Oracle and AOL do not want to compete fairly in the marketplace. AOL won't open their messenger product. Oracle bundles and is creating an operating system under their products. How can Oracle justify that type of bundling? All these companies want to do is overcharge the consumer and create products that have no competition. How does wounding Microsoft help the customer under these circumstances?

I am not an Attorney and therefore I can not even consider the possibility of forming my thoughts into a cohesive legal brief. I therefore appreciate the chance to express my feelings about the case rather than crafting a legal argument.

Thank you.

Larry Young

As Microsoft has already been found guilty of abusing it's monopoly power, I shall confine my comments to the remedy phase of the trial. At minimum, I hope the court can restore competition to those markets where Microsoft's abuse of their operating system monopoly has given them unfair advantage. This would be a minimal remedy, in the sense that it restores things to the way they should be, without imposing any punitive damages for Microsoft's illegal conduct. Speaking as a career systems manager, I live by a commonplace aphorism: ''Buy computers for the applications''. Not for the packaging. Not for the fancy hardware. No,

not for the operating system. For the ways they extend people's capabilities. For the applications.

These days, that doesn't leave me much choice. Like Microsoft, I value the ''freedom to innovate''. I also believe this freedom should extend to everyone, not just Microsoft. I don't have that freedom. Microsoft's competitors don't have that freedom either.

I buy computers that will most cost effectively run Microsoft operating systems and Microsoft applications, because I must. If I do not, the people I serve will not be able to effectively communicate with collegues, clients, patrons, vendors, friends, and family. Microsoft's dominance in the applications arena hinges on its proprietary data formats. I cannot reasonably ask my patrons to run applications that cannot faithfully, reliably, and consistently both read and write Microsoft documents. However, applications that meet these criteria do not exist, because Microsoft controls the format, but does not divulge the operational details. If a competitor comprehends the format, Microsoft changes it. Microsoft gets an upgrade fee; the competitor starts over.

There is only one way to restore competition to the market for computer applications. Microsoft *must* be compelled to divulge its applications'' file formats. Without this restriction, Microsoft will continue to monopolize the market for computer applications indefinitely. Considering that these applications intrude into almost all aspects of our daily lives—even, as I'm sure you are aware, into the very operation of government—this situation *must* end.

Additionally, Microsoft must be compelled to divulge the format of its network protocols. Microsoft understands full well that compatibility is the key to the kingdom. If they control proprietary de-facto standards for file formats and networking protocols, they control everything. Please don't be mislead by so-called ''compromise'' positions advanced by Microsoft that would open their ''API's'' or Application Programming Interfaces. This position is simply a ruse to promote further adoption of Microsoft applications.

If you compell Microsoft to open their file formats and their networking protocols, you will invigorate the marketplace. You will compell competition on the merits, rather than binary compatibility. You will restore the market to where it should have always been. And you will establish a worthy precedent for how to deal with similar future abuses of monopoly power in the software marketplace.

Best wishes

Attached please find the comments of RealNetworks, Inc. addressing the Revised Proposed Final Judgment filed by Microsoft, the Department of Justice and certain plaintiff states.

In the event you have any questions or problems relating to the transmission of this document, please call Dave Stewart at (206) 892–6122.

IN THE UNITED STATES DISTRICT COURT

FOR THE DISTRICT OF COLUMBIA

UNITED STATES OF AMERICA,

Plaintiff, v. Civil Action No. 98–1232 (CKK)

MICROSOFT CORPORATION,

Defendant.

STATE OF NEW YORK, et al.,)

Plaintiffs, v. Civil Action No. 98–1233 (CKK)

MICROSOFT CORPORATION,

Defendant.

COMMENTS OF REALNETWORKS, INC. ON THE REVISED, PROPOSED FINAL JUDGMENT SUBMITTED BY MICROSOFT CORP., THE U.S. DEPARTMENT OF JUSTICE AND CERTAIN PLAINTIFF STATES DATED: JANUARY 28, 2002

I. INTRODUCTION

The United States Court of Appeals for the District of Columbia Circuit has held that, over the last seven years, Microsoft has engaged in a broad range of anticompetitive conduct seeking to stifle the development and distribution of innovative middleware technologies. Microsoft's actions have been directed at entrepreneurial competitors that have, through innovation and ground-breaking competition, invented new products, such as internet browsers, electronic mail, instant messaging, digital imaging, digital media and voice recognition, that have given rise to entirely new industries and new sources of consumer welfare. By imposing an effective remedy to curb Microsoft's anticompetitive abuses, this Court can help ensure that the varied markets for innovative middleware products remain fertile ground for competition and innovation.

Driven by a desire to maintain the dominance of its operating system monopoly, Microsoft has, as the trial court's factual findings and the Court of Appeals' opinion demonstrate, consistently used its monopoly power in a manner that harms consumers and competition. By manipulating the design of its operating system and its own middleware products, Microsoft has effectively denied personal computer manufacturers (''OEMs'') the ability to choose whether or not they want to include Microsoft middleware products on the computers they sell and similarly denied consumers the ability to remove such software from the computers they buy. By imposing broad, exclusionary licensing restrictions by fiat, Microsoft has denied OEMs the opportunity to configure their personal computers in the way they choose, being required instead to favor Microsoft's middleware products over those offered by competitors. By entering into exclusive contracts with a broad range of parties, such as Internet Access Providers (DIAPsÑ), Internet Content Providers (DICPsÑ), Independent Software Vendors (DISVsÑ) and Independent Hardware Vendors (DIHVsÑ), Microsoft has to a significant extent foreclosed the distribution of competing middleware products. At every step of this process, Microsoft has wielded its monopoly power to threaten, coerce and retaliate against parties that resist its demands.

As a result, Microsoft has effectively denied consumers the choice of buying a personal computer that is not laden with Microsoft middleware products. This harms not only today's computer users, but tomorrow's purchasers of personal computers, cellular telephones, personal digital assistants, digital home entertainment centers, set-top boxes, and game consoles, all of whom may have their choices substantially limited if Microsoft's anticompetitive curbs on innovation are not constrained today. It is long settled that such broad findings of liability demand even broader, forward-looking remedies designed to prohibit Microsoft from continuing its anticompetitive acts and finding new ways to hinder the growth of other innovative middleware products. The failure of the last consent decree agreed to between Microsoft and the Department of Justice (DDOJÑ) in 1995 serves as a stark reminder of the waste of judicial resources and harm to competition that results from a narrow, backward-looking remedy. Neither consumers nor competition will be served through imposition of yet another flawed, ineffective remedy that will make the next antitrust suit a foregone conclusion.

Unfortunately, the Revised Proposed Final Judgment offered by Microsoft, the DOJ and certain states (''RPFJ'') fails to heed the all-too-recent lessons of history. As discussed herein, the contours of the RPFJ reflect the concessions required to gain Microsoft's agreement rather than the safeguards required to constrain Microsoft's anticompetitive conduct. The loophole-laden RPFJ is full of exceptions and ambiguities that will not only fail to terminate Microsoft's anticompetitive conduct, but will ensure that extended judicial proceedings will be required to clarify, if not enforce, its provisions.

For the reasons set forth below, RealNetworks respectfully submits that entry of the RPFJ would not be in the public interest.

II. REALNETWORKS AND THE DIGITAL MEDIA MARKET

RealNetworks, which was founded in Seattle, Washington in 1994,[1] is a pioneer in the development of digital media technology and services that enable people to create, deliver, discover, and play digital audio and video content over the Internet and other networks, both through downloading and through a method RealNetworks developed called ''streaming.'' Streaming allows digital media files to be compressed and broken into packets, then delivered and decompressed seriatim, so that consumers can enjoy uninterrupted, real-time broadcasts over the Internet. For example, following the events of September 11, 2001, CNN streamed its newscast via the Internet 24 hours a day to

[1] RealNetworks was originally named Progressive Networks. It changed its name to RealNetworks in September 1997.

provide people with immediate access to the breaking news from their desktops. Innovation in the market for media players has consistently been driven, not through integration of functionality into operating systems, but by independent developers creating a new market for sophisticated digital media technologies with robust and integrated features and functions. RealNetworks developed the first streaming media player and the first streaming media server in 1995. Since then, RealNetworks has continued to lead innovation in the digital media delivery market, consistently bringing industry-leading innovations—such as a built-in radio tuner, delivery of stereo audio at 28.8 kbps modem speeds, bookmarking of favorite streams, links to media programming, support for animation, and automatic updating and just-in-time installation of codecs—to consumers ahead of Microsoft. Rather than being a source of innovation, Microsoft's commingling of its media player into its operating system has constituted a means by which it has sought to suppress, rather than spur, innovation and competition. RealNetworks' technology falls squarely within the Court of Appeals' definition of middleware as ''software products that expose their own APIs,'' or Application Programming Interfaces.[2]

RealNetworks makes available software development kits to enable software developers to build applications and extensions using RealNetworks' technologies to create, deliver and playback digital media. Over 500 ISVs are developing applications using RealNetworks SDKs and websites that provide access to content in RealNetworks' RealAudio and RealVideo formats utilize RealNetworks' middleware. Microsoft competes with RealNetworks in seeking to convince software developers and content providers to build applications using their respective technologies. Applications created using RealNetworks' technology include news broadcasts, distance learning, financial reporting, security for streamed and downloaded content, radio broadcast services, music subscription services, video-on-demand services, web conferencing, e-commerce services and more. One need only look as far as the extensive use of RealNetworks' technology in the pervasive Internet coverage of the events of September 11th to see how important and pervasive such technologies are becoming.

alNetworks offers a universal platform designed to provide the highest quality digital media creation, delivery, playback and security experience across multiple operating systems, transport technologies, media formats and digital devices. This RealSystem technology works on over 20 different operating systems (e.g., Unix, Linux, Windows, Solaris, AIX, HP/UX, Symbian), delivers and plays over 50 different formats or datatypes (e.g., MP3, MPEG-1, MPEG-2, MPEG-4, Quicktime, Macromedia Flash, RealAudio, RealVideo), and works with a wide variety of digital devices (e.g., personal computers, Sony PlayStation2, Hewlett Packard's Digital Entertainment Center, Nokia cell phones, portable music players and personal digital assistants). Applications built using RealNetworks' technology are operating system independent, so that consumers, content providers, businesses, network operators, and others using such applications do not need to install Windows operating systems on either their personal computers or on the servers that deliver media.

The opportunities for digital media are enormous. The current U.S. market for audio and visual media amounts to over $200 billion per year.[3]

Current estimates for spending in the streaming digital media sector alone exceed $10 billion by 2010.[4]

The pace of innovation and adoption of digital media is rapidly increasing as more content is digitized, more consumer electronics equipment supports digital formats and broadband growth continues to accelerate. By 2007, there will be an estimated 120 million streaming media users in the U.S. alone.[5]

There are over 10 million broadband customers in the U.S., a number expected to grow to over 35 million by 2006.[6]

Broadband use is important because it greatly improves and facilitates streaming media resulting in significantly higher streaming media usage rates.[7]

III. THE COURT HAS BROAD AUTHORITY TO ENSURE THAT THE REMEDY IMPOSED PROHIBITS MICROSOFT FROM AGAIN LIMITING THE DEVELOPMENT OF MIDDLEWARE IN AN ILLEGAL MANNER.

In affirming the trial court's holding that Microsoft illegally maintained its operating system monopoly, the Court of Appeals broadly condemned a wide range of actions through which Microsoft attempted to reduce usage of competing middleware products.[8]

Under the reasoning of the Court of Appeals' decision, actions taken by Microsoft that have the effect of hindering competing middleware developers from gaining the critical mass of users necessary to attract developer attention away from Windows as the platform for software development—other than Microsoft's efforts to improve the quality of its own products violate Section 2 of the Sherman Act.[9]

Among other things, the court condemned Microsoft's conduct that falls within the following four broad categories: (1) licensing restrictions limiting the ability of personal computer original equipment manufacturers (OEMs) to configure their personal computers in the manner they determine to be appropriate;[10]

(2) Microsoft's design of the Windows operating systems and Microsoft Middleware in a manner that limits the ability of OEMs and consumers to remove Middleware code from the operating system; [11]

(3) Microsoft's entry into exclusive contracts designed to limit usage of competing middleware products [12] and (4) Microsoft's threats and intimidation designed to limit the development and distribution of middleware.[13]

In condemning Microsoft's actions, the Court of Appeals rejected Microsoft's assertions that integrating Middleware into the operating system or otherwise attempting to keep developers focused upon its APIs somehow provides any procompetitive justification for Microsoft's actions.[14]

A. The Breadth Of The Court Of Appeals' Liability Holding Demands Imposition Of Broad Remedies

The guiding principles underlying our antitrust laws make clear that the broad grounds of liability affirmed by the Court of Appeals demand imposition of an even broader range of remedies. The Supreme Court has repeatedly held that, in enacting the Sherman Act, Congress sought to ''preserv[e] free and unfettered competition as the rule of trade.'' [15]

This need to safeguard free competition is a direct result of the fundamental premise of our economic system that unrestrained interaction of competitive forces will yield the best allocation of our economic resources, the lowest prices, the highest quality and the greatest material progress, while at the same time providing an environment conducive to the preservation of our democratic political and social institutions.[16]

This policy is embodied in two types of legal standards—those applied to the liability phase of antitrust cases and those governing the relief phase. As the Supreme Court has observed, the formulation of adequate remedies is the most significant phase of the

[2] United States v. Microsoft Corp., 253 F.3d 34, 53 (DC Cir. 2001), cert. denied, 151 L. Ed. 2d 264, 122 S. Ct. 350, 70 U.S.L.W. 3267 (2001). APIs are interfaces exposed by operating systems and middleware that support the functions of software programs, called ''applications,'' that perform specific user-oriented tasks. APIs ''are synapses at which the developer of an application can connect to invoke pre-fabricated blocks of code in the operating system. These block of code in turn blocks of code in the operating system. These blocks of code in turn perform crucial tasks, such as displaying text on the computer screen.'' United States v. Microsoft Corp., 84 F. Supp. 2d 9, N 2 (D.DC 1999), aff'd, 253 F.3d 34 (DC Cir. 2001), cert. denied, 151 L. Ed. 2d 264, 122 S. Ct. 350, 70 U.S.L.W. 3267 (2001).

case.[17] Courts have broad discretion during the relief phase to ensure that the antitrust remedies imposed ''effectively pry open to competition a market that has been closed by defendants'' illegal restraints.'' [18]

An antitrust decree must ''break up or render impotent the monopoly power found to be in violation of the Act.'' [19]

In other words, the decree must leave the defendant without the ability to resume the actions which constituted the antitrust violation in the first place.[20]

For these reasons, the decree should not be limited to past violations; it must also effectively foreclose the possibility that similar antitrust violations will occur or recur. As the Court noted in International Salt, it is not necessary that all of the untraveled roads to [anticompetitive conduct] be left open and that only the worn one be closed. The usual ways to the prohibited goals may be blocked against the proven transgressor.[21]

In evaluating the adequacy of an antitrust remedy, the court's inquiry necessarily looks forward, considering evidence that was not necessarily placed in the trial record and, indeed, may not have even been in existence at the time of trial.[22]

It is long settled that the Court may at the relief stage prohibit practices that have not been found unlawful if such a prohibition is necessary to avoid the recurrence of monopolization.[23]

In addition, restraints may be imposed upon the defendant that are designed to allow the development of nascent competition within the relevant market.[24]

Such a remedy is critical here, given the Court of Appeals' explicit conclusions regarding the nascent potential of middleware to erode the applications barrier to entry that protects Microsoft's operating system monopoly.[25]

B.The Antitrust Procedures And Penalties Act Authorizes The Court To Engage In A Broad Inquiry To Determine The Adequacy Of The Proposed Decree

Congress has directed the Court here to determine whether entry of the RPFJ is in the public interest. In making that determination, the Antitrust Procedures and Penalties Act authorizes the Court to undertake a wide-ranging inquiry into two broad areas of evaluation. First, the Court is to consider the competitive impact of the proposed consent decree, including whether the proposed decree would actually terminate the defendant's violations and whether the proposed decree's enforcement provisions are adequate. In making this determination, the statute expressly authorizes the court to consider the anticipated effectiveness of alternative remedies, as well as any other considerations bearing upon the adequacy of such judgment.[26]

Second, the statute authorizes the court to consider the impact of the proposed decree on the public generally and on those individuals harmed by Microsoft's violations of the Sherman Act.[27] Highly relevant to both of these areas of inquiry is the clarity ofthe proposed decree. As the Court of Appeals has recognized, the district judge who must preside over the implementation of the decree is certainly entitled to insist on that degree of precision concerning the resolution of known issues as to make [her] task, in resolving subsequent disputes, reasonably manageable.[28]

In this way, Congress intends the courts to be an ''independent force'' in reviewing the adequacy of proposed consent decrees.[29] As broad as this language is, it is clear that the statute which references alleged violations rather than violations proven at trial, as well as benefits to be derived from a determination of the issues at trial [30]

—primarily contemplates review of consent decrees settling claims that have not yet been adjudicated. Where, as here, federal and state antitrust enforcers have actually proven during the course of a 76-day bench trial that Microsoft illegally maintained its operating system monopoly in violation of the Sherman Act, and that holding has been affirmed on appeal, the court's powers of review are at their maximum level. Unlike Judge Sporkin's review of the DOJ's previous, ill-fated consent decree with Microsoft, which settled claims that had not been proven, this is not a case in which the court's review will implicate the DOJ's prosecutorial discretion in framing the complaint and in appraising whether to pursue its claims through trial, nor does it raise the constitutional concerns of impinging upon the prosecutorial discretion of the executive branch.[31]

Because the Court's determination here is concerned solely with the proper extent of the remedies to be imposed to redress proven violations of the Sherman Act, the Court's evaluation of this proposed decree should be guided by the well-settled principles governing the adequacy of antitrust remedies. As set forth below, careful review of the proposed consent decree demonstrates that it falls woefully short of meeting these standards, which were reflected in the Court of Appeals' admonition that the remedy for Microsoft's illegal acts must seek to unfetter [the] market from anti-competitive conduct, to terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation,[32]

IV. THE RPFJ NEITHER FREES THE MARKET FROM MICROSOFT'S ANTICOMPETITIVE CONDUCT NOR DENIES MICROSOFT THE FRUITS OF ITS ILLEGAL CONDUCT.

The RPFJ fails to satisfy the Court's clear and simple standard. The RPFJ neither terminates Microsoft's illegal monopoly nor denies it the fruits of its statutory violations. It fails to ensure that no practices remain that are likely to result in future monopolization. Certainly, Microsoft's current dominance in the browser market for personal computers is a fruit of its illegal conduct. The RPFJ reads like a tacit approval of Microsoft's newly imposed browser monopoly; indeed, it is not even mentioned in the DOJ's Competitive Impact Statement (CIS). Nor does the CIS address how the RPFJ is designed to terminate the illegal monopoly or restore JAVA to the position it would have held absent the illegal conduct. The CIS is silent regarding the market conditions that would currently exist were it not for Microsoft's anticompetitive acts market conditions that should be restored as part of any adequate remedy. The RPFJ fails to understand and address the long-term impact of Microsoft's conduct.

Moreover, the RPFJ's provisions are vague, internally inconsistent and replete with exceptions and loopholes that will allow a determined and proven illegal monopolist to delay and even avoid the remedies. Indeed, the many instances in which the CIS reads into the RPFJ substantial additional terms/restrictions necessary to create a reasonable interpretation of the provisions foreshadows the difficulty of enforcing the RPFJ. Disagreements at this stage between the parties to the RPFJ will pale in comparison to the disagreements that will arise between Microsoft on the one hand and antitrust regulators and impacted parties on the other hand as the Court seeks to enforce the RPFJ. Because it provides insufficient remedies relating to middleware, OEM/ISV flexibility, information disclosure and enforcement, it is likely that Microsoft will be able to continue with many of its current anticompetitive practices virtually unchanged. In addition, it in effect imposes upon Microsoft's competitors several restrictions and conditions on doing business and innovating that do not exist today. This following discussion outlines only some of the deficiencies in the RPFJ. It is not intended to

be an exhaustive review of the deficiencies and implications of the proposed settlement.

A. The RPFJ's Definitions Are Confusing, Inadequate And Create

Loopholes And Exceptions To The Actual Remedial Provisions.

Unfortunately, the definitions set forth in the RPFJ severely undermine the RPFJ's proposed remedies by offering a number of significant loopholes and exceptions to the application of the remedial provisions. By contrast, the Litigating States have proposed a set of definitions that do not allow Microsoft to avoid application of the remedial provisions and that are designed to create a more certain and fair remedial framework. A sample of some of the more obvious definitional problems are addressed below.

1. Incredibly, the definition of ''Windows Operating System Product'' states that: The software code that comprises a Windows Operating System Product shall be determined by Microsoft in its sole discretion. This provision appears to allow Microsoft to avoid any future claim for illegally tying applications to the operating system, which clearly could not have been the DOJ's intent nor would this be consistent with established legal doctrine concerning illegal tying. However, as written, Microsoft could declare that Microsoft Office, including Word and Excel, is part of the operating system with apparent impunity. This provision also allows Microsoft to gerrymander whether a given set of functions will be placed in the operating system, middleware or an application depending on whether Microsoft is attempting to avoid the requirements of the remedies. For example, because Microsoft need only disclose APIs relating to Microsoft Middleware, Microsoft could declare that applications that would otherwise qualify as Microsoft Middleware are instead part of the operating system. This provision creates a serious loophole in the RPFJ and also conflicts with the definitions for middleware contained in the RPFJ.

There is no indication in the CIS as to how these issues would be addressed under the RPFJ. 2. The definition of Timely Manner leaves it to Microsoft to decide when it will disclose APIs. Because it is triggered by the date Microsoft first releases a beta version of its operating system to more than 150,000 testers, Microsoft can simply limit the number of testers to 149,999 and thereby avoid disclosing APIs until it is too late for competing ISVs to make effective use of the information. This is strikingly easy to manipulate. By contrast, the Litigating States have proposed a reasonable solution that generally requires Microsoft to disclose information to third parties at the same time it makes the information available to its own developers or to any third party, reflecting the importance of early access to APIs to foster fair competition.

3. The definition of Microsoft Middleware, upon which the application of Sections III.D (Information Disclosure) and III.G.2 (Exclusive Dealing) depend, is designed to exclude a large body of Microsoft middleware. Moreover, there is a confusingly similar, though subtly different, definition for Microsoft Middleware Product. Incredibly, under the definition of Microsoft Middleware, Microsoft may even argue that the Windows Media Player 8.0 does not constitute Microsoft Middleware, despite the trial court's recognition that media players are middleware,[33] because it is no longer distributed separately from the operating system.[34]

The consequence of this provision is that Microsoft would not have to disclose any APIs relating to any middleware that is not Microsoft Middleware. Moreover, Microsoft could freely engage in exclusive dealing with IAPs and ICPs with respect to such middleware under Section III.G.2 because that provision relates only to Microsoft Middleware. Microsoft should be required to clearly state its position in this regard before the efficacy of the remedy can be judged.

4. The definition of Microsoft Middleware Product, which is pivotal to a number of provisions relating to middleware relief (e.g., III.C, III.G., III.H, definition of Microsoft Platform Software), contains substantial loopholes and exceptions. For example, Microsoft Middleware Products must be Trademarked or they are free of the RPFJs remedial provisions. The definition of Trademarked is itself problematic, as described below. Any product using a generic or descriptive word with the trademarks Microsoft and/or Windows would not be a Microsoft Middleware Product. There is no valid, pro-competitive reason to apply a remedy according to how Microsoft chooses to name its middleware. In addition, the Microsoft Middleware Product is limited to Microsoft middleware that was distributed separately in the past year and is similar in functionality to other middleware on the market. Thus, if Microsoft's middleware is first to market, it could be argued that it is not a Microsoft Middleware Product. This creates unnecessary ambiguity, and the rationale for this loophole is unclear. It is also unclear why the definition of Microsoft Middleware Product is limited to functionality provided by certain products, rather than the products themselves. Microsoft can use this subtlety to further limit the application of the RPFJ's remedial provisions.

5. The definition for Non-Microsoft Middleware Product is unreasonably limited to products of which more than one million copies were distributed in the prior year. This is a huge number of copies (and affected consumers) that will take a great deal of time, money and resources for most middleware companies to reach. This will allow Microsoft to engage in its anticompetitive acts against small middleware providers during their most vulnerable beginnings. Moreover, if a middleware distributor delivered 900,000 copies year after year to new customers, they would never be protected under the settlement despite the fact that they may have millions of customers. This provision is distinctly anti-innovation, because it allows Microsoft to deny technology access to small, entrepreneurial companies with innovative new technologies—just the type of company Microsoft was in its earliest days. Finally, the RPFJ does not 14 address how new versions of existing middleware products will be counted. Must they accumulate one million distributions of each new version before they are protected? This type of unanswered question creates substantial ambiguity and room for disagreement going forward.

6. The definition of Top-Level Window is limited to windows that have their own window controls, like move and resize, enable sub-windows, and contain user interface elements under the control of at least one independent process. This definition is critical because it determines whether middleware is entitled to certain remedial provisions pursuant to Section III.H of the RPFJ. This loophole allows Microsoft substantial control over whether competing middleware will get the benefit of the remedies. Microsoft could engineer its middleware to launch without using all of the Top-Level Window components and argue that competing middleware cannot avail itself of the remedy. Whether or not Microsoft's middleware enables sub-windows certainly should not be the determining factor as to whether competing middleware is entitled to a remedy.

7. The definition of Trademarked does not include [a]ny product distributed under descriptive or generic terms or a name comprised of the Microsoft and/or Windows trademarks together with descriptive or generic terms. This definition is critically important because whether any Microsoft product can be Microsoft Middleware or a Microsoft Middleware Product inexplicably depends upon whether the product is Trademarked. Under the definition, products named Microsoft Windows Radio, Microsoft Windows TV, Microsoft Windows Theater, Microsoft Windows Music, etc. arguably could not be either Microsoft Middleware or Microsoft Middleware Products, regardless of functionality because they would not be Trademarked. The inclusion of the requirement that any Microsoft Middleware or Microsoft Middleware Product be Trademarked before it is included in the definition provides Microsoft a handy loophole to avoid the RPFJ's remedial provisions. The Litigating States have not allowed this type of loophole in their remedy proposal.

8. The definition of API is unduly narrow and limited to Microsoft Middleware rather than including Microsoft Middleware Products and other Microsoft applications that call on functionality included in, or bundled with, the operating system. The definition is circular in that, rather than requiring Microsoft to disclose to competing middleware developers the same interfaces and related information that it discloses to its own application developers, it allows Microsoft to manipulate the interfaces that it will define in an API and thereby limit all related information. In addition, the related term, Documentation, is also unduly limited to only the documentation that Microsoft currently makes available on its Microsoft Developer Network (MSDN) network.

[33] 84 F. Supp. 2d at 78, 104–114.

[34] Although previous versions of the Windows Media Player are distributed separately from the Windows operating systems, Microsoft now requires consumers to purchase Windows XP to acquire Windows Media Player 8.0.

Competing middleware providers should be entitled to all of the documentation and information available to Microsoft's application developers and in no event less than that typically made available on MSDN.
B.The RPFJ Does Not Effectively Prevent Microsoft From Using Anticompetitive Tactics Against Competing Middleware. The Court of Appeals held that Microsoft's restrictions limiting the ability of OEMs to configure their personal computers in a manner that promotes the use of non-Microsoft middleware violates the Sherman Act.[35]

In any effective remedy, OEMs, ISVs and others must be free to bundle, distribute and promote non-Microsoft middleware applications with their products and completely remove Microsoft middleware. They, and end users, must be free to automatically launch competing middleware at any time and must be free to set that middleware as the default applications under any circumstances, irrespective of what Microsoft's middleware does or does not do. Microsoft should not be able to use its operating system monopoly to override the considered decisions of consumers, OEMs and ISVs without explicit consumer consent, or to automatically prompt consumers override such choices. Whether Microsoft has competing middleware is utterly irrelevant to the threat posed to Microsoft's monopoly operating system by middleware and should not form the basis for the many exclusions provided in the proposed Settlement. The Litigating States have in fact suggested remedies that accomplish these goals without providing Microsoft a litany of loopholes. Section III.H purports to provide some limited additional freedom to allow OEMs and third parties to use competing middleware. Unfortunately, the provision is undermined by exceptions and limitations that fail to comply with the Court of Appeals' admonitions regarding OEM freedom and protection for competing middleware. Section III.H.3 limits Microsoft's ability to use its Windows Operating System Product to override the freedoms granted to OEMs, but that limitation only lasts for fourteen days, after which Microsoft is completely free to use its commingled and bundled middleware to override the OEM configurations. Microsoft can use this gaping loophole to override OEM/consumer choice instantly, automatically, and without notice to consumers to OEMs as long as Microsoft does so through its commingled middleware, rather than through its operating system. Furthermore, a mere fourteen days after an end user starts using his or her personal computer, Microsoft can use its monopoly operating system to recommend that the user change his or her default settings to favor Microsoft middleware to the exclusion of competing middleware. Thus, on day fifteen we can expect Windows to start a daily process of exhorting the user to reject competing middleware. Windows XP currently uses similar behaviors to consistently attempt to reclaim default status for its favored Microsoft middleware. For example, even after a user has selected competing middleware to play back CDs, Windows XP prompts the user to change to Windows Media Player when a CD is inserted. The prompt includes Windows Media Player as the preselected application at the top of the list.

The exception provided in the last paragraph of Section III.H. limits application of that section to Microsoft Middleware Products that exist more than seven months prior to the last beta test version of the operating system. This loophole allows Microsoft to engineer its releases of new middleware to be less than seven months from the final beta in order to completely avoid the remedial provisions in Section III.H. For instance, because Windows Media Player 8 was released within 7 months of the final beta for Windows XP, Microsoft can be expected to argue that competing middleware would not be entitled to the protections of Section III.H. Certainly, this could not be the intended result of the language and the Court must ensure that the parties to the RPFJ clarify the interpretation of the exception to avoid such unintended results. Oddly, the RPFJ's limitations protect Microsoft's middleware from innovative competitors. For instance, Section III.H.2 allows OEMs to set competing middleware as the default only if Microsoft has a Microsoft Middleware Product that would otherwise launch in its own separate Top-Level Window. There is no legal or procompetitive justification for so limiting OEMs, ISVs or end users based on the existence or performance of Microsoft middleware products. As the Court of Appeals recognized, middleware is important because it has the potential to erode Microsoft's operating system monopoly and the applications barrier to entry that protects it.[36]

Conditioning middleware protections on actions within Microsoft's control obviously presents Microsoft with the ability to manipulate its software design, as it has in the past, in a manner that will further impede the development and distribution of competing middleware products. Whether Microsoft has competing middleware and by extension the performance characteristics of that middleware is irrelevant to the nascent threat that middleware poses to Microsoft's operating system monopoly and ignores its past anticompetitive efforts to harm competing middleware. Third party innovators should not be excluded from the application of the RPFJ until and Microsoft first develops its own competing product. In the CIS, the DOJ states that Microsoft Middleware is the concept that triggers Microsoft's obligations, including those relating to Microsoft's licensing and disclosure obligations without providing any rationale.[37]

The applicability of the remedies set forth in Sections III.C.3, H.1 and H.2 should not depend upon the presence or performance of Microsoft's middleware in any way, nor should any other provision.

Section III.H.1 of the RPFJ allows Microsoft to override OEM configurations and consumer choice for default middleware as long as Microsoft uses one of its own servers to communicate with its own competing middleware. This allows Microsoft to use its Passport, MSN, Dot.net, Hotmail and other servers to avoid and override the explicit choices made by OEMs/ISVs and consumers. Section III.H.1 has no procompetitive justification and once again places competing middleware at an unfair disadvantage. The RPFJ would grant Microsoft the right to require consumers who expressly choose to use Non-Microsoft Middleware to subsequently confirm their choices to Microsoft. Some Non-Microsoft middleware products provide consumers with an opportunity to choose whether to establish the middleware product as the default for certain functions and, if so, to authorize the middleware product to protect against attempts by Microsoft to override the consumer's choice. Rather than requiring Microsoft to honor such consumer choices, Section III.H.2 would allow Microsoft to require the consumer to confirm his or her choice every time Microsoft attacks it.

C. The RPFJ Does Not Provide OEMs With Appropriate Freedom To Choose Competing Middleware, Remove Microsoft Middleware, And Customize The User Interfaces, Menus, Desktop And Other Windows Elements.

The need for an effective remedy that prevents Microsoft from illegally abusing its operating system monopoly to harm competitors is beyond dispute. The undisputed facts, as found by the trial court and affirmed by the Court of Appeals, establish in detail the broad power that Microsoft possesses over OEMs and the broad manner in which it has abused that power to maintain its monopoly in violation of the Sherman Act. As the DOJ and the plaintiff States proved in this litigation, Microsoft's operating system monopoly grants it tremendous sway over OEMs. For example, in June 1996 Compaq executives opined that their firm could not continue in business for long without a license for Windows.[38]

This is consistent with Hewlett Packard's lament to Microsoft in March 1997 that [i]f we had a choice of another supplier, based on your actions in this area, I assure you [that you] would not be our supplier of choice.[39].

Based on such statements, the trial court found that OEMs had no commercially viable alternative to pre-installing the Windows operating system on their personal computers.[40]

Moreover, Microsoft's power has actually increased since the trial court made its findings in 1999: according to the International Data Corporation, from 1999 to 2000 Microsoft's share of the client operating system market, including Apple's Mac OS, increased by 10.6% to 95.4% (when measured by shipment and upgrade revenue) and by 11.1% to 92.6% (when measured by new license shipments).[41] As the trial court

[40] Id. at 158.

[41] INTERNATIONAL DATA CORPORATION, WORLDWIDE CLIENT AND SERVER OPERATING ENVIRONMENTS MARKET FORECAST AND

Continued

found, Microsoft has used its monopoly power to impose its will on OEMs.[42]

First, Microsoft has used its monopoly power to force OEMs to take its middleware applications with its operating system and, by forbidding them to remove or obscure Microsoft middleware, has ensured ubiquity for its middleware while increasing the costs of competing middleware developers.[43]

Second, Microsoft has used its power to impose restrictions on OEMs that have had the effect of restricting consumer access to competing middleware and increasing the costs that competing middleware developers must incur to promote their products.[44]

Third, Microsoft has used its power to threaten and retaliate against OEMs that did not accede to its wishes.[45]

Finally, Microsoft has offered OEMs valuable consideration, which OEMs must accept in order to remain competitive with other OEMs, as a means of coercion in connection with these efforts.[46]

As the trial court found, the OEMs obeyed [Microsoft's] restrictions because they perceived no alternative to licensing Windows for pre-installation on their PCs.[47]

As a result, the trial court concluded that Microsoft's actions have stifled innovation by OEMs that might have made Windows PC systems easier to use and more attractive to consumers,[48] which is diametrically opposed to Microsoft's legitimate interests as an operating system developer.

Plainly, any effective remedy for Microsoft's anticompetitive conduct must put an end to such practices. The RPFJ, however, falls woefully short of either unfettering OEMs from Microsoft's control or ensuring that Microsoft will not continue to impose restrictions on OEMs that harm the development of competing middleware.

1. The RPFJ does not require Microsoft to allow OEMs to remove its middleware from Windows

The RPFJ does not even allow OEMs and end users to completely uninstall and remove Microsoft's middleware once they have acquired the bundled products. In affirming the trial court's conclusion that Microsoft illegally maintained its operating system monopoly in violation of the Sherman Act, the Court of Appeals twice held that Microsoft's design of Windows in a manner that denied OEMs the ability to remove middleware specifically, Internet Explorer from Windows operating systems is anticompetitive because it deters OEMs from pre-installing rival browsers, thereby reducing the rivals' usage share and, hence, developers' interest in rivals APIs as an alternative to the API set exposed by Microsoft's operating system.[49]

Moreover, the Court explicitly rejected Microsoft's assertions that such integration is highly efficient and provides substantial benefits to customers and developers, concluding instead that See also Order (DC Cir. Aug, 2, 2001)(per curiam)(denying Microsoft's petition for rehearing on the commingling issue). Indeed, in denying Microsoft's petition for rehearing on this issue in the clearest possible terms, the Court pointedly advised the parties that [n]othing in the Court's opinion is intended to preclude the District Court's consideration of remedy issues. Id. Microsoft was simply protect[ing] its operating system monopoly from a middleware threat in violation of Section 2 of the Sherman Act.[50]

Notwithstanding the clarity of the Court's ruling on this issue, the RPFJ would essentially endorse Microsoft's anticompetitive commingling of its own middleware into Windows in a manner that prevents OEMs from removing it from the operating system. This is not an idle concern because Microsoft still prevents OEMs from removing middleware, such as Internet Explorer and the Windows Media Player, from the Windows operating systems. Nor would the deceptively named add/remove remedy enable OEMs or consumers to actually remove Microsoft middleware functionality or even disable the middleware, as it simply hides icons without actually removing the middleware code from the operating system. With the middleware code intact, there are many ways in which Microsoft's middleware can still be launched and take default status for all middleware functions. Without appropriate remedies like those proposed by the Litigating States, Microsoft will leverage its ability to bundle and bind its middleware with every copy of the operating system to attempt to convince developers to write to the Microsoft's middleware APIs rather than competing middleware APIs. Allowing Microsoft to commingle its middleware and refusing to allow OEMs to remove Microsoft middleware flies directly in the face of the Court of Appeals decision. 2. The RPFJ enshrines, rather than prohibits, Microsoft's ability to require OEMs to provide access to Microsoft Middleware while restricting the end-user access that OEMs can provide for Non-Microsoft Middleware The findings of fact in this litigation establish beyond dispute that Microsoft has required OEMs to include certain icons, Start Menu entries and other forms of end-user access for Microsoft middleware products while it has at the same time restricted the ability of OEMs to promote competing middleware products during the Windows operating system boot sequence.[51] Specifically, the trial court found that, in the spring of 1996, Microsoft imposed a series of new operating system licensing restrictions on OEMs explicitly intended to restrict the ability of OEMs to reconfigure the Windows operating system desktop and boot sequence in a manner that would improve usage of non-Microsoft middleware. These restrictions included the following:

First, Microsoft formalized the prohibition against removing any icons, folders, or ''Start'' menu entries that Microsoft itself had placed on the Windows desktop. Second, Microsoft prohibited OEMs from modifying the initial Windows boot sequence. Third, Microsoft prohibited OEMs from installing programs, including alternatives to the Windows desktop user interface, which would launch automatically upon completion of the initial Windows boot sequence. Fourth, Microsoft prohibited OEMs from adding icons or folders to the Windows desktop that were not similar in size and shape to icons supplied by Microsoft.[52]

Indeed, Microsoft went so far as to threaten to terminate Compaq's operating system license based on its removal of such icons for Microsoft's Internet-related middleware products.[53]

The Court of Appeals broadly condemned such actions, which reduce usage of competing middleware products, not by improving [Microsoft's] own product but, rather, by preventing OEMs from taking actions that could increase rivals' share of usage.[54]

Notwithstanding these clear legal findings and conclusions, Section III.C of the RPFJ allows Microsoft to continue to retain considerable control over how and whether OEMs can make competing middleware accessible to consumers of its personal computers through display of icons, menu entries and shortcuts. Section III.C.1 allows Microsoft to set rules restricting the manner in which OEMs display icons, menu entries and shortcuts for non-Microsoft middleware. The discretion afforded to Microsoft provides it with yet another method of limiting the prominence that OEMs can assign to competing middleware on personal computers running Windows operating systems. Section III.C.1 allows Microsoft to dictate which Non-Microsoft middleware can be accessible in which places in the Windows operating systems, without justifying its functionality-based distinctions. There is no valid, pro-competitive reason to take this control away from OEMs. As the trial court found, [s]ince OEMs share Microsoft's interest in ensuring that consumers can easily find the features they want on their Windows PC systems, Microsoft would not have prohibited OEMs from removing icons, folders, or Start' menu entries if its only concern had been consumer satisfaction.[55] Nor does the RPFJ protect the ability of OEMs to choose which middleware products to establish as the default on its personal computers. In light of the trial court's finding that Microsoft reduced the Windows royalty price for certain OEMs, including Gateway, that set Internet Explorer

ANALYSIS SUMMARY 2001–2005 at 11–12 (Aug. 2001).

[42] For example, Microsoft delayed release of Windows 98 so as to miss the holiday shopping season in 1996 contrary to the OEMs' economic interests, as well as Microsoft's own economically rational interests solely to ensure that Internet Explorer 4.0 could be commingled into the operating system, regardless of the economic suffering imposed on OEMs in terms of lost sales. 84 F. Supp. 2d at 167 (Maritz agreed with Allchin's point that synchronizing the release of Windows 98 with Internet Explorer was the only thing that makes sense even if OEMs suffer.'')

as the default browser on their personal computers,[56] such protection is required. The proposed decree, however, safeguards the ability of OEMs to designate competing middleware as the default only in those situations where the Windows operating system would otherwise launch Microsoft's application in a Top-level Window that displays all of the user interface elements.[57] For instance, this significant loophole would allow Microsoft to continue to prevent OEMs from launching competing middleware in a variety of instances in which the middleware is invoked as an embedded component in another application, like Internet Explorer. Similarly, by allowing Microsoft to prevent OEMs from launching any non-Microsoft middleware product that does not display a user interface or that displays a user interface that is similar to or smaller than the user interface of Microsoft's middleware product, Section C.3 of the proposed settlement would hand Microsoft the ability to exercise significant control over the design of middleware products and other software applications. This loophole is particularly unjustifiable given the trial court's finding that Microsoft had previously prohibited OEMs from adding icons or folders to the Windows desktop that were not similar in size and shape to icons supplied by Microsoft.[58]

A proposed remedy that endorses, rather than condemns, anticompetitive conduct is not in the public interest. More generally, there is no procompetitive justification for allowing Microsoft, which maintained its operating system monopoly in violation of U.S. antitrust law, to have a substantial impact on the design decisions of competitors that have been disadvantaged by Microsoft's anticompetitive practices. Because these conditions would restrict the ability of OEMs to increase the usage of middleware products that compete with Microsoft, it is apparent that, were they imposed by Microsoft independently, they would be found to violate the Sherman Act under the reasoning of the Court of Appeals decision.[59]

3. The RPFJ does not prohibit Microsoft from continuing to threaten and retaliate against OEMs that have resisted doing Microsoft's bidding The trial court's findings of fact amply document Microsoft's repeated and brazen efforts to threaten and retaliate against OEMs when they have resisted doing Microsoft's bidding.[60]

For example, the trial court concluded that, as part of its efforts to ostracize Navigator from the vital OEM distribution channel, Microsoft threatened to terminate the Windows license of any OEM that removed Microsoft's chosen icons and program entries from the Windows desktop or the Start' menu. It threatened similar punishment for OEMs who added programs that promoted third-party software to the Windows boot' sequence.[61] Such retaliatory efforts extended so far as threatening to terminate Compaq's license for Windows 95, demonstrating that Microsoft was prepared to go to the brink of losing all Windows sales through its highest-volume OEM partner in pursuit of its anticompetitive ends.[62] Microsoft's operating system monopoly enabled it to take such actions with impunity, indifferent to the fact that such threats soured Microsoft's relations with OEMs and stymied innovation that might have made Windows PC systems more satisfying to users.[63]

In light of this sustained practice of intimidation, the DOJ correctly points out that it is critical that the OEMs, through whom the large majority of copies of Microsoft's Windows Operating System Products reach consumers, are free to choose to distribute and promote middleware without interference from Microsoft.[64]

The RPFJ, however, fails to place any restriction on Microsoft's ability to inflict financial retaliation on OEMs. Indeed, Section III.A. of the proposed decree explicitly limits application of its anti-retaliation provisions to newly introduced forms of non- monetary Consideration. Neither Microsoft nor the DOJ offers any justification for failing to restrict Microsoft from employing financial penalties to threaten or retaliate against recalcitrant OEMs.[65]

Moreover, in the face of the extensive record in this litigation of Microsoft's past course of threats and retaliation, Section III.A does not even prohibit Microsoft from withholding existing forms of non-monetary consideration from OEMs that seek to develop, distribute or use non-Microsoft middleware, distribute competing operating systems, or otherwise seek to exercise their purported rights under the RPFJ. Instead, Section III.A applies only to newly introduced forms of non- monetary consideration. Such gaping loopholes simply cannot be reconciled with the DOJ's assertion that Section III.A ensures that OEMs have the contractual and economic freedom to make decisions about distributing and supporting non-Microsoft software products that have the potential to weaken Microsoft's personal computer operating system monopoly without fear of coercion or retaliation by Microsoft.[66]

4. Similarly, the RPFJ does not prohibit Microsoft from continuing to employ discounts and other financial inducements to accomplish its anticompetitive ends The undisputed factual record in this case similarly documents Microsoft's extensive use of discounts and other financial inducements as a critical component of its anticompetitive conduct. For example, it is no longer disputed that Microsoft offered IBM substantial benefits, including soft dollars and marketing assistance, in return for shipping its systems without any software that competed with Microsoft.[67]

The trial court also found that Microsoft grant[ed] Hewlett-Packard and other OEMs discounts off the royalty price of Windows as compensation for the work required to bring their respective alternative user interfaces into compliance with Microsoft's requirements restricting their ability to reconfigure the desktop and boot sequence in Windows 95 and Windows 98.[68]

Similarly, Microsoft used incentives and threats in an effort to secure the cooperation of individual OEMs to promote the Internet Explorer to the exclusion of Navigator.[69]

Indeed, the court found that Microsoft agreed to give OEMs millions of dollars in co-marketing funds, as well as costly in-kind assistance, in exchange for their carrying out other promotional activities for Internet Explorer.[70]

Consistent with this, Microsoft reduced the Windows royalty price for certain OEMs, including Gateway, that set Internet Explorer as the default browser on their personal computers and that displayed Internet Explorer's logo and links to Microsoft's Internet Explorer update page on their own home pages, and offered to compensate Gateway if it would replace Navigator with Internet Explorer.[71]

The RPFJ, however, would not prevent Microsoft from continuing to use discounts, market development allowances and other such programs as part of its efforts to coerce OEMs into favoring Microsoft's middleware over competing software. Given the loopholes that pervade the proposed decree, Section III.B.3 simply requires that Microsoft identify the criteria on which discounts are based and make them available to all OEMs covered by the decree. While this may somewhat limit Microsoft's ability to discriminate among OEMs, it does not prevent Microsoft from using such inducements to coerce OEMs into discriminating against competing middleware products.

For example, the RPFJ would not prevent Microsoft granting discounts or other financial benefits to all OEMs that ship Microsoft middleware products as the default on their personal computers. This would place any OEM that wanted to establish middleware as the default at a potentially serious disadvantage compared to any competing OEMs that take the Microsoft payoff. Moreover, because Microsoft controls pricing of its monopoly operating system, it could establish the price of versions of Windows without its middleware set as the default at some artificially high price and use the difference between the artificially high price and the actual price Microsoft wanted to receive as a cash incentive to pay OEMs to carry Microsoft's middleware as the

default application. This does not correct the present judicially condemned situation.

D.The RPFJ Contains Insufficient Provisions To Ensure Adequate And Timely Information Disclosure

Microsoft has a history of refusing to disclose APIs, delaying disclosure of APIs, and selectively disclosing APIs to favored ISVs at the expense of disfavored ISVs.[72]

For example, Microsoft has refused to disclose APIs relating to Secure Audio Path (SAP)[73] and has actively used its exclusive access to this technology to market against its competitors beginning at least as far back as October 2000. The RPFJ does not end this type of head start and exclusive access. Microsoft uses its control over Windows interfaces to thwart competition from better, more compelling middleware applications. For instance, Microsoft has refused to disclose critical interface and other technical information used by it in Windows XP relating to a number of functions, including direct access to SAP and to the Play all and Burn CD features in the My Music folder. Access to all of the APIs and technical interfaces available in the monopoly Windows OS is critical to ISVs and should be in Microsoft's best interest given its stated top goal of providing a platform upon which all ISVs can build. Because of Microsoft's past anticompetitive behavior, it is important to have a clear and broad remedy provision requiring full disclosure of any technical interfaces, appropriately defined, between Microsoft's operating system, bundled middleware and any other Microsoft applications. The RPFJ contains several major exceptions and loopholes that allow Microsoft to delay and avoid disclosing the technical information necessary to allow competing middleware providers to fully interoperate with Microsoft's software. Section III.D of the RPFJ only requires Microsoft to disclose APIs relating to Microsoft Middleware a very narrowly defined term that does not include any middleware bundled with the operating system (unless separately distributed as an update). This subtlety in the RPFJ allows Microsoft to easily avoid the information disclosure requirements. As long as Microsoft bundles its middleware with its operating system, rather than distributing it separately, it will no doubt argue that there is no information disclosure requirement, although that would seem contrary to the intent of the RPFJ.

Limiting Section III.D to Microsoft Middleware makes it easy for Microsoft to avoid disclosing APIs for a host of features and functions made available to Microsoft's application developers. This is especially true given the fact that the RPFJ allows Microsoft, in its sole discretion, to decide what is in the operating system and what is not. This provides virtually unlimited opportunity for gerrymandering. There is certainly no procompetitive justification for this restriction. The Litigating States' proposed remedy, on the other hand, requires Microsoft to provide all APIs that are used by Microsoft's own application developers to interoperate with either the operating system or middleware. It does not provide a complex web of limitations and restrictions that are bound to create further unnecessary litigation. The provision regarding server interoperability excludes communications between Microsoft Middleware Products even those that are commingled and bound with the Windows operating system—and Microsoft servers. This is an enormous loophole. As written, Microsoft is likely to argue that the provision does not allow ISVs to obtain any access to Microsoft's communications protocols between Microsoft servers and applications such as Internet Explorer, Windows Media Player and instant messaging. Again, this does not seem consistent with the intent of the RPFJ.

In an amazing reversal of fortune, the RPFJ would actually require law-abiding ISVs to license their technology to Microsoft an illegal monopoly if they want to take advantage of Microsoft's APIs. The fact that an ISV might license and use technology from Microsoft, as allowed under the proposed settlement, should not entitle Microsoft to get a license to the ISV's technology relating to the exercise of their options or alternatives. By ensuring that Microsoft will obtain contractual rights to technologies that it deems to be strategic, the RPFJ provides assistance to Microsoft's continuing anticompetitive efforts to restrict the development and distribution of competing middleware by bundling its own versions of those technologies with its operating system in an attempt to dominate the market to the detriment of its more innovative competitors. Because Microsoft is not doing any development on behalf of the ISVs as part of the RPFJ, it does not need licenses to ISV technology to perform its obligations. This provision in effect operates as a poison pill that presents substantial disincentives for competing middleware developers to qualify for the protection of the very provisions of the RPFJ that are designed to foster competition in these nascent markets.

Microsoft Can Continue Its Anticompetitive Practices For Up To One Year And Intends To Do So.

The RPFJ's time periods for Microsoft's compliance with a variety of provisions, including those related to information disclosure, place competing application developers at a serious disadvantage. Middleware ISVs should have as much time as Microsoft's own application developers to use the APIs and other technical information necessary to access, utilize and support the full features and functionality offered by the Windows operating systems. Indeed, the extended time provided to Microsoft to comply with the RPJF is in direct contradiction of one of the DOJ's stated reasons for entering into the settlement: prompt relief. For example, Microsoft has a full year to comply with the bulk of the information disclosure provisions and other provisions related to middleware in Sections III.D and H. Microsoft essentially has been blessed to continue wield its monopoly power for long periods of time to the detriment of consumers and competition. Instead, relief should be immediately available. If Microsoft does not have the technology ready, it should nevertheless be required to allow others to implement the provisions on their own while Microsoft delays disclosing the APIs. There is no competitive justification for giving Microsoft nine or twelve months to disclose and license interfaces that are readily available to, and now in use by, Microsoft's own application developers. In fact, Microsoft is already relying on the 12 month delay provision to avoid disclosing APIs to SAP. Despite repeated requests, Microsoft has not provided RealNetworks with any information or even confirmation that it would provide access to SAP. In a January 2002 communication to RealNetworks, Microsoft simply pointed to the twelve-month time frame and claimed it was in compliance.

F. The RPFJ Does Not Materially Affect Microsoft's Ability To Engage In Anticompetitive Exclusive Dealing

The RPFJ does not effectively prohibit Microsoft from using deals with an IAP, ICP, ISV, an independent hardware vendor (''IHV''), or OEM to limit competition. Microsoft has long relied on such deals in an attempt to limit the development of competing middleware solutions. For example, Microsoft has entered into agreements specifically limiting or forbidding use of middleware that threatens its operating system monopoly. Microsoft has entered into agreements requiring independent content providers to use technology designed to detect whether the end user has Microsoft middleware installed on his or her computer and then using that technology to the exclusion of competing middleware, even when the consumer had chosen the competing middleware as their default. Such conduct flies in the face of Microsoft's own statements that it is trying to create a platform for ISVs; Microsoft's actions are damaging to any ISV who build competing middleware on Microsoft's platform. Section III.G allows Microsoft to demand parity with any third party product that Microsoft considers to be a competitor to its Platform Software in any deal with an IAP, ICP, ISV, IHV, or OEM that distributes, promotes, uses, or supports the third party product. This provision seems designed to prevent competitors from getting ahead of Microsoft.

In addition, Microsoft is sure to continue to use its investments as a vehicle to demand exclusivity or preference for its products to the detriment of competing middleware. Microsoft can enter into any agreement with an ISV, IHV, IAP, ICP, or OEM provided that each contributes either significant developer or other resources prohibiting the entity from competing with the object of the agreement for a reasonable (undefined) period of time. This would bless and legitimize Microsoft's current anti- competitive behavior through which Microsoft leverages other assets to maintain its illegal monopoly. Moreover, Microsoft can apparently avoid even these

[72] Id. at 90–92.

[73] Secure Audio Path is a technology designed to maintain the security of a file as it moves through the operating system for eventual playback by a sound card. It is designed to prevent interception of secure content along the route to the sound card. Microsoft has been exhorting content providers to use its Windows Media middleware in part because of its exclusive access to Secure Audio Path.

requirements simply by licensing intellectual property as part of the deal (see Section III.G.2). Section G appears to allow Microsoft to license third party intellectual property under whatever scenario it desires. This presents a gaping loophole to the entire section, as does the exception for any joint development or joint services' arrangement. Virtually any technology deal could be styled as such.

The prohibitions of Section III.G.2 are strangely applicable only to contracts with IAPs and ICPs (not IHVs, ISV or OEMs) to obtain placement in Windows. In fact, it should simply prohibit Microsoft from entering any contract conditioned on any third party's agreement to refrain from or limit distribution, promotion or use of competing middleware. As written, the provision would allow Microsoft to require any ISV or IHV to refrain from distributing or promoting competing middleware as a condition for placement in Windows, or for placement on MSN, or for access to Dot.Net or for anything else. Surely, this could not have been the intent of the DOJ, yet it is the result of the language in the RPFJ.

G. The Enforcement Provisions Are Weak And Ineffective

The Court of Appeals conclusively established that Microsoft is an illegal monopolist. Yet, remarkably, Microsoft has not modified its anticompetitive behavior in any meaningful way despite the Court's clear conclusions, just as previously the consent decree entered by the DOJ failed to end Microsoft's anticompetitive conduct. The necessary enforcement mechanisms must reflect the harsh reality that Microsoft has repeatedly shown its complete disrespect for the judicial process and directives of the courts. Unfortunately, the enforcement mechanisms in the RPFJ are completely ineffectual and are destined to fail. Any conduct-based remedies in this complex environment will be effective only to the extent they are capable of prompt, rigorous enforcement.

For instance, the proposed settlement fails to put in place a meaningful mechanism for preventing, identifying and resolving violations of the proposed agreement in an expedited manner. The voluntary dispute resolution mechanism is designed for delay rather than deterrence. It is essential that any decree establish clearly defined procedures, with prompt, prescribed time deadlines, to enable the government and the court to address violations of the decree in a full and expeditious manner. By contrast, the ''voluntary dispute resolution'' provisions of the proposed settlement are as inadequate as the name suggests. The only ''penalty'' for willful and systemic violations of the proposed settlement is a one-time, two-year extension on the already truncated five-year term, much of which does not even become effective for an entire year. The time frames for investigating complaints are loose or non-existent, with no clear or prompt recourse to the court for resolution. Moreover, the ''Technical Committee'' is housed at Microsoft, cannot independently go to the court for redress and cannot present any of its findings or information to the court, which ensures that the substantial time, effort, and expense devoted to the Committee's processes would need to be duplicated in future compliance efforts. Inexplicably, Microsoft is allowed to appoint a member of the Technical Committee, a sort of permanent seat on the security council to oversee its overseers. Rather, the proposed decree needs to establish a Special Master, that can make prompt recommendations directly to the Court. This litigation has been going on for over three years. Microsoft has reaped the rewards of its illegal conduct during that time, and continues to do so. The RPFJ would provide Microsoft with an additional 12 months to comply with several provisions that should require immediate compliance. The proposed time frames greatly overstate the difficulty of providing ISVs with technical information that Microsoft has been using itself to develop Middleware and other applications. Any purported hardship imposed by more appropriate deadlines would certainly by justified by Microsoft's history of illegal conduct. Consumers deserve swift and certain relief.

V.CONCLUSION

As set forth above, entry of the ambiguous and loophole-laden RPFJ would engender significant uncertainty as to its terms and actual effect and would, in many respects, potentially assist Microsoft in its anticompetitive efforts to restrict the development and distribution of competing, innovative middleware. The full anticompetitive harm that would result from a failure to effectively redress the anticompetitive conduct identified by the Court of Appeals cannot, however, be fully understood simply by examining Microsoft's anticompetitive conduct to date, as substantial as that is. As the trial court found in this litigation, the full effects of Microsoft's anticompetitive conduct extend well beyond today's consumers of personal computers to chill tomorrow's innovations and the new products and markets that such innovations will make possible:

Most harmful of all is the message that Microsoft's actions have conveyed to every enterprise with the potential to innovate in the computer industry. . . Microsoft has demonstrated that it will use its prodigious market power and immense profits to harm any firm that insists on pursuing initiatives that could intensify competition against one of Microsoft's core products. Microsoft's past success in hurting such companies and stifling innovation deters investment in technologies and businesses that exhibit the potential to threaten Microsoft. The ultimate result is that some innovations that would truly benefit consumers never occur for the sole reason that they do not coincide with Microsoft's self-interest.[74]

By contrast, the Court has before it an eminently superior remedy proposed by the Litigating States. Bereft of the ambiguity and loopholes that benefit the monopolist they are ostensibly intended to restrain, the States' proposed remedy highlights the extent to which the RPFJ fails to effectively end Microsoft's anticompetitive conduct. Forward- looking in scope and straightforward in application, the States' proposed remedy is appropriately tailored to redress the anticompetitive conduct identified by the Court of Appeals, while preserving Microsoft's ability to compete with other operating systems and other middleware products on the merits.

For the reasons set forth herein, RealNetworks respectfully submits that entry of the RPFJ would not be in the public interest.

Washington, DC 20530

Dear Mr. Ashcroft:

Thank you for the exceptional service you have provided our country. In the interest of furthering the cause of private enterprise, the foundation upon which our country has been built, I am compelled to speak out on the Microsoft settlement. As both a customer and a stockholder, I hold strong opinions on the outcome of this case.

Microsoft has long been a leader in the technology industry. They have earned their place of leadership in the technology industry through their focus on excellence. Due to this commitment Microsoft has consistently outperformed the competition by providing consumers with user-friendly products. As a believer in free enterprise I was outraged by the case against Microsoft. Nonetheless the resolution of this case is the most important matter at this time.

Enacting the settlement will allow Microsoft to get back to business. In addition the stipulations of the settlement will benefit users as well. With the release of Windows XP, Microsoft will be putting in a new mechanism that will allow users to add and delete programs into the system with greater ease. The settlement goes above and beyond the original scope of the case. The Justice

Department must enact the settlement at the end of
January.
Sincerely,
Maggie Hayes

Dear Attorney General Ashcroft:
I appreciate the Justice Department finally coming to a settlement over the Microsoft issue. The three year long dispute has brought up many issues regarding antitrust laws and the tech industry. The settlement that was reached represents a good compromise. I believe that it should be acceptable to everyone involved.
Now that the Windows'' operating system will be made available to producers at a uniform price, computer makers will not have to gain favor with Microsoft in order to receive discounted prices. This evens the playing field among computer makers. Further the review committee that is to be created will guarantee that everyone plays fair too.
The settlement comes at a good time. It represents both sides of the issue. The government needs to move on to more important matters. Thanks for listening.
Sincerely yours,
Harold Hall

To whom it may concern,
Please do this country a big favor and split them up, take them apart...do what ever you have to do to make them play by the same rules everyone else has to if you can't put them out of business. We're all so tired of watching and being able to do nothing while MS gets rich over the dead bodies of smaller companies that are just trying to make a living at what they do. MS stinks, their products stink and the way in which they treat the end users by marketing and selling inferior products stinks! Please give this country and the world the Technological enema that it so desperately deserves and needs and stick it to Microsoft. Though it won't even begin to make up for the way they have stuck it to countless others at least it's better then letting them get away with it unpunished.

Dear Mr. Ashcroft:
I encourage you to support the recent antitrust settlement Microsoft has reached with the DOJ. I can only imagine how much this lawsuit has cost the little people in this country—not Bill Gates, but the people throughout the country, especially those who are in pension funds.
Furthermore, I feel this attack on success is forcing Microsoft to agree to terms that go far beyond the original scope of the lawsuit so it can continue to develop software undisturbed by the government.
As an example, Microsoft has agreed to provide the code so competitors can alter Windows to remove Microsoft products and to install competing products. Furthermore, Microsoft has agreed to disclose various interfaces to its competitors—a first in an anti-trust settlement.
Further, Microsoft has agreed to not force third parties to distribute or promote Windows exclusively or as a fixed percentage; nor will Microsoft prevent computer makers or software developers from developing competing operating systems or software that runs on competing operating system.
For these reasons, I encourage you to support this settlement as good for the consumer, and so that Microsoft can return to the business of developing good software.
Sincerely,
Allan Osborne

Dear Microsoft Settlement:
The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.
Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.
Thank you for this opportunity to share my views.
Sincerely,
Dolores Dembus

Washington, DC 20530

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Thomas Leszczynski

Subject: Micrsoft Antitrust Settlement

I believe the subject settlement is more than fair. Microsoft was largely responsible for the tremendous economic gains of the 1990's. Yet the goose that laid the golden egg is severly attacked. By whom? By a gang of competitors who could not compete in a free market. By a gang of competitors who met together to costruct a case against Microsoft and ask the federal goverment to prosecute it. Collusion?

Yes Microsoft is agressive. In business you do not go far without being agressive. Agressive action and words can stir up emotional responses, but that does not make them illegal?

The general public has not been harmed by Microsoft. To the contrary. Microsoft has made it easy for the novice to use computer systems. They have provided a much needed standard. Compare that to the incompatable wireless telephone systems. My wireless telephone will not work in Europe. Old time computer users complain about Microsoft. They know how to work around computer problems and do for themself. The general public does not. Microsoft provides a standard, a tool the general public can easily use.

Bunding. I want blundling. I do not want to buy my operating software system a piece at a time. Only special applications do I want to buy one piece at a time. I also do not want to make the piece by piece selection of what goes in my basic operating system. I am not smart enough. Microsoft lets me easily buy a complete system that works great.

Cost. Per line of code, there is no maintaied software package that is cheaper.

Do we really want to put overzealious tethers on the company that had a large part in creating the golden egg economic era of the 1990's. I would think twice about that.

Thanks for the opportunity to comment.

Subject: Microsoft Settlement

We the undersigned would like to submit our comments on the Microsoft Settlement before the Antitrust Division. We are displeased to note that much effort has been expended by the government to listen to envious competitors, who unable to compete in the open market, attack a productive company so that its innovative ways can be hindered. We have been using Microsoft products for over a decade and have never had any complaints about their performance. Over the years their products have kept improving. We are therefore opposed to any settlement, in which the company which has become successful by dint of innovation, is penalized for being too successful. We would also like to state for the record that as free individuals, participating in the marketplace, we have chosen Microsoft products without coercion. Therefore we think that it is not the duty of the Government do decide or restrict the marketing of Microsoft's products at what ever price the market will bear. Also we think that as free individuals we have an inalienable right to purchase and keep on our computers software of our choice without government interference. In other words, the government should not violate our personal liberties in the realm of what we can buy and keep in our computer. Since the business of Microsoft is producing software, we fail to see how it is a threat to anyone. A free market, in essence requires that a company be productive and offer a better product at the lowest price. Microsoft has been able to do this—- a testament to it's success.

One important point to note here is that Microsoft has been brought to court by its competitors, who when unsuccessful in the open market, sought to use government force to not only shackle but also to set the terms by which businesses in future must compete in the market place. Failed businesses must not be allowed to set the terms of the operation of the market place. Penalizing successful businesses can only have a chilling effect on future iconoclastic businessmen and industrialists from trying to be innovative if they conclude that the price of success is the breakup of a company and suffering long drawn out court battles and fines and unreasonable penalties. The government should foster an environment whereby any American entrepreneur with a new idea can start a business by upsetting (if required, just as Henry Ford upset the horse and buggy industry, or what Edison's invention of the light bulb did to the candle makers) current businesses and starting a new field of production just as the computer industry replaced and automated many labor intensive functions of U. S. industry. After all a business has a right to its own property and it is the constitutional duty of the government is to secure and protect those rights.

Dear Mr. Ashcroft:

The free enterprise system in the United States has been the catalyst for making the

United States the greatest country in the world. Within the system, there will be winners and losers. Microsoft is perhaps the biggest winner of all time; they have created and marketed a product that satisfies the needs of an expanding market all over the globe.

The government has no business meddling into the affairs of Microsoft, or any other business. Microsoft used its own ingenuity and market know-how to achieve the level of success it has. The entire lawsuit between Microsoft and the US government has become a forum for Microsoft's competitors to tear a piece of Microsoft's success away.

Microsoft has agreed to permanent government oversight in the form of the three-person ''Technical Committee.'' This in and of itself should silence most any critic of Microsoft, but the settlement also agrees to make trade secrets such as operating system protocols and interfaces available to its competition as well.

I have strong reservations about this settlement, but if this is what Microsoft wants, than I will support the company. Microsoft performed as any company would in the open market, and has been duly rewarded. The federal government needs to end the litigation and let free enterprise and the market determine the final outcome for Microsoft and its competitors.

Sincerely,
Richard Kissell

Dear Mr. Ashcroft,

Today I take the time to encourage the Department of Justice to accept the Microsoft antitrust settlement. The DOJ and Microsoft have slugged this battle out for over three years. It is time to put an end to it. A settlement is available and the terms are fair. It is rally about time that the government accepted it. In order to put this issue behind them, Microsoft has agreed to many terms. They have consented to design future versions of Windows to be more compatible with non-Microsoft software, making it so that features like Explorer and Windows Messaging can be replaced by Netscape and IM. They have also agreed to change several aspects in the way they do business with computer makers. Microsoft has given up a lot in order to settle the issue. It is time for the government—and the courts—to accept the settlement and move on. Microsoft and the technology industry need to move forward, and the only way to move forward is to put this issue in the past. Please accept the Microsoft antitrust settlement.

Sincerely,
Jerome Isham

Dear Mr. Ashcroft,

I wanted to take this moment to write you, during the 60-day public comment period, to express my concern on this tedious lawsuit plaguing the Microsoft corporation. For the past three years (in its most recent version, anyway) Microsoft has concentrated its time, energy and money under public and federal scrutiny and it has been the unfair and unjustified bullying of an enterprise that built itself on American ideals, the dreams that all Americans are made of. The current proposed settlement, although harsh on Microsoft, needs to be the ending of this lawsuit once and for all. If the case goes back to the federal court, not only does the fundamental principle of freedom of enterprise fly out this nation's window, but our nation's economy will suffer further from the loss of potential capital. How can our country criminalize a business that brought this world out of the technological ''stone age?'' It is beyond me how people that have prospered from Microsoft's success are also the ones trying to put them out of business. Is this the message we are instilling in our own people that too much success is a crime and can legally be taken away from you?

By accepting the proposed settlement, Microsoft and the American consumer can put this behind them, get back to business as usual, and keep Microsoft as an investment this country needs to stay at the top of the global market.

Your time and consideration in this matter is greatly appreciated and I hope your actions will speak for the American people and not the jealous competitors trying to take ingenuity away from the Microsoft corporation.

Sincerely,

Dale Boe

To whom it may concern:

I am very much against the proposed Microsoft Antitrust Settlement ... it doesn't go far enough to level the playing field against Microsoft or in punishing Microsoft. In it's present form, it appears that the DOJ proposed settlement (once again) lets Microsoft off the hook, and lets them continue their rampant / unabaited, unethical, predatory / monopolistic practices ... it's ALL in the details and crafting of the words ... by highly paid Microsoft lawyers ... once again, there is no ''meat'' to it. ''Nothing'' surprises me anymore ... but America and the world deserves better. There IS an alternative ... ALL you have to do is read the incisive, brilliantly presented descriptions of the problems ... and solutions at the following web sites ... to realize how woefully inadequate the DOJ settlement proposals truely are.

http://www.kegel.com/remedy/letter.html,

http://www.kegel.com/remedy/remedy2.html

http://www.codeweavers.com/jwhite/tunney.html

The solutions proposed at these sites have some ''meat'' to them, and should just be a starting point of ''minimum necessary requirements''. These proposed solutions, would finally, at least, force Microsoft to be more forthright and honest. Hire these guys as consultants!!! IF there is ''any justice'', the DOJ verdict and settlement ought to ''punish'' Microsoft ''severely'', with more than just a weak slap on the wrist ... Microsoft should not continue to be ''rewarded'' by the Justice Dept. for their continued ''best business practices'' ... business practices at their worst.

I have been supporting Computer hardware / software for 40 years from mainframes to PCs, including Microsoft products. There is ''no room'' in a democratic society ... for software code (and a company) that wants to ''imbed'' itself ''everywhere'' ... to the ''exclusion'' of ALL others. This fact is even intuitively obvious to the most casual observer ... and also ought to be obvious to a ''US Justice Dept'' as well.

There is no dispute that Microsoft has stifled innovation, creativity and competition ... and in the process ''sucked'' the life out of an Entire industry / culture. For years, Microsoft has ''rushed to market'' buggy / inept, bloated software code / APIs, applications ... Operating systems (OS) ... in order to circumvent previous, WEAK Justice Dept settlements.

Just look at the security flaws in their ''latest & greatest'' XP OS ... rushed to market to ''procreate'' and ''imbed'' itself ... before it works ... and before the ''law'' can catch up with it ... yet one more time. In Windows 9X, Internet Explorer (IE) was blatently imbedded into the Windows OS, with requirements that IE be the ''default'' browser in order for OTHER Microsoft) applications (such as Outlook) to work properly ... to the exclusion of other applications, including Netscape. Microsoft ''is'' the ultimate blood-sucking virus. It's time to get out the RAID ... and a BIG flyswatter ... or gavel!!!

Surprise me ... do something right ... for a change,

Dave La Bounty,
San Jose, Ca,
Computer Engineer / Technologist (40 years)

Dear Mr. Ashcroft:

I have been using computers since 1976. That is about adecade before even the first PCs. (even before DOS). I could use computers even without Microsoft. The question is would I want to do so. Imagine the millions of Americans today that use computers and the Internet without even a clue as to how difficult things once were.

I am writing this letter in hopes of restoring some sense to the current course of affairs. I sold my Microsoft stock shortly after Judge Jackson began to try to write himself into the history books. The reason Microsoft is so successful is because we the consumers want it to be. I do not want to purchase a menagerie of software operating systems and user applications that very likely will not work together. I know this started during the Clinton Administration. I feel that it is time to put a halt to this auto-immune attack

Microsoft is an important part of the U.S. economy. Please let Microsoft get back to software production. In these difficult economic times, we need to move forward. I would find it difficult to do my job without the innovations that Microsoft has provided. I will continue to depend on Microsoft. Microsoft has agreed to a settlement that should provide any necessary compliance to regulations and prevent any further perceived need for anti-trust actions.

I hope that my opinion makes a difference. Thank you for your attention in this matter.

Subject: Microsoft Settlement

Dear Ms. Hesse:

As a consumer whose activities both at work and at home rely heavily upon the use of personal computer software, I welcome the chance to comment on the proposed settlement between Microsoft and the Department of Justice.

I feel that this agreement, as is, will leave Microsoft to continue in its anticompetitive ways. It will not prevent the monopoly from using strong-arm tactics in licensing deals with computer makers, nor will it stop Microsoft from keeping competitive products from coming to market. As a result, consumers like myself will be forced to continue to pay for Microsoft's expensive operating systems and software suite and the upgrades required to keep them functional. In addition, our choice of software products will continue to be limited and for those of us who do use non-Microsoft operating systems or Internet browsers, compatibility with other Microsoft products will continue to suffer.

The additional proposal put forth by Massachusetts Attorney General Tom Reilly along with eight other states and the District of Columbia is a far better remedy than one proposed by the Department of Justice. This proposal includes key provisions that will put an end to Microsoft's illegal business dealings, help ensure compatibility of software products and bring consumers like myself the benefits of greater choice and lower prices. Moreover, unlike the Department of Justice's settlement, this proposal will provide an enforceable solution with real penalties to guarantee compliance.

Therefore, it is my hope that the Court will find the Department of Justice's settlement with Microsoft not to be in the public interest and rather adopt the proposal of Tom Reilly and the other State Attorney Generals.

Sincerely,

Kiyoshi Yu

January 23, 2002
Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I would like to take this time to voice my opinion on the Microsoft case. The government had no right to intervene with private business, but now that the case has been allowed to drag on for three years, the American public needs to see that the case is finally ended. Microsoft is a good company; they've provided consumers with superior products and have changed our lives, contributing so much to our nation's economy. I run a production company and use Microsoft's products in my office. I am not forced to do so; I use their products because I prefer to.

The proposed settlement will be more than favorable to Microsoft's competitors and will consequently foster competition. Microsoft has agreed to tone down its supposedly aggressive marketing techniques and will allow their competitors to create and promote non-Microsoft software in Windows. They are also going to give away a lot of their technical secrets to their competitors.

This settlement is more than reasonable and is the right thing to do. Our economy is struggling and our technology industry needs to be restored. Ending this case is a perfect way to do that. Thank you for your time.

Sincerely,

Gretchen Huizinga

Ladies & Gentlemen:

We must continue to promote the best technology and give the opportunity to those who wants the freedom to innovate in all area of business and industries. Lets keep the courts and the politicians out of technology especially in this critical time ''The New World Economic''. If AOL wants to continue to played this role in promoting policy (and politics) over technology especially as they have done in the last three years and contributing in the impeding of new technology. Let us remember man is the maker of his destiny and we are all guilty if allowed it to happen. Why should the American people be punished to pay for the legal cost of this platform?

As we all know AOL has promised to open up their instant messenger as Microsoft has done, so that we all can have a platform to build services for it, but has AOL complied? NO. They say one thing and do another.

Microsoft has done bad things in the past but is not the evil some people make it out to be. If you had studied them in some depth, you'd understand that.

Microsoft has done great things for the United States Economic and World Economic and their contribution to ordinary people is the real story. Let's keep our head over water and we should continue to review all the facts and put every things on the balanced (World Economic) before we make the biggest mistake in this new World Economic.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

jack l. eich

Subject: Microsoft Settlement

It is a common misperception that Microsoft built it's monopoly upon the proprietary nature of its Windows operating system. In truth, Microsoft built its monopoly upon the proprietary and secret nature of its communication protocols. One historically important example of a proprietary communication protocol is the secret file format utilized by Microsoft application programs such as Microsoft Word and Microsoft Excel.

Because Microsoft wholly controls its secret communication protocols it has the ability to modify a specific protocol with each upgrade to an application program that uses said protocol. For example, when Microsoft issues an update for an application program such as Microsoft Word it has the ability to modify the file format used to encode Microsoft Word documents. Because Microsoft holds a monopoly within the application space that Microsoft Word competes the change in file format triggers a chain reaction of events. Once a critical mass of users adopts the new application program using the modified communication protocol (in this case the Microsoft word file format) other users are compelled to purchase the new version of the application program because the older version cannot understand and use the new protocol. People who wish to communicate within this particular space but who do not own Microsoft Word are compelled to purchase it, not because because the program offers innovative new features, but simply because the application program uses a proprietary protocol. Microsoft possesses both a monopoly and a secret proprietary protocol in many application spaces. This fact compels users to purchase Microsoft products instead of potentially superior competing products, and it allows Microsoft to set the price for these products at artificially high levels.

This situation amounts to a de facto arbitrary tax on communication imposed by a private entity.

The simplest and fairest solution with the best opportunity for success is to compel Microsoft to publicly document all of its communication protocols, including, but not limited to, all of its file formats. This solution is the fairest because it allows all competitors, including Microsoft, to innovate with respect to application features and performance, letting the market determine the price. It also frees users who wish to communicate within a particular space from the compulsion of purchasing Microsoft products.

The simplest and best method for enforcing this behavior is to require the government to confiscate any and all revenue derived from each and every Microsoft product that directly utilizes, or contains any sub component which utilizes, any communication protocol that is not completely documented, including, but not limited to, file formats.

Subject: Microsoft Settlement

I wrote to Attorney General Ashcroft about my feelings about the settlement. Now, I would like to tell you how I feel.

I hope so much that there will soon be a settlement to this long drawn out affair. The

settlement that was outlined in the newspaper a few weeks ago seems fair and just to me. As a retired educator, I was particularly pleased to see that it involved gifts of materials and software to schools. It seems like a wonderful way to help children who are the consumers of the future. As an ''older'' consumer, I have grave doubts about the fact that this continued bickering has anything to do with the consumer at all. It appears to me to be an unjust form of competition by some rival companies i.e. Sun Microsystems, AOL, Oracle etc. and they are using to court system which I fund as a taxpayer to further their own ends.

Please, make a fair and equitable end to the squabble. Microsoft is a good company who really has done a wonderful job of focusing on the consumer.

Subject: Microsoft Settlement

The proposed settlement should not be approved as is. I do not believe that the proposed settlement does anything to rectify the situation created by the found criminal antitrust activities of Microsoft Corporation. The reason for antitrust laws is to maintain healthy competition and markets to promote more and better products. The settlement as proposed only legitimizes the anticompetitive behavior that has killed off so many potential innovators in the software industry.

The proposed settlement is not in the best interests of the consumers of software, in spite of the posturing of Microsoft. Nothing they do or propose can be taken as being in the interests of the consumers. They make so-called ''standards'' and patent them (their message block structure for Windows XP to kill off Samba) and poison emerging standards such as Java all in the interest of Microsoft, not the consumer.

I am totally opposed to this settlement as now structured.

Thank you for the opportunity to comment,
Scott Dallmeyer

Dear Mr. Ashcroft:

I encourage you to accept the recent anti-trust settlement between Microsoft and the United States Justice Department because it's good for Microsoft's competitors and good for those who purchase software.

Microsoft has agreed to make the software market more competitive by providing the necessary information for computer makers to remove Microsoft products from Windows and to install competing products in their places. Further, Microsoft has agreed to not take actions against computer makers who decide to take this route, nor will Microsoft prevent computer makers or software developers from shipping or promoting competing operating systems or software that runs on competing operating systems.

For these reasons, I encourage you to support the recent settlement as good for Microsoft, good for its competitors, and good for the consumers.

Sincerely,
Robert Bezona

From: Mike Mammarella
To: Microsoft ATR
Date: 1/28/02 11:10pm
Subject: Microsoft Settlement

I believe that the terms of the revised proposed final judgement are too ambiguous; there is ample room for loopholes depending on the way Microsoft chooses to define, for instance, ''digital rights management.'' Microsoft has recently received a patent for digital rights management operating systems, which means that it would be not unreasonable to claim that the entire operating system (of some future version of Windows) is a digital rights management system and therefore exempt from API disclosure.

The terms must be more well-defined, but also not so narrowly as to be specific to the technology of today. Microsoft will soon be boasting a new platform called ''.NET'', which could escape the terms of a too-narrowly defined ''operating system'' and therefore also be exempt from many of the terms of the judgement. Furthermore, I believe that simply limiting Microsoft's illegal monopoly abuse is insufficient. Microsoft has been accused of the same practices before, and reprimanded as a result. However, this does not seem to have stopped Microsoft from continuing the abuse of its operating system monopoly. A more drastic measure could be in order; however this measure must be carefully considered. I'd personally love to see Microsoft dissolved entirely for its support of proprietary PC hardware interfaces (see P.S.), but I realize that this is both unrealistic and uncalled for. However, a split between the operating system division and the software (and middleware) divisions would help to prevent future monopoly abuse; both companies would also be well placed in their respective markets from the beginning. There would need to be restrictions on their interaction, in order to prevent what happened to the AT&T fragments (they eventually joined together again) after that famous split.

This is not the only possible solution. Others include requiring the disclosure of some or all of Windows'' source code, or that of Internet Explorer. These solutions could even be combined in full or partial strength.

I am certainly no legal expert, however as a software engineer and system administrator I feel I am qualified to make the statements I have put forth here. I hope that they will be of use and that the eventual decision will be beneficial to all involved, with the possible exception of Microsoft which can only stand to be in some way restrained from previous illegal activity.

Sincerely,
Mike Mammarella

P.S. A note about proprietary hardware interfaces—in the days of DOS, when a hardware manufacturer made a perhipheral device, whether an adaptor card or a printer, they disclosed information needed in order for the operating system or individual programs to communicate and use that device. With the advent of Windows and its driver interfaces, hardware manufacturers stopped releasing this information, claiming its proprietary nature. Technically, this was the decision of hardware vendors, but Microsoft was in the position to encourage them to continue to disclose their protocols and it instead encouraged the opposite. The effect of all this is that other operating systems cannot support these devices unless the manufacturer writes a driver for that operating system as well, which due to Microsoft's monopoly is much less likely. This further increases the barriers for entry into the operating system market.

Ladies & Gentlemen:

We must continue to promote the best technology and give the opportunity to those who wants the freedom to innovate in all area of business and industries. Lets keep the courts and the politicians out of technology especially in this critical time ''The New World Economic''. If AOL wants to continue to played this role in promoting policy (and politics) over technology especially as they have done in the last three years and contributing in the impeding of new technology. Let us remember man is the maker of his destiny and we are all guilty if allowed it to happen. Why should the American people be punished to pay for the legal cost of this platform?

As we all know AOL has promised to open up their instant messenger as Microsoft has done, so that we all can have a platform to build services for it, but has AOL complied? NO. They say one thing and do another.

Microsoft has done bad things in the past but is not the evil some people make it out to be. If you had studied them in some depth, you'd understand that.

Microsoft has done great things for the United States Economic and World Economic and their contribution to ordinary people is the real story. Let's keep our head over water and we should continue to review all the facts and put every things on the balanced (World Economic) before we make the biggest mistake in this new World Economic.

U.S. Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft,

As an independent developer and supporter of Microsoft, I write you in regard to the recent Microsoft Settlement. After three years of negotiations, it seems strange that there may even be more delays in the implementation of this plan. The process was extremely well thought out and well monitored throughout. Because of this, the terms that were reached benefit all involved.

As we go through these economically stressful times, it is crucial that we support our technology at all levels. By holding up this settlement, we take a backseat in the global market. Our entire technology industry needs to get back to business, and because of the agreement, we are ready to do so. Let us support our IT sector and allow the terms to speak for themselves, including anti-retribution and retaliation acts, and the sharing of selected intellectual property.

Splitting up Microsoft

Specifically the non-Windows platform community has attacked Microsoft for adding to much functionality to its OS, and therefore stifling competition. They argue splitting up Microsoft, would make it easier to compete with Microsoft. This ignores the large amount of developers and companies that have made available more than 100 000 programs available on the Windows platform. Splitting up Microsoft, will for them mean disrupting the dynamics of developing cutting edge technology for Windows.

Windows Building blocks

Splitting up Microsoft into pieces, will create smaller companies developing solutions/libraries that will not be included in Windows and therefore be keeping secrets from other independent developers who will have to develop their own incompatible solutions. Splitting up Microsoft, destroys Windows's ability to offer solutions for connecting together building blocks with the latest technology. Solutions that are now incorporated in Windows and documented for everyone, will end up as proprietary solutions outside Windows. Making it less feasible for smaller developers to keep up with the latest in technology.

Microsoft is giving us pre-tested building blocks guaranteed to be interchangeable and compatible with each other. Developers using these building blocks for their own designs, know that their programs will be compatible with combinations of future designs trying to link up with or work together with their designs. Think of the many millions of errors windows is getting rid of for current and future developers of software...

Whenever building blocks are rewritten with new interfaces, previous interface(s) are still available to let older designs work as building blocks change. This is true of COM+ and any of the API's that come with Windows. It beats trying to design applications to hook up to zillions of applications not using support from the OS.

The Internet building blocks Internet technology built into Windows, assists applications using various Windows technologies in communicating and sharing data with each other over the Internet. This degree of integration between applications/components is only possible by having these technologies built into the platform they are running on. Internet Explorer built into Windows facilitates in building web browsers. Any developer can build their own Web Browser with their own customized controls. In less than a day they can design their own Web Browser that is equal in power to Internet Explorer. Just download the MFCIE project from Microsoft Developer Network (has been available a couple of years). In less than a day you implement remaining Internet Explorer Functions through the OLE/COM+ interface. In a matter of days any organization can design their own Internet portals that access primarily sites of their own choosing.

Documentation for developing software Microsoft develops the functionality and the building blocks needed for applications and distributed components to interact with each other on the Windows platform. Microsoft also provides Documentation and Developer information for all developers to take advantage of these features. Preventing Microsoft from freely expanding these features to provide the latest technologies, will damage the industry's ability to develop comprehensive integrated software solutions for the Windows platform. Instead you will end up with incompatible proprietary solutions and a less versatile Windows platform.

I urge you to support our economy at this time, and help this settlement go through as it stands. I thank you for your support.

Sincerely,
Carl Lochen

From: John Cowhig
To: Microsoft ATR
Date: 1/28/02 11:12pm
Subject: Please be fair and don't reward Microsoft for breaking the law.

I believe the proposed settlement is not punitive enough for past behavior nor will it be very effective to deter future strong arm tactics by Microsoft. At this point, the company has assured itself a comfortable distance ahead of all major competitors. However, as the linux and Macintosh OS community continue to try to gain market share, Microsoft has moved onto conquer new frontiers.

It is important for the DOJ to focus on the future. The past damage is done, but Microsoft continues to use tactics which act

against the spirit of the law. The masses will continue to take the route Microsoft and AOL plan for them. However, there are many innovative small companies and grass roots type programmers who would like to continue to innovate. Please don't allow Microsoft to continue to place barriers in their way.

Thank you,
John Cowhig

RE: Comments on the Microsoft Settlement

Dear Ms. Hesse,

I am writing this email to you in my support of brining an end to this travesty of justice. The United States Department of Justice was suckered into persecuting Microsoft under the guise of an antitrust action.

If I were the Judge and it were up to me, I would make the following ruling.

* The court fines Microsoft the sum of $1.00

* The court specifically precludes any plaintiff from using the case record in support of their civil motions or claims against Microsoft if any.

The purpose of antitrust jurisprudence is not to enable a competitor to gain what they what they otherwise fait to gain in an open and competitive marketplace nor is the purpose to enable the plaintiffs bar to file a bogus class action law suit and legally extort $100 million dollars from a defendant because it's cheaper to settle then to litigate.

* If it were up to me to rescind the conclusions of law and findings of fact in this case, I would do so and dismiss the case.

Finally, I accept and approve of the settlement that the Federal Government and Microsoft have agreed to and I order the states that have not joined in it to accept it and to drop all further litigation against Microsoft.

My reasons for making the above rulings are simple, go into any computer store and there are choices to be made. A consumer has the opportunity to decided for themselves exactly what their choice should be. If Microsoft had not taken the actions that they had, they would have run the risk of becoming an also ran in the software business and their operating system would have become obsolete. What one perceives as product improvement and natural migration in an evolving market may be perceived by a competitor in a different manner. It is up to the consumer to decide which is which and not for the government to interfere and make that determination for them. We are advocates of the law, not software engineers, designers nor marketers. In a dynamic and fluid market as this case has shown, what is being argued about is history not current events nor the current state of the software business.

Let's hope the Judge has the courage to rule as suggested and let companies do their battle with each other in the marketplace free of government and judicial impediments.

Have a great day.
Sincerely yours,
Capital Solutions,Inc.

Dear Mr. Ashcroft:

Now that the Department of Justice and Microsoft have reached an agreement, why can't we just move on? It doesn't make sense that all of these states and companies are jumping on the bandwagon. I think that they are all liberal opportunists that are looking for a quick buck. What benefit does all of this have on the economy? Zero.

Microsoft has gone out of its way to settle this case, beyond what was required in the suit. They agreed to make available to the competition, protocols implemented from parts of its operating system that are used to operate with their server. Microsoft also agreed to the creation of a technical committee that will monitor Microsoft's compliance with the settlement and assist with any disputes.

Now that Microsoft has agreed to such generous terms, shouldn't we agree to let the settlement stand. Our Government has more pressing issues that they need to focus their attention on. I trust that you will do the right thing.

Thanks for your support in these efforts.

Subject: Microsoft Settlement

Dear Mr. Ashcroft,

As a user of both Microsoft and Apple computer products, I have to say that I feel Apple Computer has the edge in technology. The fact that Microsoft has a commanding lead over Apple can be attributed to Microsoft's superior marketing. Promoting one's product has never been illegal before, and definitely should not be now.

However, as I write this, I sit surrounded by Microsoft products: Windows, Internet Explorer, MSN Messenger, etc. I am typing this message on MSN Hotmail. Microsoft does have competitors in all of its business segments, but by packaging its inferior products together, it can make its software bundles seem superior to these competitors.

My father owns stock in Microsoft, yet I still do not fully support the company. It may not have committed a physical crime like murder, but it has damaged America's economy by not allowing free trade.

But perhaps economic crimes are not as bad as we think. Most companies recover from recessions, wars, etc.

In my opinion, the only solution to the Microsoft case is to stop it from bundling software. We cannot let Microsoft off too easily, but we should not punish it too hard. Terrorism is a far more important topic for the Supreme Court right now than a company that supposedly stifled innovation.

Sincerely,

Chetan Prabhudesai, 15

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Norman E. Lasko

Microsoft has developed their products for several years. It has produced programs and systems that has greatly benefited millions of consumers, businesses and governments.Without Microsoft's innovations and market savvy we would still be in the dark ages of the computer world Now comes a horde of lawyers (like vultures) seeking to gain large settlements for their benefit. I am convinced that they are not acting to benefit consumers. Just for their own greed Let us put this whole case to rest and let Microsoft continue to be innovative and produce their superior products for all consumers.

Washington, DC 20530

Dear Mr. Ashcroft:

I am happy to hear that the Department of Justice is ending its three-year antitrust lawsuit against Microsoft with a strong and binding agreement. This costly affair should have been ended a long time before this.

Microsoft did not get off easy. The settlement was arrived at after extensive negotiations with a court-appointed mediator. The company agreed to terms that extend well beyond the products and procedures that were actually at issue in the suit- for the sake of wrapping up the suit.

The agreement requires Microsoft to document and disclose, for use by its competitors, various interfaces that are internal to Windows'' operating system products that are used to communicate directly with the basic Windows system. Microsoft has also agreed not to retaliate against software or hardware developers who develop or promote software that competes with Windows or that runs on software that competes with Windows.

Microsoft has been distracted for long enough. This agreement will very much

benefit its competitors. I do not believe any more litigation beyond this settlement is necessary.

Sincerely,

Janey Schumacher

Dear Microsoft Settlement:

This is just a note to say that I feel the currently contemplated settlement with Microsoft is a miscarriage of justice. The company has been and continues to be guilty of monopolistic business practices and is largely responsible for a great amount of the insecurity of the WEB. The only reason they have a fairly productive office suite is because they had to compete with WordPerfect. They did not innovate, it was WordPerfect that was the innovator, but because Microsoft controlled the operating system and could do it. they kept secrets that allowed them to make their product appear to perform better and made WordPerfect have incompatibility problems. They finally practically ruined WordPerfect by dropping prices and forcing computers to bundle their products instead of WordPerfect. The result is that now, they can (and do) raise the prices and of their products since the competition is almost nonexistent and they ship buggy software, full of security holes. I think it is in the interest of the consumer and the industry to place huge monetary penalties on the company and that money be distributed to software companies that used to compete so they can get back in business. Also they should be banned from producing software applications that run under Windows, so that they would have no interest in undermining the performance of thirdparty vendors.

Sincerely,

Doug Schmutz

Not only does the agreement lack effective enforcement, but it seriously fails to address past, present, and future anticompetetive practices. We should also not reward companies that embrace standards for the purpose of perverting them. The end result is that the settlement preserves Microsoft's status quo. As a Senior Software Engineer I find this rather frightening.

Subject: Microsoft Settlement

It was unclear whether the deadline for submission was midnight on 27 January or midnight on January 28, so please accept this submission. The following is my opinion and understanding of Microsoft based upon over 20 years of experience with computers and electronics. I am not affiliated with any Microsoft competitor or free competition group. Microsoft has significantly impacted my choices and capabilities in a TREMENDOUSLY negative way. The impact includes monetary, quality of life, and purchasing freedom. Due to their anti-competitive practices, I have been forced into using an inferior, OVERLY EXPENSIVE, and VERY COMPLEX product in my workplace and where unavoidable, at home.

Microsoft via either restrictive licensing and/or their initially ''free'' products coerces enough people using their product that they can later drive the market. People then must either use the Microsoft product or get left out of significant capabilities which Microsoft did not initially create, but which they have since taken over via either driving the real innovator out of business, purchasing the real innovator (or a competitor), or restrictive licensing. They have the money to do any of the three and have clearly done all of them more times than any other company in history. With only a few exceptions, MICROSOFT IS NOT AN INNOVATOR AND NEVER HAS BEEN. n

Here are some (not exhaustive) examples of Microsoft's successes or at least attempts to own or control nearly all aspects of the computer/electronics industry (percentages or rankings are my guess and better numbers should be easily obtained and will likely be large or increasing):

Operating System (have nearly killed Apple) 60%
Word Processing (have nearly killed Wordperfect, killed Wordstar and others) 80%
Spreadsheets (killed Lotus, I7...) 80%
Presentation 80%
Project Management (hurt FastTrack) 80%
DB (measurable impact to Oracle, Sybase) 40%
Browser (have nearly killed Netscape, killed Mosaic) 79%
Audio Player (will hurt RealPlayer, Quicktime) ??%
Movie Editor (intent to hurt iMovie and Final Cut Pro) ??%
Network-MSN (hurt AOL, others) 30%
Information—.NET, Passport ??%
Servers (significant impact to Solaris, IBM, and HP Unix Servers) ??%
PDA Pocket PC OS (significant impact to PalmOS vendors) 45%
Gaming—XBOX (targets are Playstation, Nintendo, others) ??%
Satellite TV—Ultimate TV (target TiVo) ??%
SW Development.—VisualBasic, C++, Classes (one area which they helped originate)??%
Web Development.—Frontpage ??%
PIMs—Entourage (target Now-Up-To-Date and others) ??%
Encyclopedia—Expedia (target Groliers, others) ??%
E-Mail SW—Outlook (killed Quickmail, hurt Lotus) ??%
Design—bought Visio ??%
Java (attempted hijack of the Sun standard) ??%
News—MSNBC (CNN, Fox, others) #3
eGreeting Cards MSN#4
Expedia Travel #2
Webmail Hotmail Tied #1
Finance MSMoney#5
Housing MSN Home Advisor #4
PC Games AgeOfEmpires #2

As one can see, Microsoft has way too much control of too much of our computing/electronics-related way of life. There are also numerous other areas in which Microsoft has a least some interest and which we are not yet even aware of. EVERYONE knows that once Microsoft decides they want to dominate an area, there are few companies IN THE WORLD which will be able to compete with them. This is due to NOT JUST THEIR PRACTICES, but is also due to their ABILITY and willingness to unethically (and illegally) leverage areas which they already have control.

Please break Microsoft's applications development from their operating system development. I believe this is the ONLY thing that can prevent Microsoft from continued restriction of competition. I strongly look forward to purchasing freedom and use of alternate operating systems and applications, both at home and at work.

Thanks,

Bill Eller

Dear Mr. Ashcroft:

This is in regard to the settlement that has been reached in the government's three- year antitrust case against Microsoft. I want to let you know that I support the settlement that has been reached by the parties involved. The continued pursuit of this case would be a waste of time, money, and human resources. Microsoft will be making a number of specific changes due to the settlement. For instance, Microsoft has agreed to allow computer makers to remove the means by which consumers access various features of Windows, Windows Messenger, Microsoft's Internet Explorer, and Windows Media Player.

Also, the company has agreed to document and disclose various interfaces that are internal to Windows'' operating system products for use by its competitors. I ask that the government accept the settlement, and stop continued litigation against Microsoft.

Sincerely,

Deborah Gouge

Dear Mr. Ashcroft:

I would like to see the Microsoft settlement agreement finalized. The litigation has dragged on for long enough, to the detriment of the entire technology industry.

I work in the tech industry as a consultant for Cerner Company. I have witnessed firsthand how this case has negatively affected the technology world. Settling the case is in the best interest of everyone.

The terms of the settlement agreement are reasonable. Microsoft has agreed to license Windows to the 20 largest computer companies at the same price. They have also agreed not to retaliate against those who promote or develop software that competes with Windows. These types of concessions will help allay fears of anticompetitive business practices.

I appreciate your efforts at concluding this litigation. Thank you for your consideration of my comments regarding this issue.

Sincerely,
Electronically signed
Donald Hamachek

Attorney General John Ashcroft
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

As a retired accountant who has been following the Microsoft antitrust case, I'm still trying to come to terms with the fact that it was determined that Microsoft was acting as a monopoly. How has the public been hurt by the practices of Microsoft? I remember when the price of computers and software was prohibitive for the consumer. Because of Bill Gates'' technical and business acumen, DOS standardized and unified computer systems, and Windows popularized the graphical user interface, dramatically increasing user-friendliness and computer literacy. Thanks in large part to these developments; computers are now commonplace and cheap, reliable and easy to use, and versatile and useful in all kinds of ways.

Now that a settlement has been reached, there is now the threat of more litigation? It's a desperation move on the part of Microsoft's competition. Since they lack the knowledge and the fortitude to compete in the market, they're suing instead. And the attorney generals of the nine states that want increased litigation are only trying to further their careers by getting more money for their respective states. This is grossly unfair.

Microsoft has gone out of its way to cooperate even beyond what was expected. What other company has agreed to license its operating system to the 20 largest computer companies on identical terms, conditions and price?

Microsoft did. How many companies have agreed to disclose various internal interfaces of their operating system to the competition? Microsoft did. I guess that's not enough?! This lawsuit has got to stop. It has dragged on for over three years and may take another three years to resolve. I'm afraid for what this could do to the economy if it is allowed to continue. More poor people have moved up the ranks toward middle and upper middle class because of Bill Gates. have full faith in Microsoft's ability to come back on top if this litigation ends quickly. Otherwise, if the company is allowed to be destroyed, it will have devastating effects on this already fragile economy.

Sincerely,

Andrew Calapai

From: Walt Birdsall
To: Microsoft ATR
Date: 1/28/02 11:29pm
Subject: Microsoft Settlement

From 1979 to 1982, the Federal government squandered millions of taxpayer money trying to destroy one of the finest companies the American industrial genius has ever produced: International Business Machines, commonly known as IBM. With its reputation for boat-anchor reliable hardware and its legendary and meticulous obsession with customer service, IBM was the standard by which all other computer companies were measured.

At the last minute, the Feds broke up the phone company. Today, our computers are world-class and our patchwork quilt phone system is on par with Afghanistan.

The Federal government is now trying to destroy Microsoft, probably using the same legal blunderbusses, the same hapless but deep-pocketed taxpayers, and for the same misguided reasons: it's too big, it's a monopoly, they make too much money, stifle competition... et cetera, et cetera.

Do you folks not learn from past screw-ups?

As a professional software engineer, let me explain Windows to you. Windows is typing. Nothing else is involved. No natural resources were consumed, no wildlife was endangered, no wetlands were compromised, and no child labor laws were violated (although I've known some pretty immature teckkies in my day!) A bunch of ill clad, anti-social, frequently unwashed engineers of dubious morals and execrable personal habits, gather in consort... and they type.

And the public buys it. If you don't like it, don't buy it. Are you with me?

A few years ago, some twit at the Department of Justice crowed about having created a ''level playing field'' with respect to Microsoft. (Sports metaphors are very much in vogue at the DOJ.)

The next day there was great rejoicing in the streets of Bonn, New Delhi, Tokyo, Taipei, and London. They just *love* level playing fields!

It is the nature of the computer business that one company must dominate and set the standards that define the industry. Previously, that company was IBM; today, it is Microsoft. If you damage Microsoft, you will foment an unimaginable Tower of Babel chaos. Do you have any idea of the trillions of dollars of American wealth that have been created and leveraged by Microsoft's craftsmanship? Where would Mike Dell be? Intel? Seagate, Maxtor, and Western Digital, if there were no Windows? How many printers do you think HP would sell if there were no PCs to plug into? The Internet would revert to what it once was: an academic play-toy.

Someday, the natural evolutionary forces of technology will cause Microsoft to be set aside into an honored, hallowed place in industrial fossil history, and to a well-deserved rest. My teckkie brethren and I will then create a new enterprise.

Sadly, no one in government has any understanding in this arena except to meddle and create unimaginable mischief.

Please do us all a favor and just go away.

Walt Birdsall

Retired software engineer

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry.

It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
George A. Gribben, Jr.

Washington, DC 20530–0001
Dear Mr. Ashcroft:

I am writing to tell you what I think of the Microsoft Case. This case is certainly not serving the public interest; it wasn't even brought on by the public. It was brought on because of their competitors'' influence and is now being paid for with tax money. This case is a ridiculous waste of tax money. People are suing Microsoft because they can't compete. I think there is something wrong when the law allows that.

Microsoft is passing on their technology secrets to their competitors and has even promised not to retaliate when competitors create products from that technology that would compete with Microsoft. If that's not fair, then I don't see what would be. Breaking up the company would be disastrous to our country's economy.

This settlement is long past due and needs to be accepted immediately.

Accepting this settlement is the right way to end this mess.

Thank you for your time.

To Whoever it may concern-

I think that the government should accept the settlement from Microsoft. Although Microsoft is a monopoly, in our history there have been many other monopolies. One of them, Rockafeller's oil monopoly, had given him huge profits. Rockafeller had gotten rich on a trust fund. Now the new issue is Netscape vs Internet Explorer.

AOL Time Warner is suing Microsoft because they claim that they have been bundling their software with Internet Explorer browser and that this has reduced the internet market share for Netscape.

Well I don?t think Netscape should be blaming Microsoft when they are actually the ones who are bundling.

They bundle their product with both the hardware and software, making the buyer actually get two things in one.

Not only this, but AOL Time Warner is a huge company. They own many sub-companies. These companies include Warner Bros., AOL, and many other entertainment companies. Because of this, they probably are just suing Microsoft because they want to be the biggest company. Microsoft spokesperson Jim Desler says, ?AOL Time Warner has been using the political and legal systems to compete against Microsoft for years?? This just shows that they sued Microsoft to compete against Microsoft. Microsoft may not be the only ones violating the antitrust act.

January 28, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

The intention of this letter is so that I may express my feelings about the antitrust suit against Microsoft, and the settlement that was reached last November that ended that suit. The Department of Justice and Microsoft agreed to terms on a proposed settlement, and I support that proposition.

I do believe however, that Microsoft should have been left alone in the first place. There are many other corporations that should have received the attention from the government that Microsoft did. There are terms in the settlement that go a little far, especially the ones that force Microsoft to turn over their intellectual property to competitors. They will be documenting various interfaces and source code that is internal to the Windows'' operating system, and giving that to their competitors. This is a travesty of justice.

The antitrust suit against Microsoft was uncalled for, but I guess that the settlement is the best thing that could have happened. It could have been much worse. I support the

settlement because I do not wish to see any further legal action taken against Microsoft.

This entire law suit was brought about because of sour grapes on the part of a few people, namely Sunmicro system's CEO. With his connections with a few Senators, namely Warren Hatch from Utah. He was able to get a senate hearing, and the rest is history.

Gosh darn it, the Federal Government can do us a great deal more good by going after such corporations as big oil. Look at what they are doing with the price of oil, at this very moment, with market control of prices almost varying by zip code. And they talk of Bill gouging the public for his Windows programs and getting by with it due to a lack of competition— please, give me a break.

Ms. Hesse,

This letter presents my comments to the Proposed Final Judgment in the Microsoft Settlement. I object to the PFJ on the following grounds:

-It fails to require the release of the Office file formats. As I IT professional I've seen the lack of alternative Offices packages as a key source of the Microsoft's hold on the desktop since the ability in exchange documents in binary form is a key to collaboration both inside and outside the organization.

-It fails to address Enterprise License Agreements. Microsoft's licensing of both the OS's and Office require payment for all computers. As computers are scrapped due to age the licenses can't be moved the newer machines since OEM's require an OS to be installed.

-It fails to provide an effective enforcement mechanism. Microsoft has shown its willingness to circumvent agreements in the past. Without a strong enforcement mechanism I believe they will do so again.

There have been several lists of issues publish but these are the ones I consider the most important.

Thank you for the opportunity to comment.

Dear Mr. Ashcroft: After three long years, the Department of Justice and Microsoft have reached an agreement ending the antitrust suit brought against Microsoft. I want to give my support to this settlement and ask that you do also.

Microsoft has been more than fair in dealing with this issue. Microsoft has agreed to work with companies to achieve a greater degree of reliability with regard to their networking software; Microsoft has agreed to grant computer makers license to configure Windows so as to promote non-Microsoft software.

The list goes on and on. Microsoft and the Department of Justice obviously want to put this case behind us. Further litigation will only be counterproductive.

Give your support to this agreement. Thank you.

Sincerely,
Virginia Stone

Washington, DC 20530

Dear Mr. Ashcroft:

I recently learned the federal government and Microsoft settled their antitrust lawsuit. As the CTO of a custom software applications firm utilizing Microsoft technology, I would like to express my satisfaction with the settlement of this matter out of court.

Continued litigation on this matter would not be productive and would only serve to make the lawyers rich at the expense of innovation, among other things. That is why Microsoft wants to settle—not to mention it has been forced to spend untold millions on defending itself for the past three years.

Settling this lawsuit will lift the cloud of apprehension and nervousness that has plagued many tech firms since its inception.

The positive affects of settling this matter are quite clear. It will enable my company to continue designing custom applications without the headache of triple-sourcing which is what a Microsoft breakup would have caused. This may sound like a minor thing, however, it is not. It would be an inefficient administrative nightmare that would affect the performance of the company.

It is my hope that the settlement is finalized at the conclusion of the public comment period. It is in everyone's best interest.

The Hon. John Ashcroft;
Attorney General;
U.S. Department of Justice;
950 Pennsylvania Avenue, NW;
Washington, DC 20530–0001

Dear Mr. Attorney General:

The Department of Justice made a good pitch to Americans at the start of the ''U.S. vs. Microsoft'' lawsuit. We were told that the consumer needed government intervention to avoid being injured by Microsoft's unethical business practices. However, three years of litigation have proven enormously expensive for Microsoft and for the federal government. The inevitable result will be that any substantive benefit the settlement brings to the consumer will be balanced or outweighed by the great burden that the suit has been for the IT industry as a whole. Microsoft will have to reveal portions of Windows code to competitors and by being subject to the permanent scrutiny of a three person committee formed to review Microsoft's actions for years to come. This should be considered a fair resolution.

PLEASE—let's stick to the agreement!! Anymore time and resources spent in persuing Microsoft at the federal level can only serve to raise the price of the lawsuit to customers and taxpayers. It is high time to see this matter put behind us. The Department of Justice must end this lawsuit as soon as this period of public comment is concluded.

Very sincerely,
Richard Smith

Subject: Concern re the Microsoft Settlement

Honorable Judge,

I'm writing to ask you to reject the proposed final judgment in the U.S. vs. Microsoft case. Microsoft has been found to have violated our nation's antitrust laws, reaping many billions of dollars of profits in the process.

This proposed settlement would allow the company to retain almost all of that. I am also concerned that there are no provisions to protect us from Microsoft's continuing anticompetitive behavior. There is no indication Microsoft will cease its antitrust violations, and the company is left to police itself!

Actually, the proposed final settlement would amount to a government validation of the monopoly. I urge you to reject the proposed final judgment as it is not in the best interest of the public.

Respectfully,

Subject: My comments on the MS antitrust settlement

My view is that no one operating system should entirely dominate the market.

Not Windows, Mac OS, OS 2 Warp, Linux, Unix, nor Be OS.

So I think Windows needs to be around, but Microsoft has just gotten to big!

I only want to make a few quick suggestions. These comments should be in addition to other remedies already decided.

Microsoft (MS) should be forced to make a choice between the software business and the operating system (OS) business.

If they want to be in the software business, Windows should be made open source. This would prevent MS from taking over the market by virtue of being first to the OS table. It would foster innovation by making the playing field even.

If they want to be in the operating system business, then all other software divisions should be spun off into separate entities (or one big software entity). This again would take away the incentive for MS tying software inexorably to their operating system.

In addition, I like the idea of giving something to education. I think they should donate $800 million cash to the nations schools to be used for computer training and equipment. The schools would be free to choose what-ever brand of computer and operating system they prefer.

That is my two cents! Good luck!
Jim Pulaski

From: Todd Buckley

To: Microsoft ATR
Date: 1/28/02 11:43pm
Subject: Microsoft Settlement

I am writing this letter to voice my concern over the monopoly power that Microsoft Corporation has used in order to retard innovation in the computer industry. I have been a computer user for almost 20 years and I have seen many technologies come and go, but never have I witnessed a company with such zeal and destructive power. I am sure Microsoft truly believes that it is innovating and improving the quality of life for the general computer user, but I find it interesting that the patents held by Microsoft are significantly smaller than patents held by other companies, such as Apple Computers, Inc.

Where has the innovation come from? Microsoft is excellent at copying and mass marketing technology, but they do not innovate for the good of humanity. Quotes like this sum it up, ''Through its conduct toward Netscape, IBM, Compaq, Intel, and others, Microsoft has demonstrated that it will use its prodigious market power and immense profits to harm any firm that insists on pursuing initiatives that could intensify competition against one of Microsoft's core products,'' Jackson wrote in his findings of fact in November 1999.

This is completely true. I have first-hand experience working with Microsoft and it isn1t pleasant. I have watched companies such as Apple Computer, Real Networks, and BE, Inc. create new, beneficial products for the market, but to only get strong armed by Microsoft. And another quote that demonstrates Microsoft1s behavior. ''Many of the tactics Microsoft employed have also harmed consumers indirectly by unjustifiably distorting competition.''

There are numerous things that Microsoft has introduced that have badly hurt the consumer such as Security. Look at how many viruses have been spread. This directly equates to reduced productivity. Where is the innovation? Think about Digital Video. Apple1s Quicktime was the first computer program to use moving images and sound on a broad level for computer users. That was 1990. This lead to Real Networks, or Progressive Networks at the time, which created the ''streaming'' audio and video market over the Internet. It wasn1t until much later that Microsoft finally realized this would be an important part of an end-users experience. Microsoft did not innovate. They used their desktop OS volume to force feed consumers with a second rate technology. After many, seven, development cycles Microsoft has managed to release a good product, but there were good products available before. This behavior does not benefit the end-user.

Apple contracted with a 3rd party to help develop QuickTime for Windows. Unable to countenance Apple's success with a Windows add-on and incapable of developing an equivalent technology within, the Microsoft camp hired the same company to bail out Video for Windows. Lo and behold, Apple programmers discovered amazing similarities in Microsoft's code. Apple filed an injunction and forced Microsoft to rework their code. As part of the recent deal, Microsoft paid Apple 100 million dollars and Apple has agreed to drop such contentious issues and cross license core technologies. Potentially, of course, the market for QuickTime or a Windows equivalent is enormous.

Another example of Microsoft abuse is the user interface. Apple filed patent 5,959,624, in January 1997 which enabled many innovations in the user interface for the desktop computer. Microsoft copied many of these things. Microsoft did not innovate.

There is no justification for Microsoft1s behavior. The massive power and influence of Microsoft has hurt the consumer by limiting innovation. There are numerous more examples I could site, but I want to keep this letter to the point. Microsoft is a monopoly. Microsoft has harmed the consumer directly through its actions. Microsoft has not innovated on the consumers1 behalf. As this settlement continues please, keep these things in mind. Microsoft should not be allowed to continue with ''business as usual'', but they should be punished accordingly. The punishment should not be a simple solution, but a complete solution that will enable an industry to grow and thrive like a balanced eco-system.

Thank you,
Todd Buckley

Subject: Microsoft Settlement

I am a private citizen, not employed by any computer-industry company, organization, or group, writing about my concern the effects of Microsoft's business practices have had on the ''free market''. I have not been asked to write on behalf of anyone, or any company.

Microsoft is a moving target, a company who the courts have recently agreed, has ''won'' by cheating, a company who has a history of using dirty tricks, intimidation, and taking advantage of every possible loophole. They also made a mockery of their last ''agreement'' with the DOJ by violating it at every opportunity, and what has the government learned from these experiences? —Not enough, apparently.

If you will indulge me for a moment, my ''prediction'' for the future is that Microsoft will be spending more & more of their time in courts all over the world, not just in the US. Have you seen Microsoft's FY2001 last quarter's charge of $600,000,000.00 for ''legal expenses''? This trend will be growing —exponentially, and ''rightly'' so. The Chinese, UK, and French governments have realized how firmly they are in Microsoft's grip, and how much of their national wealth is being paid to this (American) gorilla...so much so that the Chinese government's policy is to move to Linux. Others will follow.

I'm quite sure that Sun will continue to develop Star Office. I also think that Apple's Mac OS X will be adopted in more business environments, but only because it does work well in a WinTel-dominated networking world. Apple must improve OS X's interoperability with Windows networking environments to have any real hope of growing their market share. This assumes that Microsoft's moving target strategy, combined with their -embrace, -extend, -extinguish, tactic (''because our customers demand it!''), or the ever-present FUD (Fear, Uncertainty, and Doubt) factor effect, or finally their last big gun, the $36,000,000,000,000 in their savings account, —doesn't slow Apple down so much that it's impossible for them to succeed...a BIG assumption. In the end, even if a few other companies produce a great new product, Microsoft will simply BUY THEM, —if the DOJ allows...just like they bought SGI's intellectual property, i.e. OpenGL...which, by the way, Apple's OS X uses (what a coincidence!), or simply develop a clone and then pollute the original. —Java, anyone? Here's a quote from a very recent article published on the web:

''The second most common critique had to do with my comments about Apple being a niche player. Many readers brought up examples of strong companies that themselves enjoy no more—and sometimes less—than 4.5 percent overall market share. But that reaction is (pardon the expression)

like comparing Apples to oranges. BMW and Ben & Jerry's are viable companies with relatively small market share. But neither of them is competing in a market dominated by one proprietary technology platform. There is no 95 percent gorilla in the jungle of the automobile or ice cream market. But there is one in the personal computer world, and it's called Wintel.'' No, no, no! It's called ''Microsoft'', not ''WinTel''! AMD is a major alternative/competitor, to be fair, and there are several minor players as well, but, —there's only ONE Microsoft. This point is critically important! Microsoft is the world-dominating, company-killing machine; it's Microsoft steering the boat...Intel is a very grateful passenger, trying very hard not to rock the boat (too much). Remember when Intel tried to ''do their own thing'' by developing their own multimedia software, and how Microsoft responded? Nothing happens without Bill's approval, combined with ''plausible deniability''. Sound familiar? Requisite knowledge for CEO's, these days.

Apple has suffered through a decade of negative press, who constantly produce headlines asking the same question, ''Can Apple Survive Another Year? ...why not ask the other, more relevant question, —''How Does Microsoft Constantly Defeat All Other Companies?''...and then ask why consumers, and the US Government, don't seem to care one iota until they find bloody corpses littering corporate America? Netscape, DR-DOS, VisiCalc, Apple (and the innovator, -QuickTime!). Microsoft copies everyone, adds it to their OS, which kills the innovators. ...RealNetworks, and Java, next?

Or, Microsoft ''competes'' with Sony's Playstation by buying up the gaming developers to ensure Xbox-only titles. Sounds a lot like one of the tactics used to ensure the ''success'' of Windows. If Microsoft can't/isn't allowed (anti-trust issues) to buy them up, Intel steps in for the assist; look to the audio & video companies for some recent examples (Terran & Avid). Is this the way companies win? Is this ''competing'' in America?

I have two questions, and I hope you will think about them before coming to a decision regarding an appropriate settlement with Microsoft:

1. (If) I have a great new idea for a piece of software, an idea so good that it is certain to change the way computers are used by everyone...business, consumers, schools, etc... How Likely Is It, That I Could Ever Hope To Bring It To Market Where The 900 Pound Gorilla Rules?

2. Why do the real innovators in today's computing world fare so poorly? How is it possible to have great ideas/products/management/funding, etc...and still fail completely? So completely, that there's room enough only for Microsoft?

Consider that Apple's very future relies on Microsoft continuing to publish MS Office Suite for Macintosh, and that, should Microsoft ever want to put Apple out of business overnight, they could by discontinuing this one product. Think I'm exaggerating?

How is it possible to arrive at a just remedy, without first addressing these issues? As you search for a remedy, consider making —file formats— a ''government & ISO-mandated World Standard''...so that at the very least, Microsoft won't be able to constantly use their embrace/extend/extinguish tactics —''because our customers demand it!''

Consider splitting the company into an Applications Group, and an Operating Systems Group. This is NOT as radical a solution as some have made it out to be.

Consider forcing Microsoft to make Apple (or some other third party company) a licensee of MS Office Suite for Macintosh, to remove the doubt & worry from the marketplace put there by Microsoft, that maybe, one day, we'll stop publishing it for the Mac...then where will all of you poor Mac-users be?

Sincerely,
Kevin Schumacher

Subject: Microsoft Settlement

Dear Sirs,

I truly hope this settlement will be accepted so that this whole matter can be put behind us and we can move on. As a consumer I have often felt that some of the more extreme remedies proposed by some of the Attorney's General and Microsoft's opponents amounted to something of a sword hanging over my head a punishment for all those years ago having abandoned the Apple II in favour of a Gateway PC because I could not afford to buy into Apple's Macintosh ''monopoly''. I could see in Microsoft a company which had offered me a way forward when I was stuck on an aging architecture (the Apple II) being carved and quartered in a way that meant the products I currently use and depend on would be negatively impacted. Suffice to say that whilst I believe Microsoft is not totally blameless, I have never bought into the notion that they are a purely malevolent force and the scourge of the industry, the fact is that Microsoft was never handed a ''monopoly'' it had to earn that position of dominance from scratch and the sad truth is that attaining that position had as much to do with their competitors ineptitude and greed as it did with Microsoft's innovation and savvy. I will not dwell on my differences with the monopoly ruling and all that stemmed from that and some of the crass opportunism on the part of Microsoft competitors and lawyers that continues to flow from that decision, but will focus on my two cents worth regarding this settlement.

The proposed settlement offers not only a way to bring this protracted process to a close, but also addresses the concern of choice and flexibility in the market by giving OEM manufacturers a greater choice in how they configure their PC's without the fear of retaliation from Microsoft. Further the agreement promises to bring a level of openness and transparency to Microsoft's dealing with OEM's by having a published schedule which lays down equal terms for them within defined bands based on the volume of licenses they move and not on their software bundling strategies. Indeed OEM's will have much flexibility in what they can do and will only need be mindful of whether these things are actually what consumers want instead of casting eyes warily toward Redmond. The proposed settlement offers similar flexibility to Internet Service Providers.

The proposed settlement also promises something for application developers by mandating full disclosure by Microsoft of the API's in their so called ''middleware'' products whilst at the same time protecting Microsoft's intellectual property rights, after all Microsoft is going to be an important player in the competitive ecosystem, offering the only credible competition to the likes of AOL, Sony and Palm whilst the likes of these companies keep Microsoft on its toes and the only change in play should come from new players rising on their merits and not the stifling of any player through litigation. This proposed settlement also offers to consumers the real prospect of being able to chose if they wish to remove certain components from Windows which are currently mandatory, it also offers protection for Non-Microsoft ''middleware'' and requires the consumers consent before any Microsoft ''middleware'' can remove any Non-Microsoft icons or alter any default associations to Non-Microsoft ''middleware''.

To oversee this proposed settlement it is proposed there be Technical Committee of three persons to keep a vigilante eye and ensure the spirit and the letter of the agreement are being enforced, I think the nature of its composition should also ensure that it does not overly favour one party or another, something the appointment of a special master may run the risk of. It is also good to see that either party can have a recourse should they feel that any of the TC members is not performing as they should and that they are clear procedures defined for their replacement. The proposed settlement also makes provision for a Microsoft Internal Compliance Officer, someone within Microsoft who would have the responsibility for overseeing Microsoft's compliance with the proposed settlement, giving the buck somewhere to stop; we also see where they would be responsible for a web site that would clearly state how third parties can issue complaints to the TC and it also lays out how the TC would deal with and process these complaints. Five years seems like adequate time for this proposed agreement to run its course but should time prove otherwise a two year extension is readily available, during which time any new remedies could be explored if necessary.

Though I support this agreement over continued litigation, I fear the later may prevail as many powerful interests now seem to have a lot vested in the course of litigation and I fear it is us consumers who will end up paying for this tiresome business through having Microsoft continually drawn away from innovation and toward the court and eventually through it having to recover the expenses off this exercise and its penalties through its products and quite possibly our wallets.

On a whole I must say that whilst I view antitrust as well intentioned I feel it is time

we started to put our minds to more creative and dynamic alternatives, I myself intended to post something for discussion on my website once I purchase it and get the software to put it up. On a whole I feel the antitrust process takes far too long and lacks the dynamism of the market and runs the risk of losing its objectivity to political ambition and commercial intrigue, I think we could do much to make the market more self regulating, competitive and innovative if we could address the monopoly created by patent without robbing the inventor of the rewards that often drive his innovation. Such new thinking could address not only cases in the Computer Industry but also Pharmaceuticals and other controversial industries and also allow truly brilliant ideas and concepts to become universal and broadly applied to the benefit of the consumer and the inventor. Unfortunately that is not for this forum at this time, thank you for taking my submission, I hope my support will help put this issue to rest.

Sincerely,

John Thurlow.

Dear Sir,

I feel that this matter should be laid to rest. For the good of our Nation and our economy. How long will they maliciously try to extort money from a company that has done so much for our economy. In my opinion Microsoft has already paid and settled.

Sincerely,

Raul A Cayado

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers, dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Harold A Harvey

Re: United States v. Microsoft Corp.

Dear Ms. Hesse:

Pursuant to the instructions in the Competitive Impact Statement in United States v. Microsoft Corp., we are submitting to the Department of Justice as an attachment to this e-mail the Comments of SBC Communications Inc. on the Proposed Final Judgment. We would appreciate your sending a reply to this email at your earliest convenience to confirm your receipt of SBC's submission.

In addition, to guard against the risk of a faulty email transmission, we are tonight sending a hard copy of SBC's Comments to you via U.S. Postal Service Express Mail.

Thank you for your consideration.

Very truly yours,

David A. Barrett

SBC Communications Inc. (''SBC'') respectfully submits the following comments pursuant to Sections 2(b) and 2(d) of the Antitrust Procedures and Penalties Act, 15 U.S.C. § 16(b)–(h), relating to the revised proposed Final Judgment that was agreed to on November 6, 2001, by the United States and certain state plaintiffs in these actions on the one hand, and defendant Microsoft Corporation (''Microsoft'') on the other (the ''proposed settlement'').

1. INTRODUCTION

The history of Sherman Act enforcement has witnessed few unlawful monopolies as durable, resilient and exclusionary as Microsoft's. This much is clear from the trial record, the District Court's monopoly maintenance findings and the Court of Appeals' affirmance. Far from providing reassurance that changes in technology will end Microsoft's stranglehold over operating system and middleware competition, or that the company's monopoly will be subject to serious competitive pressures when the proposed settlement's five-year term expires, the record demonstrates the exact opposite. Microsoft's continuing ability to commingle its browser and operating system, which the settlement ignores, leaves Microsoft with the incentive and ability not only to destroy traditional middleware threats to its operating system monopoly, but also to exercise anticompetitive control over the Internet, where server networks currently not dependent on Windows pose the greatest threat to the Microsoft monopoly. The consequences of failing to restrain an ever-expanding Microsoft operating system monopoly—now at over 95% market share—do not, however, fall solely upon software producers whose competitive assaults might erode that overwhelming market domination. Nothing in the proposed settlement would stop the threat that Microsoft's adjudicated and unlawfully-maintained monopoly poses to the very heart of consumer choice in the American economy. The settlement ignores Microsoft's ability to effectively destroy free consumer choice among the far greater array of businesses that use electronic means of communication—such as telecommunications services (local, long distance and cellular), Internet access, voice messaging, instant messaging, video and music services, e-commerce, interactive games, to name a few. The settlement would allow Microsoft to abuse its illegally-maintained control of operating systems by becoming the ultimate ''gatekeeper,'' controlling the bottleneck that both gives businesses in these critical related markets (whether established or still emerging) access to potential customers, and gives consumers the means to reach the providers that they choose to deal with.

Just as Microsoft has for years successfully imposed on consumers its own products and services, irrespective of the comparative merits of competing products it has excluded from the market, Microsoft will—without the kind of strong relief required to break its operating system monopoly—be in a position to repeat its anticompetitive strategy in other markets. Unchecked, Microsoft will favor its own and its partners' services, exclude competitors' products and services from access to consumers, and degrade its rivals'' services and raise their costs (by charging a toll, imposing a tee for listing as an available service or creating an interoperability obstacle). Because potential customers will have to pass through a Microsoft operating system (whether embedded in a PC, a cellular

phone, a set-top box or a PDA), Microsoft will retain the ability to exclude or marginalize all manner of telephone services, messaging products, video or music offerings, Internet services, and other ''utilities'' of modem life. In this way, the Microsoft monopoly threatens to destroy the vast panoply of consumer choice among the myriad sources that create and distribute communications and entertainment products and services. The proposed settlement does virtually nothing to lessen Microsoft's ability to maintain its operating system monopoly and to prevent its enhancement by Microsoft's impeding effective competition for all the products and services that will have to be accessed through Microsoft's monopoly platform.

SBC is one of the businesses that will be significantly impacted. Through its affiliates, SBC provides voice and data communications services throughout the United States and internationally. Some of these services are Internet-based; others are not. Some of SBC's services (such as its unified messaging service, discussed below) would erode Microsoft's operating system monopoly; others will not. All, however, are at risk if Microsoft is not prevented from maintaining and expanding its operating system monopoly. Thus, while SBC devotes a significant portion of its comments to explaining why curing the palpable deficiencies in the proposed settlement is essential to protect Internet-based services that could erode the Microsoft monopoly, including SBC's own ventures, those deficiencies are of equal importance to SBC's core communications businesses.

The reason why the effects of the Microsoft monopoly reach so far can be summed up in a single word—''convergence.'' Convergence refers to the development, for home or office use, of devices or platforms that will provide consumers with multiple communications, computing and entertainment products and services. In order to perform these functions, all such devices or platforms—including personal computers, PDAs, wireless phones and set-top boxes—need to utilize operating systems, whether installed in the device itself or residing on Internet servers. By maintaining and expanding its operating system monopoly across platforms, Microsoft can establish its position as ''gatekeeper'' to all such forms of communications, computing and entertainment services. And as gatekeeper, Microsoft will be in a position to direct customers using these platforms toward its services, to degrade or block access to competitors' services, and to impose costs on those competitors it cannot completely eliminate. By controlling all of these communications gateways, Microsoft will not only preserve its operating system monopoly against all serious threats, it will substantially lessen competition in the provision of innovative new ''convergent'' services.

For example, competition is now growing to reach consumers, through ''gateway'' devices such as PCs or television set-top boxes, with broadband communications signals that can carry everything from TV programming to Internet content to telephone conversations. An estimated 10 million American homes may use such devices next year and 25 million by 2006. See Byron Acohido, Challenging Microsoft? It Could Take Moxi, USA Today, Jan. 16, 2002, at B–3. Microsoft has already announced that it is developing an extension to Windows XP that will allow PCs to function in this manner. Id.; Microsoft Unveils New Home PC Experiences with ''Freestyle'' and ''Mira'' (Jan. 7, 2002), at www.Microsoft.com/presspass/Press/2002/Jan02/01. Unfettered by the proposed settlement, Microsoft can thus use its illegal operating system monopoly to become the literal communications gateway into and out of the American home or office. It then will have enormous power over the products and services consumers use to communicate with each other, to do their work and to entertain themselves.

In this memorandum, SBC addresses the numerous ways in which the proposed settlement fails to meet a paramount goal of relief in this case: To ''pry open to competition'' in the PC operating system market that Microsoft has dominated for over a decade by using blatantly exclusionary tactics.

The following facts are now beyond dispute in this proceeding'.

First, Microsoft's monopoly has been extraordinarily durable, having prospered for over a decade (D.Ct. at ¶35), having increased steadily to over a 95% share even during the litigation (CA at 54; D.Ct. at ¶35), and having enjoyed the continuing protection of significant barriers to entry. See CA at 54–56 (''Because the applications barrier to entry protects a dominant operating system irrespective of quality, it gives Microsoft power to stave off even superior new rivals''); D.Ct. at ¶¶36–44, 61 (''Microsoft could significantly restrict its investment in innovation and still not face a viable alternative to Windows for several years . . . . '').

Second, Microsoft's monopoly has created not only the power, but also the incentive, to exclude competition: every technological innovation that emerged to challenge Microsoft's dominance was met with a successful strategy of anticompetitive exclusion. Microsoft was able to ''extinguish,'' perhaps permanently, the two greatest innovative threats to its dominance that arose in the 1990's—Netscape and Java. CIS at 16–17; see also CA at 76–80 (''Microsoft's ultimate objective was to thwart Java's [and Netscape's] threat to Microsoft's monopoly;'' it adopted as strategic goals to ''kill cross-platform Java'' and interfere with the ability of Netscape's browser to interoperate with Microsoft products); D.Ct. at ¶¶68–77. So long as Microsoft retains the power and incentive to exclude the competitive threats of the 21st century, economic theory predicts, and history demonstrates, that it will seek to evade any regulatory barriers placed in its path. Thus, the prospect of innovation offers no solace to restoring competition, only a sure target for Microsoft's exclusionary conduct.

Third, Microsoft's incentive to engage in calculated predation is so strong that it readily harms consumers and degrades its own products to achieve anticompetitive exclusion. D.Ct. at ¶174 (finding that by commingling ''Microsoft has unjustifiably jeopardized the stability and security of the operating system''), ¶¶408–12 (highlighting harm inflicted upon consumers); CA at 62, 65 (affirming district court findings of consumer harm). It is also revealed in a ''take no prisoners'' approach in which deception, threats, attempts to conspire and degradation of middleware connections were used to stifle competition. CA at 73, 75–77. Nothing in the foreseeable future, much less in the monopoly maintenance record, suggests that marketplace or technological developments alone will suffice to curb Microsoft's market power, its incentive to exclude and its proven ability and willingness to do so ruthlessly.

Finally, Microsoft's monopoly affects the country's most powerful engine of national economic prosperity and productivity—the processing and communication of information. Where monopolization has injured industries of comparable importance, the future of competition has never before been entrusted to illusory promises by the offending firm or to uncertain marketplace developments, unprotected by judicial supervision from recurrent acts of exclusion. See United States v. Am. Tel. & Tel. Co., 552 F. Supp. 131,215–17 (D.DC 1982), aff'd sub nom. Maryland v. United States, 460 U.S. 1001 (1983) (''AT&T'') (rejecting proposed consent decree and ordering its modification based, in part, on the ''complexity and magnitude'' of the decree and the decree's effect ''on the largest corporation in the world ... the entire telecommunications industry, the computer industry... and thus the interests of literally millions of individuals'').

That is why in monopolization cases the law demands that relief must decisively end the anticompetitive practices, prevent their recurrence and extension into new markets, and restore competition. ''Antitrust relief should unfetter a market from anticompetitive conduct and 'pry open to competition a market that has been closed by defendants' illegal restraints.'" Ford Motor Co. v. United States, 405 U.S. 562, 577–78 (1972) (citation omitted). If a decree does not effectively pry a market open to competition, ''the Government has won a lawsuit and lost a cause.'' Int'l Salt Co. v. United States, 332 U.S. 392, 401 (1947). To restore competition, therefore, the relief must take account of all the factors relevant to the offense, including in particular the likely duration of the monopoly power, which, of course, is the wellspring of the incentive as well as the ability to exclude. See Ford Motor Co., 405 U.S. at 575 (affirming ten-year ban on Ford's manufacture of spark plugs; prohibition was a ''necessary step toward the restoration of the status quo ante'' in the market). The government has repeatedly embraced the foregoing standards in this case (see, .c.g., Govt. D.Ct. Memo. at 24; CIS at 3), but its proposed settlement fails their purposes. The ,government has abandoned, without explanation, injunctive relief that it urged upon the District Court as essential to curb Microsoft's appetite for anticompetitive conduct and has agreed to a decree filled with loopholes. For example, although the

Court of Appeals found commingling of browser and operating system code to be unlawful acts of monopoly maintenance, and the government advocated that such commingling be prohibited as ''an especially potent competitive weapon for Microsoft... to target competing middleware threats,'' Gov't D.Ct. Reply Memo at 61, the proposed settlement does not prohibit such conduct. Similarly, although the Department of Justice Antitrust Division Manual provides that the government ''should not negotiate any decree of less than ten years' duration'' and the government in this case objected to Microsoft's initial proposal for a four-year decree because ''there is no sound justification for entering a decree of shorter duration,'' the remedies in the proposed settlement are to last only five years.

The government's retreat from established antitrust policy and from its prior opposition to Microsoft's remedial proposals has grave implications for a competitive economy and for SBC. Not only is Microsoft allowed to repeat conduct, previously found anticompetitive, to protect its operating system monopoly from middleware sources of competition, but it is free to do so where the courts have already recognized an even more powerful threat exists, namely from the Internet. D.Ct. at ¶¶56, 59–60 (cited with approval in CA at 79). Since Internet servers can perform computing functions formerly accomplished only by PCs, networks of servers and PCs that freely interoperate (or ''talk'' to each other)—regardless of the type of operating system software that they use—are a platform for applications not dependent on Windows. This means that the combination of inexpensive computers or handheld devices (like a ''dumb'' PC. a cellphone, or a PDA) and smart server networks connected to the Internet can break the monopoly power of Microsoft's PC operating system by offering a server network alternative that will work with any operating system and provide more and better application choices at less cost. D.Ct. at ¶¶22–27 (cited with approval in CA at 52), ¶¶56, 59–60 (''[T]he rise of the Internet... has fueled the growth of server-based computing, middleware, and open-source software development. Working together, these nascent paradigms could oust the PC operating system from its position as the primary platform for applications development and the main interface between users and their computers.'').

Yet nothing in the government's settlement prevents Microsoft from turning an open Internet into a closed Microsoft environment simply by doing two things: (1) commingling its browser, Internet Explorer (''IE''), with its Windows operating system; and (2) changing the protocol its browser uses to ''talk'' to Internet servers to an undisclosed proprietary standard that will only work effectively with Microsoft servers. Because of the dominance of Microsoft's browser (currently 91% of all browser usage), all web servers would then be forced to have a Microsoft server operating system in order for the servers, and the web sites they host, to be accessible to the vast majority of users. In turn, all consumers and businesses that wish to access the Internet will be forced to purchase a Windows operating system in order to utilize Microsoft's browser. Nothing in the decree prevents this scenario, because Microsoft is free to use its illegally maintained monopoly power to force servers to interoperate only with Windows, such that Microsoft becomes the Internet gatekeeper of a once open and competitive system. Microsoft's operating system monopoly would thereby become still more powerful and durable, as another threat to its dominance is destroyed. In this way, the applications barrier to entry that protects the Windows monopoly will extend to the Internet.

The reality of this threat for the future competitiveness of Internet-based businesses has a direct bearing on a wide range of Microsoft's potential and actual competitors, including SBC. Through its affiliates, SBC provides Internet access and Internet services to customers. SBC is currently developing several new Internet-based businesses, most importantly its Unified Messaging Service (''UMS''), which will compete directly with specific Microsoft products and services. UMS will allow retrieval of voice, e-mail and fax messages from anywhere in the world, using any computer or device running on any operating system. The proposed settlement, however, allows Microsoft to make SBC's UMS product significantly less competitive by taking the two simple steps outlined above. In these circumstances, only Microsoft server operating systems would be interoperable with the vast majority of other devices that access the Internet, and Microsoft would be able to use its server control to discriminate against its competitors.

As this example shows, the omissions and loopholes in the proposed settlement are of no small importance; they have drastic consequences for a competitive economy. So too does the decision to limit the settlement to only five years. The trial court recognized in findings sustained by the Court of Appeals that competitive alternatives to the Microsoft operating system, such as web portals, servers and middleware, take years to develop as viable threats, yet the proposed decree ends almost as soon as it starts—in only five years overall, with some provisions in effect for only four years. No sensible competitor would invest in technology improvements to the maximum extent necessary to challenge Microsoft—innovations that require years to succeed absent predation—when the decree is neither strong enough, nor long enough, to protect them. Yet the government breaks with its own policy of requiring decrees with ten-year terms, despite the fact that Microsoft's monopoly has existed for more than a decade and its unlawful conduct has spanned a period nearly as long.

Equally important, there is nothing in the decree to jump start competition, much less to ''pry open'' the monopolized market to give consumers the benefit of competition that would have existed from the likes of Netscape and Java had Microsoft's exclusionary conduct not ''extinguished'' them. See Schine Chain Theaters, Inc. v. United States, 334 U.S. 110, 128 (1948) (an injunction against future violations is inadequate when it allows the monopolist to retain its ''unlawfully built empires''). Under the Tunney Act, the ''public interest,'' see 15 U.S.C. § 16(e), is not served by a settlement that allows a monopolist to pursue conduct already adjudicated illegal, that leaves open easy escape routes from the proposed decree's proscriptions, and that utterly fails to restore competition to the monopolized market.

When, as here, there is an adjudicated record of serious competitive harm (monopolization) and wrongdoing (anticompetitive exclusion), the responsibility to protect the public from an inadequate settlement is high, and a reviewing court has broad power to do so. AT&T, 552 F. Supp. at 151–53. As the District Court has said, ''The Supreme Court has vested this court with large discretion to fashion appropriate restraints both to avoid a recurrence of the violation and to eliminate its consequences.'' United States v. Microsoft Corp., Civ. Nos. 98–1232, 98–1233 (CKK), Transcript of Proceedings at 9 (Sept. 28, 2001).

For the reasons set forth below, approval of the proposed decree cannot be squared with ten years of government litigation that culminated in resounding appellate holdings of major antitrust offenses. The fact that adverse antitrust consequences will result is clear from the face of the proposed settlement, as well as by comparison to the injunctive provisions defended by the government in its earlier proposed litigated judgment. In fact, adoption of this proposed settlement would be worse than no decree at all, for its negotiated omissions and concessions allow conduct found illegal in the past to continue—such as commingling of code—and thus would appear to prevent even the government from attacking such decree-sanctioned behavior during its term. Such ambiguity surrounding the government's enforcement intentions is in itself affirmatively harmful to the public interest.

II. A MONOP0LIZATION REMEDY MUST RE TAILORED TO THE NATURE AND SCOPE OF THE OFFENSE, THE DURABILITY OF THE UNLAWFUL MONOPOLY, THE IMPORTANCE OF RESTORING COMPETITION TO THE AFFECTED MARKET AND THE LIKELIHOOD OF RECURRING ACTS OF MONOPOLIZATION

A. The Court Of Appeals Sustained A Finding Of Successful And Longstanding Monopolization In A Crucial Technology Industry

The proposed settlement in this case must be evaluated in light of the Court of Appeals' affirmance of the District Court's conclusion, supported by an overwhelming factual record, that Microsoft is guilty of a panoply of illegal activities to maintain and extend its monopoly in the market for Intel-compatible PC operating systems. Microsoft's conduct inflicted significant harm on consumers and competition in violation of Section 2 of the Sherman Act. CA at 50–80.

1. Microsoft Has Monopolized A Critical Industry

Microsoft is the world's largest supplier of computer software for PCs and, in particular, dominates the market for Intel-compatible PC

operating systems software world-wide. Although it has the second-largest market capitalization among American companies, Microsoft's importance extends beyond its financial success, because it is a linchpin of the computer industry (including hardware, peripherals, software and data services), and the computer industry is critical to the functioning of a competitive American economy. See, e.g., Henderson Decl. ¶¶87–98; Romer Decl. ¶17.

2. Microsoft's Monopoly Has Endured For More Than A Decade

Microsoft's operating systems monopoly is an enduring one, persisting for over a decade despite what the Court of Appeals has described as a ''technologically dynamic market.'' CA at 49. Over that same period, the government has been forced to spend resources on a continuous basis to investigate, and then to prosecute, Microsoft for its illegal conduct. The FTC began investigating Microsoft's acquisition and maintenance of monopoly power in the operating systems market in 1990, although it did not bring charges against the company. United States v. Microsoft Corp., 56 F.3d at 1448, 1458 (DC Cir. 1995). Using the FTC's extensive investigation file as a starting point, the Antitrust Division of the Justice Department initiated its own investigation, and in July 1994 filed a civil complaint under Sections 1 and 2 of the Sherman Act, charging, inter alia, that Microsoft unlawfully maintained a monopoly of operating systems for Intel-compatible PCs. Id. That case was settled by a consent decree, thereby avoiding trial on the merits.

Three years later, the Justice Department filed a civil contempt action against Microsoft on the ground that it had violated the decree. On appeal from the grant of a preliminary injunction, the Court of Appeals ruled that Microsoft had not violated the relevant provision of the consent decree, but reserved the question of whether the company's bundling of Internet Explorer with the Windows operating system violated the antitrust laws. United States v. Microsoft Corp., 147 F.3d 935,950 n.14 (DC Cir. 1998). The complaint that gives rise to the instant proceeding was filed in May 1998 by the Justice Department and a group of State plaintiffs, again alleging, inter alia, unlawful maintenance of a monopoly in the PC operating system market in violation of Sherman Act ¶2. CA at 47.

The Court of Appeals affirmed the District Court's finding that Microsoft's Windows operating system accounts for over 95% of the Intel-compatible PC operating system market. CA at 54. As the District Court found:

Microsoft possesses a dominant, persistent, and increasing share of the worldwide market for Intel-compatible PC operating systems. Every year for the last decade, Microsoft's share of the market ... has stood above 90 percent. For the last couple of years, the figure has been at least 95 percent, and analysts predict that the share will climb even higher over the next few years. Even if Apple's Mac OS were included in the relevant market, Microsoft's share would still stand well above 80 percent.

D.Ct. at ¶35.[1]

3. Microsoft's Increasing Monopoly Power Is Protected By Significant Barriers To Entry

The Court of Appeals held that not only was Microsoft's operating system monopoly virtually complete as measured by market share, but also that the monopoly's increasing power and scope derives from a structural barrier—the ''applications barrier to entry''—that protects the company's future monopoly position even as against superior rivals. The Court held that this barrier to entry

stems from two characteristics of the software market: (1) most consumers prefer operating systems for which a large number of applications have already been written; and (2) most developers prefer to write for operating systems that already have a substantial consumer base. This ''chicken-and-egg'' situation ensures that applications will continue to be written for the already dominant Windows, which in turn ensures that consumers will continue to prefer it over other operating systems.

CA at 55 (citations omitted). The Court of Appeals went on to hold that even if Windows may have gained its initial dominance through superior foresight or quality, Microsoft had maintained its position through means other than competition on the merits. ''Because the applications barrier to entry protects a dominant operating system irrespective of quality, it gives Microsoft power to stave off even superior new rivals.'' CA at 56.

4. Microsoft's Monopoly Has Self-Perpetuating Incentives

The Court of Appeals affirmed the District Court's findings regarding a variety of anticompetitive acts by Microsoft that were designed to maintain its monopoly by preventing the effective distribution and use of middleware products—including Netscape's ''Navigator'' browser and the Java cross-platform technologies—that might threaten the Windows operating system monopoly. The Court of Appeals noted with approval the District Court's conclusion that Microsoft's monopoly gives the firm incentives to perpetuate the monopoly by a pattern of exclusionary conduct. CA at 58. As the District Court concluded, ''over the past several years, Microsoft has comported itself in a way that could only be consistent with rational behavior for a profit-maximizing firm if the firm knew that it possessed monopoly power, and if it was motivated by a desire to preserve the barrier to entry protecting that power.'' D.Ct. CL at 37.

5. Microsoft Has Shown Itself Able And Willing To Extinguish Competitive Threats As Fast As They Emerge In A Rapidly Changing Technological Environment, And Willing To Harm Consumers And Degrade Its Own Products In Order To Exclude Competitors From The Market

In its successful efforts to thwart Netscape and Java, Microsoft demonstrated its ability to extinguish competitive threats to its monopoly as fast as they emerged in a rapidly changing technological environment. Microsoft's conduct also evidenced a remarkable willingness to hurt consumers and degrade its own products where necessary to accomplish the exclusion of competitive threats to its dominance.

Both Netscape and Java threatened to facilitate competition in operating systems by permitting software applications developers to write programs for the application programming interfaces (APIs) exposed by these middleware products, which in turn were capable of running not only on Windows, but on other operating systems. If such middleware were permitted to thrive, such ''cross-platform'' applications would have the potential to overcome the applications barrier to entry upon which Microsoft's operating system monopoly rests. CA at 53, 60.

The Court of Appeals upheld the District Court's findings and conclusions that Microsoft engaged in the following unlawful conduct in violation of Section 2 of the Sherman Act for the purpose of maintaining its PC operating system monopoly:

a. License Restrictions

Microsoft prevented OEMs from removing visible means of user access to Microsoft's browser, IE, which thwarted the distribution of rival browsers, primarily Netscape Navigator. CA at 59–61.

Microsoft prohibited OEMs from modifying the initial boot sequence, from adding icons or folders different in size or shape from those supplied by Microsoft, and from using the desktop to promote rival products, thereby preventing OEMs from promoting either browsers or Internet access providers that competed with Microsoft's own Internet access service and that often used Navigator rather than IE. Microsoft's anticompetitive conduct reduced consumer choice for the sole purpose of thwarting a middleware threat to Microsoft's monopoly. CA at 61–64.

b. Commingling Source Code

By placing computer code specific to the web browsing function in the same computer program ''files'' as code supplying operating system functions (i.e., by ''commingling'' the computer code), Microsoft ensured that the deletion of files containing browsing-specific routines would also delete vital operating system routines and cripple Windows' performance. By preventing OEMs from deleting IE, Microsoft deterred OEMs from pre-installing a second browser because doing so would increase the OEM's product and support costs. Had removal of IE been an option, OEMs could have decided to pre-install Navigator. CA at 66. This technological binding of IE to Windows not only reduced consumer choice in the browser market, but also forced consumers to buy a ''loaded'' and arguably slower operating system. The Court of Appeals found that this had no purpose other than to maintain Microsoft's monopoly.

When Microsoft modified Windows 95 to produce the Windows 98 operating system, it took IE out of the Add/Remove Programs utility, which prevented the removal of IE from the operating system. This had the effect of further curtailing end-user control

[1] As recently as January 2002, Microsoft controlled over 96% of the entire PC operating system market, and Apple's Macintosh operating system had only a 2% share. Is Apple Out of the Running in the Operating Systems War? (Jan. 8, 2002), at http://www.websidestory.com/cgi-binwss.cgi? corporate &news&press_l_163.

over the desktop, and reducing usage of rival browser products for the protection of its operating system monopoly. CA at 65.

c. Exclusionary Agreements

To extinguish the competitive threat posed to Microsoft's monopoly by Internet, Access Providers (lAPs) and online services—the other major channel through which browsers could be distributed to consumers—Microsoft entered into agreements with 14 of the 15 largest IAPs in North America under which the IAPs offered their subscribers IE as either the default browser or the only browser. CA at 68.

Microsoft agreed with AOL (the largest IAP) to place the AOL icon in the online service folder on the Windows desktop, in return for which AOL was forced to agree not to promote any non-IE browser, or software using a non-IE browser, except at the customer's request, and even then not to supply more than 15% of its subscribers with a browser other than IE. Because AOL accounted for a substantial portion of all existing Internet access subscriptions, these provisions were highly exclusionary. CA at 70–71.

During the period 199%9, Microsoft made dozens of ''First Wave'' agreements with Internet Software Vendors (''ISVs''), giving them free licenses to bundle IE with their software and preferential support in the form of access to technical information and the right to use Microsoft seals of approval. In exchange, the ISVs agreed to use IE as the default browsing software for any software that they developed with a hypertext-based user interface and to use Microsoft's ''HTML Help,'' accessible only with IE, to implement their applications' help systems. The effect of those deals was to ensure that many of the most popular Internet applications relied on browsing technologies found only in Windows, which increased the likelihood that millions of consumers using applications designed by those ISVs would use IE instead of Navigator. The agreements with ISVs further foreclosed rival browser distribution and curtailed the middleware threat to the Windows monopoly. CA at 71–72.

d. Actual And Attempted Coercion And Retaliation To Exclude Competitors

Microsoft coerced Apple to drop Navigator as the standard browser installed on its PCs, and to substitute IE as the default browser on its Macintosh operating system. Microsoft threatened to cut off production of its ''Office'' business productivity software for Apple PCs (90% of Apple Office suite users relied on the Microsoft version of Office designed for the Macintosh operating system), an action that had no purpose but to maintain Microsoft's operating system monopoly while hurting consumers. Apple was forced to agree to bundle the most current version of IE to the Macintosh operating system for as long as Microsoft continued to support Mac Office, and promised not to promote Navigator on its desktop. CA at 72–74.

Microsoft retaliated against Netscape when Netscape refused to capitulate to Microsoft's demands that it forgo development of Navigator technology as a middleware platform. Microsoft sought to convince Netscape to enter into an illegal market division agreement whereby Microsoft would treat Netscape as a ''preferred ISV'' in exchange for Netscape developing Navigator to rely on Microsoft's platform-level Internet technologies. (At the time of Microsoft's proposal, Navigator was the only browser product with a significant share of the market and the potential to weaken the applications barrier to entry.) When Netscape refused this unlawful arrangement, Microsoft punished Netscape by delaying disclosure of the technical information needed to make Navigator interoperable with Windows, which forced Netscape to postpone release of its new browser. As a result, Netscape was excluded from most of the 1995 holiday selling season. D.Ct. at ¶¶79–91.

e. Efforts To Subvert Sun-compliant Java Technologies

Sun Microsystems created Java,[2] a type of middleware that would support all applications regardless of the operating system they were written for. CA at 74. Programs calling upon Java's APIs will run on any computer that itself is configured for Java; thus, Java enabled software developers to write applications programs that could be run on different operating systems with relative ease. In May 1995, Netscape agreed with Sun to distribute Java with every copy of Navigator, which at that time was the dominant browser. Microsoft violated § 2 in three separate ways in a successful effort to extinguish Java as a competing middleware platform:

''First Wave'' Agreements: The First Wave Agreements were contracts between Microsoft and ISVs for the distribution of Microsoft's proprietary version of the Java Virtual Machine (''JVM''). The agreements required developers to make Microsoft's JVM the default in the programs they developed, in exchange for Microsoft's technical support and other inducements. CA at 75–76.

Deception of Java Developers: Microsoft offered software developers various development tools that purportedly would assist ISVs in designing Java applications, but concealed the fact that aspects of the code generated by the design tools could only be executed properly by Microsoft's JVM. The result was that many developers, relying on Microsoft's public commitment to cooperate with Sun, unwittingly used the programming tools to write Java applications that ran only on Windows, and not other platforms. Microsoft maintained this deception in order to ''kill cross-platform Java by grow[ing] the polluted Java market.'' CA at 76–77. This conduct injured consumers by fraudulently inducing development of corrupted versions of otherwise successful cross-platform middleware, for the sole purpose of protecting the Microsoft monopoly. Id.

Microsoft's Threat to Intel: Intel and Sun had entered into an agreement to create a high-performance, Windows-compatible JVM, and by 1996, Intel had developed a JVM that complied with Sun's cross-platform standards. Starting in 1995, Microsoft's senior management repeatedly requested that Intel stop its cooperation with Sun, and ultimately threatened Intel that if it did not abandon its support of Sun- compliant Java, Microsoft would begin supporting Intel competitors and refuse to distribute Intel technologies bundled with Windows. Intel finally capitulated in 1997. CA at 77–78.

B. The Remedy In This Section 2 Case Must Be Broad And Prophylactic, To Prevent Microsoft From Denying Consumers The Benefit Of Competition By Retaining Illegally-Maintained Monopoly Power

1. Purpose Of Relief

As the government acknowledges in the Competitive Impact Statement, appropriate injunctive relief here must accomplish three things: ''(1) end the unlawful conduct; (2) avoid a recurrence of the violation' and others like it; and (3) undo its anticompetitive consequences.'' CIS at 24 (citing Nat'l Soc'y of Prof'l Eng'rs v. United States, 435 U.S. 679, 697 (1978); United States v. E.I. du Pont de Nemours & Co., 366 U.S. 316, 326 (1961); Int'l Salt Co., 332 U.S. at 401); CA at 107. See also Gov't D.Ct. Memo at 24 (''Permanent injunctive relief ordered in a Sherman Act case must be both forward-looking and remedial. The decree must (i) end the violation, (ii) 'avoid a recurrence of the violation' and others like it and (iii) restore competition to the market.''). Any remedy must be broad in scope and prophylactic in nature so that competition is restored and Microsoft is effectively precluded from further exercise of its monopoly power, even as new products are developed and circumstances in the market change.

a. End Anticompetitive Practices And Prevent Their Recurrence

Any settlement here must be structured to end anticompetitive practices and not merely to prevent repetition of the same illegal conduct. As the Court of Appeals pointedly instructed:

[A] remedies decree... must seek to ''unfetter a market from anti- competitive conduct .... terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.''

CA at 103 (citations omitted) (quoting Ford Motor Co., 405 U.S. 562; United States v. United Shoe Mach. Corp., 391 U.S. 244 (1968)). In the proceedings on remand, the District Court has already recognized that any remedy, in order to be adequate, must go beyond merely prohibiting the conduct in which Microsoft has previously engaged:

The Supreme Court long ago stated that it's entirely appropriate for a district court to order a remedy which goes beyond a simple prescription against the precise conduct previously pursued .... [T]he remedy may range broadly through the practices connected with the acts actually found to be illegal. The Supreme Court has vested this court with large discretion to fashion appropriate restraints both to avoid a recurrence of the violation and to eliminate its consequences.

Microsoft, Transcript of Proceedings at 9 (paraphrasing Nat'l Soc'y of Prof'l Eng'rs, 435 U.S. at 697; and United States v. U.S. Gypsum Co., 340 U.S. 76, 88–89 (1950)).

[2] When this document refers to ''Java'' without any adjectives or other modifiers, it refers to Sun Microsystems' product.

The public interest is not served merely by eliminating past anticompetitive practices; the remedy must eliminate the future recurrence of illegal conduct:

[T]he end to be served is not punishment of past transgression, nor is it merely to end specific illegal practices. A public interest served by such civil suits is that they effectively pry open to competition a market that has been closed by defendants' illegal restraints. If [the] decree accomplishes less than that, the Government has won a lawsuit and lost a cause.

Int'l Salt Co., 332 U.S. at 401 (emphasis added).

A trial court upon a finding of... a monopoly has the duty to compel action... that will, so far as practicable, cure the ill effects of the illegal conduct, and assure the public freedom from its continuance ....

Acts entirely proper when viewed alone may be prohibited. U.S. Gypsum Co., 340 U.S. at 90 (citations omitted); see also United Shoe Mach. Corp., 391 U.S. at 252 (relief should ''render impotent the monopoly''); Nat'l Soc'y of Prof'l Engn'rs, 435 U.S. at 697 (''the District Court was empowered to fashion appropriate restraints on the Society's future activities to avoid a recurrence of the violation and eliminate its consequences'').

In this case, the government has recognized the need to go beyond enjoining current violations to assure that Microsoft's violations do not recur. See Gov't D.Ct. Memo at 24 (''Forbidding the continuance of the violation—here, for example, the anticompetitive bundling of Internet Explorer with the Windows operating system—is necessary but not sufficient to rectify the harm caused and threatened by Microsoft's illegal conduct.'').

b. Restore Competition (Deny The Fruits Of Wrongdoing)

As the government has acknowledged, ''[r]estoring competition is the 'key to the whole question of an antitrust remedy.''' CIS at 24 (quoting E.I. du Pont de Nemours & Co., 366 U.S. at 697); see also U.S. Gypsum, 340 U.S. at 90 (''The conspirators should, so far as practicable, be denied future benefits from their forbidden conduct.''); United States v. Grinnell Corp., 384 U.S. 563,577 (1966) (''We start from the premise that adequate relief in a monopolization case should... deprive the defendants of any of the benefits of the illegal conduct, and break up or render impotent the monopoly power found to be in violation of the Act.''); CA at 103 (a remedies decree must ''deny to the defendant the fruits of its statutory violation'') (citations omitted). As the Supreme Court put it in a holding that is particularly cogent here:

[A]n injunction against future violations is not adequate to protect the public interest. If all that was done was to forbid a repetition of the illegal conduct, those who had unlawfully built their empires could preserve them intact. They could retain the full dividends of their monopolistic practices and profit from the unlawful restraint of trade which they had inflicted on competitors. Such a course would make enforcement of the Act a futile thing unless, perchance, the United States moved in at the incipient stages of the unlawful project.

Schine Chain Theaters, Inc., 334 U.S. at 128.

2. The Law Requires Effective Measures To Accomplish These Results

a. Relief Must Neutralize Monopoly Power At Its Source And Eliminate The Monopolist's Incentive To Exclude Competitors From The Market

A decree must ''break up or render impotent the monopoly power found to be in violation of the Act.'' Grinnell Corp., 384 U.S. at 577. It must ''leave the defendant without the ability to resume the actions which constituted the antitrust violations in the first place.'' AT&T, 552 F. Supp. at 150.

b. Relief Must Anticipate New Forms Of Exclusion, Commensurate With The Evidence Of Microsoft's Incentive To Exclude And Its Willingness To Do So At The Expense Of Consumers And Its Own Product Quality

Because an antitrust remedy, in order to be adequate, must neutralize the monopolist's power to resume the action constituting the adjudicated violation, any remedy ''must effectively foreclose the possibility that antitrust violations will occur or recur.'' Id. at 150. Again, the Supreme Court has given instruction that is directly relevant here:

When the purpose to restrain trade appears from a clear violation of law, it is not necessary that all of the untraveled roads to that end be left open and that only the worn one be closed. The usual ways to the prohibited goal may be blocked against the proven transgressor and the burden put upon him to bring any proper claims for relief to the court's attention.

Int'l Salt Co., 332 U.S. at 400. As the District Court has recognized, even practices not found to be unlawful should be prohibited where necessary to avoid recurrence of monopolization. AT&T, 552 F. Supp. at 150 n.80 (citing United States v. United Shoe Mach. Corp., 110 F. Supp. 295,346–47 (D. Mass. 1953), aff'd, 347 U.S. 521 (1954)). Similarly, the court must impose additional restraints to allow development of new competition in the relevant market. Id. (citing Ford Motor Co., 405 U.S. at 575).

Given the record in this case, the remedy must anticipate new forms of exclusion such that, in view of Microsoft's incentive to exclude and demonstrated willingness to do so, the company may not further restrain trade illegally and is prevented from repeating its past unlawful practices in new contexts.

c. Relief Must Prevent Regulatory (Decree) Evasion

Where the monopoly in question is as powerful and persistent as that maintained over the last decade by Microsoft, there is a real danger that the monopolist will evade the particular provisions of any consent decree that is entered. In order to cope with the threat of regulatory evasion, antitrust judgments must contain broad proscriptions of anticompetitive conduct that will, by their generality, cover new forms of exclusion. See, E.I. du Pont, 366, U.S. at 1254 (An ''injunction can hardly be detailed enough to cover in advance all the many fashions in which improper influence may manifest itself.''); AT&T, 552 F. Supp. at 167 (approving consent decree ordering divestiture, preclusion from specific markets, and compulsory, royalty-free licensing) (''it is unlikely that, realistically, an injunction could be drafted that would be both sufficiently detailed to bar specific anticompetitive conduct yet sufficiently broad to prevent the various conceivable kinds of behavior that AT&T might employ in the future''); Zenith Radio Corp. v. Hazeltine Research, Inc. 395 U.S. 100, 132 (1969) (court may exercise its ''broad power to restrain acts which are of the same type or class as the unlawful acts which the court has found to be committed or whose commission in the future, unless enjoined, may fairly be anticipated from the defendant's conduct in the past''); CA at 103 (court must ''ensure that there remain no practices likely to result in monopolization in the future''). The ''broad power'' the Court has to fashion an effective remedy includes the authority to prohibit exploitation of monopoly power in any manner and to order provisions designed to create and foster new competition, including the disclosure of proprietary information, mandatory licensing, exclusive dealing bans and many other remedies. Gov't. D.Ct. Memo at 26 (citing United States v. Crescent Amusement Co., 323 U.S. 173 (1944); Hartford-Empire Co. v. United States, 323 U.S. 386 (1945); United States v. Glaxo Group Ltd., 410 U.S. 52 (1973); Int'l Salt Co., 332 U.S. 392; Ford Motor Co., 405 U.S. at 572).

In order to prevent evasion of antitrust proscriptions put in place by a consent decree, courts routinely retain jurisdiction in order to modify decrees, resolve disputes, and ensure there is a forum for timely adjudicating whether defendants are in compliance. See, e.g., Int'l Salt Co., 332 U.S. at 401–02; Otter Tail Power Co. v. United States, 410 U.S. 366, 381–82 (1973); United Shoe Mach. Corp., 391 U.S. at 251–52; AT&T, 552 F. Supp. at 215–17 (ordering modification of proposed consent decree to include provisions relating to Court's continuing ability to enforce decree).

d. Relief Must Be Of Sufficient Duration To ''Pry Open'' The Monopolized Market By Allowing Competitive Products To Take Root

i. It Takes Years For Competitive Alternatives—Web Portals, Servers And Middleware—To Develop, Even Assuming Lack Of Obstruction

The applications barrier to entry that Microsoft enjoys through its operating system monopoly will, as the District Court found (and the Court of Appeals agreed), make it extraordinarily difficult for a new operating system to attract enough developers and consumers to be a viable alternative to Windows in any reasonable time frame. D.Ct. at ¶¶30–31; D.Ct. CL at 36; CA at 54–56. The overwhelming majority of consumers will only use Windows because there are already a large variety of applications written for that operating system. Given that it is expensive to port applications from one operating system to another, software developers will generally write applications only for the operating system that is used by the dominant share of PC users.

Software developers and ISPs are now forced, given the economics of the industry, to use Windows, an operating system that

they would not necessarily choose, but that is virtually the sole conduit available to deliver their product to the end-user. Given these circumstances, ''it remains to be seen whether server or middleware-based development will flourish at all.'' D.Ct. at ¶32.

In order to allow alternative operating systems to develop, the public interest demands a decree that will ''pry open to competition a market that [is] closed'' by the enormous applications barrier to entry and by Microsoft's continuous course of illegal conduct. See Int'l Salt Co., 332 U.S. at 401. Given the time necessary for a competitive operating system or middleware product to overcome the applications barrier to entry (if it is possible at all), any sustainable decree must assure consumers, programmers and potential competitors of a lengthy time frame in which to develop new products that can compete with Windows. Without an adequate time frame for competing products to take hold, consumers will be unwilling to scrap the investment in applications, training, and hardware that they have already made in Windows.

ii. Software Developers And Other ''Investors'' Need Confidence That The Decree Will Provide Protection Long Enough To Give Their Investments A Fair Chance To Be Viable

Without a decree that is broad enough to ensure that Microsoft does not continue to benefit from its past practices and erect new barriers to market entry, the very purpose of antitrust relief in monopolization cases will be thwarted. Without a strong and long-lasting decree, Microsoft's entrenched dominance and the threat of further exclusionary conduct will preclude entrepreneurs and other innovators from improving products and services. As the government has acknowledged, ''an injunction which simply bars the precise illegal conduct proven at trial would leave the defendant with the full dividends of [its] monopolistic practices and profit from the unlawful restraints of trade which [it] has inflicted on competitors.'' Gov't D.Ct. Reply Memo at 10 (quoting Schine Chain Theaters, 334 U.S. at 128 (internal quotation marks omitted)).

If the decree leaves any room for doubt whether Microsoft will retain its freedom and power to exclude competitors, then software developers will, in their economic self-interest, continue what they have been doing for years—writing applications that operate solely on Microsoft's platform—thereby perpetuating the very monopoly that this case has found to be illegal. Such a result violates the fundamental tenet that an antitrust remedy must effectively ''restore future freedom of trade.'' See U.S. Gypsum, 340 U.S. at 90 (reversing an injunction limited to sale of gypsum board in Eastern United States and directing entry of injunction covering all gypsum products throughout the country because the ''relief, to be effective, must go beyond the narrow limits of the violation''); see also Glaxo Group Ltd., 410 U.S. at 64 (ordering compulsory patent licensing on appeal where necessary to assure ''the public freedom from... continuance of the illegal conduct'').

Rather than being narrowly drawn, the remedy in this case must be broad, prophylactic, flexible and forward-looking in order to provide competition a safe harbor from Microsoft's exclusionary power.

C. The Tunney Act Requires Courts To Reject Seriously Deficient Decrees

Pursuant to the Tunney Act, 15 U.S.C. § 16, in evaluating an antitrust settlement, a court may not ''rubber stamp'' a proposed consent decree, but must instead ''make an independent determination as to whether or not entry of a proposed consent decree [is] in the public interest.'' Microsoft Corp., 56 F.3d at 1458 (quoting S. Rep. No. 298, 93d Cong., 1st Sess. 5 (1973)); accord AT&T, 552 F. Supp. at 149 & n.74.[3]

In determining whether the consent decree is in the public interest, the Court must begin by defining the public interest in accordance with the antitrust laws, AT&T, 552 F. Supp. at 149 (citing S.Rep. No. 93–298 at 3; H.R. Rep. No. 93–1463 11–12), and ensure that the provisions of the decree will ''preserve free and unfettered competition as the rule of trade.'' Id. (citing N. Pac. Ry. v. United States, 365 U.S. 1 (1958)). The consent decree's provisions must ''break up or render impotent the monopoly power found to be in violation of the Act.'' Id. at 150 (quoting Grinnell Corp., 384 U.S. at 577) and ''must leave the defendant without the ability to resume the actions which constituted the antitrust violation in the first place,'' id. Not only must the decree remedy past violations, ''it must also effectively foreclose the possibility that antitrust violations will occur or recur.'' Id.; see also id. at 151 (''[I]t does not follow that courts must unquestionably accept a proffered decree as long as it somehow, and however inadequately, deals with the antitrust and other public policy problems implicated in the lawsuit.'').

In its first decision involving Microsoft, the Court of Appeals recognized that a more deferential review standard is appropriate under the Tunney Act in cases where there has been no trial and hence ''there are no findings that the defendant has actually engaged in illegal practices.'' Microsoft Corp., 56 F.3d at 1460–61. It follows, therefore, that where there are express findings based on a full trial record ''that the defendant has actually engaged in illegal practices,'' id., a more intensive Tunney Act review is required. Accord AT&T, 552 F. Supp. at 152. In the instant case, there have been both a lengthy trial on the merits and exhaustive findings of illegal monopoly maintenance by Microsoft—findings that the Court of Appeals expressly affirmed. Thus, unlike in more routine Tunney Act proceedings involving settlements without adjudicated findings of liability, the proposed consent decree in this case is subject to a more searching standard of review by the trial court. See also U.S. Gypsum Co., 340 U.S. at 89 (''[C]ourts should give weight to the fact of conviction as well as the circumstances under which the illegal acts occur. Acts in disregard of law call for repression by sterner measures than where the steps could reasonably have been thought permissible.'').

The AT&T case provides strong support for applying a higher degree of scrutiny in this case than in the typical Tunney Act proceeding. In AT&T, while noting that ordinarily a degree of deference to the Department of Justice's view that a settlement is in the public interest is appropriate, the District Court held that such deference was not warranted where the court had heard ''what probably amounts to well over ninety percent of the parties' evidence both quantitatively and qualitatively, as well as all of [the parties'] legal arguments.'' 552 F. Supp. at 152. The District Court thus concluded that it was ''in a far better position than are the courts in the usual consent decree cases to evaluate the specific details of the settlement.'' Id. The Court of Appeals, in its first Microsoft opinion, embraced this distinction and specifically contrasted the AT&T consent decree proceeding with the first Microsoft decree, which was presented before any evidence had been taken. See Microsoft Corp., 56 F.3d at 1461.

The circumstances now justify a searching and demanding review of whether the decree is in the public interest. The settlement here is not before the Court ''in the first instance,'' or even with ''ninety percent of the parties'' evidence'' presented (as in AT&T,) but rather after a full trial on the merits and multiple findings that Microsoft violated the Sherman Act. The District Court now has before it all of the trial evidence, as well as Findings of Fact and Conclusions of Law, affirmed by the Court of Appeals, regarding the relevant market and Microsoft's illegal, anticompetitive conduct. The Court may therefore make a fully informed and independent determination concerning whether the settlement is truly in the public interest.

As in AT&T, close scrutiny of the settlement is also necessary because of its importance to the national economy. In refusing to narrow the scrutiny given the consent decree, the District Court in AT&T noted that given the ''potential impact of the proposed decree on a vast and crucial sector of the economy and on such general public interest as the cost and availability of local telephone service, the technological development of a vital part of the national economy, national defense, and foreign trade, the Court would be derelict in its duty if it adopted a narrow approach to its public interest review responsibilities.'' AT&T, 552 F. Supp. at 152.

The proposed settlement here is of no less importance. This settlement has broad ramifications for the national economy, especially in technology development, and impacts millions of American consumers—ramifications with little precedent in the

[3] The provisions of the Tunney Act allow the Court to consider a wide variety of factors in determining whether a consent decree is in the public interest, including: (1) the competitive impact of such judgment, including termination of alleged violations, provisions of enforcement and modification, duration of relief sought, anticipated effects of alternative remedies actually considered, and any other considerations bearing upon the adequacy of such judgment; (2) the impact of entry of such judgment upon the public generally and individuals alleging specific injury from the violations set forth in the complaint including consideration of the public benefit, if any, to be derived from a determination of the issues at trial. 15 U.S.C. § 16(e)(1)–(2).

history of antitrust jurisprudence. In such circumstances, the Court's careful, independent review is essential to ensure the decree serves the public interest.

Finally, the proposed settlement also requires heightened scrutiny because half of the States that joined in prosecuting the case do not agree that the settlement would protect the interests of their citizens. The government is now expressing views substantially inconsistent with its expressed positions at earlier stages of the case. Where elected representatives of the public are sharply divided on whether the settlement actually serves the public interest, any questions concerning whether the settlement is fair to the public must be subject to exacting scrutiny. ''None of this means, of course, that the Court would be justified in simply substituting its views for those of the parties. But it does mean that the decree [should] receive closer scrutiny than that which might be appropriate to a decree proposed in a more routine antitrust case.'' AT&T, 522 F. Supp. at 153.

THE PROPOSED SETTLEMENT FAILS IN EVERY MATERIAL RESPECT TO ACHIEVE THE OBJECTIVES OF RELIEF REQUIRED BY THIS CASE AND AFFIRMATIVELY PROVIDES A ''GREEN LIGHT'' AND AN INCENTIVE TO ENGAGE IN EXCLUSIONARY CONDUCT

A. The Government Has Abandoned Its Prior Effort To Use Injunctive Relief To ''Pry Open'' The Monopolized Market, Conceding That Its Purpose Is Now Merely To Protect ''Nascent'' Threats To The Windows Monopoly

The Court of Appeals affirmed findings that Microsoft extinguished all tangible threats to its operating systems monopoly. CA at 79; D.Ct. at ¶¶68–77. The findings also support the conclusion that if Microsoft had pursued competition on the merits rather than anticompetitive conduct, significant erosion of its monopoly would have occurred. See generally CA at 58–79. Certainly, that is what Microsoft's CEO believed when he envisioned the Windows operating system being ''commoditized'' by Netscape. D.Ct. at ¶72. The proposed settlement does nothing to deprive Microsoft of either the ''fruits'' or the source of its successful strategy of extinguishing competition, nor does it restore to consumers the benefits of the choices that they would have had if Microsoft's illegal conduct had never occurred.

At this stage of the proceedings, the government states that its goal is merely to ''restore the competitive threat that middleware products posed prior to Microsoft's unlawful undertakings.'' CIS at 3. These were, as the government admits, merely ''nascent threats,'' id. at 24, 25, not the fully-developed alternatives that would have existed today but for Microsoft's conduct. The competitive threats to the Microsoft monopoly were stillborn, not as a result of fair competition but, as the government acknowledges, because of Microsoft's predation:

> Through its actions against Navigator and Java, Microsoft retarded, and perhaps extinguished altogether, the process by which these two middleware technologies could have facilitated the introduction of competition into the market for Intel-compatible personal computer operating systems.

CIS at 16–17. Although the CIS acknowledges that merely prohibiting future instances of Microsoft's past exclusionary, monopolistic conduct is not sufficient to restore competition, in reality that is all the proposed settlement attempts to do, and even those minimal efforts are unavailing.

indeed, in the earlier remedy proceedings, the government characterized Microsoft's view of appropriate relief (which the government has now largely adopted) as a ''crabbed view of antitrust remedies:''

> [E]specially in an industry like the software industry, which as Microsoft has repeatedly emphasized is rapidly changing, a remedy limited to barring repetition of the precise acts in the precise contexts that were at issue in the trial could not possibly serve the required purposes of preventing recurrence of the violations and restoring competition.

Gov't D.Ct. Reply Memo at 49. It is therefore ironic that the government now embraces in the proposed settlement many of the same substantive decree provisions it earlier dismissed as woefully inadequate.

Presaging the current dispute over remedies, the government stated in a pleading before the District Court almost two years ago:

> In crafting an effective Sherman Act remedy, a court must use the record of a backward-looking trial to fashion forward-looking relief. Looking forward, the Court must anticipate that Microsoft, unless restrained by appropriate equitable relief, likely will continue to perpetuate its monopoly by the same anticompetitive methods revealed at trial, although directed at whatever new competitive threat arises. Neither the Netscape browser nor Java continues to have the prospect of lowering the applications barrier to entry, and it is not certain where future threats to Microsoft's operating system will arise.

Gov't D.Ct. Memo at 27–28. The government then went on to describe as potential middleware or platform threats to Microsoft's operating system monopoly such products and technologies as Microsoft's own Office suite; applications such as voice recognition software, media streaming technology and email programs; server operating systems (and the need for interoperability between PCs and servers); and non-PC devices such as PDAs and hand-held computers. See id. at 28–29.

A settlement such as this one, which limits itself to protecting the next generation of emerging threats instead of ''prying open'' the monopolized market (thereby effectively blessing the extinction of the first generation and the preservation of Microsoft's monopoly), cannot claim to serve even this minimal goal without anticipating and prohibiting, with both specificity and generality, the many ways in which Microsoft can thwart new forms of competition from novel or different technologies, such as those listed by the government. In this regard, it is noteworthy that the Court of Appeals, like the District Court, found that Microsoft's commingling of its browser and operating system codes constituted illegal monopoly maintenance. CA at 64–67. Yet the settlement would allow such conduct to continue. And as long as such commingling is allowed, Microsoft has the power to prevent the next generation of computing on web and network servers, nascent or otherwise, from overcoming its operating system monopoly. Thus, the decree does not even bar ''repetition of the precise acts in the precise contexts that were at issue in the trial.'' Gov't D.Ct. Reply Memo at 49.

B. The Proposed Settlement Is Riddled With Loopholes That Invite Evasion, Does Not Anticipate And Prohibit New Forms Of Exclusionary Conduct To Protect The Windows Monopoly, And Discourages The Development Of Competition To Windows

1. The Proposed Settlement Provisions To Protect Middleware Do Not Adequately Address Microsoft's Past Illegal Conduct, Much Less Prevent Its Recurrence In The Future

One of the principal threats to the dominance of Microsoft's operating system monopoly was middleware, which refers to ''software products that expose their own APIs.'' CA at 53; D.Ct. ¶¶28, 68. Since middleware exposes APIs for which software developers can write programs, it can provide a less time-consuming and cheaper means of writing applications that can run on various operating systems. Id. Anything that reduces the need to adapt, or ''port,'' an application to competing operating systems threatens to overcome Microsoft's monopoly in the PC operating systems market by eliminating the applications barrier to entry. CA at 54–56; D.Ct. at ¶¶68–78.

Unfortunately, the provisions that address middleware are so limited and rife with exceptions as to be virtually meaningless. Sections III.C and III.H of the proposed settlement are inadequate in at least the following respects: (a) the definitions of key terms invite easy evasion and make Microsoft's compliance virtually discretionary; (b) while the settlement is fairly specific in limiting Microsoft's ability to restrict OEMs from promoting competing software, it is silent on a crucial tactic—technological binding [4]—that Microsoft was proven to have used to the same exclusionary ends; and (c) the settlement undermines its own purported goals by including exceptions to each prohibition that largely negate the relief ordered. In its narrowness, the settlement also ignores new products, the potential for future innovation, and novel methods by which similar anticompetitive results may be achieved. As such, the decree fails either to remedy past effects or prevent future anticompetitive acts from occurring.

a. The Definitions In The Decree Effectively Leave Compliance At Microsoft's Discretion

[4] The terms ''binding'' or ''commingling of code'' refer to including software or a link to web-based software in an operating system product in such a way that either an OEM or end-user cannot readily remove or uninstall the code without degrading the performance or impairing the functionality of the operating system. ''Bundling'' refers to the sale or marketing of different software products in a single package, but without commingling of their codes.

i. The Definitions Of ''Microsoft Middleware'' And ''Microsoft Middleware Product'' Encourage Microsoft To Continue Binding Middleware To Its Monopoly Windows Operating System

The definition of ''Microsoft Middleware'' is of crucial importance because, if a program constitutes ''Microsoft Middleware,'' Microsoft is then subject to requirements that it disclose the programming interfaces and communications protocols by which the middleware interoperates with the Windows operating system. The definition also triggers Microsoft's obligation to allow OEMs to re-configure the PC desktop to give purportedly equal access to competing middleware. See CIS at 17–18; RPFJ §§ III.C, III.D, III.E. As shown below, these disclosures and obligations are not adequate to accomplish their avowed purpose. The government's stated goal is to ensure the viability of the OEM distribution channel for competing middleware products and the ability of those products to achieve ''seamless interoperability'' with the Windows operating system. CIS at 38.

The proposed settlement defines ''Microsoft Middleware'' as software code that: (1) is distributed separately from the Windows Operating System Product; (2) is trademarked; (3) provides functionality similar to a Microsoft Middleware Product; and (4) has the code necessary to be considered a self-contained product. See RPFJ § VI.J. Because each element of this definition is too narrow or too easily evaded by Microsoft, the obligations that are triggered by the definition are largely illusory.

The first part of this definition bears directly upon Microsoft's practice of initially distributing a middleware product separately, then bundling it for sale with Windows, and finally binding it to the operating system. See D.Ct. at ¶¶155–74 (discussing employment of these tactics with IE). Binding, or commingling of source code was held by the Court of Appeals to be illegal conduct used by Microsoft to eliminate the browser threat. See CA at 64–67; D.Ct. at ¶¶159, 170–74. It is unnecessary technically and has no procompetitive justification. Id.

The practical effect of the settlement's definition, however, is to allow Microsoft to achieve the same anticompetitive results merely by omitting the first of the three steps mentioned above. Simply by bundling middleware applications with the operating system from the outset (so that they would not be ''distributed separately''), Microsoft may render any provision regulating its use of ''Middleware'' a nullity. Because the settlement contains no limitations on bundling or commingling of Microsoft middleware with the monopoly operating system, the definition actually encourages Microsoft to engage in anticompetitive practices—i.e., commingling of code—in order to avoid application of the decree.

Second, the definition of ''Microsoft Middleware'' requires that the product must be trademarked. Simply by not seeking a trademark, Microsoft can ensure that its middleware will not be covered by the settlement's provisions.[5] This means that Microsoft can distribute any product that may have other intellectual property protections, such as copyright or patent protection, but that is not trademarked, without the product being considered ''Middleware.'' Of course, if Microsoft chooses to bind a product to the operating system and not distribute it separately, there would be no need to trademark the product.

The third requirement, which refers to the functionality of a ''Microsoft Middleware Product,'' further limits the scope of the ''Microsoft Middleware'' definition. This is because the definition of ''Microsoft Middleware Product'' lists by name several products traditionally considered middleware, including Internet Explorer, Microsoft's Java Virtual Machine, Windows Media Player, Windows Messenger, Outlook Express, and their successors in the Windows operating system. See RPFJ § VI.K. But limiting the definition of Microsoft ''Middleware'' only to those products which in the past were distributed as middleware fails to account for future development of new products. In addition, the definition omits important existing products, such as Microsoft Office[6] 6 and Internet telephony products, that perform functions analogous to the listed ''middleware'' products.[7]

The fourth requirement is that the code must be ''self-contained.'' This too encourages commingling of Microsoft middleware with the operating system, because it allows Microsoft to create cross-dependent products solely to avoid complying with the provisions applicable to ''Middleware.'' If Microsoft is allowed to commingle the code for the products in such a way as to create cross-dependencies between the operating system and middleware (as it did illegally for IE), it can avoid compliance with many of the substantive provisions in the decree.[8]

In the CIS, the government explains that the definitions of ''Microsoft Middleware'' and ''Microsoft Middleware Product'' include the ''functionality'' of a number of existing Microsoft middleware products, including IE, Windows Media Player, and Outlook Express. See C1S at 17–20. What is not mentioned, however, is that the government previously advocated a definition of middleware that was truly based on the function of middleware and, as such, there was no need to distinguish between ''Microsoft Middleware'' and ''Non-Microsoft Middleware.'' See Final Judgment § 7(q).[9] Nor does the CIS discuss the fact that in the event that a particular item of software code fails to meet any one of the four definitional requirements in the settlement, it will not be regulated at all by sections III.C, III.D, and III.E of the decree. This is significant, because the definition as it stands now neither comports with the traditional definitions of middleware, nor with the way the courts in this case have used the term. See, e.g., CA at 53.

ii. The Definition Of ''Non-Microsoft Middleware Product'' Is Too Narrow To Protect The Ability Of Products And Competitors To Gain Equal Access To The OEM Distribution Channel

[5] Even the settlement's definition of ''trademark'' is so broad as to further limit the scope of the decree: ''Trademarked'' means distributed in commerce and identified as distributed by a name other than Microsoft(r) or Windows(r) that Microsoft has claimed as a trademark or service mark by (i) marking the name with trademark notices, such as ?? or TM, in connection with a product distributed in the United States; (ii) filing an application for trademark protection for the name in the United States Patent and Trademark Office; or (iii) asserting the name as a trademark in the United States in a demand letter or lawsuit. Any product distributed under descriptive or generic terms or a name comprised of the Microsoft(r) or Windows(r) trademarks together with descriptive or generic terms shall not be Trademarked as that term is used in this Final Judgment. Microsoft hereby disclaims any trademark rights in such descriptive or generic terms apart from the Microsoft(r) or Windows(r) trademarks, and hereby abandons any such rights that it may acquire in the future.'' RPFJ § VI.T. Thus, Microsoft may release a new middleware product entitled WindowsTM Telephone, for example, and because the name is descriptive rather than trademarked, it would not be considered ''Microsoft Middleware'' under the terms of the decree.

[6] Significantly, by omitting Microsoft Office from the list of middleware products, the government has eliminated from the proposed settlement a middleware product that provides Microsoft with a de facto monopoly in the middleware market. As of March 1997, Office's market share had reached 90%, a figure that has likely grown since that point. See Jesse Berst, Office Suites for Free ZDNet AnchorDesk (March 7, 1997), at http://www.zdnet.com/anchordesk/story/story—743.html; see also, Benjamin Woodhead, Microsoft's Australian Monopoly? Let the U.S. Handle It, iTNews (Nov. 17, 1999), at http://www.itnews,com.au/story.cfm?ID=507 (referring to the lack of recent statistics on Office Suite's market share, ''We don't bother to measure that market anymore because Lotus and Corel have been squeezed out of it ... No one will pay for that sort of research because everyone knows what the answer is.'').

[7] Describing the functionality of a product in terms of the categories of applications, rather than the operation of the product, also limits the effectiveness of section III.H of the proposed settlement, which relies heavily upon the definition of ''Microsoft Middleware Product'' to set the parameters of non-Microsoft middleware access to the OEM distribution channel.

[8] An example of cross-dependency is the link between IE and Microsoft Word in the Windows Operating System Product. Even if an end-user has selected Navigator as her default browser, IE may automatically launch if the user clicks on a URL, (i.e., an Internet address) that is contained in a Word document.

[9] The Final Judgment contained the following definition for Middleware, which it applied to both Microsoft and Non-Microsoft Middleware: ''Middleware'' means software that operates, directly or through other software, between an Operating System and another type of software (such as an application, a server Operating System, or a database management system) by offering services via APIs or Communications Interfaces to such other software, and could, if ported to or interoperable with multiple Operating Systems, enable software products written for that Middleware to be run on multiple Operating System Products.

Examples of Middleware within the meaning of this Final Judgment include Internet browsers, e-mail client software, multimedia viewing software, Office, and the Java Virtual Machine. Examples of software that are not Middleware within the meaning of this Final Judgment are disk compression and memory management.

From the outset, the government has supported injunctive relief designed both to give OEMs control over how to configure the PCs they sell and to provide end-users with the ability to remove Microsoft middleware from their computers. See Gov't D.Ct. Reply Memo at 45–47, 60–64. Sections III.C and III.H rely on the definition of ''Non-Microsoft Middleware'' to identify the competing software products that Microsoft must allow OEMs to include on the Windows desktop if they so choose and to distribute to consumers. The intention was to open the OEM channel to distribution of competing software and thereby remove one of the barriers Microsoft had erected to protect its Windows monopoly. Indeed, the definition of ''Non-Microsoft Middleware Product'' encompasses those technologies that Microsoft ''extinguished'' (such as the Netscape browser) as it defines the products entitled to protection. Before a new program receives this protection, however, the settlement's definition of ''Non-Microsoft Middleware Product'' requires that at least one million copies of the product must have been distributed in the previous year. RPFJ § VI.N. This onerous requirement defeats the government's express purpose of giving new products an adequate chance at the OEM distribution channel.

The CIS asserts that this level of distribution is ''minimal'' and ''necessary'' so that Microsoft's affirmative obligations will not be triggered by ''minor'' or ''non-existent'' products. CIS at 20–21. There is no support in the record, however, or in antitrust law generally for the notion that only large competitors deserve protection. ''Minor'' new products, i.e., the nascent competition that the CIS claims will be restored, deserve protection no less than older, more significant ones. One thing that the history of the software industry proves is that some of the most popular products and services were created by the ingenuity of small firms working alone without means of distributing their products. Most, even with the OEM distribution channel opened to them, failed to distribute one million copies the first year on the market, and the CIS cites no evidentiary support for setting the distribution trigger at the extraordinary level of one million copies.

Through this definition, the settlement creates a major obstacle to new products or competitors being able to obtain wide release and distribution of innovative products. Moreover, it has the additional pernicious effect of allowing Microsoft ample time to develop and promote or announce a preemptive offering before the non-Microsoft product reaches the one million distribution mark. Final Judgment § 7(q).

iii. The Definition Of ''Windows Operating System Product'' Grants Microsoft Unfettered Discretion To Decide What Is And What Is Not Part Of Its Operating System

The settlement defines ''Windows Operating System Product'' as a closed universe of past operating system products that is comprised of the software code of Microsoft's currently-distributed versions of its PC operating system, including Windows 2000 Professional and Windows XP Home and Professional, and their successors. RPFJ § VI.U. The definition also leaves in Microsoft's ''sole discretion'' the determination of what software code constitutes future versions of the Windows Operating System Product. Id. The CIS fails to explain why the definition in the proposed settlement does not establish an objective standard, but instead entrusts such determinations to Microsoft's ''sole discretion.'' Additionally, rather than explaining how the definition impacts upon the objectives of the decree and why it was drafted in this way, the CIS merely states that the definition leaves ''packaging'' (read: bundling or binding) decisions in Microsoft's hands. CIS at 23–24.

The government fails to reconcile this definition with the Court of Appeals' finding that Microsoft utilized commingling of code to maintain its monopoly. Nor does it explain how the definition meets the government's avowed goal that the settlement put an end to Microsoft's past monopolistic conduct. The definition gives Microsoft incentives to integrate middleware into its operating system to avoid having middleware products classified as such.

Of particular importance for the future, the definition fails to take into account that Microsoft manufactures non-PC and non-desktop PC operating systems, such as an operating system for personal digital assistants (PDAs) and other handheld devices. These systems include Windows CE 3.0, Windows NT ?? Embedded 4.0, Windows CE for Automotive, Windows 2000 with the Server Appliance Kit, Windows for Smart Cards, Windows CE .NET and Windows XP Embedded. Any settlement that serves the public interest must cover new products that Microsoft can and will use to protect its PC operating system monopoly. There is an extensive set of devices which are the target for these systems beyond PDAs and pocket PCs, including smart phones, smart TVs, gaming devices, web pads, Internet appliances, media appliances, digital cameras, printers, scanners, retail point of sale devices, Windows based thin-client terminals, set-top boxes, residential gateways, automobile computing systems, home servers, industrial control devices and smart cards. In short, the proposed settlement's definition ignores both past and future operating system products. A proper definition of ''Windows Operating System Product'' would both recognize Microsoft's past product releases and include all Microsoft operating systems for any hardware device, including PCs, servers and handheld computing devices.[10]

b. The Settlement Fails To Prohibit Tactics Used By Microsoft To Foreclose OEM Distribution Of Competing Products And Allows That Unlawful Behavior To Continue

The proposed settlement effectively endorses, through its silence, tactics previously employed by Microsoft to prevent OEMs from becoming an effective distribution channel for competing middleware products. Among the deficiencies in section III.C of the settlement are: (i) its failure to prevent Microsoft from binding middleware to its operating system; (ii) its failure to require Microsoft to set meaningful price differentials between ''fully loaded'' and ''stripped down'' (without Microsoft Middleware) versions of the Windows operating system that could ''pry open the market'' for competing bundles of software and middleware offered by OEMs and third-party customizers; and (iii) the inclusion of limitations and loopholes that undermine the purpose of the decree provisions.

i. A Prohibition Against Commingling Of Code Is Necessary To Prevent Microsoft From Continuing To Exclude Competition That Threatens The Windows Monopoly

The Court of Appeals affirmed the District Court's findings that Microsoft's commingling of the code for IE with the code for Windows and its refusal to allow end-users to remove the IE browser from the Windows desktop constituted exclusionary acts in violation of Section 2. See CA at 66–67. Binding the IE middleware product to the Windows operating system injured both Netscape and consumers by degrading the ability of Netscape to effectively interoperate with Windows, thus reducing consumer options in browser choice, and by ensuring that deletion of files containing browser-specific functions would also delete vital operating system routines, thus crippling Windows. CA at 65–66 (citing D.Ct. at ¶164). Microsoft's anticompetitive purpose so dominated its business decisions that it degraded its own products by binding, since commingling of code decreased the security and reliability of Windows. CA at 62, 65; D.Ct. ¶174.[11]

In response to these acts, the government initially advocated a prohibition against the binding of software to the operating system, in order to prevent Microsoft from repeating the illegal conduct that the Court found it undertook with respect to the browser. See, e.g., Findings ¶¶164, 166–74, 176; see also Zenith, 395 U.S. at 132 (a remedy should prevent defendant from repeating the ''same

[10] The definitions of ''Windows Operating System Product'' and ''Personal Computer,'' read together, also create an ambiguity that places in doubt whether future versions of Microsoft's operating system will even qualify as a ''Windows Operating System Product'' under the proposed settlement. Windows XP is Microsoft's first PC operating system designed for shared or multiple person use. Microsoft has promoted XP's ability to facilitate home networks where many people can share devices and Internet connections.

See Experience the Connected Home: Share One or Many Computers (May 9, 2001), at http://www.microsoft.com/windowsxp/home/evaluation/experiences/connectedhome.asp. Because Windows Operating System Product is defined as software ''distributed commercially by Microsoft for use with Personal Computers,'' RPFJ § VI.U, and the definition of ''Personal Computer'' means ''any computer configured so that its primary purpose is for use by one person at a time,'' RPFJ § VI.Q, if XP or its successors are distributed primarily for multiple users or employed for construction of mini-networks or servers, successor products could fail to meet the definitional requirements to be covered under the decree. See RPFJ § VI.Q (expressly excluding servers and other computing devices from the definition of Personal Computer).

[11] ''Binding harmed consumers who did not want Internet Explorer, by causing 'performance degradation, increased risks of incompatibilities, and the introduction of bugs.'' Felton Decl. ¶84 (citing D.Ct. at 173).

type or class'' of unlawful conduct). Forced bundling injures consumers directly and injures competition by increasing the costs rival software vendors must incur to get their products distributed effectively. It is an especially potent competitive weapon for Microsoft because Microsoft is able to target competing middleware threats—like the browser—by bundling its own version with its operating system monopoly, thereby protecting that monopoly.

Gov't D.Ct. Reply Memo at 60–61 (emphasis added). Indeed, the government's chosen remedy on this issue in the Final Judgment not only required abolition of commingling, but required the price of Windows to be reduced in proportion to the amount of unbundled programming that was removed by an OEM:

g. Restriction on Binding Middleware Products to Operating System Products. Microsoft shall not, in any Operating System Product distributed six or more months after the effective date of this Final Judgment, Bind any Middleware Product to a Windows Operating System unless:

Microsoft also offers an otherwise identical version of that Operating System Product in which all means of End-User Access to that Middleware Product can readily be removed (a) by OEMs as part of standard OEM preinstallation kits and (b) by end-users using add-remove utilities readily accessible in the initial boot process and from the Windows desktop; and ii. when an OEM removes End-User Access to a Middleware Product from any Personal Computer on which Windows is preinstalled, the royalty paid by that OEM for that copy of Windows is reduced in an amount not less than the product of the otherwise applicable royalty and the ratio of the number of amount in bytes of binary code of (a) the Middleware Product as distributed separately from a Windows Operating System Product to (b) the applicable version of Windows. See Final Judgment § 3(g). In the CIS, the government acknowledges that the Court of Appeals found that Microsoft unlawfully ''integrated its web browser into Windows in a non-removable way while excluding rivals,'' CIS at 3, but then makes no further mention of the commingling issue.

Notwithstanding the government's stated conviction (backed by the Court of Appeals'' holding) that binding violates Section 2, the proposed settlement gives a green light to Microsoft's continuing to bind middleware products to its operating system. This gap in the settlement's coverage, coupled with the definitions of Microsoft Middleware and Microsoft Middleware Product, not only allows Microsoft to continue its past anticompetitive conduct, but also provides Microsoft with an incentive to use the same techniques to extend its monopoly into other areas.[12]

The settlement's failure in this respect is underscored by Microsoft's recent introduction of Windows XP, which plainly demonstrates its intent to continue defending the Windows monopoly by binding even more applications and services to its new operating systems, notwithstanding the determination that doing so is illegal. Windows XP has more Microsoft middleware products and services bound to or included with the operating system than any previous version of Windows. One of the services integrated into XP is Passport, a web authentication, security and credit card verification service that allows consumers, using a single log-in, to shop on thousands (and ultimately, Microsoft hopes, millions) of websites that accept Passport. Because Microsoft's past unlawful conduct allowed it to maintain a PC operating system monopoly and acquire a de facto monopoly in the browser market (IE is used to access the Internet by approximately 91% of consumers),[13] Microsoft is in a uniquely advantaged position to encourage subscription to Passport whenever a user connects to the Internet from her XP desktop. This is so because XP comes fully loaded with prominently displayed prompts for Passport throughout the program, starting with the initial boot sequence and continuing each time the user logs on to her computer.

As Microsoft succeeds in generating Passport subscriptions through its monopoly distribution of Windows XP, retailers with web portals selling products and services on the Internet will be forced to accept Passport as their authentication system. In this way, Microsoft will be able to nullify threats to the Windows monopoly by precluding other web-based alternatives to Passport. Furthermore, by defending its PC monopoly with Passport, Microsoft will also insert itself on both sides of a web transaction. Because of the ''network effect,'' the final outcome—absent strong and effective injunctive relief—is likely to be that most e-commerce will be conducted with either the consumer or vendor, or both, paying a fee to Microsoft for the use of Passport.

To the extent Passport gains a foothold as an authentication gateway to Internet commerce, this will erect a new barrier to entry for competing operating systems. Consumers will be reluctant to switch to a non-Windows PC operating system, because the personal information stored on Passport is readable only by Microsoft web servers, which in turn can be designed to interact most effectively with the Windows operating system and its embedded middleware, such as IE. At the same time, by erecting a fence (Passport) between PC users and the Internet generally, Microsoft will make it far less likely that a competing middleware platform, such as Netscape's Navigator, will displace user dependence on Windows, because without Passport, Navigator may end up being of little utility for e-commerce.

Nothing in the proposed settlement would prevent this chilling repetition of Microsoft's monopolizing conduct. By failing to adequately address the old tactics used (binding middleware to the operating system) and limiting the scope of the remedy in a manner which excludes new products and services, the proposed settlement fails in a critical way to end Microsoft's monopolizing conduct, let alone to deny Microsoft the fruits of its PC monopoly.[14]

ii. The Proposed Settlement Omits Any Requirement That Microsoft Offer A Stripped-Down Version Of Windows At A Price That Reflects The Value Of The Removed Middleware Products

As the Court of Appeals held, there is an economic disincentive for OEMs to offer, install and service a second middleware product such as a browser. CA at 66. However, nothing in the proposed settlement provides OEMs with an economic incentive to become a viable and effective means of distribution for alternative middleware products. Only by requiring Microsoft to provide OEMs with an economically-viable ''stripped-down'' version of Windows—including the ability to completely remove Microsoft middleware from the operating system, see Final Judgment § 3(g)(i)—will OEMs ever have an incentive to offer users products containing Non-Microsoft middleware alternatives.

Even if Microsoft were required to provide OEMs with an unbundled operating system, it would only be possible for OEMs to offer consumers a choice of an alternative middleware/software package for the PC if Microsoft's price to the OEM were reduced to reflect the lower value of a software package that does not include Microsoft middleware that the OEM wishes to replace with competing products. Put another way, a market for alternative middleware configurations will only arise if such alternatives can be priced competitively with the ''fully loaded'' version of Windows. If the cost of alternative middleware bundles is always higher than that of the Microsoft Windows bundle, the market for non-Microsoft middleware will be limited or nonexistent.

OEMs must have more than the Hobson's choice of either buying Windows XP fully bundled at $200, for example, or paying $199 for a stripped down version of Windows and then incurring the additional capital and labor costs of replacing a Microsoft middleware product with a competing

[12] In addition to the settlement's failure to prohibit commingling of code, the settlement also condones Microsoft's bundling of products with its operating system. Section III.C presents OEMs with a laundry list of options they may adopt in installing, displaying, and distributing Non-Microsoft Middleware, but nothing in the proposed settlement prevents Microsoft from forcing OEMs to accept additional products as part of the Windows Operating System Product that are included with the operating system. As a result, under the proposed settlement, OEMs can be forced to accept a complete package of Microsoft products with each license of the Windows operating system.

[13] Don Clark, AOL Sues Microsoft Over Netscape in Case That Could Seek Billions, Wall Street Journal, Jan. 23, 2002, at B4 (citing Browser Market Shares StatMarket (2002), at www.websidestory.com).

[14] It is noteworthy that the binding of applications is not limited to browsers and internet-related services, but also includes common applications such as word processing. For example, Microsoft has used its operating system monopoly to motivate consumers to use Microsoft Word instead of Corel's Word Perfect. Regardless of the quality or perceived attributes of Word Perfect versus Word, many businesses and individual consumers use Word simply to avoid incurring the additional trouble and expense of licensing a second word processing application when the PC operating system already comes equipped with such a function.

product bought at an additional, separate cost.

Consequently, any remedial proposal that seeks to open the OEM distribution channel to competing middleware must address the pricing of the Windows operating system. The Final Judgment recognized the need for such a pricing mechanism. It required that the price of versions of Windows from which Microsoft middleware functions had been disabled or removed be reduced in proportion to the relative amounts of computer code bytes found in the operating system and middleware products in question. See Final Judgment § 3(g)(ii). Alternative formulations based on the relative product development costs are also available. See Litigating States' § 1.

Connected to the pricing issue is the failure of the proposed settlement to allow any party that is not an OEM (§ III.C) or end-user (§ III.H) to alter the configuration of the Windows platform. This omission has the effect of preventing third parties, who might fill a niche as customizers, to directly offer OEMs or end-users specific software/middleware packages that could be added to a stripped-down Windows operating system. For example, it is likely that absent Microsoft's illegal binding of its middleware to the Windows operating system, an industry of independent bundlers specializing in the sale of customized software packages would have developed. Using the operating system as a platform, these vendors could create customized software/middleware packages based on the need of particular consumer market segments, such as stock market buffs, antiques dealers or mathematicians.[15]

As it stands now, the proposed settlement creates no incentive for OEMs to pursue any of the objectives of section III.C. Yet, if the OEM distribution channel is not reopened, the decree will have no chance to succeed in its most important goal—to restore competition in the monopolized market—as no ISV will have equal access to consumers.

iii. The Provisions In The Proposed Settlement That Purport To Foster OEM Flexibility In Product Configuration And Middleware Choices Contain Fatal Ambiguities And Loopholes

Although the government originally supported straightforward remedy provisions governing OEM flexibility as to what products could be offered with a PC operating system, it now retreats to complicated provisions whose limiting language undercuts the purported relief. Compare Final Judgment § 3(a)(iii) with RPFJ § III.C. When the government initially proposed provisions that would allow OEMs to reconfigure the products they offered to meet consumer demand free from Microsoft's restrictions, it stated:

> Microsoft ... refused to permit OEMs to remove the Internet Explorer icon, even when their customers wanted them to do so. This provision of the Final Judgment thus prohibits Microsoft from preventing OEMs from undertaking competitively valuable alterations to the first screen, bootup sequence, and icon display and will help the OEM channel for distribution of non-Microsoft software, thereby giving consumers greater choices not only in how their computers look, but in what innovative software OEMs can offer them (Shapiro pp. 17–20, 24).
>
> Gov't D.Ct. Memo at 39. In response to Microsoft's objections, the government reiterated that the purpose of the provisions was to prevent Microsoft from restricting OEMs'
>
> ability to customize their PCs in certain ways to promote non-Microsoft software. [It] will simply enable them to configure their systems so that non- Microsoft software can launch automatically, OEMs can offer their own internet access provider or other start-up sequence, and non- Microsoft Middleware can be made the default.
>
> Gov't D.Ct. Reply Memo at 45–46.

Notwithstanding the logic of the government's past proposals, the proposed settlement replaces clarity with ambiguity and loopholes. Section III.C.1 states that ''Microsoft may restrict an OEM from displaying icons, shortcuts and menu entries for any product ... to products that provide particular types of functionality,'' but nowhere defines ''functionality.'' Without such definitions, Microsoft is free to decide what categories of middleware ''functionality'' qualify for display. Thus, nothing prevents Microsoft from excluding non-Microsoft middleware products for which no Microsoft counterpart exists—an obvious deterrent to competing middleware products that are more innovative than Microsoft's own products.

Section III.C.2 ostensibly allows OEMs to distribute and promote non-Microsoft middleware through the display of shortcuts on the Windows desktop, but provides that the provision will apply only ''so long as such shortcuts do not impair the functionality of the user interface.'' However, by never stating who determines when the ''functionality'' of Microsoft's operating system is impaired, the provision gives Microsoft free reign to decide which non-Microsoft products may be promoted by an OEM.

Section III.C.3 permits OEMs to configure competing middleware products to launch automatically at the conclusion of the initial boot sequence or upon connection or disconnection from the Internet. CIS at 31. It also appears to prohibit ISVs and OEMs from palming-off competing products by imitating Microsoft's trade dress. Nonetheless, the ambiguous wording of the provision would let Microsoft decide, in the first instance, which competing products may be displayed and what form the user interfaces (e.g., icons) may take. Moreover, as in § III.C.1, the provision's benefits are tied to a ''functionality'' determination made by Microsoft. The automatic launch of competing Middleware is only assured ''if a Microsoft Middleware Product that provides similar functionality would otherwise be launched automatically at that time,'' which would again limit the settlement's reach to products with which Microsoft already competes.[16]

Subsection 5 allows OEMs to configure the Windows desktop to promote a non-Microsoft Internet access provider (''IAP'') in the initial boot sequence. The provision is problematic for two reasons. First, it permits Microsoft to require that such offers meet ''reasonable technical specifications established by Microsoft,'' which are never defined.

Second, because it refers only to IAP offers, the proposed settlement prevents OEMs from offering any other type of product or service in the initial boot sequence. In striking contrast, the initial boot sequence for Windows XP offers a wide range of Microsoft products and services, including Passport, Hotmail, Instant Messenger and Internet telephony. Competition cannot be restored unless all competing middleware products, not just IAPs, are put on equal footing with Microsoft products. Because the proposed settlement allows Microsoft to retain the advantages of its operating system monopoly in the boot sequence by having an exclusive chance to promote its products and services, it fails to serve the public interest.

Finally, nothing in the proposed settlement discusses OEMs' ability to offer an alternative desktop. Prior to Microsoft's prohibiting the practice, OEMs would change the appearance of the desktop in ways they found beneficial. D.Ct. at ¶214. Some OEMs replaced the Windows desktop with a user interface of their own design or one that conformed with that of the OEM's selected browser. CA at 62–64. The government previously advocated a provision in the Final Judgment that assured OEMs the ability to offer an alternative to the Windows desktop, subject to the proviso that an OEM may not completely block access to the Windows desktop. See Final Judgment § 3(a)(iii)(3) (OEMs may ''display any user interfaces, provided that an icon is also displayed that allows the user to access the Windows user interface'').[17] In the CIS, however, there is no explanation for the

[15] The proposed settlement contains one exception to its blanket prohibition on third party alterations: it would permit a Non-Microsoft Middleware producer to designate that its product be invoked automatically in place of a Microsoft Middleware Product. However, the mechanism by which the producer may accomplish this is at Microsoft's discretion, and Microsoft may require confirmation from the end-user that he or she would like to accept this option. See RPFJ § III.H.2.

[16] Section III.C.4 allows OEMs to offer alternative operating systems. While seemingly procompetitive, the government fails to acknowledge that there currently is no market for alternative operating systems. See CIS at 32. As the Court of Appeals explained, due in large part to network effects, there is no incentive for consumers to use or for ISVs to write programs for PC operating systems other than Windows. See CA at 49–50, 55. Moreover, it is unclear that it is technologically feasible to include multiple operating systems on the same PC without sacrificing significant amounts of storage capacity or speed. No similar provision appeared in the Final Judgment, a fact which suggests that it is mere window-dressing (no pun intended) and does nothing to eliminate the barriers to competition erected by Microsoft.

[17] The Court of Appeals found no justification for the restrictions on OEM configuration generally, but did hold that ''a shell that automatically prevents the Windows desktop from ever being seen by the user is a drastic alteration of Microsoft's copyrighted work, and outweighs the marginal anticompetitive effect of prohibiting the OEMs from substituting a different interface automatically upon completion of the boot process.'' CA at 63.

omission in the proposed settlement of this and other OEM configuration options that the government strongly advocated before the District Court and on appeal.

c. Provisions That Purport To Allow End-Users And OEMS To Enable Or Remove Middleware Products Are Severely Flawed

Section III.H of the proposed settlement purports to allow end-users the freedom to add and remove middleware as they see fit. In actuality, the provision fails to do so because: (i) Microsoft is never required to permit an end-user or OEM to remove a Microsoft Middleware product from the PC's memory, only to ''disable'' the functionality and ''remove'' the icon or other visual means of access; (ii) Microsoft continues to have full control over whether and when its products may override or launch in place of competing products; and (iii) the timetable for implementation renders the provision almost useless as a means of restoring competition.

i. Inability To Actually Remove Microsoft Products From The Operating System Cripples The Effectiveness Of The Decree

The Court of emsp; Appeals held that Microsoft's removal of IE from the add/remove utility Windows had the effect of reducing usage of rival browser products and violated Section 2. CA at 65. Loading the operating system with Microsoft middleware that cannot be removed imposes greater burdens on OEMs that choose to install competing middleware products? It also prevents consumers from receiving full access to the products and services of their choice. CA at 62, 65; D.Ct. at ¶¶174. Binding middleware products to the operating system also has a significant effect on the ability to remove Microsoft middleware, as it is difficult or impossible to remove the products without degrading Windows. CA at 66–67; D.Ct. at ¶159.

The government recognized that not being able to remove Microsoft middleware had the effect of ''foreclosing customer choice and excluding competition,'' Gov't D.Ct. Memo at 6, and that Microsoft used this as a means of increasing the barriers to entry for middleware. Id. at 42; Shapiro Decl. at 25–26. Consequently, the relief initially requested by the government required that any Microsoft middleware product that was technologically bound to the operating system must be removable to create a ''stripped down'' version of Windows via the add/remove utility. See Final Judgment ¶3(g)(i). No such requirement exists in the current settlement, however. Although the CIS states that section III.H ''ensures that OEMs will be able to choose to offer and promote, and consumers will be able to choose to use, Non-Microsoft Middleware Products,'' CIS at 45, the government now discusses the provision in terms of ''removing access'' to the middleware product without explaining that ''removing access'' does not mean removing the product itself. Id.

[18] OEMs incur increased costs as a result of customer ''hotline'' calls to the OEM. CA at 61. The additional program code also reduces the storage capacity of the computer and the speed of the processor. This is yet another way that Microsoft is able to erode OEM and consumer incentives to use competing middleware products.

Because section III.H of the proposed settlement fails to require Microsoft to enable OEMs and end-users to remove unwanted Microsoft middleware from Windows, it facilitates commingling of code, raises rivals' costs, and renders product substitution illusory.

ii. The Exceptions And Limitations Contained In The End User/OEM Control Provisions Swallow The Relief Provided And Permit Microsoft To Override OEM Or End-User Selections Of Preferred Middleware Products

On the subject of OEM/end-user control, the proposed settlement replaces a provision of less than fifty words in the Final Judgment with a series of interlocking provisions that run over six hundred words. Compare Final Judgment § 3(g)(i) with RPFJ ¶III.H(1–3). None of these limitations and exceptions were present in the interim relief the government advocated before the District Court previously, and the CIS is silent regarding the rationale for the avalanche of restrictions that it now proposes. Nor does the government suggest that the changes are needed in response to any holdings by the Court of Appeals.

What the proposed provisions do is create so many exceptions, limitations, and loopholes as to vitiate the broad pronouncements in the CIS. Two aspects of section III.H exemplify the manner in which the proposed settlement undermines its own efficacy: (a) permitting Windows to automatically ask an end-user if he or she wants to alter the computer's desktop configuration to restore Microsoft middleware that was previously removed by an OEM; and (b) permitting Microsoft virtually unbridled discretion as to when to override an end-user's selection of a default web browser or other middleware.

(a) Microsoft Can Alter End-User/OEM Choices

As discussed above, the proposed settlement does not allow OEMs or end-users to actually remove Microsoft middleware from their computers, instead limiting them to merely deleting icons and menu entries; the middleware itself remains physically in the computer, or in many cases, technologically bound to the Windows operating system. Even a conscious decision by an OEM or end-user to remove Microsoft icons and menu items is subject to interference by Microsoft under the proposed settlement. Section III.H.3(a) allows Microsoft to include in the Windows operating system a prompt that would ask the end-user, fourteen days after the initial boot up of the computer, for permission to automatically erase the OEM's or end-user's configuration of the system and reinstate the Microsoft middleware that was previously deleted. RPFJ ¶III.H.3(b).

This provision is troublesome for a variety of reasons, not least its Orwellian reminder of Microsoft's omnipresence. Most importantly, it allows Microsoft to undermine the configuration choices made by OEMs that may include significant promotion of competing middleware. It allows Microsoft to do this fourteen days after an end-user first boots up the computer, at a time when the end-user may not yet have gained a great deal of familiarity with the computer. Depending on how the question is asked and the user's level of sophistication, the user may not understand that he or she is removing the programs installed by the computer's manufacturer and replacing them with Microsoft products that may not work as well. Furthermore, the prompt is unnecessary, because if a user wanted a different configuration, she would be free to buy the computer from another OEM or purchase additional software on her own.

Nor is any limitation placed on the number of times Microsoft may ''suggest'' that the user alter the configuration. But regardless of how often Microsoft asks—every day, every fourteen days, once a year, or only once—the fact that it can raise the question at all not only undermines the OEM configuration, but also the goal of providing end-users with ''a separate and unbiased choice with regard to each Microsoft Middleware Product or Non-Microsoft Middleware Product.'' RPFJ ¶III.H.1(b) (emphasis added); see also CIS at 48 (purpose of section III.H.3 is to prevent automatic alteration of OEM configuration, such as ''sweeping the unused icons that the OEM has chosen to place on the Windows desktop''). There is no justification for permitting Microsoft to undercut this aspect of relief. Microsoft should be prohibited from ever prompting users to scuttle their OEM selections or desktop choices.

(b) Microsoft Can Override End-User/OEM Middleware Default Choices

Although section III.H.2 of the proposed settlement ostensibly enables end-users and OEMs (and middleware producers themselves) to designate non-Microsoft middleware products (including web browsers) to be invoked automatically in lieu of a Microsoft product, loopholes and conditions destroy this provision's utility as a remedial device.

As an initial matter, the default election procedure is made reciprocal—requiring that identical removal options be afforded Microsoft with respect to non-Microsoft middleware that would otherwise be the default. The government does not explain why such parity is being offered to an antitrust violator at the expense of those who have not violated the law.[19]

More troubling are the ''Notwithstanding'' clauses that follow subsection 3, which directly limit the benefits extended by section III.H.2. Part 1 of the first clause allows Microsoft to invoke a Microsoft Middleware Product if it is necessary for the computer to interoperate with a server maintained by Microsoft. RPFJ § III.H. Because so much middleware—be it a web browser or a Java formulation—now interacts with commercial web servers, which are to a large extent Microsoft web servers, the loophole created by this provision is

[19] Although the Court of Appeals did not affirm the District Court's blanket conclusion that IE's override of competing default browsers was illegal in all circumstances (for example, when accessing Windows ''Help'' resources and updates on the Internet), CA at 65–67, the proposed settlement swings much further in the other direction in permitting Microsoft to write the rules of when such an override of a user's designated default middleware product will be permitted.

enormous. As computing moves off the desktop onto Internet servers, communication with servers is becoming the norm. Moreover, because IE has captured over 90% of the market as a result of Microsoft's illegal conduct, Microsoft is now positioned to dominate the server operating system market by changing the protocols its browser uses to communicate with servers, from the current industry standard to its own proprietary protocols. This will leave those who host web servers with little choice but to use a Windows server operating system. See pp. 70–76 infra. Should this occur, the first ''notwithstanding'' clause of the proposed settlement's section III.H will allow Microsoft to override users' default browser selections in the vast majority of situations. The ultimate outcome will be that the illegal Windows monopoly will again be protected from the threat to its dominance posed by non-Microsoft web-based computing.

The second ''Notwithstanding'' clause in § III.H allows a Microsoft Middleware Product to launch if the designated Non-Microsoft Middleware Product fails to implement a ''reasonable technical requirement (e.g., a requirement to be able to host a particular ActiveX control).'' RPFJ § III.H. Because the proposed settlement leaves it to Microsoft to determine what a ''reasonable technical requirement'' would be, the loophole created by this provision is also enormous. To the extent the clause provides an example of such a failure to meet a technical requirement, the exception is overly broad. ActiveX is a programming environment that allows programs provided by servers to run locally on a PC inside the web browser. Its use replaces in part the cross-platform capabilities of Java and the open standard communication protocols used by most servers. Thus, by determining that the hosting of ActiveX is a ''reasonable technical requirement,'' the proposed settlement ensures that anytime a Microsoft web product or service is launched or any product or service that relies on a Microsoft server is downloaded, Microsoft will be able to override a user's choice of browser. This provision grants Microsoft license to automatically override an end-user's browser choice when that user accesses a program or service that requires interaction with a Microsoft server. Far from restoring competition, this pernicious provision protects Microsoft's ill-gotten operating system monopoly from web-based competition.[20]

iii. The Timing Of Implementation Of Section III.H Allows Microsoft To Reap The Fruits Of Its Past Illegal Conduct Without Adequately Limiting Its Conduct Today Or In The Future

In addition to the foregoing serious deficiencies, the timetable in section III.H for implementation of the substantive provisions by itself renders the provision meaningless as a vehicle for restoring competition. Under the terms of the proposed settlement, section III.H will not be implemented until twelve months after submission of the settlement to the Court or at the release of the first service pack for Windows XP, whichever comes earlier. Because Microsoft is not bound by any of the provisions until that time, it has no incentive to release the first service pack prior to December 2002. The provision is thus rendered meaningless for a fifth of the lifespan of the decree.

Microsoft has no grounds to complain about burdens caused by making section III.H immediately effective. To the contrary, the year delay in implementation would reward Microsoft for its bad faith release of Windows XP, before a settlement was in place, with full knowledge that (notwithstanding the monopoly maintenance holding by the Court of Appeals) XP contains more bundled middleware, more commingled code, and more prompts for Microsoft-related products and services than any prior version of Windows. At the very least, the release of XP violates the spirit of the settlement by which Microsoft claims it is already abiding. No minimally adequate settlement would fail to provide relief to the marketplace as soon as practicable.

The proposed settlement also contains another glaring temporal loophole. The last paragraph of section III.H states that only the Microsoft Middleware Products that existed seven months prior to the last beta test on a new version of Windows will be subject to the requirements of the provision. This means that any new Microsoft product or service, developed six months or less prior to the date of the last beta test[21] of a new Windows operating system release or major upgrade, would not be subject to the requirements that its icon or menu entry be removable from the operating system desktop or the requirement that the automatic launching of the product be disabled in favor of a competing middleware product.

The government offers no justification for a proposed settlement that guts the section III.H ''removal'' provision with myriad and, in some cases themselves anticompetitive, limitations and loopholes, and then delays their implementation for significant portions of settlement's proposed five-year duration.

In contrast to the current settlement's abundant accommodations to Microsoft, two years ago, the government categorically rejected Microsoft's complaints that it would be enable to comply with the ''unbinding'' provisions the government then advocated (i.e., requiring that OEMs and end-users have the ability to engage the Add/Remove utility to delete IE):

Microsoft's assertion that offering an ''unbinding'' option for OEMs and end-users for the few covered middleware products in existing operating systems would take ''far longer than six months, would cost hundreds of millions of dollars,'' and would result in a ''far inferior'' OS cannot be reconciled with the record in this case and the district court's findings.

Gov't CA Brief at 132; Gov't D.Ct. Reply Memo at 63–64 (referring to its expert witness's ability to create a removal program that did not damage or degrade the operating system in a relatively short amount of time and the fact that Microsoft already provided a ready means of removing at least 80 components, many of which it considered ''integrated'' features of Windows). There is no reason, technical or otherwise, why the government should not insist upon timely and effective measures to prevent Microsoft from continuing to commingle its middleware with its operating system in blatant disregard of the Court of Appeals ruling.

2. Provisions Designed To Protect Interoperability Between Microsoft Products And Non-Microsoft Products Are Seriously Flawed

In the earlier remedy proceedings, the government explained the indispensable competitive importance of ''interoperability'':[22]

Microsoft's Operating System monopoly gives it the ability to favor Microsoft products in other markets, by refusing to disclose some of the Interfaces supported by Windows. Such a refusal would allow Microsoft to prevent some products from interoperating fully with Windows. Permitting all products to interoperate fully with Windows is necessary to ensure that that those products realize their full potential in terms of performance and functionality.

Felton Decl. ¶¶51–52 (emphasis added). Indeed, full interoperability has long been recognized by Microsoft, quite correctly, to be a primary threat to its monopoly position in the PC operating system market because it would allow multiple, competing operating system platforms to perform essentially all the functions of a Windows PC. CA at 52–54; D.Ct. ¶¶68–93; Henderson Decl. ¶¶12–18, 29–40; Shapiro Deck at 20–21. Middleware, such as Netscape and Java, posed the initial competitive threat in using interoperability to shift computing away from the Windows PC (the ''middleware threat'').

But, as recognized in District Court findings cited with approval or undisturbed by the Court of Appeals, server-based computing, which would shift many computing tasks from the Windows PC to a server on the Internet, also poses a significant threat to the Microsoft operating system monopoly. D.Ct. at ¶¶24–27 (see CA at 52). By preventing full interoperability, however, Microsoft can neutralize the server threat.

Despite the government's claim that the proposed settlement achieved ''seamless interoperability between Windows Operating System Products and non-Microsoft servers on a network'' (CIS at 38), the proposed settlement would, in reality, enable Microsoft to withhold the disclosures necessary to

[20] The last part of the ''technical requirements'' clause, moreover, puts the onus on ISVs to request the reason for the technical failure. Because ISVs are unlikely to be immediately aware that there is a technical failure on the part of their middleware, the burden must be placed on Microsoft to explain such overrides.

[21] ''Beta test'' refers to the last round of testing for a new software product that is typically performed by sending the software product out to consumers and industry insiders both as a means of ironing out the kinks in the product and obtaining publicity for the impending release. There is no set date within the industry of when these ''tests'' are performed. They can occur months before or immediately proceeding a pending product release date.

[22] As a general matter, interoperability is the ability of different computers, servers or other devices, regardless of whether they use the same software and hardware, to freely transmit and receive information to and from each other.

achieve interoperability and thus defeat this goal. The proposed settlement would do nothing to achieve interoperability between a non-Microsoft server operating system and Windows or IE. Instead, the only disclosure requirements are both ineffectual and too narrow: They apply only to PC middleware and certain client protocols, disclosures which are insufficient, on their own, to create interoperability between a PC and a server or among servers. Thus, instead of preserving threats to the Microsoft monopoly from all sources, the settlement gives Microsoft a free shot at disabling server competition.

a. The Government's Original Remedy Required Broad And Meaningful Interoperability Disclosure By Microsoft

During the initial remedy proceedings before the District Court, the government recognized that new threats were emerging to Microsoft's monopoly in the PC operating system market. Gov't D.Ct. Memo at 29. The government recognized the likelihood that, in the future, most computing will be done through networks and on servers housed at remote locations, with personal computer use diminishing. The government acknowledged that, as a result, software for communicating with servers, operating systems for servers, and middleware designed to function on servers, had become a principal competitive threat to the Microsoft PC operating system monopoly. Id.; see also Henderson Decl. ¶¶13–16; Shapiro Decl. at 20–21.

The ''server threat'' arises from the following circumstances, as the government recognizes. Instead of using an expensive, ''intelligent PC'', which contains a Windows operating system, a substantial hard drive and a powerful microprocessor, consumers increasingly use simpler or smaller, more convenient devices, such as cell phones, PDAs (such as ''Palm'' or ''Blackberry'' devices), TV-set-top boxes, or ''dumb PCs,'' all of which are typically equipped only with more basic (and often non-Microsoft) operating systems, a browser, smaller (if any) hard drives, and a microprocessor. D.Ct. at ¶¶22–27; Henderson Decl. ¶¶13–16, 91–92; Shapiro Decl. at 3–4. The consumer will then use this device's browser to connect to the network of servers on the Internet.

By accessing servers on the Internet, the consumer can perform most of the same computing functions (access/browse the Internet; word processing; e-mail; instant messaging, etc.) that are provided by a Windows PC, but at lower cost and much greater convenience. For example, under the PC computing model, to compose and spell-check a document, the PC's processor is used to process the relevant software program to perform the functions. Under the server-network computing model, however, the same function (compose and spell-check a document) is accomplished through the server, which processes the relevant software program and then transmits the document back to the PC. The PC operating system under this scenario does little more than transmit and receive the data. The actual computing functions are largely performed by the server's operating system and hardware. Similarly, far more complex applications can be offered on the Internet through high-powered servers effectively shared by thousands or millions of consumers.

The government recognized the overriding importance of server software and communications protocols in supporting the original Final Judgment:

As computing continues to move off the desktop and into the internet, middleware threats could develop on servers, in either server operating systems or server applications. Microsoft cannot defeat these threats by bundling its own version of such software into its PC operating systems, but it could use its operating system monopoly in other ways to crush any such middleware threats. For example, Microsoft's new Windows 2000 operating system, to which Microsoft intends to migrate its existing Windows users, is designed with proprietary features and interfaces that enable Microsoft's server operating systems to interoperate with PCs more effectively than other server operating systems. If Microsoft were in a competitive market, it would disclose its confidential interface information to other server software developers so that their complementary software would work optimally with, and thereby enhance the value of, Microsoft's PC operating systems. But, if faced with a middleware threat on the servers, Microsoft is likely to continue to withhold that information from competitors in order to protect its operating system monopoly. Gov't D.Ct. Memo at 29 (emphasis added).

The government's expert in the remedy proceedings underlined the importance of the server-based computing model as a critical emerging threat to Microsoft's PC operating system monopoly. Rebecca Henderson, a professor from MIT with a doctorate in Business Economics from Harvard University, testified:

Server-based computing could reduce the applications barrier to entry in the PC operating system market. If server-based applications are supported in a way that permits end-user access to full-featured application functionality on a truly cross-platform basis, users will be able to access them through any PC operating system they choose. Indeed, server software already acts as cross-platform middleware for a few network-centric applications. Web-based e-mail programs, for example, can be hosted on almost any server operating system and used to send e-mail to and from a wide range of clients, including Windows PCs, handheld computers and wireless phones. As the bandwidth available to PC consumers expands, server software could become an increasingly attractive platform for developers interested in writing full-featured applications for PC owners. For example, an accounting package could be ''hosted'' on a web server. If it were designed to be sufficiently cross-platform, and if technology permits, consumers could access its functionality using either a Windows PC or an alternative device.

Henderson Decl. ¶¶14–15.

Microsoft recognizes the server threat to its PC operating system monopoly. D.Ct. at 60. Its strategy has been to use its monopoly control over the PC's operating system and IE to force websites on the Internet to use Microsoft server operating systems, even if they are otherwise not the most desirable choices. To do this, Microsoft can withhold disclosure of communications interfaces and protocols for IE, at the same time as it changes them from previously disclosed interoperable formulations. The objective is to make IE fully interoperable only with a Microsoft server operating system, and to restrict server-to-server communication only to Microsoft server operating systems. In addition, Microsoft can fail to disclose to competitors the server protocols that facilitate full interoperability between a Windows PC and a Microsoft server operating system, or between servers. As a result, Microsoft's server operating system will always interoperate better with a Windows PC operating system or Microsoft server operating system than any competitors' operating systems. These two actions, taken together, will enable Microsoft server operating systems to dominate the Internet, because website owners will need a server that interoperates with the more than 90% of all Internet users that use IE, while consumers will continue to buy the Windows PC operating system because of the applications barrier to entry. In this manner, Microsoft will easily defeat the threat that web-based computing poses to the PC operating systems monopoly by dominating server operating systems and server applications software. Any ''dumb PC,'' cell phone or handheld device, which relies on a server on the Internet to perform the actual computing functions, will either have to use Microsoft operating system software or face elimination from the marketplace.

During the original remedy proceedings, the government's expert economist, Carl Shapiro, explained the importance of a powerful conduct remedy that would require Microsoft to provide timely disclosure of all APIs, protocols and other technical information necessary to allow all server operating systems to fully interoperate with a Windows PC operating system and Microsoft middleware, particularly IE:

Mandatory disclosure of interface information also will prevent Microsoft from using its Windows monopoly power to gain control of complementary applications and middleware... Two especially important software products today that are complementary to the Windows operating system on personal computers are operating systems on handheld devices and operating systems on servers... Indeed, a good case can be made that the most significant threat to Windows in the next several years will come from client/server architectures. Making sure that Microsoft cannot subvert this threat using undisclosed proprietary interfaces is thus central to an effective remedy in this case.

Shapiro Decl. at 20–21 (emphasis added).

For this reason, the government proposed, and the District Court granted a remedy, requiring disclosure of ''all APIs, technical information and Communications Interfaces'' that enabled:

any Microsoft software installed on one computer (including but not limited to server operating systems and operating system for

handheld devices) to interoperate with a Windows operating system (or middleware distributed with such operating system) installed on a Personal Computer.

Final Judgment § 3(b)(iii).

The effect of this provision was to promote competition in the PC operating system market by using interoperability disclosure to support the server and middleware threats to Microsoft's monopoly. These crucial interoperability disclosure provisions required full disclosure of:

(1) all technical information, including both client protocols and server protocols which allow a Windows PC and a Microsoft server operating system to fully interoperate with each other; and

(2) all technical information that enables Microsoft Middleware, such as IE, to fully interoperate with a Microsoft server operating system.

Microsoft's claim that remedies which affect the PC/server and server/server relationships are outside of the Sherman Act § 2 monopolization claims before the Court is insupportable. Defendant Microsoft Corporation's Remedial Proposal at 6–7 (Dec. 12, 2002) (brief filed in response to the Plaintiff Litigating States'' Remedial Proposals). To the contrary, both sides presented evidence on this issue in the prior proceedings, and both this Court and the Court of Appeals were particularly concerned to ensure that the nascent middleware threats to Microsoft's PC operating system monopoly be protected from further anticompetitive conduct. See, e.g., CA at 79 (''it would be inimical to the purpose of the Sherman Act to allow monopolists free reign to squash nascent, albeit unproven, competitors at will—particularly in industries marked by rapid technological advance and frequent paradigm shifts''); D.Ct. at ¶¶24–27, 56, 60.

Indeed, when Microsoft made the same argument during the original remedy proceedings, the government tersely exposed its fallacy:

Microsoft can hardly argue that client/server interoperability issues are unrelated to the trial. In the first place, its own expert, Dean Schmalensee, testified that control over the browser could enable a firm to ''severely'' affect the functionality of server applications... Second, having argued during the trial that Microsoft lacked monopoly power in the operating-systems market because of the future potential of server-based applications, Microsoft can hardly contend now that it should be free to frustrate the threat to the Windows monopoly posed by such server-based applications by withholding critical information needed for those applications to interoperate with Windows.

Gov't D.Ct. Reply Memo at 49 (internal citations omitted).

b. The Proposed Settlement's Interoperability Disclosure Requirements Are Wholly Inadequate

The interoperability disclosure provision in the proposed settlement is seriously deficient in the following ways: (1) no interoperability disclosure protection is afforded to important competitive threats to Microsoft's PC operating system monopoly, including non-Microsoft operating systems for servers and embedded devices (i.e., cell phones, PDAs, set-top boxes) [23]23; (2) the technical information that is required to be disclosed is too limited to be effective; (3) the timing of required disclosures is either too late or too vague; and (4) the definitions of major terms (API, operating system, middleware) would enable Microsoft to avoid disclosure to competitors, by claiming certain middleware or application products are part of the operating system.

i. Important Areas Of Potential Competition In The Monopolized Market Are Not Included In The Interoperability Disclosure Provision

The proposed settlement fails to provide essential disclosure of technical information necessary to ensure interoperability in at least four critical areas: (a) between Windows PC operating systems and non-Microsoft server operating systems; (b) between Microsoft middleware, particularly IE, and non-Microsoft server operating systems; (c) between Microsoft and non-Microsoft server operating systems; and (d) between Microsoft PC or server operating systems and non-Microsoft embedded devices. The absence of such protection effectively encourages Microsoft to dominate server operating systems and software in order to protect its PC operating system monopoly.

(a) The Proposed Settlement Will Not Achieve Server Interoperability

Although the government continues to espouse the public interest goal of ''seamless interoperability'' for servers, CIS at 38, the proposed settlement does not if fact achieve that result. The failure to ensure this essential remedial goal contrasts sharply with the District Court's findings of fact and conclusion of law, which were entirely affirmed or undisturbed by the Court of Appeals, establishing that Microsoft's conduct, in selectively disclosing or entirely withholding such technical information, plainly violated Sherman Act § 2. CA at 71–73; D.Ct. at ¶¶90–92, 338–40.

As late as November 2, 2001—four days before it reached the present settlement agreement with Microsoft—the government still insisted that server interoperability was essential to any settlement. The government's settlement proposal on that date expressly required server interoperability disclosure:

Microsoft shall make available for use by third parties, for the sole purpose of interoperating with a Windows operating system product ... any communications protocol that is... (i) implemented in the Windows operating system product installed on a client computer, and (ii) used to interoperate natively (i.e., without the addition of software code to the client or server operating system products) with Windows 2000 server products or products marketed as its successors installed on a server computer.

Department of Justice, Proposed Final Judgment, Draft of November 2, 2001 at § III.E. (emphasis supplied)' Pursuant to this provision, Microsoft would have been required to disclose both its client protocols and the server protocols which enable a PC and a server operating system to accept and transmit data to each other? [24]

The proposed settlement, however, deleted the requirement that server protocols be disclosed. This was accomplished by removing the words ''or server'' from the provision quoted above. RPFJ § III (E), November 6, 2001. This directly contradicts the view of the government's technical expert, who testified that if Microsoft were able to withhold from disclosure the server protocols:

[it] would give Microsoft the power to choose which server operating system products could interoperate with Windows .... A customer who felt compelled to buy client Windows Operating System Products would therefore additionally be compelled, due to his desire for interoperability, to buy his server Operating System Products from Microsoft or another vendor to whom Microsoft chose to disclose the new protocol. Microsoft's refusal to disclose the [server protocol] would prevent some competing server Operating System Products from interoperating fully with Windows, and thus would put them at a significant disadvantage.

Felton Decl. 53–57.

By removing the server protocol disclosure requirement, the proposed settlement virtually ensures that non-Microsoft server operating systems will never be viable, competitive alternatives to the Windows PC operating system monopoly. The client protocols that Microsoft is required to disclose will only allow the server to receive data or services from the PC. The other half of the transaction, whereby the server responds and sends data to the PC, cannot be accomplished without the server protocols. As a result, ISVs will not be able, on their own, to develop server operating systems that can fully interoperate with Windows PC. The government's expert has admitted that this eliminates the possibility that non-Microsoft

[23] With regard to server interoperability, the proposed settlement only requires ''client protocols'' to be disclosed. As is fully explained below, to achieve full interoperability between a PC (''client'') and a server, there must be disclosure of both client and server protocols, so that the server can accept and transmit data and services to the PC. By disclosing only the client protocol, only one-half of the transaction (PC to server) is achieved, thus defeating the server's ability to fully interoperate with the PC. See pp. 70–72 infra.

[24] A protocol is a piece of an operating system's software code that allows the operating system to translate, and thus understand, the language of another computer or server that is attempting to transmit data. When a PC (''client'') and a server are transmitting and accepting information or services between each other over the internet, server protocols allow the server operating system to accept and understand the information or services being transmitted from the client. In other words, the server protocols allow the server to transmit information to the PC by converting the information from the server's computer language to the PC's computer language. The client protocols perform the opposite task, allowing the PC to fully interoperate with the server. In order to process information from PC to server, and from server to PC, it is essential that both server and client protocols be provided. Without knowledge of the appropriate server protocols necessary to interoperate with a Windows PC, an ISV cannot design an operating system for a server which will properly interoperate with the Windows PC operating system.

servers would ever become a competitive threat to Microsoft's PC operating system monopoly:

[T]he two provisions relating to the disclosure of APIs, interfaces and technical information ... are exceptionally urgent ... [a]s long as Microsoft retains its monopoly power, the ability to withhold information and to deny interoperability in this way will be a fearsome threat. The development of server-based full-featured PC applications, for example, would be completely crippled if these applications could not be accessed from a Windows PC, or could only be accessed in a disadvantaged way, since no one would be willing to invest in building them. Requiring Microsoft to disclose its interface information... provides a necessary check on Microsoft's ability to exploit its illegally obtained position to exclude competitors.

Henderson Decl. ¶¶115–121 (emphasis added).

Quite simply, because Microsoft will not have to disclose any server protocols, this disclosure provision will not achieve ''seamless interoperability'' between a Windows PC and a non-Microsoft server operating system or aid in restoring even a vestige of competition to the PC operating system market.

(b) The Settlement Fails To Require Disclosure To Enable Interoperability Between Internet Explorer And Non-Microsoft Servers

During the original remedy proceedings the government acknowledged the crucial importance of requiring full disclosure of all technical information relevant to the interoperability between Microsoft's middleware products, particularly IE, and server operating systems.

As explained by a government expert, if Microsoft maintains control over the browser-server interaction (as it would under the proposed settlement), it can maintain its PC operating system monopoly by foreclosing the ability of a web server to interoperate with IE:

Owning the dominant browser gives Microsoft great influence over the evolution of important Internet interfaces. As Paul Maritz recognized, ''By controlling the client, you also control the servers.'' GX 498, at MS980168614. See also GX279 (discussing the role of standards in establishing Internet platform, Maritz explained, ''The key is to win the client (patch up the server later)''). This set of interfaces goes beyond the browser APIs to which developers can directly write applications, to include the set of interfaces that constitute the communications protocols between the browser and the network. For information to be received and viewed in Internet Explorer, the developer has to follow these interfaces.

The ability to influence development of web-based applications is a highly valuable tool for future anticompetitive campaigns should Microsoft choose to mount them. As web-based applications grow in importance, so does Microsoft's ability to steer them towards being IE-centric, and, given its control over the browser-to-operating system interface, Windows-centric as well.

Henderson Decl. 81–86 (internal citations to trial record). The proposed settlement, however, completely abandons the disclosure provision necessary to prevent Microsoft from using its control of IE to eliminate demand for non-Microsoft server operating systems as a competitive alternative to Microsoft's PC operating system monopoly.

Under the proposed settlement, Microsoft has no obligation whatever to disclose any technical information—APIs, communications interfaces or otherwise—that would permit a non-Microsoft server operating system to interoperate with Microsoft's Middleware, including IE. The only disclosure obligation under the proposed settlement involving Microsoft Middleware requires disclosure of APIs relevant to interoperability with a ''Windows Operating System Product,'' a term which is defined to include only ''the software code...distributed commercially by Microsoft for use with a personal computer.'' RPFJ §§ III.D, VI.U (emphasis added). For example, this provision would not require any disclosure for the purpose of allowing competing server operating systems to interoperate with IE, the very product that the Court of Appeals held was used by Microsoft to illegally maintain its monopoly power. CA at 64–68.

As a result, under the proposed settlement, only Microsoft server operating systems will be guaranteed access to the proprietary APIs and communications interfaces necessary for a server to interoperate with IE. If a website owner purchases a non-Microsoft server operating system, the more than 90% of consumers who use IE on their Windows PC would be unable to access that website unless Microsoft had agreed to separately license the technical information required for interoperability.

Of equal significance is Microsoft's recent decision not to distribute Java as part of Windows XP. Java had been included in prior versions of Windows. Java is a software program that is an open industry standard; it allows websites both to operate on numerous non-Microsoft operating systems and to display rich colors and graphics to enhance the website's appearance. CA at 74–75; D.Ct. at ¶¶386–405. Approximately 50% of all websites currently on the Internet, including SBC's website, are Java-compatible. Microsoft dropped distribution of Java in favor of promoting ActiveX, which is Microsoft's proprietary software that competes with Java by allowing a web server to process an Internet-based application in a fashion similar to Java. ActiveX is a proprietary browser interface that is installed as part of the software code for IE. As a result, the only way a non-Microsoft server operating system can obtain the proprietary interfaces for ActiveX (or for Internet Explorer generally) is through a license from Microsoft. If Microsoft chooses to make IE's protocols a completely undisclosed, proprietary standard, which it is free to do under the proposed settlement, Microsoft's PC operating system monopoly will be perpetuated, because the already formidable applications barrier to entry will be increased, and the server threat will be further diminished. This will occur as a result of two interrelated effects. First, website owners will be forced to purchase Microsoft server operating systems to ensure that their website remains fully accessible by the more than 90% of consumers who use IE. Second, for this reason among others, the vast majority of applications that are already written exclusively to interoperate with Windows will be increased, as ISVs' commercial need to write their Internet-based applications to be compatible with IE and ActiveX will increase. As time goes on, the number of servers which interoperate with Java and other browsers will continue to fall. Moreover, consumers who want to browse the Internet, that is, to access what will become the overwhelming majority of websites run on a Microsoft server operating system, will have to use IE and to get it, they will need a Windows PC operating system or another device that runs on Microsoft software. In the end, the prospect of ''dumb PCs,'' cell phones and handheld devices equipped with non-Microsoft operating systems and browsers also will be eliminated.

SBC's own website provides an example of the exclusionary effect this lack of disclosure will have on non-Microsoft server operating system. SBC uses non-Microsoft operating systems on its website servers, and the website is designed to be compatible with Java. Because Windows XP (unlike earlier Windows versions) does not contain Java, when Windows XP users attempt to access SBC's website, they receive a message that ''to display this page correctly, you need to download and install the following components: Java Virtual Machine.'' However, to make this (free) download on a normal dial-up connection will take the consumer over 30 minutes in normal conditions (i.e., low network congestion and latency), and an hour or more during times of peak usage. Thus, by dropping Java from Windows XP and failing to disclose its browser interfaces (which would enable SBC to obtain programs that could achieve ''seamless interoperability'' with Windows XP), Microsoft has compelled the consumer to undertake a confusing and lengthy download process. This creates an anticompetitive barrier to consumers' use of SBC's website and entrenches the Windows monopoly.[25]

(e) The Proposed Settlement Does Not Contain An Interoperabillty Disclosure Provision To Cover Server-To-Server Communications

Another corollary to the potential transition from the PC to a server-based computing environment is the need for a vastly increased volume of server-to-server communication transmissions. The proposed settlement contains no provision requiring disclosure of any technical information whatever to facilitate such communications—''interoperability''—between Microsoft and non-Microsoft server operating systems. The government offers no explanation for its absence, which will have

[25] In October 2001, Microsoft dispelled any doubt whatever that it would use its control of Internet Explorer and Microsoft server operating systems to exclude competing browsers, when it blocked access to its MSN.com server for Netscape's and Opera's competing browsers. See p. 80 infra.

the predictable effect of further diminishing the server threat to Microsoft's PC operating system monopoly, while also restraining competition in the server operating system market itself. All of the same deficiencies in interoperability discussed above with respect to PCs and servers also apply to server-to-server communications as well. For this reason, the same outcome is certain to occur: an overwhelming percentage of servers on the Internet will be forced to use a Microsoft operating system. If Microsoft is not required to disclose any of the technical information necessary interoperate with Microsoft's server operating system, the demand for non-Microsoft server operating systems will be significantly reduced. As a result, the Internet-based threat to Microsoft's PC operating system monopoly will be neutralized.[26]

(d) The Proposed Settlement Does Not Contain Interoperability Disclosure Provisions To Cover ''Embedded Devices''

Like a ''dumb PC,'' an ''embedded device'' (such as a cell phone, PDA or set-top box) also can provide a viable, competitive alternative to a Windows PC. The government once again admitted this in prior remedy proceedings when it included embedded devices in the interoperability disclosure provisions:

It is also possible that some of the middleware now being developed for alternative client devices—such as the handheld computer, the Personal Digital Assistant (PDA), the so-called ''Internet Appliance,'' or the wireless telephone—might one day attract developers in large numbers. If ported to the PC, this middleware could then begin to erode the applications barrier to entry to the PC operating system market.

Henderson Decl. 16. See Final Judgment § (3)(b)(iii) (requiting full disclosure of all technical information relevant to interoperability between operating systems of handheld devices and Windows PCs).

The government's position at the time rested squarely on District Court findings that such devices could present an alternative to a Windows PC in the future. D.Ct. ¶¶at 22–23. Those findings were not disturbed on appeal and remain binding today. CA at 52 (handheld devices could, but do not yet, perform enough functions to be an alternative to a Windows PC.)

In the proposed settlement, this essential salutary provision has been removed without explanation by the government. The result is to eliminate another potential threat to Microsoft's PC operating system monopoly, while also giving Microsoft a significant advantage in the closely connected market for operating systems for such embedded devices.[27]

(e) The Technical Information That Is Required To Be Disclosed Under The Proposed Settlement Is Insufficient To Achieve Interoperability

Even in those situations where the proposed settlement does require Microsoft to disclose certain technical information (interoperability between Microsoft middleware and Windows PC operating system; client protocols), the type and extent of the disclosure is inadequate to promote competition, because it fails to achieve the ''seamless interoperability'' that the government admits is essential to provide an effective remedy for Microsoft's antitrust violations.

While the government now claims to have achieved equal access to the ''same interfaces and related information'' for non-Microsoft and Microsoft middleware developers (CIS at 33), this is not correct. Specifically, the proposed settlement only requires disclosure of ''the APIs and related documentation'' used by Microsoft Middleware to interoperate with a ''Windows Operating System Product.'' RPFJ <§ III.D. This limited disclosure is in stark contrast to the disclosure the government sought, and obtained, in the Final Judgment. Final Judgment § 3(b). At that time, the government required disclosure of ''all APIs, technical information and communications interfaces'' to achieve interoperability. Id. (emphasis added).

For example, by limiting disclosure to APIs, the government has left out important additional technical information that is indispensable for a middleware product to achieve ''seamless interoperability'' with a Windows PC operating system. In addition, the definition of what constitutes an ''API'' is drawn too narrowly in the proposed settlement; it does not include items like registry keys, file formats, communications protocols and other necessary technical information that is critical for an ISV to develop a middleware product that is fully interoperable. See RPFJ § VI.A. This stands in sharp contrast, once again, to what the government advocated in the Final Judgment, when its own expert explained that disclosure of all APIs, communications interfaces and other related technical information was essential to promote full interoperability. Felton Decl. ¶¶15–28. The government offers no explanation for its change of position. See Final Judgment § 7(b); Litigating States' § 22(c).

The same deficient definitions apply to the type of technical information that Microsoft must disclose to promote interoperability between a non-Microsoft server operating system and a Windows PC operating system. RPFJ § III.E. Such disclosure is now limited only to ''client protocols,'' while the Final Judgment required disclosure of ''all APIs, Technical Information and Communications Interfaces'' necessary to achieve full interoperability. Final Judgment § 3(b); Litigating States' § 4. The proposed settlement's limited disclosure obligation has grave negative ramifications for ISVs seeking to achieve full interoperability. First, as stated above, both the client and server protocols are necessary to achieve interoperability between a PC operating system and a server operating system. Moreover, there is substantial additional technical information that far exceeds a ''communications protocol.'' Such additional information includes APIs, software tools, file formats and other technical information without which a non-Microsoft server operating system will never achieve ''seamless interoperability'' with a Windows PC, let alone operate as well as a Microsoft server operating system.

The possibility that Microsoft will maintain its PC monopoly in this manner is not hypothetical. In fact, in the absence of strong remedial provisions, not only is Microsoft certain to use disclosure, or the lack thereof, to create and maintain an advantage over its competitors, but it has already used the very same control over communications protocols and the like to disrupt competing browsers' ability to communicate with its own servers over the Internet. At the time of the release of Windows XP just last October, Microsoft secretly changed the MSN web server program codes to specifically prevent the competing browsers Netscape Navigator and Opera from interoperating with the MSN web server.[28] Browser Bruiser, Chicago Sun Times, October 27, 2001, at 36 (''Microsoft's premiere web portal, MSN.com, denied entry to millions of people who use alternative browser software such as Opera and told them to get Microsoft's products instead.''); MSN Shuts Out Other Browsers, Associated Press, October 28, 2001 (''Microsoft's premiere web portal, MSN.com, denied entry to millions of people who use alternative browser software such as Opera...The blockage coincided with Microsoft's showcase launch of its Windows XP operating system. Instead of getting MSN's news, games and shopping features, Opera users were given links to download Microsoft's browsers.'').

(f) The Timing Of The Required Disclosure Under The Proposed Settlement Will Impede, Not Promote, Competition

To restore competition in the PC operating system market, proper timing is no less important than the substance of the required disclosures. The District Court made multiple findings of fact, affirmed by the Court of Appeals, which established that delayed disclosure of technical information to achieve interoperability effectively nullifies its value. D.Ct. at 338–40; CA at 71–73. The ''time to market'' in developing software is of the utmost importance. Id. The ability of an ISV even to attempt to compete with Microsoft is ''highly dependent'' on Microsoft's release of its technical information relevant to interoperability. Id. Netscape learned this lesson in 1995 when Microsoft, in the face of repeated demands from Netscape for technical information regarding interoperability with Windows 95, withheld this technical information from

[26] The Litigating States' proposal properly requires full disclosure of all technical information necessary to design a non-Microsoft server operating system that would be fully interoperable with a Microsoft server operating system. Litigating States'' § 4.

[27] The Litigating States' proposal justifiably requires full disclosure of all technical information relevant to the interoperability between a Microsoft PC or server operating system and any embedded device. Litigating States'' § 4.

[28] When browsers connect to a web server, they send information identifying specifically which browser it is and the capabilities of that browser. Programmers often code their web servers to be aware of browser differences so that the web server can provide a richer end-user experience. It is unusual, to say the least, to use browser and web server capabilities in this way to deny access.

Netscape for approximately three months. D.Ct. at ¶¶90–92. While Netscape was waiting for this information, Microsoft brought to market its competing product—Internet Explorer. Id. The result of this delay was to destroy any fair competitive challenge Netscape might mount against Internet Explorer. Id.

The government has previously acknowledged that the proper timing of disclosure of technical information related to interoperability is critical to restore competition to the PC operating system market. Gov't D.Ct. Reply Memo at 21–23. As a result, the government sought provisions in the Final Judgment that required the timing of all disclosures to be made when Microsoft disclosed the information to its own developers, and well in advance of when any new Windows product is brought to market. Final Judgment § 3(b).

Having manipulated for its own competitive advantage the timing of interoperability disclosures in the past, it is not surprising that Microsoft demanded very liberal and vague timing in the proposed settlement. The government, however, having litigated and prevailed on the timing issue, now largely gives up. The proposed settlement does not require the disclosure of technical information related to interoperability of Microsoft Middleware products to begin until the ''earlier of the release of Service Pack I for Windows XP or twelve months after the submission of this Final Judgment.'' RPFJ § III.D. If Microsoft intends to introduce a new Middleware Product, it does not have to disclose any technical information related to interoperability until the product's ''last major beta test.'' Id. All other disclosures must be made in a ''Timely Manner,'' which is defined as the ''time Microsoft first releases a beta test ... that is distributed to 150,000 or more beta testers.'' Id. § VI.R.

Similarly, the disclosure of client protocols contained in the Windows PC operating system are not required to begin until nine months after the submission of the final judgment, and all subsequent disclosures are not regulated as to time, and thus left solely within the discretion of Microsoft. RPFJ § III.E.

The inadequacy of these timing requirements is patent. There is no conceivable justification, and none has been offered, for delaying disclosure with respect to Microsoft's current products for nine to twelve months from the date of the settlement. By definition, Microsoft knows, and its programmers have access to, current product information today. The delay built into the settlement simply allows Microsoft time to exploit its proven monopoly for another year so that Microsoft's products will have an even greater advantage when disclosure finally begins.

With respect to new middleware products and others, the timing of disclosure also fails to serve the public interest. Disclosure for a new middleware product is not required until the new product's ''last major beta test'', which is also an undefined term. RPFJ § III.D. As to all other middleware disclosures, Microsoft is free to decide when to conduct the required beta test to 150,000 or more beta testers. RPFJ § III.D. With respect to the disclosure of client protocols, Microsoft is not subject to any time limit whatever. RPFJ § III.E. These provisions effectively immunize continued anticompetitive conduct. Microsoft is essentially given free rein to choose when it will be most advantageous in terms of marketing its products to make the required disclosures; and prior to disclosure it is free to develop and position its products for maximum competitive advantage.

Once again, the CIS provides no explanation why Microsoft's disclosure obligations should not commence immediately, and why at all times thereafter, should not be made as soon as information is available to Microsoft's own programmers. CIS at 34–35. For example, the ''beta test'' standard in the proposed settlement is far too late to be competitively meaningful. A beta test is one of the last steps taken by a software developer before placing a new product on the market. It is often viewed as more of a marketing tool (to create a ''buzz'' among technology writers and other cognoscenti), rather than a true development step. Thus, if Microsoft is allowed to wait until this point, it will be able to do to other software developers exactly what it did to Netscape in 1995—ensure that a competing product is so late to market that it faces an insurmountable barrier to overtake Microsoft's lead. D.Ct. at ¶¶90–92.

The Final Judgment and Litigating States' proposal are much more rational, and likely to lead to meaningful disclosure that would promote interoperability and competition. All disclosures under the Final Judgment and Litigating States' proposal are required to be made in a ''timely manner,'' which is precisely defined as, at a minimum, the earliest of the following times:

(i) When the information is disclosed to Microsoft's own application developers;

(ii) When the information is used by Microsoft's ''own platform software developers in software released by Microsoft in alpha, beta release candidate, final or other form'';

(iii) When the information is disclosed to any third party; or

(iv) Within ninety days of the final release of the Windows operating system product, but ''no less than five days after a material change is made between the most recent beta for release candidate version and the final release.''

Final Judgment § 7(ee); Litigating States' § 22(pp).

(g) Important Terms In The Proposed Settlement Are So Loosely Defined That They Enable Microsoft To Avoid Disclosure

The definitions of important terms relevant to interoperability are so vague that Microsoft can largely avoid its disclosure obligations. Among other things, the proposed settlement's definitions of ''Microsoft Middleware'' and ''Windows Operating System Product'' give Microsoft the ability to completely circumvent even the otherwise paltry disclosure requirements. See pp. 36–40, 42–43 supra. Just as important, the critical term ''interoperability'' is not defined in the proposed settlement. It should be defined as the ability of a system or product to work with other systems or products in such a way as to effectively access, utilize and support the full features and functions of one another. See Litigating States' § 22(q).

In addition, the definition of ''Windows Operating System Product'' provides that ''[t]he software code that comprises a Windows Operating System Product shall be determined by Microsoft in its sole discretion.'' RPFJ § VI.U (emphasis supplied). Essentially, this provision grants Microsoft the ability to avoid disclosure to competitors of technical information—even that necessary to achieve the government's promised ''seamless interoperability''—merely by embedding a middleware product in the Windows PC operating system code. Microsoft can then argue that the product at issue is not middleware, but rather part of Windows, and thus outside all disclosure obligations.

The definition of ''Microsoft Middleware'' demonstrates the intentional nature of the government's concession on this point and serves no function other than to dilute the effectiveness of the proposed settlement. That definition, which is essentially the flip-side of the ''Operating System'' coin, also allows Microsoft the flexibility to define whatever it wants to as middleware, by either not obtaining a trademark for the product or by simply bundling it with the Windows PC operating system. RPFJ § VI.J. In either instance, the effect is the same: Notwithstanding the conclusion of the District Court and the Court of Appeals that Microsoft bound middleware to its operating system for the purpose of defending its operating system monopoly in violation of § 2, the company will remain free to continue the same conduct.

ii. The Mandatory Licensing Provisions Are Illusory

The proposed settlement provides that Microsoft must license to its competitors the intellectual property fights for any technical information it is required to disclose. The CIS explains that ''[t]he overarching goal of this section is to ensure that Microsoft cannot use its intellectual property fights in such a way that undermines the competitive value of its disclosure obligations.'' CIS at 49. Limitations on Microsoft's licensing obligations, however, make the provision's impact largely illusory. Indeed, they may well benefit Microsoft to the exclusion of its competitors and competition generally in the PC operating system market.

First, Microsoft is permitted to charge a ''reasonable royalty'' to any competitor who requests disclosure related to interoperability. RPFJ § III.I.1. This provision is anticompetitive. On its face, it allows Microsoft to enjoy the fruits (i.e., licensing royalties) of its proven illegal monopoly. Moreover, it gives Microsoft the opportunity to use a ''royalty'' charge to control crucial technical information in a way that restrains its competitors—a practice Microsoft has already shown a willingness to undertake.[29] The government earlier acknowledged that

[29] Under the proposed settlement, there is no practical way for competitors who must pay the fee to challenge its reasonableness.

these dangers can be avoided only by requiring any license to be royalty-free:

The disclosure of APIs, Communications Interfaces and Technical Information required by the Final Judgment will enable third parties to make their products interoperate effectively with Windows, thereby increasing the value of Windows as a platform ..... There is thus no need or justification to charge a royalty for access to the same information about interoperation with Microsoft Platform Software on a Personal Computer that Microsoft's own developers receive.

Gov't D.Ct. Sum. Resp. at 14.

The relevant case law also supports the position that royalty-free licenses are necessary to prospectively remedy Microsoft's illegal monopolization of the PC operating system market. See United States v. General'' Elec. Co., 115 F. Supp. 835,844 (D.N.J. 1953) (royalty-free licenses an essential remedy to prevent a continuance of monopoly). The government made this same legal point when it recognized that the instant case is analogous to United States v. Western Elec. Co., 569 F. Supp. 1057, 1082–1091 (D.DC 1983), aff'd sub nom. California v. United States, 464 U.S. 1013 (1983), where compulsory, royalty-free, sublicensable licenses were required to remedy past anti-competitive conduct. Gov't D.Ct. Reply Memo at 27–29. As the government pointed out, this provision was one of several that insured that ''telecommunications [would] continue to operate in an engineering sense as one national network.'' Id. at 29 (internal quotation marks omitted). The same functional interoperability is necessary to ensure maximum innovation and competition in all aspects of the computer industry.

Moreover, as in the AT&T case, whether royalty-free licenses are necessary is not an issue of remedying a monopolist's past anticompetitive use of its intellectual property per se, but rather a matter of making sure that the relief granted (in this case, disclosure of certain APIs and communications protocols) is not impeded by onerous license terms. Thus, requiring royalty-free licensing is merely in aid of a remedy for antitrust violations that are not directly related to Microsoft's licensing of its intellectual property.

The public interest also is not served by giving Microsoft the tight to condition the grant of any license of its own software upon the licensee's ''cross-licensing'' any intellectual property rights it may have ''that are related to the licensee's exercise of its tights'' under the settlement. RPFJ § III.I.5. It was established long ago that cross-license requirements are inconsistent with restoring competition to a monopolized market:

[A] provision for reciprocal licensing would tend to perpetuate the situation of industry dominance by General Electric which the decree is designed to end... Were General Electric granted the right of reciprocity, since it would be the overwhelmingly largest source from which to demand licenses, once again it would be in a position of being able to channel all development through itself. Therefore the proposal of General Electric for reciprocal licensing will be declined.

General Elec. Co., 115 F. Supp at 847.

The government's present justification, that this provision is necessary to ensure that Microsoft would not be exposed to ''infringement liability'' as a result of the interoperability disclosures, is difficult to understand. CIS at 50. No competitor should be forced to disclose its own proprietary information in order to exercise rights put in place to restore competition in a monopolized market. Again, the government does not explain why it was wrong when it earlier concluded that such a provision has no pro-competitive benefit:

There is no justification for requiting third parties to disclose to Microsoft the APIs' and Communications Interfaces in their products that interoperate with Windows. Microsoft has monopoly power in the market for PC operating systems, and third-party developers of middleware that might challenge that monopoly are thus dependent on access to Windows APIs, Communications Interfaces and Technical Information. Microsoft has previously withheld access to APIs and interfaces to defeat such threats in the past, and the restoration of competition requires that it not be permitted to do so in the future. No comparable concern has been raised in this case about access to information regarding third parties' products. In any event, third parties that get access to APIs, Communications Interfaces, and Technical Information are doing so to create complements to Microsoft's operating system.

Gov't D.Ct. Sum. Resp. at 14–15.

In addition, the disclosures required by cross-licensing would enable Microsoft to get a jump on developing its own product to compete with that which the licensee was forced to disclose. The settlement would thereby further increase Microsoft's timing advantage over its licensee in selling a new product. Nothing requires giving a proven monopolist such a benefit.

iii. The Limitation Upon Disclosure Based On Alleged Security Concerns Is A Massive Loophole

The provision in the proposed settlement that limits Microsoft's interoperability disclosure obligations based on security considerations is another loophole that Microsoft can use to justify withholding crucial technical information. Under this provision, if technical information would ''compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems, including without limitation, keys, authorization tokens or enforcement criteria,'' it is exempt from disclosure. RPFJ § III.J.1. In addition, Microsoft is also given the right to require that the following conditions be met prior to licensing APIs or communications protocols related to the foregoing subjects:

(i) that any licensee never have participated in software counterfeiting or piracy, and never have willfully violated intellectual property rights;

(ii) that the licensee have a ''reasonable business need'' for the technical information, and the need must be related to a product that is currently being planned or shipped;

(iii) that the licensee meet ''reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business''; and

(iv) that the licensee agree to submit any program using the disclosed technical information to a third party, approved by Microsoft, to ''ensure verification and compliance with Microsoft specifications.'' RPFJ § III.J.2.

The government did not permit any such ''security'' exception in its proposals for the Final Judgment. The government now attempts to justify this provision as a ''narrow exception'' that is necessary to maintain the integrity of the security-related features of Windows. CIS at 10. To the contrary, the broad language and significant discretion given to Microsoft create loopholes for Microsoft to withhold information essential to interoperability from disclosure generally or from specific rivals it wishes to prejudice.

First, virtually all APIs, communications interfaces or other technical information that are relevant to interoperability, on some level will perform ''authentication'' or ''encryption'' functions related to the security of an operating system. Accordingly, the allegedly ''narrow'' security exception in reality gives Microsoft a virtual carte blanche to withhold information necessary for interoperability, simply by citing this section and claiming the code at issue provides ''authentication'' or ''encryption'' functions.

The language requiring that a person seeking disclosure must meet ''reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business'' invites abuse by Microsoft. RPFJ § III.J.2.c (emphasis added). For example, Microsoft could exercise its veto power over a disclosure request from an open source developer, on the ground that Microsoft does not consider ''its business'' to be ''authentic'' or ''viable''. The open source community typically operates on a not-for-profit basis, and has long been a competitive adversary of Microsoft. Rebecca Buckman, Microsoft is Suing Linux Start-up Over Lindows Name, Wall Street Journal, December 24, 2001 (Microsoft brings trademark action against open source operating system developer); Lee Gomes, Linux Campaign Is An Uphill Battle For Microsoft, Wall Street Journal, June 14, 2001 (''A Microsoft Corp. effort to vilify Linux and other open-source software appears to be backfiring ... Microsoft Chief Executive Steve Ballmer ... [called] Linux ''a cancer that attaches itself in an intellectual property sense to everything it touches.''); Byron Acohido, Microsoft Memo to Staff: Clobber Linux, USA Today, Jan. 4, 2002 (''Microsoft is escalating its war against Linux.'').

Similarly, the requirement that the prospective licensee have a ''reasonable business need'' for the information also gives Microsoft anticompetitive powers. Microsoft could dispute the asserted ''need'' or use to its own competitive advantage the information that licensees would presumably submit to it to demonstrate their ''need,'' since the provision effectively gives

Microsoft advance notice of its competitors' new products. For this reason, the provision will discourage competitors from even exercising disclosure rights. Finally, Microsoft is given the gratuitous fight to require all competitors' programs that use Microsoft's APIs to be verified by a third party, who is ''approved by Microsoft,'' to ensure compliance with ''Microsoft's specifications for use of the API or interface.'' RPFJ § III.J.2.d.

Microsoft's alleged concern for security is a pretext to create a loophole, as well as to allow Microsoft to obtain an unwarranted advantage by having early access to its competitors' trade secrets, The fact that certain code may provide a security function is not a legitimate reason to withhold disclosure. Although Microsoft has not been required to license this information in the past, its software security record is arguably one of the worst in the industry. See, e.g., Wayne Epperson, NT Insurance at a Premium, HostingTech (August 2001), at www.hostingtech.com/security/01_08_nt. (reporting that insurer J.S. Wurzler Underwriting Managers had discovered ''that clients who used Microsoft Windows NT software in their Internet operations were at a greater risk of loss to computer hackers than were the insured Unix or Linux users .... After 5 months of analysis, Wurzler Underwriting Managers made the decision to charge its NT clients an extra premium for insurance coverage.''). On the other hand, several of the most effective security programs, such as Kerberos and ''Pretty Good Privacy,'' are available on an open-source basis and freely accessible by the public. These examples prove that even full public disclosure is not inimical to security. What disclosure does prevent, however, is the exercise of monopoly power. For purposes of this proceeding, therefore, the ''security'' loopholes are not in the public interest.

3. The Proposed Settlement Fails To Remedy The Proven Pattern Of Unlawful Retaliation, Inducements, And Exclusive Dealing Arrangements Used By Microsoft To Maintain Its Monopoly

As determined by the District Court in findings upheld by the Court of Appeals, Microsoft threatened to and did withhold critical technical information from software developers; Microsoft provided or withheld financial benefits depending on a party's willingness to aid in its anticompetitive campaign; and Microsoft contractually prohibited third parties from distributing competing software. CA at 71–73, 76–77. Yet, the proposed settlement fails in many respects to protect third parties from new versions of such past conduct which may be used by Microsoft to protect its operating system monopoly.

In earlier proceedings, the government recognized that any remedy must be ''directed towards future competition and innovation,'' and that while the remedy was based on historical experience, the analysis was ''done on a forward-looking basis.'' See Shapiro Decl. at 2. The government further acknowledged that in this fast-moving industry, any remedial conduct provisions must ''be broad enough to prevent Microsoft from engaging in a number of categories of anticompetitive tactics in the future, precisely because the specific tactics that Microsoft might employ in the future are hard to predict today in the face of changing products and technology.'' Id. (emphasis in original)

Having recognized these elements as essential to any remedy that would serve the public interest, the government now proposes to settle on terms that do virtually nothing to anticipate and prohibit new forms of exclusion. Indeed, in many instances, the government has given up or severely limited provisions in the original Final Judgment that were fully justified by the Court of Appeals' affirmance. On a number of such issues, the proposed settlement accepts positions that Microsoft sought to include in the Final Judgment, but the government then specifically rejected. The government rejected Microsoft's proposals precisely because they ''consist[ed] largely of changes that would create loopholes and permit Microsoft to continue to engage in anticompetitive practices like those found by the Court or otherwise to frustrate or undermine the purposes of the Final Judgment.'' Gov't D.Ct. Sum. Resp. at 6. However, the recent CIS does not attempt to justify the government's acquiescence in what were once viewed as ''loopholes'' and a license to resume ''anticompetitive practices.''

a. The Government's Settlement Substitutes Weak And Narrow Protections Of Third Parties For The Strong And Broad Provisions Justified By Microsoft's Conduct s

The Court of Appeals held that Microsoft had engaged in exclusionary acts and threats of retaliation in violation of § 2. CA at 73, 77–78. In its efforts to promote IE and restrict the distribution of Navigator, Microsoft successfully made threats against Apple. To halt the development of cross-platform interfaces for Java, Microsoft threatened to retaliate against Intel. Microsoft also made threats and retaliated against others who posed potential threats to its monopoly. D.Ct. at ¶¶83–84, 91, 101, 102.

The government has recognized the established and urgent need to prevent Microsoft from engaging in acts or threats of retaliation. The original Final Judgment prohibited Microsoft from ''tak[ing] or threaten[ing] any action [that] adversely affect[s] any OEM... based directly or indirectly, in whole or in part, on any actual or contemplated action by that OEM to use, distribute, promote, license, develop, produce or sell any product or service that competes with any Microsoft product or service.'' Final Judgment § 3(a)(i). The Final Judgment further prohibited Microsoft from ''tak[ing] or threaten[ing] any action affecting any ISV or IHV... based directly or indirectly, in whole or in part, on any actual or contemplated action by the ISV or IHV to use, distribute, promote or support any Microsoft product or service, or develop, use, distribute, promote, or support any software that runs on non-Microsoft Middleware or a non-Microsoft Operating System or that competes with any Microsoft product or service.'' Final Judgment 21§ 3(d)(i) and 3(d)(ii).

With respect to OEMs, the government recognized that Microsoft's retaliatory actions ''highlight[] the potential for misuse of monopoly power that must be prevented if potential rivals to Windows and new innovations in software can be expected to emerge.'' Gov't D.Ct. Memo at 38. The government specifically admitted that the broad anti-retaliation provision was needed ''both to prevent subtle or varied forms of coercion and to avoid difficulties in determining the scope of the restriction in an enforcement proceeding.'' Id. at 38–39.

With respect to banning retaliation against ISVs and IHVs, the government said it was necessary to ''ensure that Microsoft does not use its operating system monopoly to nip new competitive threats in the bud.'' Gov't D.Ct. Memo at 41. The provision was a ''safeguard to prevent Microsoft's continued use of the wide array of opportunities presented by its monopoly position to bribe and coerce third parties to favor its own products and exclude others.'' Gov't D.Ct. Reply Memo at 55.

Moreover, because Microsoft repeatedly sought anticompetitive agreements, such as its attempted market allocation agreements with Netscape and Intel, the Final Judgment included a provision that flatly prohibited agreements that limit competition (Final Judgment § 3(h)) ''to ensure that the defendant will be unable to repeat its unlawful conduct.'' Gov't D.Ct. Sum. Resp. at 17. ''Prohibiting anticompetitive activity that could stifle the emergence of other forms of middleware as potential platforms is necessary both to prevent recurrence of past misconduct and to restore competitive conditions.'' Gov't D.Ct. Reply Memo at 65.

Even today, the government recognizes the need to prohibit retaliation based on the specific findings of illegal conduct upheld by the Court of Appeals. In its attempts ''to protect the applications barrier to entry, Microsoft embarked on a multifaceted campaign to maximize [IE]'s share of usage and to minimize Navigator's.'' CIS at 13. Not content to merely develop its own browser, ''Microsoft decided to constrict Netscape's access to the two distribution channels that led most efficiently to browser usage; installation by OEMs on new personal computers and distribution by [IAPs].'' Id. ''To ensure that developers would not Comments of SBC Communications Inc. view Navigator as truly cross-platform middleware,'' Microsoft also pressured Apple ''to make Navigator less readily accessible on Apple personal computers.'' CIS at 14.

Additionally, as part of ''its effort to hamper distribution of Navigator and to discourage the development of software that used non-Microsoft technology, Microsoft also targeted [ISVs] by contractually requiring ISVs to use [IE]-specific technologies in return for timely and commercially necessary technical information about Windows, and precluded important ISVs from distributing Navigator with their products.'' CIS at 14–15. Ultimately, ''Microsoft's actions succeeded in eliminating the threat that the Navigator browser posed to Microsoft's operating system monopoly... Navigator lost its ability to become the standard software for browsing the Web because Microsoft had successfully—and illegally—excluded Navigator from that status.'' CIS at 15.

The proposed settlement (RPFJ §§ III.A,F) fails to implement the procompetitive goals that the government has repeatedly expressed, and substitutes weak and narrow protections for broad prohibitions to interdict new forms of exclusionary conduct adopted by Microsoft in response to new forms of competition.

i. The Range Of Parties Protected From ''Retaliation'' Is Too Limited

The settlement would only protect OEMs, ISVs and IHVs against ''retaliation.'' Microsoft's record of retaliatory conduct, however, demonstrates that the ban against retaliation must apply to all third parties.[30] Microsoft has demonstrated that it will take any action necessary against any entity that poses a threat to its monopoly, by making threats, offering inducements, coercing or contractually restricting others. The government offers no justification whatever, let alone any persuasive reason, to limit the types of third-parties against which Microsoft cannot engage in unlawful retaliation. The settlement's failure to ban retaliation broadly is all the more troubling because this provision does not impose any affirmative duties on Microsoft. The only ''burden'' is that Microsoft must refrain from punishing those who might challenge Microsoft's illegal monopoly.

ii. ''Retaliation'' Is Not Defined

The proposed settlement states that Microsoft ''shall not retaliate,'' but never defines ''retaliation.'' Although the government stated that its intention was to ''prevent subtle or varied forms of coercion and to avoid difficulties in determining the scope of the restriction in an enforcement proceeding'' (Gov't D.Ct. Memo at 38–39), the vague language of the settlement fails to meet that goal. Without a definition of ''retaliate,'' such as a prohibition against ''taking or threatening adverse actions'' (see Final Judgment §§ 3(a)(i), 3(d)), Microsoft will be free to argue that no violation has been established on a particular set of facts. Given the extraordinary record of Microsoft's ingenuity in abusing its monopoly power, any definitional doubt must be resolved against the wrongdoer by imposing a broad definition of ''retaliate.''

Moreover, with respect to OEMs, Microsoft is only prohibited from ''retaliating against an OEM by altering Microsoft's commercial relations with that OEM or by withholding newly introduced forms of non-monetary Consideration.'' See RPFJ § III.A (emphasis added). The use of the words ''newly introduced'' is ambiguous in that it suggests that Microsoft is permitted to withhold existing forms of non-monetary compensation. The CIS offers no explanation for this ambiguity concerning whether Microsoft may continue to engage in conduct previously adjudged illegal. CIS at 25–26.

iii.The Party Injured By Retaliation Must Prove Causation

The proposed settlement too narrowly limits the type of conduct by third parties for which Microsoft may not ''retaliate.'' It only prohibits ''retaliation'' that occurs ''because'' of conduct by the OEM, ISV or IHV. By imposing a causation requirement on the injured party, the government again gives a proven wrongdoer the benefit of a doubt to which it is not entitled. The prior Final Judgment struck the correct balance by prohibiting any adverse action by Microsoft based directly or indirectly on any actual or contemplated action by the protected party. Final Judgment §§ 3(a)(i), 3(d); see also Litigating States' § 8.

iv. Retaliation Not Involving Windows Or Middleware Is Allowed

The proposed settlement's ban on ''retaliation'' currently only applies to a protected party where it is developing, distributing, promoting or using products that compete with Microsoft Platform Software or middleware.[31] Given the multitude of ways in which new threats can (and did) develop to contest the Windows operating system, the ban on retaliation will not be truly effective unless it protects any action or contemplated action involving products or services that compete with any Microsoft products or services.

v. Loopholes Vitiate Even The Existing Limitations

The settlement contains broad savings clauses and exceptions that give Microsoft loopholes for abuse and are not justified by the Court of Appeals' findings. The OEM retaliation provision permits Microsoft to provide ''Consideration'' to any OEM with respect to any Microsoft product or service if the ''Consideration is commensurate with the absolute level or amount of that OEM's development, distribution, promotion, or licensing of that Microsoft product or service.'' RPFJ § III.A. Similarly, Microsoft may enter agreements with ISVs limiting their ability to develop, promote or distribute competing software, if the limitations are ''reasonably necessary to and of reasonable scope and duration in relation to a bona fide contractual obligation of the ISV to use, distribute or promote any Microsoft software or develop software for, or in conjunction with, Microsoft.'' RPFJ § HI F.2.

These vague provisions are an invitation for abuse. Microsoft has repeatedly used these very practices to maintain an illegal monopoly for over a decade. Under these circumstances, a broad prohibition that puts the burden entirely on Microsoft to prove the bona fides of any ''consideration'' or exclusivity is not only appropriate, but essential to revive competition.

vi. Unnecessary And Ambiguous Savings Clauses Undermine The Decree

The retaliation provisions also include broad savings clauses that provide that nothing in the provisions ''prohibit Microsoft from enforcing any provision of any agreement with any [OEM, ISV or IHV] or any intellectual property right, that is not inconsistent'' with the settlement. RPFJ §§ III. A and III. F. 3. Given the ambiguities in the settlement, this loophole, too, will invite aggressive interpretation by Microsoft, and further litigation.

vii. There Is No Prohibition On Agreements Limiting Competition

The provision in the Final Judgment banning agreements to limit competition (Section 3(h)) has been completely eliminated, leaving Microsoft free to seek to enter market allocation agreements such as the ones it proposed to enter with Netscape and Intel. D.Ct. at ¶¶83–84, 97, 101. The proposed settlement (§ III.G) only prohibits Microsoft from entering into agreements with certain entities to use or distribute Microsoft Platform Software exclusively or in fixed percentages. There is no provision that limits Microsoft's ability to enter into agreements with competitors providing that they refrain from developing or distributing products that compete with the Windows operating system or a Microsoft middleware product. This CIS does not explain this glaring omission.

viii. There Is No Protection Against Retaliation For Participating In This Lawsuit

Nothing in the proposed settlement protects individuals or entities from retaliation by Microsoft for participating or cooperating in this litigation. In a letter to the Senate Judiciary Committee, former Solicitor General Robert H. Bork expressed the realistic concern that ''any potential witness with knowledge of anticompetitive conduct in a monopolized market has to weigh the potential benefit of his or her testimony against the likely response of the defendant monopolist. The [government's] proposed meaningless remedy would insure that no witness would ever testify against Microsoft in any future enforcement action.'' See Letter from Robert H. Bork to Senate Judiciary Committee of 12/11/01, at 4. Again, the CIS does not address this issue of obvious concern, given Microsoft's track record of anticompetitive abuse.

b. The Proposed Uniform Licensing To OEMs Is Insufficient

The District Court made findings of fact, which were not questioned by the Court of Appeals, that provide examples of incentives and threats used by Microsoft to induce OEMs to promote IE and not pre-install or promote Navigator. Thus, Microsoft gave reductions in price to OEMs who set IE as the default browser on their PC systems; Microsoft gave further reductions to OEMs who displayed IE logos and links on their home page; and Microsoft gave OEMs millions of dollars in co-marketing funds in exchange for carrying out other promotional activities for IE. D.Ct. at ¶231.

The original Final Judgment contained a strong ban on discriminatory license terms. It compelled Microsoft to license Windows to all covered OEMs on uniform terms and prohibited Microsoft from offering market development allowances or discounts. Final Judgment § 3(a)(ii). Microsoft was further required to give OEMs equal access to, inter alia, licensing terms, discounts, technical and marketing support and product and technical information; and to give written notice and an opportunity to cure before terminating an OEM's license. Id.

[30] The listing of categories of protected parties, instead of applying the ban to all third parties, also presents a significant risk of omitting some competitors (e.g., SBC and Sun Microsystems) from the decree's protection because their businesses do not fit neatly into any standard category.

[31] Microsoft Platform Software is defined as Microsoft Middleware and the Windows Operating System. The limitations of those defined terms which, among other things, exclude applications (including applications on Internet-based servers that would threaten the Windows monopoly), render the ''retaliation'' ban far too narrow. See pp. 36–40, 42–43 infra.

The government recognized the necessity for this provision requiring ''transparent and uniform pricing to the largest OEMs... so that Microsoft cannot retaliate against an OEM for supporting non-Microsoft software.'' Gov't D.Ct. Memo at 39. Uniform terms and pricing were also seen as necessary to ''terminate[] Microsoft's practice of charging substantially different prices for Windows licenses to reward cooperative OEMs, effected in part by its market development allowances, and will thus make it easier for OEMs to promote non-Microsoft products in response to consumer demand.'' Id. The government found that this uniformity was ''necessary to prevent Microsoft from employing the myriad forms of coercion and reward that'' have been held to injure competition. Gov't D.Ct. Reply Memo at 43–44. ''Such coercion is difficult to detect, and the mere threat of its use may be sufficient to accomplish the desired, anticompetitive result.'' Id. at 44.

In the context of the present settlement, the government continues to define as a ''critical'' objective ensuring that OEMs are truly ''free to choose to distribute and promote middleware without interference from Microsoft.'' CIS at 25. It recognizes that Windows'' license royalties and terms are ''inherently complex and easy for Microsoft to use to affect OEMs'' behavior, including what software the OEMs will offer to their customers.'' CIS at 28. By purportedly requiring uniform licensing, the govemment says that the proposed settlement eliminates ''any opportunity for Microsoft to set a particular OEM's royalty or license terms as a way of inducing that OEM to decline to promote non-Microsoft software or retaliating against that OEM for its choices to promote non-Microsoft software.'' CIS at 28. The government's stated goal is ensuring ''that OEMs can make their own independent choices.'' CIS at 28.

Here, as in many other respects, the proposed settlement fails to fulfill the government's stated objectives.

i. Allowing ''Market Development Allowances'' Invites Evasion

Unlike the Final Judgment (§ 3(a)(ii)), which prohibited market development allowances (''MDAs'') outright, the proposed settlement would permit MDAs (RPFJ § III.3.B3), if certain restrictions are met, despite the fact that MDAs have been repeatedly used by Microsoft to induce OEMs to take actions that protect Microsoft's monopoly. As the government earlier acknowledged, making any MDAs permissible creates a loophole that will allow the very discrimination against OEMs that the provision is intended to prevent. See Gov't D.Ct. Sum. Resp. at 10 (the use of undefined and unbounded ''objective'' pricing criteria will permit Microsoft to reward or punish OEMs by charging them different prices).

ii. Microsoft Is Allowed To Keep License Terms Secret

The proposed settlement does not require that Microsoft provide equal access to licensing terms, discounts, technical support, etc. Without this information, OEMs cannot fairly negotiate license terms. In the current market, Microsoft offers significant discounts to OEMs that take the entire Windows package; those discounts enable the OEMs to be competitive with other PC manufacturers. However, if an OEM tries to negotiate anything out of the package, Microsoft significantly increases the price, making the OEM non-competitive. OEMs do not know what terms are negotiable and are afraid to negotiate aggressively out of fear they will be punished by Microsoft.

For this reason, when Microsoft previously requested deletion of the equal access provision, the government rejected the idea because it ''would allow [Microsoft] to reward or punish Covered OEMs with different Windows prices and non-price licensing terms and conditions and thus to evade the purpose of the Final Judgment.'' See Gov't D.Ct. Sum. Resp. at 10. Moreover, the government's view then was that ''the burden should not be on OEMs to know of and affirmatively seek out equal treatment; Microsoft could take advantage of a Covered OEM's ignorance of what has been provided to other Covered OEMs to reward or punish that OEM and thus to evade the purposes of the Final Judgment.'' Id. at 10–11. The government provides no satisfactory rationale for changing that view.

iii. There Is No Independent Verification Of ''Volume'' Discounts

The proposed settlement allows Microsoft to provide reasonable volume discounts based upon the actual volume of licenses. (RPFJ § III.B.2) Unless the provision requires that the volume discounts be based on the independently determined actual number of shipments, however, Microsoft will continue to have the power that it exercised in the past to manipulate discounts.

iv. License Terminations Without Cause Are Allowed

The proposed settlement creates an unnecessary exception to the written notice requirement for termination of OEM licenses. It provides that Microsoft need not provide notice or opportunity to cure if Microsoft has given two prior written notices. This exception invites Microsoft to abuse the notice provision and then arbitrarily revoke an OEM's license. Moreover, Microsoft is not even required to show ''good cause'' for termination. Again, the government provides no rationale why a proven monopolist should be given any such advantages.

c. The Proposed Settlement Fails To Address Exclusive Dealing Adequately

The Court of Appeals held that Microsoft's exclusive contracts with IAPs are exclusionary devices in violation of § 2. CA at 71. By ensuring that the vast majority of IAP subscribers were offered IE as their default browser or as the only browser, Microsoft's deals with IAPs had a significant effect in maintaining its monopoly by keeping usage of Navigator below the critical level necessary for it or any other rival to threaten Microsoft's monopoly. CA at 71.

In addition to the evidence specifically relied on by the Court of Appeals, the District Court made findings, not reversed, of other unlawful exclusive agreements. For example, in exchange for an agreement by IAPs to promote and distribute IE preferentially over Navigator and to convert existing subscribers from Navigator to IE, Microsoft gave fourteen IAPs placement in its Windows Referral Server. D.Ct. at ¶255,256. Microsoft also entered into agreements with AT&T, WorldNet, Prodigy and CompuServe limiting their ability to promote non-Microsoft browsers. D.Ct. at ¶305.

The Court of Appeals also held that Microsoft's illegal agreements with ISVs further foreclosed rival browsers from the market. CA at 72, 76. Microsoft entered dozens of ''First Wave'' agreements with ISVs, promising to give them preferential support in using Windows in exchange for ISVs agreeing to use IE as the default browser in any software they developed. The ''First Wave'' agreements with ISVs also required the ISVs to use Microsoft's JVM rather than Sun's JVM. This directly protected Microsoft's monopoly from the middleware threat. CA at 76.

To redress these exclusionary agreements, the government, earlier in this case, advocated a general and broad prohibition against any and all manner of exclusive dealing by Microsoft. In the Final Judgment, Microsoft was generally prohibited from offering a third party any consideration in exchange for that party's agreement to restrict development, production, distribution, promotion or use of, or payment for, any non-Microsoft Platform Software; distributing, promoting or using any Microsoft Platform Software exclusively; degrading the performance of any non-Microsoft Platform Software; and with respect to IAPs or ICPs, distributing, promoting or using Microsoft software in exchange for placement with respect to any aspect of a Windows Operating System. Final Judgment § 3(e).

The government recognized that such a ban was necessary because Microsoft had ''coerced and bribed'' third parties into becoming, willingly or unwillingly, participants in strengthening the applications barrier to entry. Gov't D.Ct. Memo at 41. The government stated that to prevent recurrence, Microsoft had to be barred from any exclusive dealing or percentage contracts that require a third party to limit its dealings in, or to degrade the performance of, non-Microsoft products, to deal solely in Microsoft software, or, in the case of IAPs or ICPs, to exchange promotion of Microsoft products for placement in the Windows operating system. Id. Significantly, the government advocated a general ban because Microsoft had dealings with a wide range of companies and because ''it is difficult to predict precisely which trading partners Microsoft might otherwise seek to tie up under exclusive arrangements in the next several years.'' Shapiro Decl. at 19. Only a general ban on exclusionary contracts would ''serve to lower entry barriers more effectively than would more limited provisions directed at specific categories of trading partners.'' Id.

In the CIS, the government continues to recognize the necessity of preventing ''Microsoft from using either money or the wide range of commercial blandishments at its disposal.., to hinder the development and adoption of products that, over time, could emerge as potential platform threats to the Windows monopoly.'' CIS at 42. However, the exclusive dealing provision in the proposed settlement (RPFJ § III. G) fails to

meet the goals that the government recognizes are essential. Nor will it prevent Microsoft from engaging in the same types of conduct that were found to be unlawful.

i. The Exclusive Dealing Prohibition Is Limited To Identified Parties Only

The provision is limited to the listed entities (IAP, ICP, ISV, IHV or OEM), but should be extended to all third parties. The government has specifically acknowledged that a ''general ban'' is necessary precisely because it is too difficult to predict which entities Microsoft might seek to tie up under exclusive arrangements in the next several years. Only a general ban may effectively lower entry barriers, as compared to ''more limited provisions directed at specific categories of trading partners.'' Shapiro Decl. at 19.

ii. Paying Third Parties To Refrain From Using Non-Microsoft Products Is Allowed

The proposed settlement only prohibits Microsoft from entering into agreements with certain third parties that grant consideration on the condition that the entity ''distributes, promotes, uses, or supports, exclusively or in a fixed percentage, any Microsoft Platform Software.'' RPFJ § III.G.1. The Final Judgment prohibited Microsoft from entering into an agreement with any third party that grants consideration to ''distribute, promote or use any Microsoft Platform Software exclusively'' (Final Judgment § 3(e)(ii) and ''to restrict its development, production, distribution, promotion or use of, or payment for, any non-Microsoft Platform Software'' (Final Judgment § 3(e)(i)). Microsoft attempted to delete the provision that prohibited agreements with a third party to restrict the development, production, distribution, promotion or use of non-Microsoft Platform software, but the government rejected the proposal. See Microsoft D.Ct. Com. at 12.

The proposed settlement does not prohibit Microsoft from granting consideration to a party that agrees to refrain from using or distributing products or services that compete with Microsoft.[321] RPFJ § III.G.1. Microsoft would thus be allowed to grant consideration (in the form of money, technical information or support, or otherwise) in exchange for the party's agreement not to use or distribute a competing product. Such an agreement would be the functional equivalent of the ''First Wave'' agreements with ISVs found to be illegally exclusionary by the Court of Appeals. The CIS does not articulate a satisfactory basis for omitting from the settlement a prohibition on the types of actions that were adjudged illegal.

iii. Microsoft Can Pay Others To Distribute Its Monopoly Software

Under the proposed settlement, Microsoft is permitted to enter into agreements with IAPs and ICPs that condition their placement in Windows on their agreement to distribute or promote Microsoft Platform Software. RPFJ § III.G.2. When Microsoft argued against this provision in the original Final Judgment, the government rejected its proposal because phrasing it the way Microsoft proposed (and as it is now phrased in the proposed settlement) would allow Microsoft to achieve the same anticompetitive purpose, by simply amending its agreements to require distribution of Micr0s0ft's browser instead of limiting distrution of competing browsers. See Gov't D.Ct. Sum. Resp. at 16; Microsoft D.Ct. Com. at 12. The government has not explained why it has now completely reversed its position.

iv. The Exclusive Dealing Provision Is Riddled With Loopholes

The various exceptions built into the exclusive dealing ban render it potentially meaningless. While purportedly prohibiting exclusive or fixed percentage arrangements, such agreements are actually permitted when Microsoft: obtains a representation that it is ''commercially practicable'' for the entity to provide equal or greater distribution of a competing product; if Microsoft enters into any type of loosely defined ''joint venture'' agreement; or if Microsoft licenses in intellectual property from a third party. (RPFJ § III.G). When Microsoft proposed to include a similar joint venture exception in a related provision of the Final Judgment (Final Judgment § 3(h), Ban on Agreements Limiting Competition), the government rejected the proposal as ''unnecessary'' and because it ''would enable Microsoft to enter into anticompetitive market division agreements regarding such products by labeling them, as it attempted to label at trial the June 1995 Netscape meeting, ''joint development agreements'' or ''agreements ancillary to lawful joint ventures.'' Gov't D.Ct. Sum. Resp. at 18. Once again, the government has agreed to a loophole that can only benefit Microsoft by inviting abuse and further litigation.

4. The Term of the Settlement Is Too Short, Even If Its Deficiencies Were Corrected

As demonstrated above, without correction of numerous deficiencies, the proposed settlement will not restore competitive conditions because it largely permits Microsoft to conduct business as usual and it effectively rubberstamps further anticompetitive conduct. Even if all of the other deficiencies were corrected, however, the term of the proposed settlement is too short to restore meaningful competition with the Windows monopoly. Although this Court's finding that Microsoft illegally maintained its decade-long monopoly has now been affirmed by the Court of Appeals, Microsoft has availed itself—up to and including the present—of every opportunity to maintain and extend its monopoly through anticompetitive actions. For example, Windows XP, designed during the height of Microsoft's litigation with the government and released just before the settlement was announced, commingles code in the exact manner found unlawful by the Court of Appeals.

The government now claims that a five-year decree will be sufficient to restore competition. CIS at 60. This assertion is inconsistent with the Department of Justice's own Antitrust Manual, which states that ''the Division's standard decree language requires that the consent decree expire on the tenth anniversary of its entry by the court. [T]he staff should not negotiate any decree of less than 10 years' duration, although decrees of longer than 10 years may be appropriate in certain circumstances.'' Department of Justice, Antitrust Division Manual, ch. IV at 54 (3d ed. 1998) (emphasis added). As the government argued in earlier urging entry of a ten-year decree:

> Ten years is customary in antitrust cases and in any event four years is too short a time for the Final Judgment to remain in effect. Despite [Microsoft's] assertion that ''[t]en years is an extraordinarily long time in the software industry,'' Microsoft has had the dominant position in the operating-systems business for at least a decade (see Findings (¶35), and under the circumstances there is no sound justification for entering a decree of shorter duration.

Gov't D.Ct. Sum. Resp. at 20 (emphasis added).

The government offers no ''sound justification'' for its acceptance of a settlement that would last only five years. RPFJ § V.A. The CIS only states that five years ''provides sufficient time for the conduct remedies contained in the Proposed Final Judgment to take effect in this evolving market and to restore competitive conditions to the greatest extent possible.'' CIS at 60. There is no factual support cited for the ipse dixit that this is ''sufficient time,'' while it is certain that the standard ten-year decree would restore competition to a greater extent. The government's present position also conflicts with other assertions that it previously made in this case. See Gov't D.Ct. Memo at 27 (''Looking forward, the Court must anticipate that Microsoft, unless restrained by appropriate equitable relief, likely will continue to perpetuate its monopoly by the same anticompetitive methods revealed at trial, although directed at whatever new competitive threat arises.'').

Moreover, the government's only recourse under the proposed settlement—the possibility that the proposed decree could be extended ''one time'' for a ''maximum of two years''—is so short as to be virtually meaningless. RPFJ § V.B. And, even to obtain the ''one-time'' two year extension, the government would first have to demonstrate through a complex, lengthy and burdensome enforcement procedure, that Microsoft engaged in ''a pattern of willful and systematic violations'' of the decree. Id. The government should be seeking—as it originally sought—more than just conduct remedies ''tak[ing] effect.'' CIS at 60. It should instead be trying to ensure that, once the remedies ''take effect,'' they remain in effect for a period sufficient to restore competition to the greatest extent possible. As the government told the District Court, ''[t]en years is customary in antitrust cases and in any event fore' years is too short.'' Gov't D.Ct. Sum. Resp. at 20. There is nothing in the Court of Appeals' decision that justifies the government's decision to depart from its own formal policy.

[32] The proposed settlement does purport to limit Microsoft's ability to enter into agreements with ISVs which require the ISV to refrain from ''developing, using, distributing, or promoting any software that competes with Microsoft Platform Software.'' RPFJ § III.F.2. However, as discussed supra at pp. 97–98, that same section creates an exception that permits such agreements with ISVs if they are in relation ''to a bona fide contractual obligation of the ISV.'' Therefore, even as to ISVs, the restriction is rendered potentially meaningless.

As a matter of law, the government's previously stated position was correct. The case law demonstrates that in cases where a monopolist has committed a Section 2 violation, it has been ''customary'' for courts to impose remedial decrees lasting ten years. In over 70 cases since the Department of Justice's Antitrust Manual was adopted in 1978 to change the prior policy of seeking decrees of unlimited length, the government has required consent decrees having a minimum ten year duration. See e.g., United States v. Greyhound, Civ. No. 95–1852 (RCL), 1996 WL 179570 (D.DC Feb. 27, 1996) (bus companies); United States v. Playmobil USA, Inc., Civ. No. 95–0214, 1995 WL 366524 (D.DC May 22, 1995) (toy companies); United States v. Republic Services, Inc., Civ No. 00–2311, 2001 WL 77103 (D.DC Jan. 18, 2001) (waste collection companies). [33] The government also imposed restrictions on broadcasters'' purchase of television program rights for a period of 15 years. See United States v. American Broadcasting Co., Inc., Civ. No. 74–3600 (RJK), 1980 WL 2013 (C.D. Cal. Nov. 14 1980).

In contrast to these settlements, the proposed decree here is to last only five years, although this case has significantly more importance to the national economy. In addition, Microsoft's prior conduct, the importance of this case to the national economy, and the explicit findings, upheld on appeal, of Microsoft's illegal monopolization activities mandate, if anything, that Microsoft's conduct be supervised for a period longer than the standard ten-year term.

At bottom, a five-year injunction is too short to allow meaningful competition to develop in the operating system market. It has been over ten years since the government first began to investigate Microsoft's practices, and it took six years from Microsoft's first anticompetitive act cited by the District Court for this case to reach the appellate level. The effects of Microsoft's past and present anticompetitive actions, which have already continued for over a decade, will likely last much longer. The government itself concedes that Netscape and Java are likely dead and no longer pose credible threats to Microsoft's operating system monopoly. CIS as 16–17. Even if the proposed decree's numerous loopholes were plugged, it will take considerably longer than five years for strong new competitors to emerge. Most important, the ability of those competitors to become viable depends upon the existence of judicial protection. See United States v. GTE Corp., 603 F. Supp. 730, 742–43 (D.DC 1984) (rejecting as too short five-year expiration date for decree provisions in section 2 case).

5. The Proposed Settlement Nullifies Effective Enforcement

The government claims that the various obligations imposed upon Microsoft in the proposed settlement are supported by ''strong enforcement provisions,'' ''including the power to seek criminal and civil contempt sanctions and other relief in the event of a violation.'' CIS at 5. It also states that Plaintiffs' right, under certain circumstances, to request a one-time extension of the final judgment of an additional two years ''is designed to supplement the government's traditional authority to bring contempt actions.'' CIS at 60.

The reality, however, is to the contrary. The compliance and enforcement provisions in the proposed settlement are entirely inadequate to prevent Microsoft from engaging in future anticompetitive conduct. The provisions in the proposed settlement will result in time delays, inefficient administration of the decree, and ultimately give Microsoft the opportunity to continue its anticompetitive acts unabated. The most critical deficiencies include:

a. The Technical Committee Proposal Is Misguided

By agreeing that a ''Technical Committee'' comprised of computer programming and software experts should perform a monitoring role (RPFJ §§ IV.B.1 and IV.B.2), the government seemingly recognizes the difficulty of monitoring and enforcing Microsoft's compliance with the decree. The government also appears to recognize the obvious—that ''Internal Antitrust Compliance'' by Microsoft, though necessary, is insufficient. Unfortunately, the government fails to recognize that its own concessions make the compliance task vastly more difficult.

The Technical Committee contemplated by the settlement is simply not an adequate answer, much less a substitute for self-enforcing prohibitions, The person charged with responsibility for monitoring and enforcing Microsoft's compliance must be an experienced antitrust lawyer or former federal judge. He or she can then hire software and programming experts to render assistance, but the responsibility for determining whether the specific provisions of a complex court order have been violated must be made by an individual with impeccable legal credentials and long experience in antitrust law and decree interpretation. No novel device such as a ''Technical Committee'' is required. The mechanism of a special master under Rule 53, Fed. R.Civ.P., is readily available and entirely appropriate. See United States v. Microsoft Corp., 147 F.3d 935,954 (DC Cir. 1998) (recognizing ''well-established tradition allowing use of special masters to oversee compliance'').

Aside from its dual, repetitive investigative and reporting procedures (Technical Committee to the government, then the government to the Court, see pp. 114–115 infra.) (RFFJ § III.D.4), the proposed settlement is flawed because it imposes substantial constraints upon how the Technical Committee's findings may be used to assure compliance. The settlement prohibits the admission into evidence of the Technical Committee's findings ''in any enforcement proceeding before the Court for any purpose;'' and prohibits any technical committee member from testifying in any proceeding or before any tribunal regarding any matter relating to the Final Judgment. RPFJ § IV.D.4.d. Each of those prohibitions denies the Court information from the independent technical personnel who are uniquely knowledgeable about the nature of the violation. Indeed, although the decree proposal allows Microsoft to offer any evidence it wants, it shuts off from the Court the evidence in the possession of the technical committee members who rejected Microsoft's explanations.

b. All Relevant Employees Should Be Required To Be Trained In The Decree, But Are Not

The proposed settlement only requires that the officers and directors of Microsoft receive copies of the decree and be ''annually briefed on [its] meaning.'' RPFJ § IV.C.3. In order to be effective, however, all managers (not just corporate ''officers'') and all employees who have positions that enable them to initiate or implement anticompetitive conduct must be required to read, understand and comply with the decree. Of the published consent decrees that require employees of the company to certify that they have read, understood, and will comply with the decree, most extend compliance certification beyond officers and directors of the company, to also include other managers and employees who have responsibility for overseeing the business activities of the antitrust violator. See, e.g., United States v. Western Elec., Civ. No. 82–0192 (HHG), 1991 WL 33559, at *5 (D.DC Feb. 15, 1991) (requiring certification of compliance from each officer and management employee); United States v. Delta Dental of R.I., Civ. No. Civ. A. 96–113P, 1997 WL 527669, at *2 (D.R.I. July 2, 1997) (requiring certification of compliance from all officers, directors, and employees who had responsibility for approving, disapproving, monitoring, recommending, or implementing any provisions in agreements with participating dentists); United States v. Business Inv. & Dev. Corp., No. MO-81-CA-20, 1982 WL 1866, at *2 (W.D. Tx. July 16, 1982) (requiring certification of compliance from all officers, directors, employees and franchisees).

Moreover, the Chairman, CE0 or other responsible senior officer of Microsoft should be required to certify periodically to the Court that Microsoft is in compliance with its obligations. The record evidence that Microsoft's highest officials were not only aware of, but actively encouraged, initiated or directed Microsoft's anticompetitive practices, see, e.g., CA at 73, 77; D.Ct. at ¶¶80–87, 100, 108, 112–13,124–29, 340–349, 396, 406–07, makes it all the more necessary to include such certification provisions to ensure that Microsoft takes seriously its responsibilities under any decree to abide by the antitrust laws.

c. The Proposed ''Dispute Resolution'' Mechanism Encourages Delay

Because of the extraordinarily rapid pace of technological and business developments in the computer industry, avoiding delays in compliance is a critical element in effectively eliminating Microsoft's unlawful behavior and restoring competition. Whether the monitoring function is performed by a Technical Committee or Special Master, the monitor should simultaneously report to both

[33] Based on a review of the published cases, every consent decree that the government has entered in a Section 2 case since 1978 has been ten years or longer in duration, with the exception of the first Microsoft decree. That decree was not entered after a full trial on the merits and a finding of unlawful monopoly maintenance.

the Court and the Plaintiffs. In defending its decisions to make numerous substantive concessions to Microsoft during the settlement process, the government has cited the substantial time it might take to litigate this case to conclusion if it held out for stronger relief than Microsoft would accept. CIS at 61. Those same time considerations militate against the time-consuming enforcement process contained in the proposed settlement.

The proposed decree contemplates an elaborate procedure whereby the Technical Committee, after receiving a complaint about Microsoft's conduct, would be required to meet with Microsoft's internal compliance officer, and allow Microsoft to respond to the complaint, before it determines whether the complaint can be resolved informally. RPFJ § III.D.4.b. There are no time limits on most of these procedures. If, after completing that procedure, the Technical Committee believes the dispute cannot be resolved and that Microsoft's conduct violated the decree, the Technical Committee would then report the violation to the government in the first instance. RPFJ § III.D.4.c. It then would be up to the government, in turn, to evaluate Microsoft's conduct and determine whether the violation should be reported to the Court.

This process guarantees that considerable time will lapse between a violation of the decree by Microsoft and the Court's eventual review of the problem. First, the process for ''Voluntary Dispute Resolution'' contemplated by the proposed decree will substantially delay, and, in some circumstances, entirely eliminate, the reporting of violations to the Court. However, effective enforcement requires that any violation of the decree should be reported by the Technical Committee or Special Master immediately and directly to the Court. Action by Microsoft to ''voluntarily'' cease the unlawful conduct may then, along with other factors, be considered by the Court in determining the severity of any sanction imposed.

in sum, for any remedy to be effective in this case, it must be imposed quickly—not after months or years of further ''dispute resolution.'' Under the enforcement scheme contemplated by the proposed settlement, however, that simply cannot happen.

IV. DEFICIENCIES IN THE PROPOSED SETTLEMENT CREATE SIGNIFICANT RISKS FOR SBC'S COMMUNICATIONS AND DATA BUSINESSES, INCLUDING SBC'S INTERNET-RELATED BUSINESSES, WHICH DEPEND UPON OPEN ARCHITECTURE AND COMPETITIVE ALTERNATIVES

SBC is one of the world's leading businesses in the provision of data and voice communications and Internet access. SBC's affiliates serve nearly 60 million telephone access lines nationwide and 21 million wireless customers. SBC and its affiliates are major providers of DSL high-speed and dial-up Internet service, voice messaging services, and if directory advertising and publishing products. SBC, through its affiliates, has committed substantial resources to the development of a host of computer- and Internet-related businesses. These businesses are designed to provide consumers with flexibility, convenience and, most importantly, more choice.

With these initiatives, together with its expanding telephone, wireless and Internet operations, SBC is prepared to compete vigorously during the coming decade as the ''convergence'' of communications and computing technologies continues to accelerate. That highly competitive environment, however, is threatened by Microsoft's ability—unless restrained by a strong and effective decree in this case—to use its Windows operating system monopoly to control the electronic ''gateways'' that link the Internet and its myriad service and content providers to consumers' homes and offices. That control of the gateways, in turn, will enable Microsoft to entrench the Windows monopoly even more firmly.

A. How SBC Competes, Or Will Compete, With Microsoft

SBC currently has, or is developing, several businesses in competition with Microsoft, which, together with other similar businesses, directly or indirectly, threaten or are threatened by the Windows operating system monopoly.

1. Telephone, Cellular And Internet Services

SBC affiliates Southwestern Bell, Ameritech, Pacific Bell, Nevada Bell, and SNET are the Incumbent Local Exchange Carriers that provide telephone service in thirteen states.[34] In addition, SBC owns a sixty percent interest in Cingular Wireless, which provides nationwide cellular telephone and Internet-related services.

Various SBC affiliates, including Prodigy, provide ISP services, as well as dial-up and broadband (via DSL) Internet access services nationwide. SBC recently finalized a joint venture with Yahoo, whereby Yahoo will provide SBC's Internet portal (home page). In addition, SBC owns an ''Internet Data Center'' which rents server usage to businesses and e-commerce clients.

Microsoft is an actual competitor of SBC in all of these businesses, including voice telephony. Microsoft is actively developing its Voice over Internet Protocol (''VoIP'') through its ''Net2Phone'' business. This service is being embedded in Windows XP, with the aim of convincing customers to use the Internet for long distance and local calls. Microsoft also provides an Internet access service, MSN, which takes advantage of Microsoft's operating system monopoly by virtue of its being bundled with Windows. By bundling additional products and services such as its ''.NET'' initiative and its Passport service with Windows XP, Microsoft is also using its monopoly power to give itself an unfair advantage in new markets for Internet and e-commerce business solutions.

Even in businesses in which Microsoft is not now a direct competitor of SBC, however, such as local, long distance and cellular telephone service, Microsoft's operating system monopoly poses grave risks to the competitive marketplace that Congress sought to ensure in the Telecommunications Act of 1996. If Microsoft is permitted by the proposed settlement to maintain and expand its PC operating system monopoly, it will become the gatekeeper for competitors to offer and for consumers to access key communications and entertainment products and services, including telephone, Internet access, voice messaging, instant messaging, music, video services, e-commerce, and interactive games. Without strong remedial measures designed to break its operating system monopoly (which the proposed settlement does not contain), Microsoft will be in a position to favor its own and its partners' communications, entertainment and related services, to exclude competitors'' services from access to consumers, to impose costs on rivals and to degrade their services (whether through a toll, a charge for being listed as an available service or an interoperability obstacle), all with the effect of squelching competition and harming consumers. No provisions in the proposed settlement even address, let alone bar, such anticompetitive conduct.

Just as Microsoft has for years successfully imposed on consumers its own software products and other services, irrespective of the comparative merits of competing products it excluded from the market, Microsoft will be able to repeat its anticompetitive strategy in collateral markets including the key communications and entertainment markets described above. This is not speculation; Microsoft has already announced that it is developing an extension to Windows XP, named Freestyle, that will make its Windows PC the communications gateway to the home. See Byron Acohido, Challenge Microsoft? It Could Take Moxi, USA Today, Jan. 16, 2002, at B-3; Microsoft Unveils New Home PC Experiences with ''Freestyle'' and ''Mira'' (Jan. 7, 2002), at www.Microsoft.com/presspass/Press/2002/Jan02/01.

2. Unified Messaging

SBC's Unified Messaging Service (''UMS'') is a good example of a new business placed at serious risk because of the anticompetitive actions that the proposed settlement Would allow UMS is currently in the final development stages, with a projected market introduction in late 2002. UMS will allow customers to retrieve their voice, e-mail and

---

[34] 34 Prior to 1996, SBC was subject to line of business restrictions imposed by the AT&T Consent Decree or Modified Final Judgment (''MFJ''). These prevented SBC's entry into markets such as long distance telephone and imposed numerous affirmative obligations to assist actual and potential competitors. See U.S.v. AT&T, 522 F. Supp. at 186–95 (setting forth line of business restructions); United States v. Western Electric Co., 673 F. Supp. 525 (D.DC 1987) (upholding ''core'' line of business restrictions on local telephone companies), aff'd in part, rev'd on other grounds, 900 F.2d 283 (DC Cir. 1990). These provisions, which were of indefinite duration, were ultimately superseded by the Telecommunications Act of 1996, which replaced the MFJ with detailed regulatory obligations to preserve non-discriminatory access to the local telephone network, to require SBC to share its network elements at regulated prices, and to take affirmative actions to open its local network to competition as the price for entry into the long distance market. See Telecommunications Act of 1996, 42 U.S.C. §§ 251–59, and § 271 et seq. The duration, detail and substantial scope of those affirmative requirements and prohibitions, even when they were embodied in the MFJ, stand in marked contrast to the trivial and temporary prohibitions applied to the Microsoft monopoly.

fax messages from a single ''mailbox'' that will be accessible by phone (wire or wireless) or via the Internet. In the future, SBC plans to add other services to UMS, including instant messaging and video messaging.

UMS is the first in a new generation of services that will create a convergence of all voice, video and data services into one application. Central to UMS is the principle of ''any device, anywhere.'' SBC has designed UMS to be fully accessible through any type of telephone, personal computer, or handheld device. UMS will operate on any software operating system and with any combination of other software applications and services. UMS is also ''agnostic as to provider,'' meaning that it will function regardless of the provider of Internet access, phone or wireless service. For example, consumers can access UMS as easily and effectively through an inexpensive cellular phone that makes no use of Microsoft technology as they call through an expensive Windows PC using Internet Explorer as its browser.

UMS and similar services offered by other companies will compete by giving consumers the ultimate in choice and convenience, enabling them to access all UMS services from virtually any phone or computing device anywhere in the world. UMS will be a direct competitor of Microsoft's e-mail service (Hotmail), and with MS Messenger, a video and instant messaging service, both of which are promoted through integration with Windows.

B. UMS Is An Integral Part Of Movement To Server-Based Computing Model That Will Erode The Applications Barrier To Entry That Currently Shields Microsoft's Monopoly Power

Because UMS will function with any operating system or Internet browser, and will provide a number of the same functions (voice/data messaging, e-mail, instant messaging) that are or will be provided by a Windows PC, UMS presents a significant competitive threat to Microsoft's PC operating system monopoly. UMS is part of the ''movement off the desktop'' taking place in the computer industry, which offers increased flexibility and choice to the consumer.

Central to this innovation is that the vast majority of actual computing functions will be performed away from the consumer's computing devices, on servers connected through the Internet. A consumer will no longer need a Windows PC, containing a large hard drive and powerful microprocessor. Instead a simpler, inexpensive device, such as a cell phone or PDA, with a very basic operating system and an Internet browser, when coupled with products like UMS, will allow the consumer to perform many of the functions of a Windows PC at a significantly reduced price and with much greater flexibility and convenience. D.Ct. at ¶¶22–27, 56, 59–60 (cited with approval in CA at 52, 79).

In order for UMS to function, however, and to present a competitive alternative to the Windows PC operating system monopoly, SBC must have the ability to effectively process voice and data transmissions through a complex network of different servers, each of which performs separate functions and employs different technologies. At a minimum, when a UMS customer seeks to retrieve a message, either by phone or through the Internet, the voice or data transmission will travel between and through several separate SBC servers (gate, mail, LDAP (lightweight directory access protocol), directory and web server). Each of these servers performs independent functions. As a result, it is critical to UMS that any type of PC, Internet browser, cell phone or handheld device be fully interoperable with all of SBC's servers. UMS also has the potential to be used in a home network, thus requiring full interoperability to extend to set-top boxes.

In short, for SBC and other companies to deliver Internet-based services like UMS, they absolutely must have a ''protected chain of interoperability'' extending throughout all computers, servers, and other devices which participate on the Internet—including the Internet browser and PC. If only one link on the chain is not fully interoperable with the entire network, UMS will not be able to process its voice and data transmissions, and thus the convenience and vast array of choices UMS could bring to consumers as an alternative to the Windows PC operating system monopoly will be eliminated.

There is little doubt that Microsoft will continue to recognize the danger that server-based computing, and multi-platform, multi-device products like UMS, pose to the applications barrier to entry. D.Ct. at ¶60 (cited with approval in CA at 79). Such alternative server-based computing pathways on the Internet, which rely on open operation and architecture, like Java, will attract applications used for Internet communications. In the past when such threats to the applications barrier to entry that protects the Microsoft monopoly have emerged, Microsoft has responded with anticompetitive conduct. Indeed, the actions taken by Microsoft to eliminate Netscape and Java, found to be illegally exclusionary by the District Court and the Court of Appeals, had the sole purpose of protecting the applications barrier to entry. As shown below, however, the deficiencies in the proposed settlement are so pervasive that SBC's competitive, Internet-based offering and similar products from other companies are threatened with the same fate as Netscape and Java.

C. The Proposed Settlement Would Allow Microsoft To Render SBC's Internet-Based Businesses Significantly Less Competitive

1. The Proposed Settlement Will Allow Microsoft To Block Consumers' Access To Competing Products And To Impede Their Functionality

Under the proposed settlement, Microsoft could use its monopoly power to (i) prevent UMS and related products from being accessed by anyone using a Windows PC and IE; (ii) degrade or impede the ability of UMS to function on a Windows PC; and/or (iii) deny UMS access to the Windows desktop. Moreover, Microsoft could avoid the requirements of the proposed settlement by simply claiming UMS was a ''service.'' See pp. 46–48 supra. Because the proposed settlement does not require Microsoft to ensure that UMS will function smoothly on Windows, or even have proper access to the Windows desktop, it could significantly harm the ability of UMS to compete with Microsoft products providing similar services. The danger, of course, is not limited just to UMS, but applies equally to related communications and entertainment products and services that are being developed and offered by other companies.

i. Blocking Access to UMS

The inadequate interoperability/disclosure provisions in the proposed settlement would allow Microsoft to completely block all access to a competing product, like UMS, for all users of a Windows PC and IE. Because the proposed settlement does not require any disclosure to ensure interoperability between IE and a non-Microsoft server operating system, Microsoft is able, and indeed encouraged, to change, and then withhold disclosure of, IE's protocols in order to prevent interoperability with those SBC servers that run on non-Microsoft operating systems. In that case, all UMS customers would be unable to access their UMS account from a Windows PC operating system equipped with IE.

Should SBC decide to convert the entire UMS network of servers to Microsoft operating systems, Microsoft would still, under the proposed settlement, be able to block access to UMS for some users. In this event, Microsoft could merely program its server operating system so that it could not interoperate with a non-Microsoft browser. In fact, Microsoft employed this very strategy recently, when it reprogrammed its web servers for the MSN website to block all access by consumers using the competing Netscape and Opera browsers. See p. 80 supra.

ii. Degrading the Performance of UMS

Should Microsoft choose not to completely block access to UMS, the proposed settlement permits Microsoft to substantially degrade UMS' functionality on a Windows PC operating system. The degradation can be accomplished by programming Microsoft's PC operating system in such a way that UMS' functions are purposefully disadvantaged. For instance, by altering the program codes for IE or Microsoft's version of Java, Microsoft can hinder the performance of UMS on a Windows PC operating system, including the speed at which UMS processes requests, its efficiency and the graphical presentation the user sees.

iii. Denying UMS Access to the Windows Desktop

SBC's strategy for UMS is largely dependent on having access to and visibility on the desktop, as well as on OEMs and end-users being able to change default settings in the Windows operating system to select the SBC home page or set the pre-login screen to allow for message notification. Without provisions in the settlement guaranteeing these rights, Microsoft can prevent UMS from having its own icon on the Windows desktop, or being on the Windows start menu. Furthermore, the proposed settlement would allow Microsoft to prevent UMS customers from choosing to set the SBC-Yahoo homepage as their default homepage on IE. Likewise, nothing in the proposed

settlement would stop Microsoft from denying SBC equal access to the pre-login indicators on the desktop for message notification. Only through such notification could UMS compete with Microsoft's Hotmail or Messenger, which have such indicators on both the desktop and the pre-login screen for the purpose of notifying the subscriber that messages are waiting.

2. Microsoft Can Foreclose Competition By Using Its Ability To Raise Its Rivals' Costs

By not requiring ''seamless interoperability,'' the proposed settlement would allow Microsoft to raise substantially the fixed costs associated with a competing product or service, as well as the ultimate cost to the consumer, to the point that such products are unable to compete. The anticompetitive initiatives Microsoft can pursue under the proposed settlement will force Internet-based businesses to move toward using Microsoft server operating systems and software exclusively. At the same time, the settlement will channel consumer access to the Internet through Windows PC operating systems, which consumers will have to purchase in order to obtain IE.

For example, SBC currently uses Microsoft server operating systems for less than 5% of its UMS server network, and anticipates this percentage will approach zero within the next few years—provided there is full interoperability among servers, PCs, PDAs, phones and all other computing devices. If the proposed settlement is approved, however, SBC will probably have no choice but to replace its entire UMS server network at considerable cost with Microsoft server operating systems and software.

Microsoft's server operating systems are currently significantly more expensive than those of its competitors, and this price differential is likely to grow as Microsoft solidifies its position in the server market. Even at current prices, replacing the UMS server network with Microsoft server operating systems would significantly increase SBC's overall costs for UMS (including the cost of hardware, software, maintenance of hardware and software, staff, network management, and disaster recovery). In addition, if SBC were required to replace the hardware in its entire current server network within the next few years, this would dramatically increase costs for UMS during its critical first years on the market. Taken together, these cost increases will make UMS a much less appealing alternative to the Windows PC, as the consumer's cost savings will be much smaller.

UMS is not the only SBC network service to be negatively impacted. SBC's telephone network also utilizes many servers for various functions. For instance, SBC has servers that perform ''operation support systems,'' as well as ''operations administration maintenance and provisioning.'' Like UMS, under the proposed settlement these network support systems would be at risk, and the cost to convert them all to Microsoft server eperating systems would be significant.

3. Consumers Who Want To Access The Internet Will Have To Have A Windows Operating System,Which Will Increase The Cost To The Consumer For UMS

UMS is designed to save consumers money, because they can access the service through a ''dumb PC'' or handheld computing device, equipped only with a few features, like UMS, that will allow the consumer to use the Internet to perform essentially all major computing functions currently offered by a Windows PC at a fraction of the cost.

Assuming full interoperability, a ''dumb PC'' with a browser would be able to access and browse the Internet as well as a Windows PC. Moreover, by purchasing a product like UMS to accompany the ''dumb PC,'' even more of the functions of a Windows PC (voice/data messaging, instant messaging, e-mail), would be available and the total price would remain substantially below a Windows PC. The cost savings to the consumer, when coupled with the other positive attributes of UMS, would make it a very attractive alternative to the comparable Microsoft products the consumer can only obtain by purchasing a Microsoft operating system.

By preventing full interoperability throughout the network of servers (including the browser), however, Microsoft can destroy any cost savings provided by UMS, because the consumer will have to buy a Windows PC or another device with a Microsoft operating system in order to obtain IE. That operating system already will have integrated or bundled Microsoft products that compete with UMS (MS Messenger; Outlook Express, Hotmail) which are included in the cost of the operating system. Thus, to use UMS, the consumer will have to pay an ''add-on'' or double cost in addition to the cost of the Microsoft operating system. The competitive disadvantage, for both SBC and the consumer, is plain.

4. The Proposed Settlement Will Stifle Innovation And Force Competitors To Sacrifice Quality In Certain Critical Markets

SBC, or any Internet-based business, is highly dependent on the quality and speed of technological innovation in markets that supply the hardware and software used in new ventures, such as UMS, or established services. This is particularly true for UMS, which will rely on an extensive network of servers, computers and related devices and technologies to deliver its range of services. SBC's policy is to use a wide variety of suppliers for different products, including software, throughout the UMS networks and its other computer systems. To take full advantage of technological innovation, SBC chooses the ''best in class.'' This term reflects SBC's philosophy to choose the provider for each particular product or service that best performs the specific functions needed by SBC. In this way, SBC can obtain maximum benefit from the speed and diversity of innovation to create the most competitive products possible.

In certain crucial markets, the proposed settlement will convert this world of choice into a world of one choice—Microsoft. In the process, SBC's ability to employ its ''best in class'' strategy would be severely reduced. Indeed, technological innovation itself will be gravely hindered, particularly for server operating systems and server software—two critical product areas for any network. This change will be driven by the proposed settlement's failure to ensure interoperability. As a result, consumers and businesses will be forced to purchase the Windows PC operating system, IE, and Microsoft server operating systems, or at least license Microsoft intellectual property, in order to guarantee full interoperability. The fact that Microsoft server products, especially in relation to the particular needs and functions of SBC, are more costly but by no means superior in quality or functionality, will no longer be determinative.

In the longer term, as competitive choices in these markets are diminished, Microsoft will be able to unilaterally control the pace of innovation. Currently, many different companies are working to innovate and develop different product functions and niche uses. SBC can take advantage of specialized innovations that are essential to supporting or improving its operations. In the world created by the proposed settlement, however, Microsoft will be the sole arbiter of what areas, products or uses should or should not be explored for technological advancement. Microsoft would be free to stifle innovation in a particular area that may be crucial to developing a product or service which competes with Microsoft.

The government made this very point to the District Court through the testimony of one of its expert economists, who stated that Microsoft's exclusionary practices had

> interfered with the process of innovation in three distinct ways. First, consumers did not get the innovative products that the technology being developed by Netscape and Sun might have delivered. Second, Microsoft's predatory acts had a chilling effect on innovative efforts by all people who might have developed other software technologies that Microsoft found threatening. Third, Microsoft harmed the innovative process because it limited competition, and competitive markets are, on balance, the best mechanism for guiding technology down a path that benefits consumers.

Romer Decl. ¶5.

The effect of the proposed settlement on UMS is illustrative. SBC currently uses between 15 and 20 different providers for different products, including software, throughout the UMS network. In the ''Microsoft world'' that would be created by the proposed settlement, SBC expects that it would be limited to a total of 5 to 10 providers. Each of the lost providers will have to be replaced by Microsoft products because of interoperability obstacles created by Microsoft commingling and nondisclosure.

SBC currently uses three separate server operating systems in its UMS operations, based on the particular needs and functions of different servers throughout the network. The three products are a UNIX operating system which is run on servers produced by several companies; Linux operating systems which run on a variety of servers; and, for certain limited functions, Microsoft server operating systems (which are run on less than five percent of the UMS network). In SBC's view, the Microsoft server operating systems are substantially less effective than

competitors'' systems in performing the functions needed by the UMS network. Among other things, Microsoft products have a poor security performance history, see pp. 90–91 supra, and thus it is SBC's policy that no server that faces the Internet is based on a Microsoft server operating system. As a result of the need for interoperability, however, under the proposed settlement, SBC could be forced to use Microsoft server operating systems throughout the UMS network.

SBC's choices will be similarly circumscribed for server software. For its mail server and directory server, SBC currently uses a range of non-Microsoft software products. For the functions needed by the UMS network, these products better meet SBC's requirements, and are less costly than, comparable Microsoft products. For SBC's web server, which is the critical primary link to the Internet and the Internet browsers, SBC uses server software from Apache. The Apache software is also preferable to comparable offerings from Microsoft for this purpose.

Similarly, in the areas of network management and voice over Internet protocol (''VoIP''), SBC could well be forced to switch to Microsoft products under the proposed settlement. Network management products essentially ensure that SBC's telephone network runs effectively and reliably, by monitoring the system for failures, analyzing configuration, and developing utilization statistics. The network management software currently used by SBC is more efficient and less costly than comparable Microsoft products. In the VoIP area, SBC's ''gateway,'' which translates voice conversations into VoIP, uses a non-Microsoft, ITU (''International Telecommunications Union'') H.323-compliant gateway, or translator. If the proposed settlement were approved, nothing would prevent Microsoft, by changing its server or browser programs to a non-compliant format, from forcing SBC to replace this translator with a Microsoft product or a product that incorporates Microsoft-licensed intellectual property to ensure the interoperability required for SBC's telephone network to function.

5. Delayed Disclosure Will Harm Competition

The flexibility provided to Microsoft to delay the disclosure of technical information could also significantly harm the competitive prospects of UMS and related products. As explained above, Microsoft can delay the release of technical information related to interoperability with a new Windows product or a change in an existing Windows product until very close to the time when the new or altered product is placed on the market. See pp. 80–85 supra. SBC, and other competitors, thus face the very real possibility that there will be insufficient time to ensure that a competing product, like UMS, will be fully interoperable when a new or altered Windows product is introduced. If UMS is not fully interoperable, the result would be that certain UMS customers who attempted to access their mailbox from a Windows PC would be ''dropped''—meaning their request for data or voice information would not be processed. Since SBC plans that UMS will have over 5 million customers by 2007, if UMS is not fully interoperable with Windows PCs for even one day, many UMS customers would be ''dropped.'' The negative consequences should customers be unable to access their UMS mailboxes for any period of time are obvious.

By making it impossible for server operating systems which run websites on the Internet to interoperate with non-Windows operating systems, Microsoft will be able to force all businesses and all consumers to conform to the Windows world. With over 90% of the operating system and browser markets, for example, Microsoft can make its Passport product the dominant intermediary between consumers and e-commerce web sites, and can effectively impose a tax or toll on all transactions. If it wishes to, Microsoft will be able to use its browser dominance to ensure that any web portal in which it has a stake receives preferential display. And if it chooses to, Microsoft will be able to use its browser dominance to control the flow of information or content on the Internet by using its Internet gate-keeper position to prefer one type of message over another, for example, blocking access to sites that are critical of Microsoft. In all of these ways, Microsoft can use the developing world of Internet technology to protect and strengthen its PC operating system monopoly.

V. WITHOUT SIGNIFICANT CHANGES, THE PROPOSED SETTLEMENT CANNOT SATISFY THE PUBLIC INTEREST STANDARD

As shown, the proposed settlement allows Microsoft to continue exclusionary practices, like commingling, to easily evade virtually all of the proposed settlement's proscriptions and affirmative obligations, and, by simply doing what the settlement allows, or fails to enjoin, ensuring that the next generation of threats to the operating system monopoly in the form of Internet servers and web-based computing never leaves its crib. By the time the proposed settlement expires, Microsoft middleware will be the firmly entrenched medium of Internet communication, displacing open architecture with a closed proprietary system; all competition will be forced to use Microsoft's proprietary standards instead of the open architecture currently thriving as the medium for program development and communication; and OEMs will be even more beholden to Microsoft's demands. This is the teaching of an exhaustive trial record and a careful appellate review that affirmed the lower court's findings of a decade-long scheme of monopoly maintenance in violation of Section 2 of the Sherman Act.

Under the law of the District of Columbia Circuit, the proposed settlement falls far short of providing any meaningful remedy for this most serious of antitrust violations and for that reason alone does not satisfy the public interest standard. United States v. Microsoft, 56 F.3d 1448, 1458 (DC Cir. 1995) (The Court must ''make an independent determination whether the proposed consent decree [is] in the public interest.''). Worse still, because the proposed settlement operates to perpetuate this unlawful monopoly by permitting the continuation without sanction of conduct previously found to be exclusionary, the proposed settlement in fact injures the public interest. For these reasons, the District Court must reject it.

Indeed, the proposed settlement fails to meet the public interest standard on all of the bases set out in the 1995 Microsoft decision. As discussed above, and in further detail below in the context of recommended changes and additions to the proposed consent decree, the settlement now advanced by the government (1) is ''ambiguous'' in many respects and fiddled with loopholes and exceptions to key provisions; (2) presents numerous ''difficulties in implementation'' that arise because so many provisions leave compliance in Microsoft's sole discretion; (3) has been subject to widespread condemnation by ''third parties [who] contend that they would be positively injured by the decree,'' including SBC; and (4) in view of the remedies the government said were absolutely essential only two years ago—after the District Court's detailed findings as to monopolization were upheld on appeal—but which have now been omitted from the proposed decree, ''on its face and even after government explanation, appears to make a mockery of judicial power.'' Microsoft Corp., 56 F.3d at 1462.

For these reasons, SBC submits that the proposed decree should not be entered. The proposal made by the Litigating States would, if adopted in its entirety, adequately serve the public interest in SBC's view. Alternatively, SBC respectfully offers the following detailed revisions that, if fully incorporated into the proposed settlement, would provide an appropriate remedy for Microsoft's adjudicated wrongdoing:

A. Changes Must Be Made to RPFJ § III.A (OEM and Other Licensee Retaliation)

Sections 8 and 9 of the Litigating States' proposal provide an adequate remedy prohibiting retaliation by Microsoft against others. Alternatively, the following revisions should be made to the proposed settlement:

§ III.A The retaliation provision should not be limited to OEMs, but should also prohibit retaliation against any third party that is a licensee or potential licensee of Microsoft products or services. Given Microsoft's proven propensity to root out and extinguish competition wherever it develops, the risk of retaliation could affect many sources of competitive pressure on Microsoft besides OEMs. One example would be third-party software system integrators, who pull together products from numerous different vendors to give customers a software or total computing package that is tailored to their specific needs.

The term ''retaliation,'' which is not defined in the proposed settlement, must be defined broadly to include ''any threats or any actions that directly or indirectly have an adverse effect'' on OEMs or other licensees. The phrase ''by altering Microsoft's commercial relations, or by withholding newly introduced forms of non-monetary Consideration'' should be eliminated, because it unnecessarily limits the scope of the term retaliation. Microsoft's proven ability to devise new forms of anticompetitive restraints to meet new competitive threats amply justifies this broad definition.

The scope of the conduct by OEMs and other licensees which cannot be subject to retaliation by Microsoft must be broadened. The provision should prohibit adverse action by Microsoft based on the OEM or other licensee undertaking or contemplating ''any business activity that promotes or distributes software, products or services that may be competitive with Microsoft products or services.'' See Final Judgment § 3(a)(i)(1). Again the record of Microsoft's constantly evolving panoply of anticompetitive actions justifies the broad prohibition to ''pry open'' the market to competition. The burden should be on Microsoft, as the convicted lawbreaker, to seek an exception to the decree's prohibitions if it believes there is a reasonable, procompetitive justification for a particular adverse action.

§§ III.A.1, III.A.2 and III.A.3 Each of these subsections should be deleted because they limit the scope of the conduct by OEMs for which Microsoft is prohibited from retaliating.

The provision in the second half of § III.A addressing license termination should require that Microsoft show good cause before terminating the license of an OEM or other licensee, in addition to giving written notice and an opportunity to cure. See Litigating States' § 2(a). The provision should also be changed to give the licensee 60 days' opportunity to cure. Id. The exception allowing Microsoft to terminate an OEM's license if it has previously given two or more written notices should be deleted because it is too easily subject to abuse. All of these changes are necessary to ensure that Microsoft, given its sorry history of abuse, deals fairly with licensees.

The exception in § III.A that permits Microsoft to provide ''consideration to any OEM with respect to any Microsoft product or service where that consideration is commensurate with the absolute level or amount of that OEM's development, distribution, promotion or licensing of the Microsoft product or service'' should be deleted. It provides Microsoft the opportunity to provide unlawful incentives to licensees based on undefined criteria (''absolute level or amount'') that Microsoft alone determines.

Proposed Additions to Follow RPFJ § III.A

B. A Provision Prohibiting Retaliation By Microsoft Against Any Party Who Participates In The Litigation Must Be Added

A provision, such as Litigating States' proposal 9, should be added following § III.A to specifically prohibit Microsoft from retaliating against any individual or entity who participates or cooperates in any way in any aspect or phase of antitrust litigation involving Microsoft. Such a provision will ensure that Microsoft does not retaliate against any individual or entity that has participated thus far, and will afford protection to any individual or entity that wishes to come forward with complaints against Microsoft based on the consent decree that is ultimately entered. In view of Microsoft's continuing dominant position, its history of retaliation, and the fear it has engendered throughout the marketplace, such a provision is both necessary and reasonable.

C. A Provision Requiring Microsoft To Port ''Office'' To Apple's Operating System Must Be Added

Litigating States' proposal § 14 should be included in the decree to require Microsoft to continue making and updating a version of its ''Office'' business productivity suite that can be ported to the Apple operating system, and to require Microsoft to auction licenses to third parties to facilitate the creation of versions of Office that port to operating systems other than Windows. Such a provision is necessary because the Apple Macintosh operating system at present is the only viable alternative to Windows as an Office platform, but if others develop, they should have access to this widely-used application software. Such a provision is justified by the specific findings, affirmed on appeal, that Microsoft used the threat of dropping support for the Apple version of Office to coerce Apple into using IE as its default browser.

D. Changes Must Be Made To RPFJ § III.B (Uniform Licensing)

The subject of uniform licensing is adequately addressed in ¶2(a) and ¶2(b) of the Litigating States' proposal. Alternatively, the RPFJ should be revised as follows:

§ III.B

For the reasons discussed in connection with RPFJ § III.A., the provision must apply not only to Microsoft's licensing to OEMs, but to all third party licensees. § III.B.2

The proposed decree should allow Microsoft to provide reasonable volume discounts only if they are based upon an independent determination of the actual volume of shipments. See p. 102 supra; Litigating States' § 2(a)(ii). § III.B.3

This provision and its three subsections should be eliminated. Instead, the provision should include an outright prohibition, such as that included in Final Judgment § 3(a)(ii) or Litigating States' § 2(a), against Microsoft's offering market development allowances (''MDAs'') or discounts to OEMs or third party licensees. This loophole allowing MDAs makes it possible, as a practical matter, for Microsoft to engage in the very discrimination that the provision is intended to prevent.

Proposed Additions to Follow RPFJ § III.B

A provision should be added to the proposed decree that would require that Microsoft provide OEMs and other licensees with equal access to ''licensing terms, discounts, technical, marketing and sales support, product and technical information, information about future plans, developer tools or support, hardware certification and permission to display trademarks or logos.'' gee Litigating grates' § 2(b); Final Judgment § 3(a5(ii5. Without this provision, Microsoft will be able to keep such information secret, which will allow Microsoft to continue to take advantage of licensees' ignorance about what terms are available.

F. A Provision Prohibiting Microsoft From Enforcing Agreements That Are Inconsistent With The RPFJ Must Be Added

A provision should be added that prohibits Microsoft from enforcing any contract terms or agreements that are inconsistent with the decree. See Litigating States' 2(a); Final Judgment § 3(a)(ii). This prophylactic measure is justified by Microsoft's proven history of evasion of antitrust regulation and anticompetitive conduct.

G. Changes Must Be Made to RPFJ § III.C (Restrictions on OEM Configuration of PCs)

Section III.C attempts to address Microsoft's past illegal imposition of restrictions on OEM configuration of the desktop. These restfictions closed the OEM distribution channel to non-Microsoft middleware. Because the provision fails to address Microsoft's commingling of code, contains no affirmative requirement to offer a stripped-down version of Windows with a corresponding price reduction, and is fiddled with loopholes and ambiguities that allow Microsoft to override both OEM and end-user choices regarding competing middleware products, section III.C fails to accomplish its goal. To effectively close these loopholes and reopen the OEM distribution channel in an effort to revive middleware competition, SBC recommends the following:

The Litigating States' proposal is adequate to satisfy SBC's concerns regarding the effectiveness of OEM configuration options. SBC recommends that the Litigating States' proposals addressing restrictions on OEM options be adopted to replace section III.C of the proposed settlement. See Litigating States' §§ 1, 2(c), 3, 8, 10. In the alternative, SBC recommends the following modifications to the proposed decree:

§ III.C

Following the words ''OEM licensee'', the phrase ''or Third Parties'' should be added. ''Third Parties'' should be defined as ''any persons offering to purchase from Microsoft at least 10,000 licenses of a product or products offered and licensed to OEMs, including without limitation ISVs, systems integrators, and value-added resellers.'' See Litigating States'' § 22(oo). As described in these comments, this would allow third party software customizers to develop as a competitive force in the industry, as they may well have absent Microsoft's illegal conduct.

Add after the word ''alternatives'' in the first sentence of the provision ''..., which are set forth below, by way of example and not limitation: .... ''This prevents the list of items that follows from becoming an exclusive list of the restrictions Microsoft cannot impose on OEMs. Broad language is necessary so that the remedy can be adapted to technological changes.

Added to the list should be an option that states OEMs are free to display alternative non-Microsoft desktops, provided that an icon or other means of user access is provided to the Microsoft desktop. This allows OEMs the freedom to offer consumers completely separate non-Microsoft interfaces without interfering with, changing the appearance of, or precluding access to, the Microsoft desktop.

§ III.C.1

This subsection is meant to ensure that OEMs are free to install competing middleware products and services and to place icons and shortcuts to those products on the desktop. CIS at 30. To fulfill that purpose:

Eliminate everything after the words ''generally displayed.'' The exception that

follows those words may be misconstrued as providing Microsoft discretion to prohibit OEMs from featuring middleware products as to which Microsoft may not offer a competing product or a product with the same ''functionality.'' The deletion of the language prevents any misunderstanding.

Section III.C. 1 should also make clear that Microsoft may not restrict OEMs from offering an alternative desktop, provided that an icon linking the user to the Windows desktop is also displayed. This would expand options for consumers, while at the same time reducing the burden on OEMs of attempting to conform to Microsoft's desktop requirements.

§ III.C.2

Related to section III.C.1 is subsection 2, which prevents Microsoft from restricting an OEM's ability to distribute and promote non-Microsoft Middleware by displaying shortcuts on the desktop. However, the provision limits this ability to those middleware products that do not impair the ''functionality'' of Windows. At the end of the provision, the following language should be added: ''Whether the functionality is impaired shall be determined by the Technical Committee upon Microsoft's written submission to the Committee as to how the OEM modification impairs the functionality of the Windows Operating System.'' Nowhere in the decree is the term ''functionality'' defined. So as not to leave the determination as to whether a change impairs the ''functionality'' of Windows in Microsoft's discretion, either the term should be defined in the definitions section of the decree, or the aforementioned language should be added.

§ III.C.3

Subsection III.C.3 requires Microsoft to permit OEMs to configure the desktop in a manner that allows non-Microsoft products to launch automatically at the conclusion of the tint or subsequent boot sequences or upon connection or disconnection from the Internet. To accomplish this:

Eliminate everything after ''a user interface'' and replace it with ''that may be seen as attempting to imitate the trade dress of or otherwise appear identical to the corresponding Microsoft Middleware Product.'' While subsection 3 attempts to prevent ISVs from palming-off their products as Microsoft products, as currently written, the provision appears to give Microsoft discretion to decide, in the first instance, which competitors'' icons and interfaces, and in what form, may be displayed. The change clarifies the intent.

As in Section III.C.1 above, this provision contains imprecise language describing when and whether a Non-Microsoft Middleware Product can launch automatically (''if a Microsoft Middleware Product that provides similar functionality would otherwise be launched automatically at that time'') that can be interpreted as allowing Microsoft to stop OEMs from launching innovative middleware products as to which Microsoft has not developed a competing product. This language should be deleted both to avoid any possibility of such an interpretation and also because Microsoft's business choices should not determine or in any way limit OEMs' decision to launch a non-Microsoft product or service.

The provision should include the phrase ''..., application or service (including any security/authentication service)'' after the first appearance of the term ''Non-Microsoft Middleware''. This would allow ISVs to compete with Microsoft's new products and services such as NET and Passport to which Windows XP contains embedded prompts in the initial boot sequence and on the MSN default homepage.

As now drafted, the provision can be read as limiting competition 0nly to the categories of middleware product that existed when the litigation began, i.e., browsers and media players.

The settlement should require that, as part of ensuring that a Non-Microsoft Middleware Product can launch automatically in place of a Microsoft Middleware Product, the non-Microsoft product will replace the Microsoft product in such cross-dependent scenarios as when clicking on a URL in Microsoft Word. In the past, regardless of a user's selection of default browser, IE would launch in its place when the user attempted to reach the Internet in this fashion. Microsoft should not be permitted to automatically invoke its middleware products despite a contrary choice by a consumer or OEM.

§ III.C.5

In this section concerning an OEM's freedom to promote a competing IAP, the settlement must either identify what a ''reasonable technical specification'' is or otherwise remove that determination from Microsoft's sole discretion. Otherwise, Microsoft will be able to block OEMs from featuring competing IAPs for virtually any reason, or else impose anticompetitive requirements, such as the use of Microsoft's proprietary protocols, before a competing IAP is allowed on the desktop. Proposed Additions to Follow RPFJ

§ III.C

H. A Provision That Prohibits Microsoft From Commingling Must Be Added

A provision that reads similarly to the Litigating States' proposed ¶1 should be adopted to prevent Microsoft from repeating the illegal conduct that the Court of Appeals found it engaged in by commingling the code of its IE browser with the code for its Windows operating system. A restriction on the practice of binding middleware to the operating system is essential to restoring competition by making the OEM distribution channel a viable option once again for software vendors. See Litigating States' 1. Such a provision will have the salutary collateral effect of preventing the exceptions contained in RPFJ § III.H from rendering the substance of sections III.C and III.H meaningless, as well as supporting innovation. See Shapiro Decl. at 23 (stating that an anti-binding provision in the Final Judgment, similar to the one proposed here, ''strikes an excellent balance between the consumer benefits that can arise when Microsoft adds functionality to its operating system and the benefits that consumers enjoy when new and improved software is developed independently of Microsoft, especially if that software may serve a role in eroding Microsoft's monopoly position. By allowing OEMs to choose whether to make Microsoft's Middleware Products or rival software directly available to end-users, OEMs will have the incentive to experiment to best serve consumers' interest.'').

I. A Provision Determining The Relative Prices Of Unbundled Versions of Windows Must Be Added

Either as part of the provision dealing with the binding of middleware or elsewhere in the decree, there must be a provision requiring Microsoft to differentiate its product prices based on an OEM's selection of the Microsoft middleware products, if any, that it chooses to bundle with the Windows operating system. Such a mechanism must ensure that ''stripped-down'' versions of Windows cost less than the fully loaded version in a proportion that properly reflects the value of middleware products not included. Failure to provide a pricing mechanism, such as those contained in States' proposal ¶¶1 and 3(b), removes any incentive OEMs have to create software packages composed of competing middleware products.

Several such mechanisms are possible. The Final Judgment provided that pricing be guided based on bytes of code. See Final Judgment § 3(g)(ii). SBC believes it would be preferable to allocate costs between the operating system and the removed middleware based on measurements of ''function point code.'' The International Function Point Users Group Counting Practices Manual is a generally accepted, objective industry standard for measuring non-multimedia software (which excludes games and training software) and estimating software costs using an existing code base. See T. Capers Jones, Estimating Software Costs Function Point Analysis: Measurement Practices for Successful Software Projects (1998); David Garmus and David Herron, Function Point Analysis: Measurement Practices for Successful Software Projects, 34–61 (2000). Alternatively, SBC supports the use of a pricing mechanism based on the fully allocated product development costs for the operating system product and middleware products in question. See Litigating States' ° 1.

J. A Provision Requiring That Microsoft Continue To Offer Predecessor Versions Of Windows Must Be Added

SBC recommends adoption of Litigating States' proposed ¶3. Section 3 mandates that Microsoft continue to license for 5 years its immediate predecessor version of Windows, at a price no higher than the last price at which the predecessor version was offered. This is a further means of preventing Microsoft from commingling its middleware products with Windows without offering OEMs, end-users and third parties the chance to buy a version of the operating system that is both cheaper and without Microsoft products bound to it. Prior versions of Windows typically have less Microsoft middleware product bundled with or bound to the operating system, and rely more heavily on accepted industry standards. As a result, predecessor versions may be more easily configured to include non-Microsoft middleware products.

K. Changes Must Be Made To RPFJ §§ III.D and III.E (Interoperability Disclosure)

Full interoperability is necessary to prevent Microsoft from perpetuating its monopoly of the PC operating system market by exercising control over server operating systems and software, and Internet browsers, and using that control to eliminate the nascent competitive threats posed by non-Microsoft server operating systems and embedded devices.

Section 4 of the Litigating States' proposal achieves full interoperability between (i) a Windows PC operating system and non-Microsoft Middleware; (ii) a Windows PC operating system and a non-Microsoft server operating system; (iii) Microsoft Middleware, including Internet Explorer, and a non-Microsoft server operating system; and (iv) Microsoft and non-Microsoft server operating systems. Litigating States' § 4.

To achieve full interoperability, the disclosure must include ''all APIs, communications interfaces and other technical information related to interoperability.'' Litigating States' § 4. Only in this way can the ''seamless interoperability,'' recognized by the government in the CIS as the operative goal, be achieved. CIS at 38.

The timing of required disclosure under the proposed settlement is equally deficient, because it provides Microsoft sufficient flexibility to use the timing of a disclosure to gain a competitive advantage for its own software. Microsoft should be required to disclose the technical information related to interoperability in a ''timely manner,'' which should be defined as the earliest of the following: (i) when it is disclosed to Microsoft's applications developers; (ii) when it is used by Microsoft's Platform Software developers; (iii) when it is disclosed to any third party; or (iv) within 90 days of a final release of a new version of Windows, and no less than 5 days after a material change is made by Microsoft after the most recent beta or release candidate version. This is the timing provision employed by both the District Court's Final Judgment and the Litigating States' proposal. Final Judgment ¶3(b); Litigating States' § 22 (pp).

Proposed Additions To Follow RPFJ § III.E

L. A Provision That Requires Mandatory Distribution of Java Must Be Added

The Litigating States' proposal properly requires Microsoft to distribute Java, free of charge, for ten years. Litigating States' § 13. The copy of Java that is distributed must be ''a competitively performing Windows-compatible version of the Java runtime environment (including the Java virtual machine and class libraries) compliant with the latest Sun Microsystems Technology Compatibility Kit.'' Id. The proposed settlement does not require Microsoft to distribute a version of Java that is compliant with the latest technology from Sun Microsystems, and that is fully compatible with the most recent version of Windows. This requirement is critical to ensure full interoperability between IE and all non-Microsoft server operating systems, and will also help to erode the applications barrier to entry that shields Microsoft's monopoly power.

M. A Provision Prohibiting Interference With Or Degradation Of Non-Microsoft Middleware Must Be Added

The government's own expert explained the need for an affirmative prohibition against such interference by Microsoft as necessary to prevent one of the more insidious methods of monopoly maintenance:

> Microsoft has demonstrated its ability and incentive to hinder the adoption of rival middleware through a variety of exclusionary tactics such as it employed against Netscape's browser. Once Microsoft is enjoined from employing the tactics it has already used, Microsoft will have an incentive to switch to new, substitute tactics having the same effect. One such tactic is to intentionally degrade the performance of rival middleware interoperating with Windows.

Shapiro Decl. at 22. The Final Judgment and Litigating States' proposal explicitly prohibit Microsoft from knowingly impeding or degrading the performance of non-Microsoft Middleware on a Windows PC. Final Judgment § 3(c); Litigating States' § 5.

The Litigating States' proposal also properly requires that if Microsoft takes any action that would ''interfere with or degrade the performance of non-Microsoft Middleware,'' it must give 60 days advance notice to the affected ISV. Litigating States' 8 5. The proposed settlement does not contain a knowing interference provision. Since the Court of Appeals specifically affirmed the findings upon which this remedy was based, the decision to delete it is difficult to understand. CA at 65–66. To the contrary, the proposed settlement actually gives Microsoft the incentive to make slight changes to its operating system product, as part of a ''minor upgrade,'' that would have the effect of impeding the interoperability of non-Microsoft middleware with a Windows PC operating system. See RPFJ §§ III(D), VI(J). If the change is a part of a ''minor upgrade,'' Microsoft is not required to disclose the APIs and other technical information required to ensure full interoperability. Id.

N. A Provision Requiring Microsoft to Comply With Industry Standards Must Be Added

To create a level playing field and foster competition, a provision must be added to ensure that open or industry standards continue to be promoted and used by Microsoft as part of the Windows PC operating system environment. An industry standard is any technical standard that has been approved by (or has been submitted to and is under consideration by) any independent, publicly recognized organization or group that sets standards. If Microsoft can replace an open industry standard with its own proprietary codes, it will prevent full interoperability and thus reinforce the applications barrier to entry.

As a result of Microsoft's monopoly power in the PC operating system market, it is able now, and in the foreseeable future, to depart from industry-recognized standards for its own competitive advantage. This is accomplished in two ways. First, Microsoft has in the past made subtle, undisclosed changes to a number of recognized industry standards that are used to execute functions by the Windows operating system. Even a small modification can severely impede the ability of a competing operating system or middleware product from interoperating with a Windows operating system product.[35] Second, any new or modified standards implemented by Microsoft become, as a practical matter, an industry standard within a very short period of time because of the high percentage of Windows users.

Microsoft's Brad Silverberg explained this Microsoft strategy in the context of a previous standards battle with Novell's Netware:

> It seems very clear to me that if you are currently on the losing end of a standard battle, your strategy needs to be: (a) adopt the standard so you don't force customers to choose between you and the standard, (b) bootstrap that so you have a reasonable installed base, (c) begin to change the standard on top of it to get people dependent on ''you.'' Once people are dependent on you .... you ''start to turn the crank.''

Henderson Decl. ¶35 (internal citations omitted).

To ensure that Microsoft's practices are changed and to ensure full interoperability, the settlement must include a provision that requires:

(i) that Microsoft continue to use and promote all open or industry-recognized standards;

(ii) that Microsoft not alter or modify an industry standard in any way, except to the extent that such modification is compliant with, and approved by, an independent, internationally recognized industry standards organization;

(iii) that Microsoft disclose any change it implements to an open or industry-recognized standard, in a ''timely manner,'' as that phrase is defined in the Litigating States' Proposal § 22 (pp);

(iv) that Microsoft assist any other software provider to achieve interoperability with any protocol Microsoft uses in any such situation in which Microsoft is the holder of the reference protocol implementation; and

(v) that Microsoft work with all other holders of reference protocols to achieve and ensure interoperability with any protocol Microsoft uses, in any situation in which Microsoft is not the holder of the reference protocol implementation.

There are over 300 separate standards used by any PC operating system to function within a local area network or on the internet. The following protocol families are among those that are particularly important to Internet-based computing: (1) the TCP/IP protocol family, which is universally used to transmit data and services on the Internet; (2)

[35] For example, if Microsoft made subtle changes to the industry-recognized audio Codec standard, applications that used audio features, such as Real Player, would not be able to interoperate with a Windows PC operating system. If Real Player continued to employ the industry-standard Codec in its program, Windows PC users would be able to download that Codec to their Windows operating system, but would face the very real possibility that the program would not function with their Windows PC operating system as well as the competing Microsoft product, Media Player, which would, of course, be designed to run with Microsoft's modified Codec.

the H.323 protocol family as defined by the ITU, which supports video and voice communications and is often referred to as a Voice over IP (VoIP) protocol; (3) the SIP protocol family, which supports video and voice communications, as well as instant messaging; and (4) the HTML/HTTP protocol family, as defined by the World Wide Web Consortium (W3C), which supports web browser and server protocols.

A Provision Requiring Open-Source Licensing for Internet Explorer Must Be Added

Microsoft's control of IE is an integral part of the anticompetitive conduct that has maintained Microsoft's monopoly over the PC operating system market. As the Litigating States propose, to remedy these anticompetitive acts and prevent recurrence, the source code for IE must be disclosed on a royalty-free and non-discriminatory basis. See Litigating States' § 12.

P. Changes Must Be Made To RPFJ § III.F (Retaliation Against Any Third Party)

Sections 8 and 9 of the Litigating States' proposal adequately address retaliation issues. Alternatively, the following revisions should be made in the RPFJ:

§ III.F.1

The retaliation provision must be revised to prohibit retaliation not only against the limited category of ISVs and IHVs, but against any third party. For the reasons discussed in connection with Section III.A above, the continually evolving nature of computer and software technology and business practices means that, as a practical matter, new threats to Microsoft's operating system monopoly could come from as-yet unidentified entities. In light of Microsoft's record of past retaliatory conduct, and the durability of its monopoly power, such ''nascent'' threats must be protected wherever and however they emerge.

The term ''retaliation'' must to be defined broadly to include ''any threats or any actions that directly or indirectly have an adverse effect'' on third parties. See discussion of RPFJ § III.A supra.

The scope of conduct by third parties for which Microsoft may not retaliate must be broadened. The provision should prohibit adverse action by Microsoft based ''directly or indirectly on any actual or contemplated action'' by the protected party. See discussion of RPFJ III.A supra.

The ban on retaliation should be based on any action or contemplated action by a third party ''to develop, use, distribute, promote, or support any non-Microsoft product or service.'' See Litigating States' § 8. The proposed settlement prohibits retaliation based on a party's ''developing, using, distributing, promoting or supporting any software that competes with Microsoft Platform Software or any software that runs on any software that competes with Microsoft Platform Software.'' Based on the inherent problems with the definition of Microsoft Platform Software, this limitation narrows the types of products within its scope. For example, it would be permissible for Microsoft to retaliate for a party's distribution or use of an application that competes with Office, because Office is not ''Microsoft Platform Software.''

§ III.F.2

At a minimum, the exception in this provision must be deleted. It would allow Microsoft to enter agreements that limit an ISV's ability to develop, promote or distribute competing software, ''if those limitations are reasonably necessary and of reasonable scope and duration in relation to a bona fide contractual obligation of the ISV to use, distribute or promote any Microsoft software.'' RPFJ § III.F.2. This creates a loophole for Microsoft to restrict an ISV's ability to develop products that compete with Microsoft products. Given its proven history of anticompetitive conduct, Microsoft should not be entitled to an automatic opportunity to use its market power to obtain even ''reasonable'' exclusive dealing agreements. If Microsoft and an ISV believe a particular agreement has procompetitive justification, they can seek prior approval from the government. In the alternative, this entire provision may be deleted if a provision as discussed in ¶V.Q below is added. See also Litigating States' § 11; Final Judgment § 3(h).

§ III.F.3

This broad savings clause, which provides that Microsoft is not prohibited from enforcing agreements with any ISV or IHV, or any intellectual property right, that is not inconsistent with the proposed settlement, should be removed. It is unnecessary and vague, and invites further litigation. Given the overwhelming record of Microsoft's anticompetitive conduct, the burden should not be placed on the government or a third party to prove that Microsoft did something ''inconsistent'' with the decree.

Proposed Additions to Follow RPFJ § III.F

Q. A Provision Prohibiting Microsoft From Entering Agreements That Limit Competition Must Be Added

A provision should be added, such as Litigating States' proposal 11, prohibiting Microsoft from offering consideration to any competitor in exchange for the competitor's agreeing to refrain from developing or distributing any product or service that competes with any Windows Operating System or Middleware Product. See also Final Judgment 3(h). Such a provision is necessary to prevent Microsoft from seeking anticompetitive contracts that divide markets or otherwise limit competition, regardless of whether the ''terms'' are reasonable. See discussion of RPFJ § III.F.2 .supra.

R. Changes Must Be Made To RPFJ § III.G (Ban on Exclusive Dealing)

SBC believes that Section 6 of the Litigating States' proposal is consistent with the public interest on the issue of exclusive dealing. Alternatively, the following changes should be made in the RPFJ:

§ III.G.1

The provision governing exclusive dealing must be extended to third parties. See Litigating States' § 6; Final Judgment § 3(e). The government previously acknowledged that a general ban is necessary because it is too difficult to predict which entities Microsoft might seek to tie up in exclusive arrangements over the next several years. See Shapiro Decl. at 19.

Microsoft should be prohibited from granting consideration to any third party that agrees to ''restrict its development, production, distribution, promotion or use of, or payment for, any non-Microsoft product or service; distribute, promote or use any Microsoft product or service exclusively or in a minimum percentage; or interfere or degrade the performance of any non-Microsoft product or service.'' See Litigating States' § 6; Final Judgment § 3(e). The proposed settlement would prohibit only agreements that grant consideration for the entity to agree to distribute, promote or use Microsoft Platform Software exclusively or in a fixed percentage. The settlement terms do not prohibit restricting the development or use of non-Microsoft products or services and interfering or degrading the performance of non-Microsoft products or services. Yet such conduct is blatantly anticompetitive and entirely consistent with Microsoft's record of proven illegal conduct.

The exception allowing exclusive or fixed percentage arrangements if Microsoft obtains a representation that it is ''commercially practicable'' for the entity to provide equal or greater distribution of a competing product, should be eliminated. This loophole permits Microsoft to demand parity with any product that it considers a competitor in an agreement with a third party that promotes or distributes a competing product. As a proven monopolist, Microsoft should not be given what is effectively an affirmative right to demand that others carry its products. The opportunities for coercion are far too great.

§ III.G.2

The proposed settlement must be changed to prohibit Microsoft from entering into agreements with IAPs and ICPs that condition their placement on the Windows desktop on their agreement ''to distribute, promote or use any Microsoft product or service.'' See Litigating States' § 6(e); Final Judgment § 3(e)(iv). The proposed settlement only prohibits agreements that condition placement of the IAP or ICP on the Windows desktop upon the IAP or ICP's refraining from promoting or using software that competes with Microsoft Middleware. This creates a loophole permitting Microsoft to condition desktop placement on the IAP or ICP agreeing to distribute, promote or use other Microsoft products or services exclusively. Given Microsoft's proven history of anticompetitive exclusionary conduct, it should be barred from any kind of exclusive dealing arrangement.

The provision that permits exclusive dealing arrangements for joint ventures, joint developments or joint services arrangements should be deleted. It would permit Microsoft to avoid the general prohibitions on exclusive dealing, which are essential to restoring competition, merely by restructuring prohibited agreements as ''joint ventures.'' Once again, if Microsoft believes it has a legitimate, procompetitive basis to enter into a true joint venture agreement, it can seek authorization to do so.

The provision that excludes licensed-in intellectual property should be deleted. Like the ''joint venture'' loophole, it would allow Microsoft to evade the exclusive dealing ban by including in an agreement, licensed-in intellectual property of nominal value.

g. ChanGes Must Math To RPFJ § III.H (OEM/End User Control the Desktop)

Section III.H focuses on OEMs' ability to offer and promote and end-users' ability to choose competing middleware products. Yet the provision undermines this purpose in several ways, including: (1) preventing either OEMs or end-users from removing Microsoft products from the operating system; (2) permitting Microsoft to override or alter OEM and end-user choices of competing middleware products; and (3) delaying the implementation of the provision to such an extent as to render it meaningless for a fifth of the lifespan of the decree. To remedy these flaws, the following changes are suggested:

§ III.H

The first sentence, which delays the applicability of the section for the earlier of 12 months after submission of the settlement to the Court or the release of the first service pack for Windows XP, should be revised to delete the introductory phrase. Microsoft should be required immediately to implement the changes necessary to comply with the OEM/end-user control provisions. This would also maximize the amount of time the provision is in force before the relief expires.

The last sentence of this section, which follows the ''Notwithstanding'' clause, should also be eliminated. All Microsoft Middleware Products should be required to comply with the substantive provisions of sections III.C and III.H. There is no justification for a temporal cut-off point of any kind (such as seven months prior to the last beta test of an operating system release, contained here) for new products, which should be developed with a focus on meeting, not evading, the requirements of the relief.

§ III.H.1

Subsection 1 allows OEMs and end-users to enable or disable the automatic invocation of a Microsoft middleware product or to remove the icon for that product. A subsection (c) should be added that allows end-users and OEMs to add or remove any Microsoft Middleware Product from the operating system, not just the icon for that product. The additional language will eliminate the problem of automatic invocation of Microsoft middleware under certain circumstances and open up hard drive space to add additional programs. This provision will only be effective, however, if there is a prohibition against the binding of middleware to the operating system.

§ III.H.3

The CIS states that section III.H.3 prevents automatic alteration of an OEM configuration (CIS at 48), but subsection III.H.3(b) undercuts this commitment. It would permit Microsoft to prompt an end-user to ''sweep the desktop'' of all selected icons and middleware choices 14 days after the initial boot-up of the computer and thereafter. Because of the possibility of consumer confusion, this has the potential to undo the very OEM and end-user control Section III.H is intended to allow. Subsection (b) therefore should be eliminated. There is no need for Microsoft ever to seek end-user confirmation that he or she wants to reverse an OEM configuration that includes competing products, or ever to prompt the end-user to ''sweep away'' all previous non-Microsoft product choices.

The ''Notwithstanding'' Clauses In This Provision Must Be Deleted

The ''Notwithstanding'' clauses at the end of section III.H allow Microsoft to disregard OEM and consumer choice whenever Microsoft decides that its products must be invoked to operate with its servers or when the Non-Microsoft Middleware Product fails to implement a ''reasonable technical specification'' (a term that is left to Microsoft to define). The clauses should be eliminated in their entirety. The exceptions contained in these clauses are so broad that they threaten to render the substance of section III.H meaningless by permitting Microsoft to override an OEM's or end-user's middleware default choice at will.

T. Changes Must Be Made To RPFJ § III.I (Mandatory Licensing)

The proposed settlement allows Microsoft to charge a royalty for the required license of technical information concerning interoperability, and to obtain a cross-license to the licensee's technical information used to interoperate with a Windows PC operating system or Microsoft Middleware. As the government recognized in the earlier remedy proceedings, royalty and cross-licensing requirements are anticompetitive. Final Judgment § 3(i); see also Gov't D.Ct. Sum. Resp. at 14. As the Litigating States have proposed, Microsoft should be required to license the necessary technical information on a royalty-free basis, and without the tight to a cross-license from the licensee. Litigating States' ¶15.

U. Changes Must Be Made To RPFJ § III.J (Limitations on Mandatory Licensing)

Section III.J of the proposed settlement is a loophole and must be deleted. All APIs, communications interfaces and technical information that must be disclosed to ensure interoperability serve, at least in part, an authentication or encryption function related to the security of the operating system. Microsoft should not be given an excuse to withhold disclosure of crucial technical information for potentially anticompetitive purposes. Neither the Final Judgment nor the Litigating States' proposal contains a similar provision.

V. Changes Must Be Made To RPFJ §§ IV And V (Compliance And Enforcement)

In contrast to the proposed settlement, certain aspects of the Litigating States' proposal would be far more effective in ensuring that the intent and spirit of the final relief entered in this action be effectively enforced:

As mandated by the Antitrust Division Manual and conceded by the government as being ''customary in antitrust actions'' (Gov't D.Ct. Sum. Resp. at 20), the final decree should remain in effect for ten years, not five, as prescribed by RPFJ § V. See Litigating States' § 21 (b); Final Judgment § 6(c).

Pursuant to Rule 53 of the Federal Rules of Civil Procedure, the Court should appoint a Special Master, who would be in a position to immediately report violations directly to the Court and also periodically report to the Court regarding Microsoft's compliance with its obligations, instead of the Technical Committee prescribed by the proposed decree. See Litigating States' § 18.

Any decree should set forth specific sanctions for different levels of violations and impose a strict, rapid, no-nonsense timetable for the formal resolution of all complaints about Microsoft's conduct. See Litigating States' ¶18(f).

A critical deficiency in the proposed settlement is the lack of a requirement that anyone at Microsoft, including its designated Internal Compliance Officer, certify periodically to the Court that Microsoft is in compliance with its obligations. Indeed, no one is in a better position than Microsoft to know whether it is in compliance. For these reasons, the Court should require that any decree include a self-reporting requirement, providing that a senior executive of Microsoft certify periodically under oath to the Court that Microsoft is in compliance with its obligations, Such a provision would further ensure that Microsoft takes its obligations seriously.

Instead of limiting training in the decree to officers and directors (RPFJ § IV.C.3.a), the provision must require officers, directors and all other employees that are in positions that enable them to initiate or implement anticompetitive conduct to read, understand and comply with the decree, as is customary in antitrust consent decrees. See Litigating States' § 17(c); Final Judgment § 4(e).

W. Changes Must Be Made To RPFJ § VI (Definitions)

The way the proposed settlement defines key terms significantly restricts, and in many instances eliminates, the effect of the proposed settlement's substantive provisions. SBC generally recommends the adoption of the definitions contained in the Litigating States' proposal § 22. Some of the problems posed by the proposed settlement's definitions relating to middleware are as follows:

The definition of''Microsoft Middleware'' in section VI.J must be eliminated. The term is defined in so restrictive a way that it would exclude, among other things, any middleware which is bound to the operating system or as to which Microsoft has not sought trademark protection. It should be replaced with a straightforward definition that applies to middleware irrespective of whether it is Microsoft or non-Microsoft middleware, such as the definition of Middleware contained in the Final Judgment § 7(q). See also Litigating States' § 22(w).

The proposed settlement's definition in section VI.K of ''Microsoft Middleware Product'' limits what are considered Microsoft middleware products to specific categories of products. It should be replaced by Litigating States' proposal § 22(x), which is both a broader and more accurate description of a Microsoft Middleware Product, as it accounts for both middleware products currently in existence and products that will be developed in the future.

Subsection (ii) of the definition of''Non-Microsoft Middleware Product'' requires that one million copies of the product be distributed in the previous year for the product to be considered a competing middleware product. See RPFJ § VI.N. This definitional limitation excludes new competing products from a number of the proposed settlement's protections, including those relating to the important OEM distribution channel.

The last sentence of the definition of ''Windows Operating System Product'' grants Microsoft ''sole discretion'' to determine what constitutes a Windows Operating System Product, and should be deleted. See RPFJ § VI.U. The definition should be objective and should roughly correspond to the definition of ''Operating System Product'' in the Final Judgment § 7(v). The definition of ''Windows Operating System Product'' should also include prior versions of Windows, including Windows 95 and Windows 98, as well as versions of Microsoft's operating system developed for non-PC products, such as Windows CE. See Litigating States' § 22(rr).

VI. CONCLUSION

For the reasons stated herein, the proposed settlement with Microsoft is contrary to the public interest and should be substantially modified or rejected entirely.

Subject: Microsoft settlement

To whom it may concern,

As part of the public comment on the proposed Microsoft settlement, I am objecting to the prosecution of Microsoft by the Department of Justice and the various Attorney Generals' offices. I understand that with a gun to its head Microsoft wants this settlement. However, the settlement is unjust. As a consumer, Microsoft has benefited me. Sometimes I buy Microsoft, but not always. I use operating systems and browsers produced by other companies. However, Microsoft's leadership in creating software that has been selected by the marketplace as the dominant products created a computing revolution that has changed my life through higher income. In contrast, the government's prosecution of Microsoft has harmed me.

The club-fisted actions by the government in this matter have adversely affected the development of products that would have benefited me. First, the government's attack on Microsoft distracted their expansion in the enterprise server software market which is dominated by companies that have supported the government's efforts. Resources Microsoft could have been used to enhance products that would have benefited me professionally were diverted to pay for attorneys instead of programmers. Second, the government's attack on Microsoft caused the high tech meltdown in the economy by depressing the equity markets. Consequently, jobs were lost and innovative products never made it to market.

Because of the coercion used by the government, I have several objections to the proposed settlement.

First, the settlement imposes restrictions on Microsoft's ability to make contracts. This infringement on Microsoft's right to enter contracts on its own terms is akin to the ''badges of slavery'' prohibited by the 13th Amendment. Consequently, while Microsoft retains title to its property, the government is specifying the terms under which it may exercise its own property. Thus, our government is pursuing fascist economic policies that obliterate the rights of private property.

Second, the settlement mandates the disclosure of proprietary information by Microsoft. This attack on intellectual property rights undermines our economy. Further, it contradicts the foreign policy of our government that seeks to protect the intellectual property rights of Americans abroad. Although there is some recourse to prevent the dissemination of information affecting security, the settlement makes no adequate provisions for resolving disputes between Microsoft and the government on these security claims to protect consumers. Therefore, this settlement puts the property and privacy of Microsoft customers in jeopardy.

Third, this settlement infringes constitutional protections Microsoft, and all Americans, have from unreasonable searches. The presence of government agents in the Microsoft facility at the company's expense with unlimited access to confidential Microsoft information is an affront to our sense of ordered liberties. If this settlement were instead a warrant, the court would deny it as overly broad and unreasonable. In addition, the settlement does not specify sanctions against the government for potential violations of the confidentiality agreements.

Finally, if the government was serious about the danger Microsoft pose to consumers, the Justice Department and the state Attorney Generals' offices should have promised to not use Microsoft products during the term of the settlement. That would let the government work in an environment of incompatible software products that the market has freely chosen to avoid. In summary, the government's prosecution of Microsoft and this settlement is a threat to our individual liberty because it permits the government to destroy the wealth created by our citizens arbitrarily.

Subject: Microsoft Settlement

January 28, 2002

Renata B. Hesse

Antitrust Division

U.S. Department of Justice

601 D Street NW

Suite 1200

Washington, DC 20530–0001

Dear Ms. Hesse:

Please register my emphatic opposition to the subject Proposed Final Judgement (PFJ) [in re the conjoined Civil Actions No. 98–1232 (CKK) and 98–1233 (CKK), collectively termed the Microsoft Antitrust Case]. My reasons for opposing this PFJ are based upon review and thoughtful consideration of the following:

a) Microsoft's extensive and consistent record of gross anticompetitive abuses in the software industry that gravely harmed competitors, eliminated consumer freedom of choice, and erected illegal barriers to innovation by competitors—abuses for which Microsoft has been adjudicated to be guilty of violations of the Sherman Antitrust Act in this Case—which Microsoft will gladly continue;

b) the provisions of the PFJ, which appear on the surface to offer substantive remedies but in fact, upon careful reading, provide no effective or enforcable restrictions to prevent Microsoft from continuing its anticompetive practices to extend its monopoly illegally - precisely the offense that requires remedy;

c) the glaring omissions of the PFJ, which is blind to current conditions in the software industry and Microsoft's continuing predatory tactics there and in contiguous markets such as Internet enabled ecommerce, mass media delivery and digital rights management, and definition of worldwide network standards, and which further offers no forward looking constraints to prevent Microsoft from proliferating such oppressions of suppliers, customers, competitors, and ultimately consumers and fair markets both within the US and internationally. Microsoft has proven that it is willing to use any means or pretense to avoid or circumvent restrictions on its practices (see the earlier Consent Decree). Microsoft is like a twice-convicted burgler proposing to bargain for parole by promising not to commit burglary again—except if (i) the front door is open, (ii) a window is unlocked, or (iii) the back door can be jimmied open easily. Microsoft can't be trusted to abide by any restrictions on its business acts in good faith. The Judgement of the Court should therefore be in imperative terms without any loopholes Microsoft can use to subvert the Court's intent. Unfortunately, the PFJ is as far from such a clear standard as Microsoft might wish. No wonder Microsoft agreed to this. Far from offering even minimally adequate remedies, the PFJ is a perverse gift to Microsoft in that it would enshrine in a legal settlement the permission to continue, extend, and expand Microsoft's predatory actions and anticompetitive behaviors. For every declaration of prohibited future conduct or requirements to treat other market players and consumers fairly there are entire paragraphs and clauses, definitions and exclusions, which Microsoft can and predictably will employ to subvert both the letter and intent of these supposed remedies.

Furthermore, the face-to-face contact between Steve Ballmer (he is Microsoft's CEO and President) and Dick Cheney (Vice President of the US) as negotiations were ongoing to draft the PFJ but not reported by either party in violation of the Tunney Act,

deserve censure of both sides by the Court, if not appointment of a Special Prosecutor to investigate political and adminstrative corruption.

Don't sell the software industry down the river, allow a monomaniacal company to unfairly wield its monopoly to take over several additional sectors of the economy, destabilize international standards for interoperability in ecommerce and communications, and continue to prey upon businesses, marketplaces, and consumers worldwide. Reject this PFJ. Write a fitting Judgement, with teeth!

Subject: Microsoft Settlement

To Whom It May Concern:

I have attached three documents that explain my position on the Microsoft Antitrust Case, along with a proposed solution. I also attached a copy of my resume to establish my credibility and to assist you in determining the value that you should place on my recommendations. I do not believe that the Technical Committee will have the necessary access to key Microsoft personnel or the enforcement authority, either directly or indirectly, to make a difference.

Although the Proposed Settlement contains several good measures for curtailing some of Microsoft's anti-competitive actions, it does not go far enough.

I believe that the solution I propose in the first attached document will level the playing field to the degree needed to make a long-term positive impact.

January 28, 2002

U.S. Department of Justice
Anti-trust Division
Microsoft.atr@usdoj.gov

To Whom It May Concern:

I am writing to convey my proposed solution to the Microsoft anti-trust case. The dilemma is how to prevent Microsoft from using its monopolistic power in the future, to weaken competition, consumer choice, and innovation. Breakup along product lines is problematic due to Microsoft's successful public relations disinformation campaign Microsoft has astutely intertwined its various products so tightly that any breakup of the corporation is unrealistic, if it occurs along product lines, requiring each new organization to become its own, independent profit center. At least that is what Microsoft would have us believe.

Although such a restructuring is possible, Microsoft's argument would be that it would reduce the value of each product by approximately 30% because it would eliminate the benefits derived from their capability to ''interconnect,'' and exchange data 'seamlessly.'' In my opinion, this interconnectivity argument is flawed, as virtually the same quantity and quality of interconnectivity has existed amongst Microsoft's products for many years. Microsoft is notorious for inflating the value of its product's features in the media, in advertising, and in supposedly objective articles written by shills in technical journals. However, it has failed to introduce significant new interconnectivity feature enhancements over the past few years, and it is unlikely that any new advancements or features in this area are forthcoming.

In addition, the other major vendors in the desktop software market already offer the same level of interconnectivity between their own products and Microsoft's products, in the only area that really matters—cutting-and-pasting between applications. Nevertheless, any government or court-ordered solution must confront Microsoft's strong public relations and marketing machine, which means that the product line-based breakup model is at best a steep, uphill battle.

Proposed alternative solution—impose structural changes to Microsoft's business processes, not its organization.

My recommended solution requires looking at the situation from a different perspective—instead of imposing structural changes on the organization, impose structural changes to Microsoft's business processes.

My recommended solution is as follows:

1. Require Microsoft to develop and support versions of its major office products that are fully functional on other popular, current and future operating systems, such as Linux, Java, and Mac OS;

2. Until item (1) is achieved, impose a moratorium on the development and release of the following:

a. New Microsoft operating systems or significant upgrades to existing operating systems (except for security-related enhancements or upgrades);

b. Internet Explorer browser (except for security-related enhancements or upgrades);

c. Office suite product upgrades (except for security-related enhancements or upgrades).

3. Obviously this approach will impose a significant burden on the court or its designated representative to develop and rigorously apply a method for monitoring Microsoft's development activities, both at its own facilities, and at its subcontractor's facilities. Nevertheless, I believe this approach, although not without its challenges, is reasonable and realistic, and, if properly enforced, through a process or mandatory quarterly reporting to the court, is likely to achieve the desired objective.

Some amount of financial profit from the licensing of its products on alternative operating systems is appropriate, as further encouragement for Microsoft's enthusiastic cooperation.

This letter represents a rough outline of my proposal. If you would like to discuss it further, please feel free to contact me. You are free to use my ideas that I have enclosed in this letter in your prosecution of Microsoft's anti-competitive behavior, or in a related matter.

THE TROUBLING TRUTH ABOUT ''TRUST'' ON THE INTERNET

An objective survey of the security risks associated with ActiveX and its impact on Microsoft's share of the Web browser market.

(by Rick Hornbeck, M.S., J.D. 1997)*

BACKGROUND

Where did ActiveX Come From and Why Doesn't It Go Away?

By now it is generally accepted that Microsoft and Netscape are engaged in a great World-Wide-Web (WWW) browser war. It is also generally understood that Microsoft's almost limitless revenue from its Windows operating system software and related products will allow it to keep giving it's Internet Explorer browser away free for the next 20 years, while Netscape has to charge customers for it's products. What is less well understood is why ActiveX and the Authenticode securitymodel represent the other two prongs of Microsoft's Internet marketing strategy.

As recently as early 1995 Microsoft was still unsure of the Internet's significance and the role it would play in the PC desktop market. Microsoft believed it could continue its phenomenal year-on-year profit growth relying solely on new sales and paid for upgrades of its existing products. However, these sales must in turn rely on its ability to maintain its grip and influence on the distribution channel, on the corporate purchasers, the original equipment manufacturers (OEMs) and on the standards process. (For example, according to the Microsoft 1996 Annual Report, OEM channel revenues were $1.18 billion in 1994, $1.65 billion in 1995, and $2.50 billion in 1996.)The primary source of OEM revenues is the licensing of desktop operating systems. As such, Microsoft's OEM channel revenues are highly dependent on Windows-compatible PC shipment volume. During 1995 armies of software developers and consumers launched a blitzkrieg against Microsoft's PC desktop dominion, penetrating the Windows defenses everywhere with dynamically distributed Java applets and gaining over 70% of the market for Internet browsers.

Microsoft quickly realized that the confluence of Java with Netscape's browsers had the makings of a platform-independent de-facto industry standard, which would empower users to buy more non-''Wintel'' (Windows operating system on an Intel processor) desktop PCs. The Internet gave Microsoft a vision of it's impending mortality. In response, on Pearl Harbor Day, December 7, 1995, Bill Gates declared war, announcing that ''[t]oday, the Internet is the primary driver of the new work we're doing across our entire product line.''

The Microsoft Web servers took 8,000,000 hits on the first day of their campaign. After his two-hour public presentation Gates told National Public Radio in an interview, ''Well, we've got to make sure that we're leading the

way on the opportunities the Internet represents.'' ''Netscape has two great strengths,'' Gates admitted. ''They've got very high browser market share, and they've got the attention of the world .... It's very important to increase the popularity of our browser.''

Microsoft executive vice president Steve Ballmer put it bluntly when he said, ''[h]ave no confusion in your head: Job one for us right now is the Internet and defeating Netscape.'' Of his Mountain View, Calif., rival in Internet software, Ballmer says, ''They're simply our smartest competitor.''

It was against this backdrop that Microsoft launched its triumvirate Internet marketing strategy, using the parasitic relationship between Authenticode and ActiveX to increase the popularity of Internet Explorer.

INTRODUCTION

ActiveX and Java are ''mini-programs'' that can be downloaded from a Web site and executed directly on a user's PC. Unfortunately ActiveX mini-programs, or ''components'' or ''controls'' can reformat a user's hard drive, or copy personal files to a remote server on the Internet, or do any number of harmful things to a user's PC without the user's authorization or knowledge. A malicious hacker or terrorist could write one of these downloadable and executable programs and the user-victim has no reasonable way of either stopping it's attack once the control has gained access to their PC or reliably preventing it from gaining access in the first place.

The user has several ''unreasonable'' means of minimizing her risk: she can permanently disconnect her PC from the Internet, depriving herself of its benefits. She could browse only those Web sites that she ''knows'' do not contain harmful or malicious controls (''safe zones''), although the possibility of a hacker either spoofing a Web site, or covertly placing harmful controls into a ''known'' Web site exists. She could configure her Internet Explorer browser to prevent all ActiveX controls from downloading to her PC, and hope she does not encounter one that is able to bypass her browser's security configuration, which has been demonstrated in practice. Finally, she could take her chances using Microsoft's ''Authenticode,'' or Netscape's or Sun Microsystems'' ''code-signing'', trust-based security models that use public-key digital signatures and independent third-party Certification Authorities (CAs). Each of these unreasonable alternatives represents a different point on the risk/benefit scale which each user should consider before exploring the WWW.

However, this analysis is only necessary because Microsoft created a previously non-existent security risk by introducing ActiveX. As will be explained below, other software tools exist to provide software developers with the same capabilities as ActiveX, with virtually no security risk. Still, Microsoft has successfully obfuscated the seriousness of these self-created security issues and successfully redirected consumers attention' away from Netscape and Java. In doing so Microsoft has also successfully achieved its goal of creating the perception, in a very short period of time, that it is a player in the Internet game.

Because ActiveX does not contain its own internal security mechanism to restrict the actions of the program, Microsoft was able to introduce the Authenticode trust model as a viable protection solution. Because Authenticode uses public-key digital signatures in combination with trusted third-party Certification Authorities, and only runs on Internet Explorer, Microsoft sought to ''increase the popularity of its browser'' by touting its use of this ''cutting-edge'' technology as evidence of its leadership in the Internet software industry. At the same time it actively castigated Netscape and other browser vendors for allegedly leaving their users vulnerable to the hazards of ActiveX. Unfortunately, the people that suffer from this Machiavellian marketing strategy the most are the innocent netizens who ''reasonably'' allow unproved and potentially dangerous controls to be downloaded to their PCs leaving themselves vulnerable to the vagaries of malicious programmers.

It would be too harsh to accuse Bill Gates of raising Microsoft to is position of dominance through villainy or malice against his customers, given the trends of modern business practices. However, his continued promotion of Authenticode without acknowledging its serious security defects would seem to indicate that its effectiveness in mitigating security risks is subordinated to creating the impression that Microsoft is a leader in the Internet/Electronic Commerce industry. According to Eric Schmidt, Novell CEO, ''if Bill Gates continues with his strategies he could become the most powerful person in the world, and that's not necessarily a good thing.'' Simson Garfinkel wrote recently, ''Microsoft's ActiveX technology is the single greatest technological threat to the future of the World Wide Web. Microsoft's ActiveX promoters are either so blinded by their own rhetoric that they don't see the danger of this new technology, or else they are so cynical that they would destroy the very essence of the Internet rather than compromise their market dominance.''

In a different industry, Microsoft's actions could be analogous to a pharmaceutical/bio-engineering company releasing a virus or disease into the general population so it could profit from the sale of its potential cure. At the same time the pharmaceutical company could also enhance its reputation by advertising that it's anti-virus was created through the use of cutting-edge genetic engineering techniques thereby establishing itself as a leader in this field. However, for this analogy to be consistent the anti-virus must only be effective for a small percentage of the population. The rest of those exposed to the virus would remain susceptible to its deadly effects at any time.

This article will explore the very real damage that can be caused by harmful ActiveX controls, it will explain how Authenticode is supposed to mitigate these security risks, and why it does not. It will also explain why digital signature technology as currently applied under the Authenticode model cannot assist most users in adequately reducing their risk of injury from ActiveX because it does not provide the user with the necessary means of assessing whether or not the software they are considering downloading is ''safe.'' Bill Gates' vision of the future is a seamless integration of the Internet, the World-Wide-Web and the Windows operating system. According to Gates, when someone wants to e-mail a spreadsheet or other file to someone else over the Internet, they are not interested in going out and buying 14 different products to make sure the file will be compatible with the recipient's software. Instead what they want is a desktop environment that can provide spreadsheet and any other kind of robust functionality, without concern for the software or hardware on which it operates.

Most Internet software developers' share this vision however they don't share Gates' vision for implementing it, Microsoft believes this seamless integration should be based on Windows and Microsoft's Internet Explorer (IE) browser whereas the rest of the software industry favors Java because of its true platform-independence. Today Java can run on virtually any hardware or software platform in existence, including such varied platforms as IBM mainframes and Personal Digital Assistants (PDA's).

Yet Microsoft continues increasing the popularity of its proprietary browser by:

Marketing the benefits of ActiveX while simultaneously cross-marketing Internet Explorer (IE) because IE is the only platform capable of directly running ActiveX controls;

Continuing to give its IE browser away for free;

. Failing to live up to its promises made in the fall of 1996, to disclose ActiveX's specifications to an independent standards body, thereby preventing other browser manufacturer's from supporting it in their products;

. Marketing IE as the only means available for user's to purportedly protect themselves from the potential damage threatened by its own hazard, ActiveX, and

. Cross-marketing Authenticode as a general-purpose Internet security solution, thereby further reinforcing the perceived need for IE, because it is the only browser capable of supporting Authenticode.

A BRIEF COMPARISON AND CONTRAST BETWEEN ActiveX, JAVA AND PLUGINS.

(1) Origin of ActiveX

ActiveX adds to the user's Internet Explorer-based Web browsing experience by ''jump-starting'' Web site content, providing a variety of multimedia effects, enhanced page layouts, and executable applications, all of which are downloaded and run in real-time over the Internet. According to Microsoft, over 1,000 ActiveX controls already have been written in C, C++ and other languages for applications such as audio, video and live chat, all of which complement the core technologies of today's Web environment such as HTML, plugins, Java, cgi scripts and more.

According to Fred Langa, writing in Windows Magazine, ActiveX is ''... the fifth and most recent step in a long-developing evolution [by Microsoft Laboratories] of data-sharing and interoperability among applications.'' Essentially it is a trimmed down version of Microsoft's OLE (Object Linking and Embedding) system which a Windows ''power'' user will recall enables

several applications to collaborate on a single ''compound document.'' For example, OLE provides the ''glue'' that allows data to be copied from a WORD document and pasted into a PowerPoint document. The PowerPoint document can then be inserted into an Excel document and later opened as a PowerPoint document from within the Excel document. ActiveX is the next step in the development of this seamless interaction amongst applications. However, where ''Distributed OLE'' only lets the user share data, links and control over a local or wide-are network, ActiveX has taken the technological ''leap'' into Cyberspace by enabling the user to share data, application links and control between a Web page on the Internet and the user's Internet Explorer browser running on his PC. Java has taken the same leap but with much less risk to the user.

ActiveX controls automatically download and install themselves, and they persist (remain available) on a user's system. This feature provides two advantages over other programs: the user doesn't have to download and install software manually, and she only has to download the control once. This is good news to those who don't like waiting for controls to download every time they visit a certain site. However, these controls can be downloaded without user awareness or consent which means the user doesn't know what she is downloading.

(2) JAVA

Java applets can be thought of in the same way but with some important differences. Java applets run either inside the Java Virtual Machine (JVM), a software application that is built into newer browsers, or they can be run separately using the Java Development Kit (JDK). The JDK is a sort of software interpreter that converts Java code into code that is recognizable by the particular platform on which it is running. JDKs are now available for virtually all software and hardware platforms in existence. However, because JDK is another layer of software between Java and the actual operating system, Java tends to run more slowly. ''The major fear is that Java is not going to have the performance it promises, and its going to fade away like a bad TV show.'' Built into both the JVM and the JDK is a set of security controls colloquially called the ''sandbox.'' Java's security model automatically prevents any code from accessing portions of the operating system or the PC hardware that is outside the parameters of the ''sandbox.'' In other words if a Java applet wants to ''play'' on your PC it has to keep its toys inside the sandbox. In contrast, ActiveX controls are not restricted, which means they have direct access to the PC hardware, software and operating system. As a result, ActiveX controls run faster and do more, but at a substantial price in security. Also, because ActiveX controls are distributed in native binary code, separate controls have to be written for each operating system. Java applets, on the other hand are distributed in a one-size-fits-all or ''write once, run anywhere'' fashion meaning that developers only have to produce one version to run on any platform.

(3) Plug-ins

A third means of ''activating'' a Web site is through the use of Netscape ''plugins.'' Both Netscape and Internet Explorer browsers are packaged from the factory with a built-in set of ''standard'' features such as graphics viewers, which a Web site developer can then take advantage by including graphics in his Web site. However, in order for a Netscape browser to take advantage of any non-standard features which the Web site developer has programmed into his Web site, the ''plugin'' version of the entire application that is used to run it must first be downloaded to the user's PC from the developer's Web site and then executed. This is because the application is not embedded with the program, as in the case of ActiveX.

For example, assume that both an ActiveX control and a non-ActiveX program using plugin technology are created to enable users to download and view a short animation sequence from a commercial Web site. The ActiveX developer will include both the animation sequence and the ''viewer'' program in the same control. However, the developer using plugin technology must create a built-in hyperlink in the code to the viewer developer's Web site. When the user clicks on the link on the Web site to view the animation sequence, the code will automatically notify the user that she must go to the vendor's Web site and manually download the entire ''viewer'' software application before she can see the animation. ActiveX components are inherently much smaller because they contain only a limited subset of the entire application needed to perform the function at hand, and therefore can be downloaded more quickly. Once the ActiveX component is resident on the user's PC it can be reused, on-demand precluding future downloads.

According to Microsoft, the excessive amount of time needed by a user to download the actual application ''plugin'' file (.exe) poses a significant deterrent to the use of Netscape's browsers. However, as described in an article in the May 27, 1997 issue of Fortune magazine, Netscape's new Communicator browsers will also automatically install ''plugins.''

ACTIVEX's SECURITY DEFECTS ARE ''GENETICALLY INHERITED''

Because ActiveX is the product of many years of ongoing research and development at Microsoft laboratories it represents the latest in a long line of remarkable software technologies. However its predecessors, OLE and COM, have burdened ActiveX with their ''genetic blueprint,'' legacy code written for earlier generations of software and hardware platforms. In other words this latest progeny is constrained by its ''gene pool'' consisting of thousands of lines of code which have accumulated over the course of years of development and evolution and over which ActiveX is unable to break free. The most significant constraint imposed on ActiveX by this genetic blueprint is a deficient security model. According to Microsoft:

We are doing everything possible to create the technical safeguards that will make software safe. However, in order to remove trust from the equation, we would have to rip away significant amounts of functionality [read: code that could actually be rewritten to more closely fit the needs of the modern Internet environment] that users rely on today. Since the purpose of our industry is to provide more value and power to users, rather than limiting functionality, Microsoft and most other major software manufacturers are advocating a trust-based security model. [read: we could rewrite it if we wanted to but because it doesn't suit our interests we won't]

This ''genetic'' deficiency allows ActiveX controls to interact without constraint with both the operating system and the PC hardware. In a sense, it is as if ActiveX was born without an auto-immune system, making it incapable of combating viruses or malicious programming written by evil programmers that might invade the control and use it to enter and harm an innocent, unsuspecting host.

ActiveX's predecessors did not have to be concerned with such an auto-immune system because they were virtually guaranteed of living out their lives in a ''sterile'' environment. In other words, prior to the advent of the Internet the operating environment in which PC software was executed was always under the complete and exclusive control of the PC user. Each user was able to decide whether they wanted to load a particular program on to their PC, and once loaded whether and when to execute it. This environment remained ''sterile'' regardless of whether or not the PC was a standalone or networked because no external source, including a network operating system could place something onto the users PC without his or his network administrator's permission.

Today, however, through the wonders of downloadable and executable software technologies, a program can automatically download to a user's PC from a Web site or a network server and execute without the user's awareness or consent. Thus, the operating environment in which Microsoft's next generation software tool is living is completely different than the environment of its forefathers. Yet Microsoft has chosen not to take this congenital auto-immune deficiency seriously and has failed to reengineer ActiveX's ''DNA'' to create a reasonable security model thus leaving users vulnerable to exposure to the dangerous code. Such an unprotected and infected control acts like a cyber ''Typhoid Mary'' as it infects everyone it meets with the virus of harmful code. By way of explanation, suppose Mr. And Mrs. Jones owned and lived in a house during the same time the Microsoft software engineers were developing the ancestors of ActiveX. Mr. Jones worked diligently on his house, making improvements and refinements so it would be more comfortable for he and his wife. Now suppose Mr. And Mrs. Jones decide they want to start a family and Mr. Jones asks a contractor for a cost estimate to build a second-story bedroom. The contractor tells the Jones'' that because their house was built using an ''A frame'' design a second story cannot be added. Thus, the Jones'' are constrained from meeting their needs for another bedroom by the limitations of their house's original design, which did not take into consideration the future need for a second story. Similarly, ActiveX is

constrained from incorporating a security model by the limitations imposed on it by the software designs of its predecessors.

However, if Bill Gates were the owner of this ''A frame'' and he wanted to add a second story because he and his wife wanted to start a family, he could easily afford to tear down the existing structure and build whatever design fits his current needs. Similarly, Mr. Gates and Microsoft have the resources to re-write ActiveX or develop a replacement. Indeed, one can only speculate why he has chosen not to develop an Internet software product that fits the current needs of his customers, given that the environment in which his software executes (the Internet) has changed, and is now ''open'' and ''insecure.'' Without providing an answer to this rhetorical question, Jesse Berst also observes in PC Week, ''ActiveX is.. the key to its future. Microsoft will be damned before it acknowledges that ActiveX has a security problem.'' Berst goes on to explain that ''[r]ather than help users understand and minimize the risks [associated with ActiveX], Microsoft contented itself with pointing out that similar problems were theoretically possible with Netscape products.'' Quoting PC Week Editorial Director and former director of PC Week Labs, David Berlind, Berst writes, ''Frankly, I want to puke.'' Microsoft will not give up ActiveX because it is the key to ''Increas(ing) the popularity of its browser.'' Without ActiveX there would be no need for Authenticode, and without Authenticode and ActiveX there would be no way of significantly distinguishing IE from a Netscape browser, except that it is given away at no immediate up-front cost.

THE AUTHENTICODE SOLUTION—Myth and Reality

(1) The Myth

In his article Jesse Berst explains that Authenticode is ''... like requiring people who send mail bombs to put their names on the package.'' Were that approach effective, even the alleged ''Unabomber'' would have been apprehended many years earlier, because according to news reports many of his mail bombs had postmarks from the small town where he lived. Obviously this approach is ineffective because the names would be blown up, just as any evidence of an Authenticode digital certificate could also be destroyed by a malicious ActiveX program after causing other damage to a user's PC. And yet on August 7, 1996 a Verisign Press Release quoted Verisign president and CEO Stratton Sclavos as stating, ''With this service, users can feel confident that the quotes Sclavos as stating that, ''Under the Authenticode program, developers must go through an application and verification process to ensure that certificates are issued only to the appropriate party. This eliminates any worry that developers could be falsely represented by an impostor.''

Microsoft's Authenticode security model requires that all software developers (commercial and independent) must register their ActiveX components with a Certification Authority such as Verisign, before Internet Explorer browsers will allow them to be downloaded to a user's PC from a Web site, if the browser's security setting is on ''High.'' The software developer must ''legally'' affirm that to the best of his knowledge the control is incapable of causing damage to a user's PC. Verisign issues the developer either an electronic ''individual Software Publisher's Certificate'' or an electronic ''Commercial Software Publisher's Certificate'' depending on whether they are registering as an individual or corporate software developer. Different identity verification criteria are used to establish the developer's identity depending on the type of certificate requested.

One way Microsoft successfully propagates the Authenticode myth is through contradictory and vague announcements and bulletins. The following excerpts demonstrate the range of conflicting statements about Authenticode that come from both Verisign and Microsoft management.

The following excerpt from Verisign's Web site explains the service it provides to its customers:

When customers buy software in a store, the source of that software is obvious.

Customers can tell who published the software, and they can see whether the package has been opened. These factors, along with others, enable customers to make judgments about what software to purchase and use, and how much to ''trust'' those products and the companies and individuals who publish them. When customers download software from the Internet, all they see (at most) is a message warning them about the dangers of using the software. The Internet lacks the subtle information provided by packaging, shelf space, shrink wrap, and the like. Without an assurance of the software's integrity, and without knowing who published the software, it's difficult for customers to know how much to trust software. It's difficult to make the choice of downloading the software from the Internet.

Verisign Digital IDs in conjunction with Authenticode (software validation) technology provide customers with the information and assurance they need when downloading software from the Internet. Authenticode communicates to customers the real identity of the publisher and assures them that the product has not been altered or damaged. (emphasis added) Contrast this language with the statement of Cornelius Willis, Microsoft's group product manager-Internet developer marketing, ''Authenticode does not guarantee that users will never download malicious code to their PC .... We don't claim ActiveX is a (a) The Problems of Establishing Identity in Cyberspace The advantage of knowing the publisher's true identity is that if provides the relying party with recourse in the event the software turns out to be ''harmful.'' In the physical world this is generally not a problem, as a purchaser can usually assume that the store's physical location will not change. The benefit of having a physical location to return to serves several purposes. First, the store owner's physical assets can be attached; second, the unsatisfied consumer can create a scene inside the store, or in the community, creating bad publicity for the owner and an incentive for prompt resolution; third, the physical location will be an indicator of the laws that will apply in the particular jurisdiction. Transacting in a physical location has advantages for the seller as well. The merchant can demand physical identification which can usually be verified through on-line databases combined with visual scrutiny of a photo ID, the purchaser's demeanor and dress and other non-verbal cues which can be stored by a video camera for future retrieval and proof of the transaction should the purchaser later attempt to repudiate. Telephone-based sales represents a hybrid marketplace with portions of the physical world and Cyberspace. From the consumer's standpoint, if she dialed an 800 or 888 number she has little assurance of who she was actually calling, where they are located what laws apply, and whether the ''order taker'' works for the company she is purchasing the product from, or an outsourced tele-marketing firm. The risks to the consumer are only that she may be giving her credit card number to someone other than a legitimate merchant who will use it fraudulently. However, her exposure is minimal because most credit card companies limit the consumer's liability to $50, assuming timely, good faith reporting efforts.

The merchant suffers greater risks through telephone-based sales, although the tradeoff is less overhead than a storefront. If the consumer dials an 800 or 888 number, 'caller id'' will notify the merchant of the phone number used by the purchaser to make the call which can be used in connection with reverse phone directories and address cross-checking databases to provide additional identity verification. However, the merchant is unable to demand visual identification, and is legally protected only by on-line credit card clearing services, which can only benefit the merchant after the credit card theft has been discovered and reported. The majority of credit card thieves use the card as quickly as possible after the theft to take advantage of delays in reporting, Because of the limitations on identify verification, and the delays in theft reporting, the likelihood of fraudulent telephone-based transactions increases significantly.

Internet-based sales represent the greatest opportunity for fraud to both parties. The merchant is unable to establish the caller's telephone number and related identifying information. Telephone records cannot provide evidence that the phone call took place because access will be through an independent Internet Service Provider dial-up service. Although Web servers can gather user information through cookies this is not always reliable. The opportunity for using stolen credit cards is at least the same as with telephone sales. (See ''The Essential Role of Trusted Third Parties in Electronic Commerce,'' Michael Froomkin)

Also, it is possible for a Web site to be ''spoofed'' or misrepresented by a hacker, causing the unsuspecting user to enter their credit card and other relevant identifying information on-line. Although a technical discussion of ''Web spoofing'' is beyond the scope of this article, a ''spoofed'' Web site can look exactly like the original to anyone but the most cautious of users. The unsuspecting consumer personal data would be turned over to the thief who would quickly use it.

Because of these and similar identity authentication problems consumers and merchants cannot know with certainty, even with Digital Ids, the actual identity of someone on the Internet. Greater security measures are needed before consumers can reasonably trust the Internet as a medium for safe commerce.

AUTHENTICODE—THE REALITY WHAT IS THE ROLE OF THE CERTIFICATION AUTHORITY?

The purpose of a Certificate Authority is to bind a public key to the common name of the certificate, and thus assure third parties that some measure of care was taken to ensure that this binding is valid. A measure of a Certificate Authority is their ''Policy Statement'' which states what measures they take for each class of certificate they offer to ensure that this binding of identity with public key is valid.

2. WHAT IS THE ROLE OF A DIGITAL ID (PUBLIC KEY CERTIFICATE)?

Although the actual digital signature process will not be covered in detail, the following brief explanation will highlight some of the important points. Traditional encryption for confidentiality uses only a single, ''secret'' key and is called symmetric cryptography. Digital signatures use a mathematically related key pair, (a ''public'' key and a ''private'' key) and employ a technology called asymmetrical cryptography. A mathematical formula or algorithm is used in conjunction with a ''random-number'' generator to create the public and private keys. The design of the encryption algorithm relates the two keys in such a way as to allow either key to decrypt a message encrypted by the other. However, it is ''computationally infeasible'' to determine the value of the private key based on the public key and the digitally signed message. Additional information on digital signature is available at www.rsa.com and www.abanet.org/scitech/ec/isc.

The utility of a digital signature as an authenticating tool is limited by the ability of the recipient to ensure the authenticity of the key used to verify the signature. The following explanation will demonstrate this truth. The traditional labels used to represent the different parties in this sort of discussion are Bob, the sender, and Alice, the recipient. For purposes of this discussion a third party, Mallet, will play the role of evil hacker. If Bob digitally signs a message using his private key and sends it to Alice the only way she has to verify that Bob really sent it is if she knows Bob's public key. However, Alice must be able to retrieve Bob's public key from a source other than Bob's message because if Mallet is forging Bob's message he will send his own public key, claiming that it actually belongs to Bob.

Mallet has the private key corresponding to the public key sent to Alice, her attempt to authenticate the message will result in a positive confirmation even though it was not really from Bob. However, if Alice has access to Bob's real public key from an outside trusted third-party source, and uses it to verify the message signed with Mallet's private key, the verification will fail, revealing the forgery. In short, the Certification Authority (CA) fills the role of an outside source and Bob's public key is transmitted from the CA to Alice in the form of a Digital ID or public-key certificate. In order to ensure the authenticity of the certificate, Bob's Digital ID will be digitally signed by the CA. In order for Alice to establish a ''trusted'' relationship with the CA she must have access to the CA's public-key from another trusted third-party:

In practice, most if not all CAs have chosen to provide their public-key certificates to Netscape or other browser developers, who embed them into their browsers for easy access. In the event Bob has registered his public-key with a new, or unregistered CA, the browser software will notify the user and give him the opportunity to accept the CAs public-key 'on the spot.'' This presents the user with a predicament, and also presents CAs with a strong incentive to pre-register with the Netscape, IE and other browsers.

The fundamental problem comes down to how good a job the CA did in authenticating the subscriber identity. The CA's response will be that it made a good-faith effort consistent with the terms of the agreement or CPS to which both parties are bound. However, close scrutiny of the agreement will reveal that (1) very little detail is provided about the authentication methods used or the reliability of its sources of information, (2) the level of effort invested in the identity verification process is a function of the Level or Class of Digital Id. In other words, a subscriber's Digital Id that costs $20 will not receive as much identify authentication effort as will the subscriber to a $400 Digital Id. The following examples are cited by Verisign as representative of the sorts of transactions that could reasonably be performed using the various Levels of Certificate:

These examples, as well as any attempt to standardize on a generalized template of reasonable reliance is of marginal utility. It quickly breaks down when faced with simple counter-examples such as the following. According to the Verisign Digital Id Certificate model, a Class 1 Digital Id is acceptable for use in confirming the identify of e-mail correspondents and transactions of very low value. Assuming an organization chose to use the Class 1 Id for transactions that are limited to a value of $.01, but the number of these transactions exceeds one million per day. Under these facts the company

3. HOW DOES THE INTERNET EXPLORER BROWSER PROCESS THE DIGITAL ID?

The following step-by-step explanation of what happens when an Internet Explorer browser visits a Web site containing an ActiveX component will provide an overview of the basic steps involved in the public-key digital signature process, as applied in Microsoft's Authenticode model. Additional introductory material on the subject is widely available on the WWW, including the Verisign, RSA, and American Bar Association, Information Security Committee sites.

When the IE browser arrives at a Web site that contains an ActiveX control the browser will first check to see if the component has been digitally signed.

If not, the browser will display a warning message to the user, stating that the component is of unknown origin and may present a security risk, and then allow the user to make the choice whether to allow the component to be downloaded to their PC or not.

If the component has been digitally signed the browser will determine which Certification Authority (CA) authenticated the certificate, and if it doesn't already have a stored copy, it will automatically obtain the software publisher's public key from that CA via the Internet.

The browser will then use the public key to decrypt the ''message digest'' portion of the certificate. The browser will then run the same digital signature ''hashing algorithm'' on the component again and match the resulting message digest against the one in the certificate.

If the component has not been modified, either intentionally or inadvertently since it was signed, the new digest should match the old one. If they don't match, either the code was modified or the public and private keys aren't a matched pair. Either way, the component becomes suspect and the browser notifies the user that it should be discarded.

4. PROCESS WHEREBY SUBSCRIBER CONTRACTS WITH A CERTIFICATION AUTHORITY FOR A DIGITAL ID.

The subscriber must provide the Certification Authority with enough identifying information to satisfy the CA's authentication requirements, depending on the Certificate Class. For example, the following information must be provided to Verisign during the enrollment process, either through their on-line enrollment forms or through regular mail.

Individual Software Publishers (Class 2):

. Individual Publisher's name, address, and e-mail address

. Date of birth

. Social Security Number

. Previous address (if you have moved in the past 2 years)

. Credit card information for billing

Commercial Software Publishers (Class 3):

. Company name, address, e-mail, phone, and fax

. information for a technical contact and an

. organizational contact.

. company's DUNS number, if any.

. Billing information (credit card, P.O. or check), and billing contact information, if any. As of June 1997, pricing for Software Publisher Digital IDs are as follows. Digital Ids for different purposes are also available, at different prices.

Class 2 Digital ID for Validating Software: $20 annually [for Individual Software Publishers)

Class 3 Digital ID for Validating Software: $400 annually [for Commercial Software Publishers, i.e. companies]

The following excerpt from the Verisign Web site explains their procedure for verifying a company or individual identity.

Based on Microsoft code signing program criteria, VeriSign will attempt to verify that your company meets a minimum financial stability level using ratings from Dun & Bradstreet Financial Services, or attempt to verify your personal information through a credit reporting agency such as Equifax for individual software publishers. Your

certificate will indicate if you have met this level. Some software, such as the Microsoft Internet Explorer 3.0, offers end users an option to bypass making an explicit choice to trust code from each new software publisher. If an end user checks an option to trust all software signed by vendors who have met the financial criteria, code signed by these vendors will be run without any user intervention.

5. THE UTILITY OF AN AUTHENTICODE DIGIIAL ID

All properly authenticated digital signatures can demonstrate to a high degree of certainty the following three attributes: Integrity—The component has not be modified since it was signed, either intentionally or inadvertently.

Authentication—The purported identity of the party who registered as the component's author, based on the certificate's level of assurance and Verisign's corresponding identity verification criteria.

Non-repudiation—The component's registered author cannot later repudiate his identify as the component's registered author should it cause damage to a user's PC or other computer-related product (assuming the author registered the component using his own identity).

However, because Authenticode will only work on Microsoft's Internet Explorer, users of any other browser will be unable to gain whatever benefit might be provided by this information. For example, if the ActiveX plugin from NCompass Labs, Inc. is used with a Netscape browser, any ActiveX component encountered on a Web site by the browser will be downloaded without Authenticode's intervention. Netscape's generic software download alarm will probably display a warning, giving the user an option to proceed or quit, but the existence of a Digital ID will not be a factor in the user's decision.

Digital Certificates can only attempt to vouch for the authenticity of someone's identity, not for their good intentions. Neither the digital signature technology nor the Certification Authority (CA) make any warranties as to the safety of the ActiveX component. The Authenticode system merely relies on the assurances made by the component's developer to the CA when they initially apply for a Digital ID subscription. In the patois of logic this appears to be circular reasoning. The party whose trustworthiness is in question is providing the means for assuring the user of his trustworthiness. Furthermore, CA's have neither the mandate, resources, nor the incentive to actively monitor the behavior of millions of its certificate holders. Although they do have a duty to suspend or revoke a subscriber's Digital ID based on reported breaches of a specific set of criteria, they are not obligated to perform an independent monitoring function.

The possibility of undiscovered fraud is significant due to the ubiquity of stolen credit cards and access to personal information on the Internet combined with the limited authentication of the user's identifying information. Authenticode is supposed to provide the means for a user or corporation to ''trust'' the ActiveX components they download from the Internet by ensuring ''accountability.''

The approach here is accountability—to cease having publication of software on the Internet be an anonymous activity. If an organization or individual wants to use the public Internet to publish software, they should be willing to take public responsibility for the code they author and publish. If the code proves to have errors or even malicious faults, these organizations and individuals should be willing to answer for them just as they would take credit for good code. This approach is founded on the idea that accountability is an effective deterrent to the distribution of harmful code. (emphasis added)

The same argument can be made that license plates should act as deterrents to either prevent or curtail the use of cars in the commission of crimes. Because the license plate establishes the owner's identity (with possibly more certainty than a software publisher's certificate) it makes him accountable for his acts using the car and therefore cars will not be used in the commission of crimes. Still, stolen cars are used every day, to smuggle drugs, transport criminals to and from crime scenes, and perform other illegal acts.

Obviously accountability is not an effective deterrent to the use of cars to commit crimes. Likewise, accountability is not an effective deterrent against the malicious use of ActiveX, because stolen credit cards are readily available. What is the solution to this problem? There is probably no single solution short of eliminating ActiveX entirely. However, a number of individual solutions are appearing which, when used in aggregate have the potential to reduce the threat of injury to an acceptable level. Several of these potential solutions are discussed below.

6. DIGITAL AUTHENTICATION FOR WEB SERVERS.

Verisign, Xcert, GTE and other companies are also in the business of selling Digital Ids for Servers. According to Verisign, their product would enable the server owner to establish his authenticity to Web browsers visiting his site. in the marketing literature describing Digital Ids for Servers on its Web site, Verisign explains:

In the virtual world of the Internet, however, the web-site of an unscrupulous con-artist might look just as professional as that of a legitimate business. The low cost-of-entry and the ease with which graphics and text can be copied make it possible for almost anyone to create sites that appear to represent established businesses or organizations. To protect your organization and your customers from such impostors, you need a way to establish you site's authenticity.

Interestingly, in one context Microsoft and Verisign guarantee that users will be able to garner enough information by visiting the developer's Web site to make an informed judgment of both the developer's and his program's trustworthiness. However, in this context Verisign is saying that because almost anyone can create Web sites that appear to represent established businesses or organization that Web site owners should use Digital Id for Servers to establish their site's authenticity to visitors. Later in this same Microsoft document mentioned above, under ''Qualifying for the Individual Software Publishing Certificate'' Microsoft rhetorically asks the question, ''What is the value of the Individual Software Publishing Certificate?'' The document responds:

it would seem that users aren't going to trust individuals they don't know, and businesses aren't going to let code signed by students at a local university into their corporate domain. While this may indeed be the case, the value of this type of certificate is in the information it provides to the user so that he/she can make the decision on how to run the code. Knowing who authored the code, and that the bits have not been altered from the time the code was signed to the present is indeed comforting information. Additionally, the implementation provides links from the user interface (UI) to Web pages so the user can obtain detailed information about the signed code, the author, and the certificate authority. After learning about this code and the author, the user may decide to run the code, and/or all future code signed by this certified individual. (emphasis added).

Leaving aside the remarkable statement that corporations would inevitably not allow software developed by local university students into their domain, Authenticode fails to provide an objective means for users to evaluate this supposedly detailed information about the signed code and its author that is being made available to them. One is left with the gnawing suspicion that Microsoft intends for there to be a direct relationship between a software developer's advertising budget, the purported ''trustworthiness'' of his software, and the frequency with which users will download it over the Internet. In other words the more a developer can achieve brand name and product name recognition amongst Internet users the more frequently his products will be downloaded. Not surprisingly, Microsoft has one of the biggest advertising budgets in the world.

7. PULLING IT ALL TOGETHER WITH SSL. ... ALMOST.

We have seen that browsers can authenticate software publisher Digital Ids and that Web servers can authenticate client browser Digital ??ds, assuming the subscriber's identity is established with reasonable certainty. However, this authentication is only performed once, at the beginning of the transaction. After the initial ''handshaking'' takes place and the browser software is convinced that the other party is who she claims to be, no further checking is performed. This would leave either or both parties vulnerable to eavesdropping, replay and spoofing attacks during the remainder of the communication, if not for SSL.

Secure Sockets Layer (SSL) is an industry standard communications protocol that attempts to remedy these problems by creating unique signature keys that are exchanged throughout the entire communication ''session.'' In other words, after the client is certain the server is not spoofing its identity, the server and client exchange ''session-keys'' that will be used to

sign the data during the data exchange. With SSL 2.0, the same signature keys must also be used for encryption, if confidentiality is needed, however with SSL 3.0 signatures can use different keys than the encryption engine. SSL's main function is to protect users from attack by eavesdroppers or message interceptors. Both the client and the server provide part of the random data used to generate the keys for each connection and that same random data is also used to generate the master secret key associated with that session.

(a) Caching data during secure connections. One important drawback to this SSL scheme is the fact that the Netscape browser can store in local cache on the user's hard disk any data that has been sent by it during the secure connection. Navigator 3.0 has an option to allow caching of data fetched over SSL connections, however the default setting is to not cache data. in Navigator 2.0, documents fetched using SSL were cached in the same way as non-SSL documents. However, the command ''Pragma: no-cache'' in the HTTP header can be used to disable caching for a particular page. Interestingly, in Navigator 1.0 documents fetched with SSL were not cached.

Most importantly the cached data is not encrypted and is available to ''prying eyes'' in cleartext form. As long as the cache remains on the user's hard disk, any information such as credit card numbers or private keys that were sent over the secured SSL connection are ripe for the picking by anyone either physically accessing the PC or using an intermediate agent such as an ActiveX control.

(b) Handling previously unknown certification authorities while Web browsing Whenever a previously unknown CA is encountered by a browser their Root keys for Certificate Authority certificates are loaded through an automatic process using an SSL connection. This means that conceivably a ''rogue'' CA can load its certificate into browsers and begin authenticating harmful ActiveX controls without any restrictions. Netscape states that presumably in the future loading a root certificate through a local process, such as from disk, LDAP, or other out-of-band mechanism, will be a supported addition or in place of the present method of connecting to a trusted server and downloading the certificate chain. This presumption is an acknowledgment of the severe security risks associated with the current approach, and also an acknowledgment of the technological complexity of the more secure approach.

(c) Vendor Incompatibles The successful application of these SSL keying standards is also completely dependent on the capabilities of both the client browser and the Web server. However because different software vendor's products support different implementations and versions of SSL, fundamental barriers still exist to prevent a universally ''secure'' Web browsing experience. Other obstacles to trustworthy applications include the inability for Web servers to automatically check every certificate for currency, either by checking its expiration date, or checking an on-line ''certificate revocation list'' (CRL) to determine whether the certificate has been suspended or revoked for fraudulent or criminal abuse. As this technology evolves, these barriers will be eliminated, bringing us closer to the goal of authenticated, safe communication on the Internet. The problem in the near term however, is that most users are not made aware of the risks associated with these technological shortfalls.

8. CERTIFICATION REVOCATION LISTS (CRLs)

A certificate revocation list (CRL) is a repository of information that presents the current state of any public-key certificate to anyone who accesses it. The CRL can be implemented in different ways but the approach Verisign uses for the Authenticode Digital Ids is to only include those certificates that have a current unrevoked status. In other words, it is possible for a certificate to either be in an active, suspended or revoked state. If the certificate has been revoked it should not be relied on under any circumstances. However, if the certificate is temporarily suspended it is possible that removal of that status is imminent and the potential relying party should contact the Certification Authority directly for further details. Regardless of the unique circumstances it is essential the potential relying party have access to the certificate status or he will be making an uninformed decision regarding reliance. Implementation of the CRL is another contentious subject that again trades off between the development costs to provide customer ease-of-use and informed decision making. Unless the potential relying party knows how to access and use the CRL they are unable to benefit from its contents. However, instructions on its location and use are not conspicuously displayed when the potential relying party is presented with the publisher's Authenticode-based Digital Id. This is generally because this option has only recently been made available to HTML programmers and so a significant retrofitting of all certificates is needed to implement it. When implemented properly a button will appear on the Document Info page for servers whose certificate supports the appropriate extensions or commands. When the button is pressed the CA will be queried via HTTP GET, and will display a dialog to indicate to the user if the certificate is good or not. This button does not appear in the Authenticode Digital Id but instead must be ''manually'' selected from the ''View'' pull-down menu on the browser. If a user attempts to use a client certificate that has expired, a dialog will be displayed warning them that their certificate has expired, and if this extension exists, a button will be on the dialog that will bring up a window displaying the URL. There is no automatic revocation check. As mentioned above, a button allowing manual checks is displayed on the Document Info page. According to Netscape this feature was added because some people needed revocation, but they did not have time to support full CRLs. However, in a future release they will support CRLs, and possibly other forms of revocation technology.

Client authentication as implemented by Microsoft Internet Explorer 3.0 is interoperable with popular Web servers that support secure sockets layer (SSL) 3.0 client authentication. Microsoft is working to extend the complete set of technology components necessary for webmasters to incorporate client authentication in their Web applications. This includes extending Windows NT(r) Server operating system support for challenge and response and the SSL 2.0 protocol used by Microsoft Internet information Server to also ''include support for client authentication through the SSL 3.0 protocol.

7. RELYING PARTY AGREEMENT

The greatest potential victim of any defects in the Authenticode model is arguably the relying party who attempts to verify the Digital ID and make the decision to download. A detailed discussion of the many legal uncertainties surrounding CAs and certificates is beyond the scope of this article. Suffice it to say that a legal outcome will in part depend on the jurisdiction hearing the claim and the ''reasonableness'' of the reliance. Verisign has attempted to address many of these issues in its ''Relying Party Agreement'' which, according to its language, is binding as soon as the third party ''relies,'' either intentionally or otherwise. This reliance is supposed to be triggered automatically when the party inspects a Verisign Certificate Revocation List or accepts a Verisign Digital ID. This agreement also attempts to remove the ''choice of law'' or jurisdiction question by specifying that all parties are bound by California laws. However, a more fundamental question must first be addressed. Under California's Uniform Commercial Code (UCC) statutes however, if a certificate is considered a good rather than a service, any disclaimer of warranties must consist of a conspicuous writing attached to the good being sold. It is difficult to envision how this should be accomplished, yet Verisign's incorporation by reference may not meet the California standard for conspicuousness. Furthermore, the relying party is expected to read this agreement before ''us(ing) or rely(ing) upon any information or services provided by VeriSign's Repository or website '' or ''search(ing) for a certificate, or ( ) verify(ing) a digital signature'' in Verisign's repository and that by doing the verification the user is agreeing to the terms of the agreement, including acknowledging that she has ''access to sufficient information to ensure that [she] can make an informed decision as to the extent to which [she] will chose [sic] to rely on the information in a certificate.''

The relying party is supposedly bound by the agreement which affirms that she has enough information to decide to what extent she will rely on the information in a certificate, and also that she is solely responsible for deciding whether or not to rely on the information in the certificate. In other words Verisign is making no statements about what the information in the certificate represents and instead shifts the burden to the relying party to make the download decision without providing them with the necessary tools and resources.

There are at least two flaws with this approach: (1) It presupposes the relying party can agree that sufficient information will be

on the certificate to make the determination as to whether she will rely on it or not, without having seen the publisher's Web site, and (2) The relying party must be able to receive authentication of a subscriber's public-key from a trusted-third-party (TTP) or the entire model is useless.

8. FACTUAL EXAMPLE OF FLAWS IN THE AUTHENTICODE SOLUTION

(a) Unforeseen Interactions

Consider two ActiveX controls. One provides a control similar to the Win95 ''Start'' button with all the commands on the user's computer presented in a list to choose from. Suppose it keeps these command names in a preferences file such as C:\windows\commands. The file may contain a list such as: Word, Excel, format c:, IE3, etc.

Consider a second ActiveX control that performs certain ''housekeeping'' functions on the PC at regular intervals. It automatically wakes up at a specified time and executes a list of commands such as backup, defrag, etc. Suppose it keeps its list of commands in, for instance C:\windows\commands. At the next scheduled interval the second control dutifully finds the file written by the first one and fires up Word, Excel, and then formats the C drive. Commands after this one are of diminishing consequence. The user's hard disk is wiped clean and so are the ''fingerprints'' for Authenticode. Even if they are somehow located, who should the user point the law enforcement people towards? Both controls did exactly what they were designed to do, exactly what they advertised to do. Who is the user going to sue? Obviously neither ''misbehaved.'' What happened was an unforeseen interaction between the two, and was only possible because ActiveX is given unrestricted access to those system-level tasks. With only a bit of planning it would be possible to come up with a cooperating gang of ActiveX controls to do deliberate theft via collusion where each program is only doing what it's ''supposed'' to, yet the total of their activity is much greater than the sum of the parts. Current methods of tracking events through logfiles are unable to accurately reflect the non-linearity that is clearly at work here in the interaction of the components, the only way to avoid this would be to strictly de-couple the controls, by not allowing any to share information with the other, such as giving each its own private file-space to write in. Although this is the approach used by Java's sandbox, alas it is not possible in the ''security-free'' world of ActiveX.

(b) Proving the Origin of the Malicious Code Can be Almost Impossible

In the event the malicious code does not either reformat the user's hard disk or destroy its digital certificate outright there is still a great deal of uncertainty as to how the particular malicious code at fault can be identified as the cause of any particular harm. Certainly it would be easy if the damage occurred immediately after the ActiveX control was downloaded. But if it does something indirect; or waits until executed the 100th time; or modifies some other program so that it later does something nasty; then tracking down the source of the original corruption will be extremely difficult.

Assume for example that a component is signed by the real author, who was certified by a competent CA to be a reputable software developer. The user reviews the certificate at install time, and accepts it on the basis of the reputation of the developer. The user then forgets about the code for some weeks to come. Later on, he or she visits a page of a hacker, or a page of a web site that has been broken into by a hacker, and the IE browser invokes the code with arguments supplied by the hacker. The code may appear to do what it's supposed to, or appear to do nothing at all while it's erasing the web browser's history file. The user may not even be aware that code is executing. The user goes on to about 50 other Web pages that night, and shuts off their machine with no evidence of a problem. When they reboot they may have a huge problem, depending on what the code was reprogrammed to do. The Authenticode scenario suggests that the user can now call their lawyer to sue someone, but who do they sue? The hacker that the FBI can't track? The well intentioned but pressured software developer who wrote the harmless control that was manipulated by the hacker to cause the damage? The certification authorities like Verisign that have forty page disclaimers of liability? And even if someone could be sued, is this an acceptable remedy for being without their computer system?

(c) No Consideration is Given to the Author's Competence as a Programmer

In cases where a program such as ActiveX has the ability to act on untrusted data, it isn't valid to make a judgment of its security simply on the basis of trusting that the writer of the program is not malicious. Consideration of how competent they are at writing ''safe programs'' is also important. Users of ActiveX are being encouraged to accept or reject controls based on whether they think the signer is trustworthy or not. No consideration is given to the stronger, and more relevant criterion of the author's competence as a programmer.

Because third parties can provide potentially hostile input to Active X controls—at least for those classified as ''safe for initialization''—the ''appropriate diligence'' for such a control is much greater than that required for an ordinary application. Even though a well intentioned author creates a ''safe'' program, unless it has been written using the appropriate security safeguards it can be made to cause damage through the actions of another ActiveX control.

(d) Microsoft Justifies the Inherent Security Risks of ActiveX by Arguing that Users Want and Demand a Rich Computing Experience.

It has been argued that the Java sandbox approach is too restrictive, and that users want and demand a rich computing experience. This may be true, but these same users would prefer to use the name of their favorite movie star or basketball player as a password. It is up to the computer professionals to maintain a balance between adequate security protection and ease of use. Users should be encouraged to take informed risks, but they must be given the guidance and tools to accurately perform the risk/benefit analysis. Authenticode deters users from taking informed risks because it fails to provide them with the information needed to make an informed decision while at the same time assuring them that it is at their disposal.

(e) The Myth That Commercial Software Publishers and Others Will Be Deterred From Writing and Distributing Malicious Software Because of the Polential Risks of Economic Loss and Legal Liability

Historically hefty financial barriers to entry into the software development market using traditional distribution channels have restricted the number of market entrants. However the Internet provides a very low entry-cost distribution mechanism that is not without an increase in associated risks. Lowering the entry cost increases the potential for abuse. Furthermore, automating the process increases the chance that the abuse may go unnoticed. No longer can it be assumed that software developers will not risk loss of their potentially small financial investment by loading malicious controls onto the Web that, if undetected, would serve their ends.

(f) Average User Lacks the Training and Resources Necessary to Make Appropriate Downloading Decision Based on Information Provided by Developer's Web Site

The average user is probably only able to recognize a handful of big name Internet-related software development companies and even fewer companies that develop ActiveX components. And yet users are being asked to decide whether or not they should download a particular company's ActiveX component based on whether they are ''known'' (which, according to Microsoft's definition means ''trustworthy''). Assuming the developer is ''unknown'' to them, the user has no idea what information on the developer's Web site is needed to making this critical decision and yet Microsoft clearly states that the user ''can make the decision on how to run the code'' based on the information provided in the certificate,

Furthermore, the average user will probably be reluctant to spend much time seriously evaluating the trustworthiness of a software developer and will instead base their decision on the site's professional appearance or some other intangible and possibly irrelevant factor. According to Michael Sullivan-Trainor, director of International Data Corp.'s Internet program, ''The problem with the Web is that the sleaziest company in the world can put up a site as slick as the most respected corporation. Shopping [and downloading software] on the Web requires a little more investigation.'' Because a professional appearance can easily be created by the most criminal of software developer's it cannot be used as a measure of the developer's trustworthiness and yet Microsoft provides no guidelines to assist the user in making this analysis. Nevertheless they continue to assert, as stated above, that ''the value of this type of certificate is in the information it provides to the user so that he/she can make the decision on how to run the code'' and that this should be ''comforting information.''

(g) Contrary to Microsoft's Claim, Downloading Software From ''Known'' Software Vendors Does Not Necessarily Eliminate Risk

Implicit in the Authenticode trust model is the belief that all ActiveX components

created by ''known'' software developers will be harmless and can therefore be trusted and downloaded without reservation. The recent track records of several software developers including Microsoft, seriously undermine this notion. According to an article called ''Microsoft Security Flaws Run Deep,'' in the March 6, 1997 issue of CNET's NEWS.COM authors Nick Wingfield and Alex Lash state that ''ActiveX is not the only security headache Microsoft is suffering. There are problems with its Internet Explorer browser.'' The article goes on to explain how earlier that week a group of students (does not specify whether they were students from the local university) found that by planting ''Shortcuts'' on a Web site they could trigger resident Windows 95 and NT programs to delete and manipulate files on a user's computer when browsing the Web site. According to the article Microsoft developers worked around the clock to fix the security hole.

In response to this IE ''Shortcuts'' security hole Stephen Cobb, director of special projects at the National Computer Security Association (NCSA) states, ''1 would say that you have to seriously question the integrity of Internet Explorer at this point because this was such a big hole.'' Cobb goes on to comment that ''Microsoft's statement that they did a lot of testing [on Internet Explorer] is worrying, because if they did a lot of testing and didn't find this problem, their testing is very flawed.'' In all fairness, it must be pointed out that security holes are being found in other software developer's products as well, however the significance of Microsoft's track record in this particular case is that they are the ones that are making the argument that if the software developer is ''known'' then their ActiveX components must be trustworthy, and that the only criteria that is important is whether or not the user recognizes the software developer.

The same CNET article also points out that even if no one's computer is actually damaged by a security hole that is subsequently discovered after the user has downloaded software, individuals and companies still have to spend time and money to install the security patches on their systems. Stephen Cobb concludes that ''[I]t's difficult for Microsoft to weasel its way out with the ''it does no damage'' excuse, because [in the case of the ''Shortcuts'' bug] systems administrators are already looking at a big cost hit,'' There is no empirical evidence to support Microsoft's assertion that downloading software from ''known'' origins is less risky than from ''unknown'' sites. Nor does this assertion take into consideration the possibility of a hacker placing a malicious control on a ''known'' Web site, or the possibility of a hacker ''spoofing'' a ''known '' Web site. Either of these can be done without detection either by the user or by the Authenticode system.

Joel McNamara explores this same issue in the June 1997 issue of Infosecurity News. In an article titled, ''Security-Market Dynamics'' he writes, ''As security professionals, we like to think that security ranks right up there on everyone's most-important list. But when security isn't the primary purpose of the product, security features all too often take a back seat. '' McNamara lists some of the security holes that have been discovered recently in many of Microsoft's products ranging from Windows NT, Windows 95, WORD macro viruses, to Internet Explorer, Authenticode and ActiveX. Joel observes that ''Microsoft's testing methodology appears to be more oriented toward discovering classic, show-stopping bugs rather than searching for more subtle, exploitable security holes.'' He concludes that, ''[i]f people continue to buy products with marginal security, why spend the extra time and money implementing high-end security .... Unfortunately, the marketplace usually needs to yell, scream and ??reaten to walk away before it gets what it wants. So, until then, expect to see security as little more than just another check on a marketing features list.'' A user can be exposed to significant security risks even when downloading software from a ''known'' developer such as Microsoft.

(h) Relevance of Authenticode ''Trust-Model'' for users outside the United States

Software developers located outside the United States but who wish to allow their components to be downloaded in the U.S.

According to the Verisign Web page, ''Digital Ids for Servers: High-level Security at a Low Cost:''

If your company has a Dun & Bradstreet (DUNS) number, you can complete your Digital ID request online. If you do not wish to use a DUNS number, or your company is not in the US, you can complete the enrollment form electronically and fax or mail Verisign any of the following pieces of documentation to establish your company's identity:

. * Articles of Incorporation
. * Partnership Papers
. * Business license
. * Fictitious Business License
. * Federal Tax ID Confirmation

Even assuming, for the sake of discussion, that Verisign's document authenticator's are familiar with the Articles of Incorporation or foreign equivalent for every country, and is able to make a reasonable effort to detect a faxed fraudulent document, how will the user who relies on the Digital ID know whether that foreign country even has any laws that will allow him some measure of recourse in the event that he suffers injury caused by the developer's software?

Software developers located outside the United States but who wish to allow their components to be downloaded both in the U.S. and overseas. Verisign has begun ''franchising'' overseas Certification Authorities who wish to base their practice statements on the Verisign ''Certification Practice Statement'' (CPS). Although several are under development, BelSign (www.belsign.be) is the first franchisee to go productional, , and their stated territory is limited to Belgium and Luxembourg. So far little details are available about identity authentication procedures and other practical considerations and responses to e-mail inquiries have not been forthcoming.

(i) Web sites Can Be Spoofed or Hacked

In December, 1996 the Secure Internet Programming team at Princeton University published a technical report describing an Internet security attack called ''Web spoofing.'' In this scenario, an attacker:

. * Creates a shadow copy of a web page;
. * Then, funnels all access to the web page through the attackers machine;
. * And finally, tricks the unwary consumer into revealing sensitive or private data, such as PIN numbers, credit card numbers or bank account numbers

Web spoofing requires that the attacker be able to interject his machine between the server and client, in a man-in-the-middle attack. Although under some situations certain visual cues may be used to detect the presence of a spoofed Web page, these can be eliminated by the skilled programmer. The only real solution is to check the ''View Source '' option and read the html source code for the Web page the user is currently browsing to know for certain whether their browser is connected to the correct site. Even a server and client using SSL can be spoofed if the hacker is able to intercept the client's initial request for authentication to the server and before a secure link is established. Once the unsuspecting user is connected to the attacker's bogus Web page, all transactions between the user and the certification authority can be intercepted and fraudulently manipulated. Thus, a harmful ActiveX program could easily be made to look as though it came from a ''known'' and trustworthy developer. After the program has downloaded to the user's PC and done its damage there is no way for the user to identify the developer because the program never had a Digital ID in the first place. Furthermore, the knowledgeable hacker will delete or modify the browser's history file so no record would remain of the user's visit to the spoofed Web site. According to Ed Felten, co-founder of the Princeton Internet Programming research team, there have been reports of the FBI investigating false sites and forcing them to shut

(j) Obtaining a Digital ID Through Fraudulent Means

Fred Mclain, software developer, consultant, and author of the now infamous ActiveX ''Exploder'' control (see below), provides the following perspective on the Authenticode ''code signing'' process, from a FAQ on his personal Web site located at www.halcyon.com/mclain/.

Code Signing simply attempts to identify who signed the control. Anyone can go out and get a code signature. It's a pretty much automatic process. You go to a web site, give them a name, address, credit card number and some other stuff (none of which have to be yours), click ''1 Agree'' on a page full of legal jargon, and pretty soon you get an e-mail with the information you need to sign the control in it. Once you have your Digital ID, you can sign any unsigned ActiveX control. Nobody reviews these controls! In other words, a signature doesn't tell you who wrote the control and it doesn't tell you if the control is safe or not. Heck, with the number of hot credit card numbers out on the net, it doesn't even tell you for sure who signed it. A danger is that seeing that a control is signed will give folks a warm fuzzy feeling about the control, and encourage them to run it, even though it does not guarantee their safety!

A recent Associated Press news item from San Francisco dated May 22, 1997

demonstrates the prevalence of credit card theft on the Internet and the accessibility to those stolen numbers. The article reports that according to Bureau spokesman George Grotz, the FBI recently arrested a hacker who used a ''sniffer'' program to eavesdrop on electronic transactions between customers and a dozen companies selling products through a major Internet provider. The sniffer software gathered 100,000 credit card numbers along with enough information to use them. The hacker was arrested for allegedly attempting to sell the information to an undercover FBI agent who saw the hacker's advertisement on a computer bulletin board.

FBI statistics indicate that the majority of computer crimes go undetected, and, until recently, most of the ones that are detected are never reported. Therefore it is safe to assume that there are many other sources of fraudulent credit card information gathered from the Internet that are available to persons registering ActiveX controls. Frequently the credit card owner will not realize their number has been stolen for several weeks or months, depending on the thief's spending patterns. As a result, if a stolen credit card is used to acquire a Digital ID using fake identification, the fraudulent charges will go through undetected and because there is no retroactive follow-up on the part of Verisign or Microsoft, the certificate will remain valid even after the card theft has been discovered and the card invalidated, unless the defrauded consumer makes the effort to contact them which is unlikely.

FACTUAL EXAMPLES OF ACTIVEX-RELATED SECURITY RISKS

(1) InfoSpace Program Compromises Authenticode Security

On September 23, 1996 CNET-Online and other publications reported that Lycos, a WWW Search engine company posted a program on its Web site that would allow downloadable programs with InfoSpace Digital Ids to bypass the Authenticode security controls in Internet Explorer.

Nick Wingfield's article ''Program compromises IE security'' explains that because the program which was created for Lycos by InfoSpace, a startup Internet company, circumvents IE's security warning window, InfoSpace could sneak programs onto a user's personal computer without warning.

InfoSpace executives denied that there was any malice intended in its program, adding that it has provided Lycos with an updated version of the code. Lycos planned to post the new program later that evening, according to InfoSpace. ''It was a bug that got incorporated into the production code,'' InfoSpace CEO Naveen Jain said. Although the InfoSpace program apparently was not created with malicious intent, according to Wingfield ''it underscores the fragility of Internet Explorer's security defenses, as well as broader security issues related to downloading over the Internet.'' ''Code signing is not a guarantee of code quality,'' Charles Fitzgerald, a product manager at Microsoft said. ''It's on accountability trail.''

The InfoSpace ''bug'' modified the Windows 95 Registry configuration setting by simply registering InfoSpace as a ''Trusted Publisher'' thereby allowing all code from InfoSpace to be downloaded automatically without requesting the user's consent. The operation is akin to inviting a guest over to your house for dinner before you leave town for a month-long vacation and having them copy the key to your front door without permission. If the guest enters your house while you're gone and a neighbor questions him about it, the guest only has to show the neighbor the copy of the key as confirmation he has your permission to enter. Whenever the user's browser detects an InfoSpace program it will automatically be downloaded without the user's awareness or consent, because Authenticode has been told to automatically trust all InfoSpace developed programs. ''Clearly their software is doing something a tad aggressive,'' said Rob Price, a group program manager for Internet security at Microsoft.'' (With Authenticode), users are making a one-time trust decision, this is a persistent trust decision.''

(2) Symantec Corporation's Norton Utilities Victimized by Malicious ActiveX Control According to information posted on their Web site (www.symantec.com), on April 7, 1997, Symantec was notified that a malicious Web site had been created that uses an ActiveX control to gain access to a user's PC if they use Norton Utilities 2.0 for Windows95 and get on the World Wide Web. Because a specific component (TUNEOCX.OCX) of the Norton Utilities System Genie is marked as a script file, ActiveX-aware WWW scripts can make use of it as an ActiveX control. The result is that a malicious user could use the script to run any command, such as delete, format or ftp, on the local host. Symantec responded to the news quickly and responsibly, posting a fix for the problem within 24 hours.

(3) ''Exploder'' Control

Software developer and consultant Fred Mclain created a live demonstration of ActiveX's capabilities in late summer of 1996. Mclain created an ActiveX control which he called ''Exploder'' and which he placed on his Web site with the explanation that it would perform an automatic ''graceful'' shutdown of any user's PC running Windows95 who chose to voluntarily click on the control link and automatically download it to their PC. Because the control caused a ''graceful'' shutdown no damage was caused to the user's PC, but the damage to Microsoft's image was immediate and irreversible. As recently as April 1997, Sun Microsystems CEO Scott McNealy was still demonstrating MClain's Exploder control to crowds of Java enthusiasts.

(4) Germany's Chaos Computer Club Live Demonstration To Make Bogus Money Transfers From Intuit's Quicken Online Banking Customers

The Chaos Computer Club (CCC), a German hackers group from Hamburg, demonstrated on national TV in February 1997 that they can use an ActiveX control to steal money from one account and put it into another without the use of a Personal Identification Number (PIN) during an online banking transaction.

CCC showed that once the ActiveX control is downloaded by a user browsing their Web site who uses Intuit's Quicken for electronic banking, the control will add an extra electronic fund transfer command to the pending transfer list. The next time the user does his or her banking online, the bogus transaction will get executed along with the rest without alerting the user.

The Computer Club's stated purpose in holding this public demonstration was to alert people about the risks associated with doing business on the Internet and specifically with ActiveX.

intuit, the company that develops Quicken, responded by recommending that users disable the ActiveX controls in their Internet Explorer browsers or switch to the Netscape Navigator if they are concerned about the safety of ActiveX controls. The company also stated that of the 9 million copies of Quicken currently in use worldwide, the present U.S. version of Quicken can only be used to transfer money from ''pre-authorized'' accounts as approved by the user. A future German version of the software will have encryption features to prevent hackers from breaking in. To its credit, Intuit did an excellent job of public relations ''damage control'' and used wide, the Web, because it is the the situation as an opportunity to educate consumers on how to take proper safeguards to protect themselves on the Internet in general and from similar situations in the future.

RECENT MICROSOFT SECURITY ENHANCEMENTS

(1) Microsoft's Authenticode 2.0—Band-Aid for a severed artery

Microsoft recently announced Authenticode 2.0, a significant upgrade to the initial version which was first released less than one year ago. On the plus side the new upgrade includes a number of features Microsoft says will make downloading code safer, including time-stamping support to ensure that code was signed with a valid digital certificate. Various Microsoft bulletins and announcements inconsistently report that It also supports access to certificate revocation lists (CRLs), a feature that checks in with an online list of revoked certificates before downloading code.

However, on the negative side the logistics of the upgrade are cumbersome, time-consuming and will potentially result in delays while unsuspecting users are forced at the last minute to download either the upgrade. Software publishers who have signed their code prior to June 1997 must re-sign their code by June 30, or before their current Digital ID expires. According to Microsoft, because Authenticode 2.0 checks the revocation list to determine whether the Digital ID is still valid, it will notify a user who wants to download an control that has not been re-signed as either unsafe to download (if their security is set to High), or out-of-date (if their security is set to Medium). Only code that has been re-signed will appear in the revocation list as safe to download.

This upgrade is significant as a validation of Microsoft's willingness to obfuscate the facts and fabricate its own reality, in its single-minded pursuit of market share. Prior to this upgrade a user was expected to navigate the maze of menus and options on

the Verisign Web site to locate CRL information. No explanation or instructions were presented to the user when the subscriber's certificate appeared on their screen, informing him that he must inquire of this proprietary database to find out whether the Id used to sign the certificate he was viewing and potentially relying on was still valid or whether it was suspended or revoked. Also, without the time stamping capability, it was impossible for the user to tell whether the certificate appearing on his screen was signed using an expired Digital Id or not. Although Microsoft and Verisign engineered this upgrade prior to the time most Digital Ids and certificates would have expired, there was no advance acknowledgment of this limitation. One can only hope that other essential attributes of this ostensibly trustworthy Authenticode security model are not still on the drawing board to released later as enhancements.

(2) ''Security Zones''

This new feature will let users or their network administrators arbitrarily divide the Web sites into four predefined zones: intranet, trusted extranet, general Internet and untrusted. Web sites can then be assigned to a particular zone, and be subject to the corresponding level of security protection. For example, ActiveX controls and Java applets coming from the Internet might be assigned to untrusted zones, and the administrator could prevent them from being downloaded by configuring that zones security protection accordingly.

In a sense this is just a ''macro'' version of Java's ''sandbox'' security model. The sandbox prevents Java applets from gaining access to sensitive system functions that are outside its boundaries. IE's security zones can also prevent Java and ActiveX programs from gaining access to sensitive system functions, depending on the way the security protections are configured. However, the user or administrator is Unable to override or misconfigure Java's default sandbox protection, whereas the IE security zone protection can be turned off or improperly configured, leaving the user completely vulnerable.

THE FUTURE OF ACTIVEX AND DOWNLOADABLE AND EXECUTABLE CONTENT—Will it ever be safe to ''trust'' again?

If Microsoft is unwilling, users must organize and develop alternative means of protecting themselves from ActiveX. Some examples of proposed alternatives include:

(1) Web of Distrust

One author is calling for an online, independent watchdog organization that ''provides users with timely alerts on hazardous or questionable software.'' This group would act as a clearinghouse for reports of all harmful or suspicious downloadable and executable content. The information could be distributed by newsletters to subscribers, or available to any user by hyperlink access before they make the ''fateful'' decision to download. Kobielus writes, ''Our best defense against malignant controls is to pool our experiences, expose the offending code-mongers to the entire online ''.... Net community and thereby burn them out of existence.''

Although certain legal issues and standards must be addressed before ''burning'' anyone out of existence, this approach could serve as a model for a more effective means of keeping Cyberspace free from harmful code.

(2) Better-Business-Bureau OnLine (BBBOnLine)

The Council of Better Business Bureaus, best know for their certification of local businesses in the physical world, have developed a new U.S. online service, ''dedicated to helping consumers identify ethical marketers on the Internet and thereby make the Internet a safer, more reliable place to get information and conduct business.'' According to information on their Web site, companies that display an encrypted BBBOnLine CARE seal on their Web pages have demonstrated their commitment to a series of strict business standards for customer service and marketplace ethics. Consumers can hyperlink from the seal to the BBBOnLine home page to get a reliability report on the member company, including their management, time in business, relevant aspects of its goods and services, complaint experience and other evidence of responsible marketplace behavior. Several large corporations involved in Internet-related markets are co-sponsoring this service including, Hewlett-Packard, Xerox, Netscape, AT&T, and GTE....

Some examples of their rigorous Participant Standards include: Provide the BBB with inform ation regarding company location, background, etc. which will be verified by the BBB in a visit to the company's physical premises;

Be in business a minimum of one year (with limited exceptions); Respond promptly to all consumer complaints; Agree to binding arbitration, at the consumer's request, for unresolved disputes involving consumer products or services advertised or promoted online.

(3) PC-based Browser Add-on Security Products

Several vendors including Finjan Inc., and Safe Technologies have recently released products that promise to provide protection against all Internet threats, whether they are hostile ActiveX controls or Java applets, eSafe Protect not only recognizes a set of known security holes and rogue controls, but it also has the ability to run in a learning mode. This allows the program to see where the user's browser and e-mail clients usually read or write data or execute other applications and develop a pattern of acceptable behavior (similar to an ''intelligent'' sandbox model). After the learning period is completed (usually about one day), any activity outside of the normal range will generate an alarm, and require user intervention to proceed. As a result it also provides protection against yet-to-be-discovered security holes in popular Web browsers or other unknown hazards. Independent Software Accrediter is Necessary to Determine Software ''Harmlessness'' Digital signatures can measure the authenticity of a person, but not their intentions or competence. Until software developers see it is in their best interest to invest more resources into writing secure software a separate entity is needed to gather concrete evidence of the software developer's intention and competence in advance. By testing their software against industry benchmarks and providing guidance to the uninformed user interested in ascertaining the safety of the software they want to download this entity will bridge the gap between identity verification and a software publisher's intentions and competence.

The ''Software Accrediter'' will validate that an ActiveX component is both harmless and ''safe'' to operate in an ''open'' environment by testing it against a set of industry-wide programming and Internet security standards. For a control to be ''harmless'', it must be unable to cause damage by itself. For it to be ''safe'' the control must be designed and written with a level of programmer competence that prevents other controls from being able to advantage of programming flaws and force it to cause harm.

The Software Accrediter will take on significance in the use of downloadable and executable content to authenticate its conformity to the norms of programming and Internet security practice. For instance, where a Software Publisher Digital ID is executed and digitally signed by a Certification Authority, the ''Software Accrediter'' will issue a message of accreditation attached to the Digital ID which validates the harmlessness and safety of the program within certain parameters. The validation will identify the level of risk associated with the control and the user can make an informed decision whether or not to download the control, based on the potential injury he could suffer. Neither the mere application of a digital signature, or the restriction to ''safe zones'' satisfies accreditation requirements for these types of dangerous programs. The ''Software Accrediter'' will combine the benefits of digital signatures with industry-accepted software accreditation to provide high quality international control authentication in a measure far exceeding current practices.

Public key cryptography, or digital signatures, can be used to sign application software and certify it as ''safe'' as judged by some certifier, only if the software is held up against a set of industry standards—where one of the ''safety'' properties would be that the application cannot be corrupted by malicious external programs or data. Microsoft offers Authenticode as a way of empowering the user to determine whether individual downloadable executable Web content is safe to use. It purports to provide the user with information which will be ''comforting'' to them in their analysis. Unfortunately, Authenticode simply moves the burden of assurance on to the user, without making the analysis any more tractable. It places an unreasonable burden on users, who must decide which developers are trustworthy based on insufficient data and inadequate tools. Because even major mass market application software (e.g., Quicken) appears susceptible to attacks by malicious controls, it is not clear what this type of certification technique could add.

Netscape's Hybrid ''Code-Signing'' Solution

Netscape has recently released its own implementation of an Authenticode-like Product that has much more robust security protection against harmful downloadable and executable programs. In addition to the generic characteristics of a digital signature; authentication, integrity and non-repudiation, ''code-signing'' also determines what an ActiveX control or Java applet wants to do on the user's machine, Netscape's Communicator checks to see if the software is signed and attempts to verity the signature. If the applet is unsigned or if the signature is unverified the applet is automatically restricted to running inside the ''sandbox.''

When the downloaded program wants to get access to a PCs system resources a dialog box is displayed that shows the user what kind of access it wants, the identity of the signer, and the associated risks. With this information the user then decides to allow or deny the access that the Java applet has requested.

ActiveX controls can be packaged in such a way as to fulfill the Java specifications necessary to allow code-signing. This process is accomplished using the JAR Packager tool which creates an envelope around the control that results in a cross-platform JAR file. The JAR Packager is a tool that allows developers to sign, envelope and compress Java applets, plugins, and any other type of file. The JAR file format was a joint effort between JavaSoft and Netscape.

In the future, an evolving combination of these and other approaches will be used to provide protection. Security guru Gary McGraw believes the long-term solution combines ''code-signing authentication and some sort of security model, like a [Java] Sandbox.'' He believes it will be ''much easier to [add code-signing] to extend Java .... than it will be reverse engineer Sandbox into ActiveX.''

SUMMARY

The general outlook for ActiveX as a computer security problem is unclear. The potential vulnerabilities are legion. Bearing in mind the FBI's computer crime statistics indicate that over 80% of all detected computer crimes go unreported, and many more of them go undetected, during its initial 18 months in existence exploitation of ActiveX has been virtually non-existent. Unfortunately, as the economic incentive for creating malicious ActiveX controls increases, it seems likely that attackers will attempt to exploit its security vulnerabilities.

Given the obvious security risks presented by ActiveX, combined with the absence of broad-based support for Authenticode, the only possible explanation for Microsoft's continued pursuit of this folly is a last-ditch effort to keep its hand in the Internet game and maintain its share of the desktop computing software market. Microsoft is Committed to maintaining its monopolistic hold on the PC and Internet software industry by marketing its auto-immune deficient ActiveX software product, and its parasitic partner Authenticode. Even with the intellectual horsepower at its disposal it appears to be unwilling to develop a secure alternative because then there would be little incentive for users to purchase its internet Explorer Web browser, and there would be little hope for Bill Gates'' vision of a single, seamless Windows-based PC desktop and Internet interface.

CONCLUSION

This article has presented some good points and bad points about ActiveX and Authenticode both of which have only been in existence for less than two years. It is inevitable that both security protection for downloadable and executable programs and Certification Authority policies and practices will evolve gradually. Nevertheless, in the interest of minimizing the risk exposure to the user, it would be prudent for software developers to acknowledge these risks up front and allow users to understand them and begin making informed decisions based on accurate information, or paying customers must demand something better. Risks associated with downloading any software from the Internet are unavoidable, but Microsoft chooses not to explain those risks to users or give them the tools to properly manage those risks. Instead what Microsoft does provide is confusing, contradictory FAQs, bulletins and marketing announcements that even go so far as to state, ''Because Microsoft must respond to changing market conditions, this document should not be interpreted to be a commitment on the part of Microsoft, and Microsoft cannot guarantee the accuracy of any information presented after the date of publication.''

Microsoft understandably wants to be the first to market with each of its latest Internet software products so it can gain whatever advantage it can over its competitors. But they are cutting corners at the customer's expense by leaving necessary security features out and the customer needs to be informed to decide whether it is an acceptable expense. In the wake of Love Canal, Three-Mile Island, Hanford Nuclear Reactor, Rocky Flats and other life-threatening breaches of the public trust we have matured as a nation to the point where even the courts support our right to receive advance notice before toxic chemicals are pumped into our back yards and personal spaces. Yet Microsoft is allowing toxic ActiveX components to be downloaded into our PCs without reasonable notice and disclosure of all the risks by pretending that it's fake security system Authenticode can provide reasonable detection and defense.

The most effective long-term technical solutions appear to require systemic changes in the way computer software is built and the way software standards are developed and enforced. The safest near-term alternatives for the majority of users all involve giving up many of the ''bells and whistles'' that make Web browsing so entertaining by configuring Internet Explorer browsers to restrict all ActiveX controls from being downloaded to the desktop.

Microsoft recently announced on TechNet that, as of the release of XP, the only way that consumers and businesses can make on-line purchases, or submit private data (e.g., on-line banking) through a ''secure'' (SSL-enabled) Web site, is by using new features that are available exclusively on Windows XP, via the Windows Update Web site. Users of Microsoft NT, ME, and WZK may install an ''upgrade patch'' that will allow them to manually download new root certs, and to use a limited subset of the XP-based capability.

To better protect Microsoft customers from security issues related to the use of public key infrastructure (PKI) certificates and enhance the experience for Windows users, Microsoft is moving to standardize and clarify the criteria for root certification authorities in Windows XP. This standard also applies to root certification authorities in Internet Explorer and any other Microsoft product.

(http://www.microsoft.com/technet/security/news/rootcert.asp)

Let me repeat, as of the release of XP next week, the ability for consumers using non-Microsoft operating systems to perform ''secure'' transactions via Internet Explorer (IE) will be severely curtailed, and over the coming months, entirely eliminated.

When a user visits a secure Web site (that is, by using HTTPS), reads a secure e-mail (that is, S/MIME), or downloads an ActiveX control that uses a new root certificate, the Windows XP certificate chain verification software checks the appropriate Windows Update location and downloads the necessary root certificate. To the user, the experience is seamless. The user does not see any security dialog boxes or warnings. The download happens automatically, behind the scenes.

Microsoft has no plans to provide an ''upgrade patch'' for the non-Microsoft versions of IE that it currently supports (e.g., Solaris, Linux, HP-UX, and Mac.). Microsoft properly considers Auto Root Update and Windows Update to be Windows technologies for conveniently keeping users up to date with certificates in the Microsoft Root Program (the user doesn't have to take many steps to install the roots). However, it has no plans to provide these convenience mechanisms for non-Windows platforms at this time.

The result is that the only way that CAs or on-line merchants can get their certificates into the IE browsers of non-Microsoft consumers is by forcing the consumer to manually download and install the certificate directly from a Web site. This eliminates any level of trust assurance that may have resulted from IE's existing root certificate accreditation process.

Under this new regime, when a consumer using IE on a non-Microsoft platform enters a secure Web site to make a secure on-line purchase, he is prompted to download and trust the CA root certificate of any merchant whose root is not already in that browser, The same is true if a Web site wants to download an ActiveX control, which is signed by an unknown and hence ''un-trusted'' Publisher, Eliminating future access to new root certificates in its IE browser will deprive consumers using non-Microsoft platforms from the ability to conveniently and ''securely'' make purchases at a secure Web site (HTTPS), read secure e-mail (S/MIME), or download signed ActiveX controls with the same level of trust assurance that he experienced prior to this new regime.

This change will adversely affect the consumer, the on-line merchant, and the CA,

as each of them has a stake in making the on-line experience as smooth, secure, and convenient as possible. This latest manipulation of the Internet software market by Microsoft will provide consumers with a strong incentive to migrate to a Windows platform, so they can continue to use the Web with the same degree of ease, and sense of security as before.

In addition, some commercial PKI applications and products are designed around consumer access to their root certificates in Microsoft's IE. Eliminating consumer access to their root certificates from IE will force them to restructure their applications, and in some cases their whole product strategy. Of course, Microsoft will argue that these vendors were receiving a ''free ride,'' while it developed the technology to tighten up its PKI solution. However, Microsoft's PKI solution is anything but ''tight,'' and in fact, it is still quite immature. In addition, it will remain so for several years, to the detriment of the consumer, and the industry.

This tactic is virtually identical to the one that Microsoft used to eliminate competition in the browser market. It offered features similar to Netscape's, but at no charge, because it could afford to use its income from OS sales to offset the loss it took on its browser product. Initially, Microsoft's browser was inferior to Netscape. However, over time, as the marketing power of the Windows desktop gradually surmounted Netscape's marketing channels, and as Microsoft commandeered many of the existing Internet browser standards, IE achieved a superior market position. This time Microsoft provided consumers and the industry with ''free'' access to CA root certificates embedded in IE. However, now that it believes it has eliminated any competition for this service, Microsoft intends to force consumers to purchase XP or another Windows platform, so they can continue to enjoy the same convenience and benefits from digital certificates as before.

Although Microsoft will certainly claim otherwise, I believe it is well within its power to continue to support the storage of new root certificates in non-Microsoft versions of IE. However, Microsoft representatives have indicated that they have no plans to do so at this time. As are result, consumer trust in on-line commerce, and the viability of many PKI solution vendors will both suffer in Microsoft's latest grab for another piece of the Internet software market, PKI. Microsoft's PKI solution is inferior to current alternatives, and it will not achieve its promised capabilities for many years, after using the public as its testing ground.

Is Microsoft trying to corner another piece of the Internet software market by illegally leveraging its market powers, as the court agreed that it has done in the past? The pattern is virtually identical.

Pasadena, CA 91105
Rick_Hornbeck@pacbell.net
(323) 363–2151

PROFESSIONAL EXPERIENCE:

HORNBECK CONSULTING—Pasadena, California 2000—Present.

* Security Policy, Certificate Policy, and Certification Practice Statement consulting and development; Internet and network security policy consulting; PKI legal issue spotting and consulting. Representative topics include privacy; identity authentication; ''qualified'' certificates, security services, jurisdiction, and digital and electronic signatures; and local, national, and international regulations and case law in both civil and common law jurisdictions.

Customers include:

* ENSURELINK CERTIFICATION AUTHORITY—San Diego, California 2000—Present. PKI Consultant—Certificate Policy, Certification Practice Statement, and PKI-related consulting.

* ALPHATRUST CERTIFICATION AUTHORITY-Dallas, Texas 2000. PKI Legal Consultant-Certificate Policy, Certification Practice Statement, and PKI-delated legal consulting.

* EXPERIAN—Orange, California 2000. PKI Legal Consultant—Consulted with in-house legal counsel, defining and documenting application-specific, PKI-related legal issues.

ENTRUST TECHNOLOGIES—Plano, Texas 1999—2000. Senior Security Consultant-Developed Security Policies, Certificate Policies, and Certification Practice Statements for large national, multi-national, and international organizations. Worked directly with senior client management to determine 1heir PKI requirements. Worked with sales force on national opportunities. Worked with consulting partners to out source PKI consulting work during peak periods and on joint projects. Provided on-site classroom training programs lasting 3–4 days for consulting partners and customers on Entrust-specific security and PKI consulting methodology and concepts.

Customers include: Experian, Bell Atlantic, MCI WorldCom, Hoffman-LaRoche, State Farm Insurance, First American Real Estate Information Services (FAREIS), Ernst & Young, Price Waterhouse Coopers, People's Bank of China, Capital One, US Department of Agriculture, Fidelity Investments, Illinois Secretary of State, First Data Corporation ....

OFFICE OF COURT ADMINISTRATION, STATE OF TEXAS—Austin, Texas 1997—1998. Strategic Technology Planner-Responsible for the implementation of a statewide computer and communication network linking all state courts. Developed supporting rules, policies, guidelines, and statutes relating to the electronic filing of court documents. Prepared cost analysis and preliminary design for the Texas Judicial Committee on Information Technology, based on planned technology.

ELECTRONIC COMMERCE SYSTEMS—Los Angeles, CA (1995—96); Austin, TX 1997–1998. Principal-Consulting company provided electronic commerce consulting services with an emphasis on Internet and Web-based security, public-key infrastructure (PKI), digital signatures, electronic filing of court records, and electronic payments.

Customers included:

Wells Fargo Bank—Los Angeles, California, 1996.

Database Developer-Designed and developed MS-ACCESS database integrating First Interstate Bank commercial loan database with Wells Fargo data following bank merger.

Orange County Superior Court ('intern, part-time)—Santa Ana, California, 1996.

—Court Technology Department—Drafted new court rules for electronic filing of pleadings via the Internet for pilot family law electronic filing project.

—Law and Motion Research Department—Reviewed, researched, and summarized legal motions for judge's Law and Motion hearings.

LAX SHUTTLE TRANSPORTATION CONSORTIUM, El Segundo, California 1996. Arbitralion Hearing Officer ('part-time)—Arbitrated appeals from personnel disciplinary actions.

ATTORNEY GENERAL'S OFFICE, DEPARTMENT OF JUSTICE, STATE OF CALIFORNIA—Los Angeles, California 1995–96. Legal Intern (part-time)—Wrote briefs, motions, and memos; performed legal research in support of Deputy Attorneys General; assisted in trial preparation.

COMPUTER SCIENCES CORPORATION—El Segundo, California 1993—95. Senior Management Consultant—Developed Information Systems Strategic Plan and Architecture for United States Air Force, Materiel Systems Command, Los Angeles Air Force Base (LAAFB). Delivered an integrated, base-wide strategic plan encompassing reengineered business processes, network operating systems, e-mail, and network security for over 25 unique, on-base Air Force organizations with disparate computer and network platforms.

TRW SPACE & DEFENSE (ELECTRONIC SYSTEMS GROUP), Redondo Beach, CA. 1988–93. Network Systems Engineer-Led team in design, development, and implementation of a reengineered purchase order processing system using state-of-the-art client-server technology linked with the corporate network. Implemented software upgrade for Procurement EDI application .and integrated with batch FTP transfer from mainframe. Responsible for implementation, administration, and security of multiple, inter-connected local area network servers running SCO UNIX, AT&T System V.4, and SUN OS over TCP/IP, and DOS/Windows clients.

PRICE WATERHOUSE, OFFICE OF GOVERNMENT SERVICES, Los Angeles, California 1987. Senior Consultant Created functional model for reengineered application in support of ''Los Angeles Employees Retirement Association'' (LACERA) software development project team.

XEROX CORPORATION, PRINTING SYSTEMS DIVISION, El Segundo, California 1985–87. Senior Analyst/Programmer-Supervised two analyst/programmers and coordinated design, development and implementation of purchase order entry system for Printing Systems Division.

TRANSAMERICA CORPORATION, Los Angeles, California 1983–85. Analyst/Programmer-Assisted in design, development, and implementation of a nation-wide information system enabling insurance agents to submit customer applications for insurance coverage directly

into the mainframe computer in the home office from field offices across the country.

TEACHING EXPERIENCE:

* UNIVERSITY OF PHOENIXON-LINE, 2001

Part-time instructor-Risk Management in a CIS Environment (Computer Security); Contracts, Ethics, and Intellectual Property;

* SANTA MONICA COLLEGE, 2001.

Part-time instructor-introduction to Computer Systems;

* CALIFORNIA STATE UNIVERSITY, LOS ANGELES, 2001.

Part-time insfrucfor-Internet security.

LOYOLA LAW SCHOOL, Los Angeles, California.

Juris Doctor—December 1996.

Dean's List Honors, 1995.

California State Bar Foundation—Public Service Grant 1996.

UNIVERSITY OF SOUTHERN CALIFORNIA, Los Angeles, California.

Master of Science, Information Systems Management—May 1990.

CALIFORNIA STATE UNIVERSITY, LOS ANGELES, California.

Bachelor of Science in Business, Minor in Business Information Systems—June 1983.

Dean's List Honors, 1982.

ADMITTED TO PRACTICE

State Bar of Utah—May 2000, Active Member.

ARTICLES, STANDARDS ACTIVITY, PRESENTATIONS, AND COURSES TAUGHT:

PUBLISHED ARTICLES:

* Electronic Filing of Court Records: Standards and Open Systems (West Group 1998);

* Electronic Court Filings for Attorneys: What, Where, When, Why and How (West Group 1998);

* Into the Breach.'' Understanding Security Issues Involved in Commerce on the Internet—Parts I and II, The DataLaw Report, (Clark, Boardman, and Callaghan 1997);

Subject: Microsoft Settlement

Hello,

I just wanted to share my opinion on the Microsoft Settlement. As it stands, I don1t see how the current proposal of basically flooding the market with Windows-based PCs would create or foster a competitive environment. I truly hope those making the decisions think things through and see this as what seems to be an underhanded and sneaky way to comply with a demand without really complying at all.

Attorney General
John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing you today on behalf of my husband and myself in regards to Microsoft. We both support this company whole-heartedly, and we believe this litigation should be ended. During a time when we are facing many pressing national and economic issues, we should not continue to spend precious time and resources concentrating on Microsoft.

In our opinion, the proposed settlement is more than adequate to deal with the issues in this case. Microsoft has pledged to share more information with other companies and be monitored by a technical oversight committee for compliance. Microsoft has also agreed to design future versions of Windows to make it easier to install non-Microsoft software. This settlement is complete and thorough.

We are also concerned about the negative effect the continuation of this litigation will have on the Seattle area economy. As a result of major Boeing lay-offs, Washington State now has one of the highest unemployment rates in the country. Dragging out this issue further will have an even more detrimental effect on the local economy. It is time to end this litigation and focus our energies on more pertinent issues. Thank you for your support.

Sincerely,
MaryAnn Goeppele

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Susan J. Handy

Subject: Microsoft Settlement

To whom it may concern,

I am writing to express my concern with the proposed settlement of United States v. Microsoft Corp., Civil No. 98–1232.

I am a regular user of both Microsoft Windows and a distribution of the operating system known as Linux. I am not a professional software developer, but I have at times written software for both platforms. In essence, my concern is that the proposed remedy for Microsoft's anticompetitive behavior will not restore competition even if its intent is enforced and it is effective in curbing illegal actions.

In my view, a key feature of a competitive operating system market is that users have

the option not to purchase or use any given any given operating system (OS). Specifically, competition in the OS market will be restored only when it is feasible for most users to elect not to purchase Microsoft Windows for a given application.

Unfortunately, a consequence of Microsoft's dominance in many markets is that its ''file formats'' have become de facto standards. (By ''file formats,'' I am referring to the methods used by applications such as Microsoft Word to encode data such as text, document layout, images, etc.) These formats are not publicly available. Attempts at deciphering certain formats have been made by (for example) Sun Microsystems'' StarOffice; however, reverse engineering complete functionality is extremely difficult and has not yet been accomplished successfully for many important formats. Furthermore, changes to such formats are not difficult for Microsoft relative to the burden placed on attempted competitors in deciphering any new changes.

The result of this ''standardization'' of proprietary formats, combined with Microsoft's policy of releasing the applications using these formats only for Windows (although there are exceptions, e.g. Microsoft Word for MacOS), is that potentially competing OS'es cannot run applications that interoperate reliably with these ''standards.'' Thus, anyone wishing to use these ''standard'' formats, even for purposes of e.g. backwards compatibility with existing documents, must purchase not only the relevant Microsoft application but also Microsoft Windows. Such a user may also use other OS'es but is effectively required to purchase Windows. Please note that I do not believe that Microsoft's conduct regarding file formats is illegal, and to my knowledge it has not been found to be so in any court of law. However, I do believe that it will be impossible to restore competition to the OS market unless the issue of file formats is addressed, given the dominant position held by Microsoft. If the fruits of Microsoft's illegal behavior are to be negated successfully, the final remedy must address this issue. An obvious solution would be to require from Microsoft full disclosure of information necessary to flawlessly read and produce files of any Microsoft application. Such a remedy could be similar in spirit to, but more broad than, part III.E of the revised proposed Final Judgement (requiring disclosure of any communications protocols necessary for interoperating with a Microsoft OS).

Thank you for giving me the opportunity for comment. I look forward to a settlement addressing these issues and a more competitive operating system market.

Sincerely,
Michael Hemond

Subject: Microsoft Settlement

To whom it may concern,

My observations of Microsoft's outrageous behaviors in court and in business lead me to believe that nothing short of dismemberment of the corporation will control its behavior.

I disapprove of this settlement, and hope that the Justice Department presses its case once more for a splitting of Microsoft into several completely separate companies.

Nothing I observed over the years of this case indicates that Microsoft ever intends to comply with the intent of a judicial ruling. Even if this settlement succeeded in controlling Microsoft's behavior for a number of years, I am convinced that Microsoft would immediately reknew its anticompetitive actions as soon as its restrictions ended.

Instead, I hope to see Microsoft split into three, four, or more separate and unrelated companies: operating systems (e.g. Windows), software (e.g. Office), hardware (e.g. XBox), and ISP (MSN). Since Microsoft sees fit to attempt to dominate in every popular technology-related market, there may be other divisions to split off, as well. Only then can we hope for Microsoft to cease using its near-monopoly on PC operating systems to leverage its position in every other market.

Thank you for your attention.

Dear judge,

Microsoft is in my opinion, has broken in the past and will continue to break many anti-trust laws with this back-room deal. The PFJ will not only allow Microsoft to have an unfair advantage on the market, but will also hinder other companies such as Netscape in having a fair chance at this thing called capitalism. Please do not allow this deal to go through. Thank you.

Subject: Microsoft Settlement

I am strongly opposed to the settlement. It is too little, too late.

In the time between the rulings finding Microsoft guilty of violating antitrust laws, Microsoft has increased its dominance of the market even further, by continuing to use the same type of anticompetive business practices.

Punishing Microsoft for its business practices will not quash innovation as they and their supporters claim. On the contrary, by allowing healthy competition to thrive, it will encourage innovation.

Best regards—
David Gallardo

Subject: I am backing Microsoft

Well, I don't know what comment I could make that isn't obvious to at least a large part of the population. I'm not an historian nor am I an attorney. I am but a simple consumer.

There is little doubt in my mind that every man, woman and child on the planet is aware of the case against Microsoft. In at least a general sense, we all know the jest of the case. I think consumers have already responded to the case brought forward by a small handful of attorney's.

Yes, I think we responded well to the needs of a few attorney generals that need to ''protect us'' from ''evil''. Oh yes ... We all know about the righteous.

Before, during, and after this case the general public will continue to appreciate Microsoft innovations. We will continue to purchase their products. I have, over time, used some of Microsoft's competitors products (Netscape for example). I have no doubt that these competitors did not fail due to practices by Microsoft, but by their own hands. Even when given the choice (which we have always had) we have made the choice to pick Microsoft products.

It is sad that only after millions of dollars and several years will we all have the opportunity to reflect on current events and realize what nincompoops these attorney's are for pursuing a case against Microsoft. I back dropping this case against Microsoft without any reservations. One citizen ... And there's my one vote.

No, among other things, I am not an eloquent writer, but I did feel compelled to voice an opinion.

Regards
Bruce C. Pippin

Judge Colleen Kollar-Kelly
microsoft.atr@usdoj.gov

Dear Judge Kollar-Kelly,

I wish to comment on the Microsoft Antitrust case awaiting judgment in your court. To keep things brief, I shall focus on points that I think have not been adequately brought out in the proceedings of which I am aware.

Point of information:

I am an Associate Professor in the Department of Plant Science at the University of Manitoba in Winnipeg, Canada. I have been doing research in molecular biology for over 20 years. I was also instrumental in the original development of software for DNA sequence analysis, beginning in 1979. I am an active contributor to the field of Bioinformatics, which has gained recognition recently in its role in sequencing the human genome.

Finally, I am an American citizen.

A. The effects of Microsoft's practices, and the indirect effects of its ''de facto standard''

1. The Microsoft culture

It has been well established in court proceedings that Microsoft has a long history of premeditated anti competitive practices. The main point I want to make is that the decision making process at Microsoft is centered around leveraging the existing monopoly to maintain the monopoly. When you have the monopoly advantage, you choose different strategies than a company that uses different premises for decision making, such as ''we need to be competitive'' or ''let's make the best product possible, and then figure out how to best market it.'' Microsoft's decision making, as shown in documents already presented to the court, has become entrenched in the practice of monopoly.

It is this type of mindset that allows Microsoft to treat its customers with contempt. The most glaring example is the Mail and News program, Outlook Express (OE). OE, through its feature of allowing the user to directly click on any icon in an email or news message, resulting in the haunch of an application, is fundamentally insecure. Even after repeated spread of viruses such as the ''Melissa'' virus, each time on a world-wide scale, Microsoft has refused to eliminate this feature from OE. Similarly, the integration of Visual Basic into applications such as MS Word makes it possible for viruses to propagate via text documents. In both cases, Microsoft has completely ignored security experts who advise that these strategies are fundamentally insecure, and remain invitations to an endless stream of viruses. Only a company with an arrogant certainty of market domination could afford to ignore such obvious flaws in its software.

2. The fact of monopoly results in de facto anti competitive effects

a) ''No one was ever fired for buying Microsoft''. In fact, this quote is based on an earlier generation quote ''No one was ever fired for buying IBM''. People make decisions not based upon whether a product is better, but they buy the MS product because it is a safe, defensible decision for which they can't be criticized.

Examples:

i) Long after NCSA Mosaic, and its successor, Netscape were introduced, Microsoft created Internet Explorer (IE). Even though IE was clearly an inferior product for several years, it quickly gained market share. Further leveraging of the Windows platform resulted in the ultimate domination of the browser market, at the expense of Netscape.

ii) RealPlayer and other products from www.real.com virtually created the market for browser-based multimedia. Yet, with the bundling of Windows Media Player (WMP), this established platform is losing ground. Why develop for RealPlayer when you can count on everybody having WMP?

iii) At one time there was a competitive market among word processors, spreadsheets, and drawing/presentation programs. Corel Word Perfect, Quattro Pro, and CorelDraw/ CorelPresents were viable competitors to MS Word, MS Excell, and Powerpoint. Today, the MS products are overwhelmingly the only products in widespread use.

In each case, the Microsoft product took over an already existing market, not by being better, but simply, because it was made by Microsoft. These examples illustrate the point that the de facto aspects of the Microsoft monopoly are far more pernicious than the deliberate anti competitive practices. Put another way, everybody buys Microsoft because everybody has Microsoft. This phenomenon ensures the continuation of the Microsoft monopoly. One might call this the ''market share cycle''.

b) Why develop for other platforms when Windows is the only one that anyone uses. Just about any software developer will tell you that they develop for Windows because it is the dominant desktop platform. Although virtually all computer science professors will teach their students that software development should aim to be platform-independent (for very good reasons), the reality of the marketplace is such that this advice is ignored. Developers, not surprisingly, develop for platforms with a large market share. For most software developers, even developing for the Macintosh platform is not worth their while, because it is such a small percentage of the market share. The net result is that no one chooses which platform to develop for, based on criteria such as quality of the platform, or ease of development. There is no choice at all. They develop for Windows.

Put another way, everybody develops for Windows because everybody develops for Windows. The process is self-perpetuating.

c) The self-perpetuating Microsoft monopoly impedes the evolution of computing There are alternatives to the desktop computing model of MS-Windows. While Macintosh is the most visible competitor, Linux is also a credible contender. As well, server-based solutions such as Sun Microsystem's iPlanet platform (http://www.sun.com/software/sunone/ overview/platform/), make it possible for both novice users and high-tech users to replace the desktop computer entirely with a user-friendly graphic terminal, or to run applications remotely through a browser.

The latter is a viable model as high-speed Internet connections proliferate, especially because they eliminate the need for the user to do any system administration, and insulate the user from the hardware obsolescence, and allow the user to access their computer files and applications from anywhere in the world. Such alternative solutions are in fact used by a very small number of users. They are only slowly gaining ground due to the Microsoft monopoly. The users of these alternative platforms would all argue that they do so because these platforms are superior to the Windows platform. Whether any or all of these alternatives is actually superior is moot. A putatively-superior computing platform simply can not compete with the de facto Microsoft standard.

d) The Microsoft monopoly has a negative effect on the quality of alternative systems. Even those of us who have chosen to use systems other than Microsoft Windows feel the negative impact of the monopoly. In my own case, I have operated my research laboratory, and performed all my teaching duties, almost exclusively on the Sun Unix system. Detailed examples can be found at http://home.cc.umanitoba.ca/psgendb/nc/. At home, my family and I exclusively use Linux.

While the members of my lab group, myself, and my students have often been ahead of the curve in utilizing networked computing resources, there have been a number of stumbling blocks resulting from the Microsoft monopoly. Probably the greatest problem is the fact that the choice of applications available on the Sun Unix system or Linux is much smaller than on Windows, due to the much smaller desktop market share of these systems. Again, developers won't write for these systems because the market share is small, and the market share stays small because the applications aren't available. When new hardware devices are marketed (eg. CD–ROM drives, printers, video cards etc.) the manufacturers seldom write drivers for non-Microsoft platforms. At the same time, they often refuse to make their specifications public, forcing the Linux community to reverse engineer new models in order to write device drivers.

The market share cycle also influences such fundamental things as the ability to purchase alternative systems. All computer stores sell computers with MS Windows preloaded. Only a small number of vendors will sell Linux pre-loaded, even though Linux is freely available. In many cases, a person wishing to run Linux might actually have to buy a Windows machine, thus paying for Windows, and then erase the hard drive and replace it with Linux. This phenomenon is sometimes referred to as the ''Microsoft Tax''. As well, because the user has to take the extra step of installing Linux, Linux is falsely perceived as being less user friendly. This would not be the case if the consumer

had a choice of buying a pre-installed Linux system.

The self-perpetuating Microsoft monopoly therefore results in an arguably flawed operating system maintaining control of the direction of computing, even when better alternatives exist.

B. A behavioral remedy is inadequate because:

* It does not break the market share cycle. As long as Microsoft remains the ''1 stop shopping'' choice for all software needs, no alternative platform, whatever its merits, can compete. Even worse, as the Windows platform continues to scale to midrange servers, that vertical integration will make the Windows platform even harder for IT decision makers to avoid.

* It guarantees endless litigation. MS has managed to make a career out of doing what it wants anyway, while tying up cases in courts for years while competitors flounder.

* It still leaves the MS anti competitive culture intact. The Microsoft corporate culture, as the company is now structured, is oriented toward perpetuating the monopoly. As long as Microsoft remains intact, the culture and attitudes of its employees will be perpetuated.

* One of the recommendations of the joint DO J/Microsoft settlement released in September is that Microsoft should be required to make its software available on other operating systems besides Windows. This might actually result in a further domination of the desktop market, because, due to the ''No one ever got fired for buying Microsoft'' phenomenon. Software that is currently common on non-Windows systems might be pushed out of the market by the perceived ''industry standard'' application. The goal should not be to encourage MS to grab an even larger market share.

Rather, it should be to eliminate the self-propagating domination of the market share that prevents competitors from vying for some of that market share.

C. Microsoft should be broken into several smaller companies

It is my contention that behavioral remedies will not correct the fundamental problems caused by Microsoft's domination of desktop computing. My basic point is that if the settlement is to be truly fair, then Microsoft should be put onto the same level playing field as other companies. It must be forced to make its decisions based on a competitive model, not a domination model.

The structural remedy should be based on the breakup of Microsoft into several companies. There may be many possibilities, and it must be recognized that the breakup should not make it impossible to do business, and should not be structured such that its implementation would be disruptive to the world of computer users, most of whom currently use Windows and MS Office. One such structural remedy would see Microsoft broken into different companies specializing in specific product areas:

1. Operating system

2. Office (current MS-Office: WORD, Powerpoint etc.)

3. Internet and Enterprise services (IIS, Internet Explorer, Outlook Express)

4..NET—API development tools

5. Applications (graphics, multimedia, etc.)

I believe that breakup into even 2 companies does not adequately curb the monopoly effect. It is too easy for two companies to coordinate efforts. It is more difficult for a larger number to coordinate. It also requires a greater effort on the customer's part to end up buying everything from an MS company, rather than buying some from MS, some from IBM, some from Sun, and others from another party.

Other stipulations:

* None of these companies may use the name ''Microsoft'' or ''Windows''. Each company will independently choose new names (eg. Gatesware, Redmond OS, IIS Systems, .NET inc.) This makes it a little more difficult for the ''Microsoft'' product to be automatically recognized and chosen solely for its name. It should be pointed out that MS really can't argue that it will be hurt one bit by a name change. Name changes in very large corporations happen all the time, especially in cases of mergers and acquisitions (eg. Esso to Exxon, AgrEvo to Aventis, Allegheny Airlines to USAir)

The resultant companies are not permitted free access to resources of other former MS companies. They must license use of software, or access to source code, on the same terms as any other OEM, developer, or other partner. That is, if a former MS company licenses something from another former MS company, the same licensing terms must be made available to all interested OEMs or developers.

MS companies are not allowed to dictate terms of inclusion or exclusion of other 3rd party software to any OEM or developer wishing to license products of former MS companies.

Current Microsoft corporate structure: http://www.microsoft.com/press pass/corpprofile.asp

One might argue that a structural remedy is somehow ''unfair'' or overly punitive. However, Microsoft holds no sacrosanct position of privilege. There is no imperative that Microsoft must remain as a pillar of the American way. It is not entrenched in our constitution. It is simply a company that was successful at a certain business strategy, at the expense of the ruin of many other companies.

D. Benefits of a structural remedy

1) It works automatically, and requires less monitoring.

2) It lets smaller companies compete piece by piece with MS, rather than having to compete with the full bundled MS array of products.

Today, an OEM or an IT department really makes few decisions about what to put on their new computers. The choice of OS is a ''no-brainer'', because everybody uses Windows, and most software is developed for Windows. MS-Office is usually bundled with Windows, so there's no choice there. With WindowsXP, a full multimedia package is bundled—again no decision is made. If bundling were eliminated, OEMs and IT departments might return to making decisions about what kind of components best meet their needs, rather than just ''voting the straight ticket'' for Microsoft.

3) Business and home computer users will not be harmed by a Microsoft breakup.

As non-Windows users like myself have demonstrated, one can work just as easily on non-Windows platforms. Especially in the Open Software sector, there are alternatives for most of the main types of applications available on the Windows platform, including applications for office tasks (word processors, spreadsheets, drawing and presentation, calendars), multimedia (MIDI, MP3, video etc.), Internet (web browsers, mailers, FTP, telnet etc.) At the enterprise level, server-oriented tasks such as database management, web serving, application serving and such are strongly represented on alternative platforms such as Unix or IBM's AS400. As well, a Microsoft breakup doesn't mean that Microsoft will go away. It simply means that the consumer will have to explicitly choose Microsoft, rather than having no choice at all.

4) The evolution of computing will not be driven by a single computing platform.

Regardless of whether or not one believes that the Windows platform is good or inferior, the fact remains that it is a monolithic platform. For the average desktop user, Windows is synonymous with computing. The more deeply intertwined the different parts of Windows are allowed to become, the less chance there will be for evolution of ANY part in a way other than that decreed by Microsoft. Microsoft's current strategy is to continue evolving its desktop model of computing to higher levels of computing, such as enterprise file:///C√/win/temp/tristens. computing or supercomputing, where it is a very poor model. Yet, the sheer inertia of Microsoft's market share will drive this system even into places in which it is not an appropriate solution. A set of smaller companies derived from Microsoft would not have the same power over the development of computing, allowing for greater diversity, which is key to any evolutionary process.

E. Closing remarks

Perhaps as good an argument as any from breaking up Microsoft is because computing has become central to almost every aspect of life in the modem world. Computing is unlike, say the oil industry, or the food industry. No car runs on just one brand of gasoline, and people buy a variety of foods because they like variety. When you couple our great dependence on computers in all walks of life, with the monolithic structure nature of desktop computing as controlled by a single company, the result is that the company that dominates that computing infrastructure has some degree of control on most aspects of our modem life. The level of power wielded by Microsoft is frightening. The fact that they had sufficient clout to cause the US Justice Department to reverse its position on a breakup is a chilling example of that power. The fact that Microsoft has maintained its arrogant domination of the computer market, and been allowed to do so with impunity, should be cause for alarm.

It is not unAmerican for any branch of government, executive, legislative or judicial, to limit the power of a private corporation, if that corporation is usurping powers that should rightly be exercised by the government or by the free market. Bill Gates was not elected by voters. The management

of Microsoft is not accountable to the public. The antitrust laws were wisely enacted in recognition of the fact that non-elected entities such as corporations could sometimes wield too much power. It is the job of the judiciary to ensure that they are not allowed to do so.

Detailed examples can be found at http://home.cc.umanitoba.ca/psgendb/nc/. At home, my family and I exclusively use Linux.

While the members of my lab group, myself, and my students have often been ahead of the curve in utilizing networked computing resources, there have been a number of stumbling blocks resulting from the Microsoft monopoly. Probably the greatest problem is the fact that the choice of applications available on the Sun Unix system or Linux is much smaller than on Windows, due to the much smaller desktop market share of these systems. Again, developers won't write for these systems because the market share is small, and the market share stays small because the applications aren't available. When new hardware devices are marketed (eg. CD-ROM drives, printers, video cards etc.) the manufacturers seldom write drivers for non-Microsoft platforms. At the same time, they often refuse to make their specifications public, forcing the Linux community to reverse engineer new models in order to write device drivers.

The market share cycle also influences such fundamental things as the ability to purchase alternative systems. All computer stores sell computers with MS Windows preloaded. Only a small number of vendors will sell Linux pre-loaded, even though Linux is freely available. In many cases, a person wishing to run Linux might actually have to buy a Windows machine, thus paying for Windows, and then erase the hard drive

and replace it with Linux. This phenomenon is sometimes referred to as the ''Microsoft Tax''. As well, because the user has to take the extra step of installing Linux, Linux is falsely perceived as being less user friendly. This would not be the case if the consumer had a choice of buying a pre-installed Linux system. flawed operating system maintaining control of the direction of computing, even when better alternatives exist.

B. A behavioral remedy is inadequate because:

* It does not break the market share cycle. As long as Microsoft remains the ''1 stop shopping'' choice for all software needs, no alternative platform, whatever its merits, can compete. Even worse, as the Windows platform continues to scale to midrange servers, that vertical integration will make the Windows platform even harder for IT decision makers to avoid.

* It guarantees endless litigation. MS has managed to make a career out of doing what it wants anyway, while tying up cases in courts for years while competitors flounder.

* It still leaves the MS anti competitive culture intact. The Microsoft corporate culture, as the company is now structured, is oriented toward perpetuating the monopoly. As long as Microsoft remains intact, the culture and attitudes of its employees will be perpetuated.

* One of the recommendations of the joint DO J/Microsoft settlement released in September is that Microsoft should be required to make its software available on other operating systems besides Windows. This might actually result in a further domination of the desktop market, because, due to the ''No one ever got fired for buying Microsoft'' phenomenon. Software that is currently common on non-Windows systems might be pushed out of the market by the perceived ''industry standard'' application. The goal should not be to encourage MS to grab an even larger market share.

Rather, it should be to eliminate the self-propagating domination of the market share that prevents competitors from vying for some of that market share.

C. :Microsoft should be broken into several smaller companies

It is my contention that behavioral remedies will not correct the fundamental problems caused by Microsoft's domination of desktop computing. My basic point is that if the settlement is to be truly fair, then Microsoft should be put onto the same level playing field as other companies. It must be forced to make its decisions based on a competitive model, not a domination model.

The structural remedy should be based on the breakup of Microsoft into several companies. There may be many possibilities, and it must be recognized that the breakup should not make it impossible to do business, and should not be structured such that its implementation would be disruptive to the world of computer users, most of whom currently use Windows and MS Office. One such structural remedy would see Microsoft broken into different companies specializing in specific product areas:

1. Operating system
2. Office (current MS-Office: WORD, Powerpoint etc.)
3. Internet and Enterprise services (IIS, Internet Explorer, Outlook Express)
4..NET—API development tools
5. Applications (graphics, multimedia, etc.)

I believe that breakup into even 2 companies does not adequately curb the monopoly effect. It is too easy for two companies to coordinate efforts. It is more difficult for a larger number to coordinate. It also requires a greater effort on the customer's part to end up buying everything from an MS company, rather than buying some from MS, some from IBM, some from Sun, and others from another party.

Other stipulations:

* None of these companies may use the name ''Microsoft'' or ''Windows''. Each company will independently choose new names (eg. Gatesware, Redmond OS, IIS Systems, .NET inc.) This makes it a little more difficult for the ''Microsoft'' product to be automatically recognized and chosen solely for its name. It should be pointed out that MS really can't argue that it will be hurt one bit by a name change. Name changes in very large corporations happen all the time, especially in cases of mergers and acquisitions (eg. Esso to Exxon, AgrEvo to Aventis, Allegheny Airlines to USAir)

The resultant companies are not permitted free access to resources of other former MS companies. They must license use of software, or access to source code, on the same terms as any other OEM, developer, or other partner. That is, if a former MS company licenses something from another former MS company, the same licensing terms must be made available to all interested OEMs or developers.

MS companies are not allowed to dictate terms of inclusion or exclusion of other 3rd party software to any OEM or developer wishing to license products of former MS companies.

Current Microsoft corporate structure: http://www.microsoft.com/press pass/corpprofile.asp

One might argue that a structural remedy is somehow ''unfair'' or overly punitive. However, Microsoft holds no sacrosanct position of privilege. There is no imperative that Microsoft must remain as a pillar of the American way. It is not entrenched in our constitution. It is simply a company that was successful at a certain business strategy, at the expense of the ruin of many other companies.

D. Benefits of a structural remedy

1) It works automatically, and requires less monitoring.

2) It lets smaller companies compete piece by piece with MS, rather than having to compete with the full bundled MS array of products.

Today, an OEM or an IT department really makes few decisions about what to put on their new computers. The choice of OS is a ''no-brainer'', because everybody uses Windows, and most software is developed for Windows. MS-Office is usually bundled with Windows, so there's no choice there. With WindowsXP, a full multimedia package is bundled—again no decision is made. If bundling were eliminated, OEMs and IT departments might return to making decisions about what kind of components best meet their needs, rather than just ''voting the straight ticket'' for Microsoft.

3) Business and home computer users will not be harmed by a Microsoft breakup.

As non-Windows users like myself have demonstrated, one can work just as easily on non-Windows platforms. Especially in the Open Software sector, there are alternatives for most of the main types of applications available on the Windows platform, including applications for office tasks (word processors, spreadsheets, drawing and presentation, calendars), multimedia (MIDI, MP3, video etc.), Internet (web browsers, mailers, FTP, telnet etc.) At the enterprise level, server-oriented tasks such as database management, web serving, application serving and such are strongly represented on alternative platforms such as Unix or IBM's AS400. As well, a Microsoft breakup doesn't mean that Microsoft will go away. It simply means that the consumer will have to explicitly choose Microsoft, rather than having no choice at all.

4) The evolution of computing will not be driven by a single computing platform.

Regardless of whether or not one believes that the Windows platform is good or inferior, the fact remains that it is a monolithic platform. For the average desktop user, Windows is synonymous with computing. The more deeply intertwined the different parts of Windows are allowed to become, the less chance there will be for evolution of ANY part in a way other than that decreed by Microsoft. Microsoft's current strategy is to continue evolving its desktop model of computing to higher levels of computing, such as enterprise computing or supercomputing, where it is a very poor model. Yet, the sheer inertia of Microsoft's market share will drive this system even into places in which it is not an appropriate solution. A set of smaller companies derived from Microsoft would not have the same power over the development of computing, allowing for greater diversity, which is key to any evolutionary process.

E. Closing remarks

Perhaps as good an argument as any from breaking up Microsoft is because computing has become central to almost every aspect of life in the modern world. Computing is unlike, say the oil industry, or the food industry. No car runs on just one brand of gasoline, and people buy a variety of foods because they like variety. When you couple our great dependence on computers in all walks of life, with the monolithic structure nature of desktop computing as controlled by a single company, the result is that the company that dominates that computing infrastructure has some degree of control on most aspects of our modern life. The level of power wielded by Microsoft is frightening. The fact that they had sufficient clout to cause the US Justice Department to reverse its position on a breakup is a chilling example of that power. The fact that Microsoft has maintained its arrogant domination of the computer market, and been allowed to do so with impunity, should be cause for alarm.

It is not unAmerican for any branch of government, executive, legislative or judicial, to limit the power of a private corporation,

if that corporation is usurping powers that should rightly be exercised by the government or by the free market. Bill Gates was not elected by voters. The management of Microsoft is not accountable to the public. The antitrust laws were wisely enacted in recognition of the fact that non-elected entities such as corporations could sometimes wield too much power. It is the job of the judiciary to ensure that they are not allowed to do so.

Dear Ms. Hesse:

This is to advise you that I strongly believe that the terms of the proposed settlement—which have met or gone beyond the findings of the Court of Appeals ruling—are reasonable and fair to all parties involved. This settlement represents the best opportunity for Microsoft and the industry to move forward.

I say this with a 30-year successful business career behind me and, hopefully, even greater success ahead. But should this settlement not be finalized and a harsher penalty imposed on Microsoft, I know, not believe, that it will affect my business and most all general, old-economy businesses in a severely negative and expensive way. Similarly, the so-called new economy industries will not benefit though those that are envious of Microsoft's success and those who cannot keep up with Microsoft's efficient execution of its business plan may feel differently.

I strongly request that you support this settlement to the greatest degree possible and do all things available to you to assure its being finalized. As both a business owner and home user who has and does use many software programs as well as spends quite a few hours a week on the Internet, I am grateful for all the many wonderful things that Microsoft has accomplished and have always made available to me at reasonable and fair prices that have aided me in my business and family life. Please feel free to contact me if you wish. Should you be speaking to Joel Klein, please say ''Hi'' from an old fraternity brother (we were in Alpha Epsilon Pi, Class of 1967, Columbia College of Columbia University, NYC).

Sincerely,

Attorney General John Ashcroft
Us Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I am writing you today to inform you of my position regarding the Microsoft antitrust dispute. I support Microsoft in this dispute and feel that the litigation that has gone on is costly and a waste of resources. I support the Microsoft settlement reached in November, and I sincerely hope there will be no further action against Microsoft at the federal level.

This settlement was reached after extensive negotiations. Microsoft has agreed to all terms of this agreement, including terms that extend well beyond the original issues of this lawsuit, all for the sake of wrapping it up. Under this agreement, Microsoft has agreed to grant computer makers broad new rights to configure Windows to promote non-Microsoft software programs that compete with programs included within Windows. Microsoft has also agreed to license its Window operating system products to the 20 largest computer makers. This settlement will benefit companies attempting to compete.

Most importantly, this settlement will help boost our lagging economy and will benefit consumers. Microsoft should be allowed to devote its resources and talent to designing innovative products, rather than litigation. Thank you for your support.

Sincerely,

I think that Microsoft should be allowed to settle. Because Microsoft used itswindows system to distribute Internet explorer, it would a kind of monopoly. However, Microsoft does not make any money off the Internet explorer browser. Netscape is being destroyed because they make their money off their browser. If Microsoft pays enough money, and if the money goes to Netscape, it should be allowed to settle.Microsoft had already made several concessions ???We kept making concessions, and the government kept coming back with unreasonable demands, wanting us toinstall Netscape for them,??? Gates said. ???It was like hearing ???Netscape this, Netscape that,??? all the time.??? Obviously the federal government is pushing Microsoft too hard. Though if Microsoft monopolizes the browser they may charge very high fees for using it,the government would not allow them then. Even so, Microsoft says that theyhave no intention of doing so: ''' Gates says. ''In no way are we eliminating choice.'' He also bristles at the notion that Microsoft wants to turn theInternet into its personal toll road. ''We'll get our revenue from selling great software.'' In the Pac-bell incident, Pac-bell was split because it had amonopoly of basically the entire market. That is one extreme past example.

Subject: Microsoft Settlement

Microsoft is a monopoly. That is the only way I can find to describe a company who, for years, has concentrated on squashing competitors rather than improving their shoddy products.

I have used Microsoft products in various capacities for many years—starting with MS-DOS 2.10 on a home PC to Windows NT 4 / Windows 2000 in a work environment (as a system administrator, no less). All versions of Microsoft Windows I have used, starting with 3.0, have experienced severe reliability problems—and these problems have grown over time. The rest of their software seems to follow this model.

In stark contrast, there have been quite a few companies over the years who have tried to improve upon the deficencies in Microsoft's products, only to be bought out or forced out of the market by unsavory business practices (bundling, etc.), thereby leaving the market barren of competetors. Netscape is only the most recent example of predatory practices that Microsoft has been using to boost their position for years.

Microsoft is fond of claiming they ''innovate''. I don't think Microsoft has innovated a single thing in their entire existence, instead choosing to buy or steal technology belonging to others. So much for innovation.

Please, don't let this settlement go through. It will just validate Microsoft's position of providing the worst products possible. Given their history of unreliable software with an amazing number of security holes, I would think that this is the last thing you'd want to do.

As I understand the meaning and nature of the Tunney Act statutory process, its principle goal is to ensure that the people who are invariably the principle victims of all antitrust violations, that is to say the general public, have a voice in determining what is and is not in their own best interests. It seems self evident that when deciding how to remedy violations of law which harm the general public, the first principle of guarding the public interest should be to minimize the recurrence of violations by making certain the consequences to the violator always outweigh the rewards. It is unavailing to resolve the case if the violator is allowed to profit from his misdeeds in any fashion, since this only encourages others to show even greater contempt for the law. It is similarly fruitless to go to great expense proving in court the facts of eight such violations and then allow the violator to keep

the rewards of them all, and even continue committing one or more. Such seems to be the case in this matter, the United States v. Microsoft, Civil Action No. 98–1232 (CKK).

After carefully reading and researching the findings of fact and conclusions of law of the District Court, as well as the unanimous opinion of the Circuit Court of Appeals, it is apparent that the United States Department of Justice, assisted by the attorneys general of several of the States, made a very compelling and conclusive case to establish that Microsoft Corporation had engaged in an illegal campaign of antitrust violations in order to strengthen and defend their monopoly in PC operating system software.

The District Court ruled firmly that Microsoft had committed a large number of violations, and the Court of Appeals unanimously upheld eight of those. In order to analyze the effectiveness of the remedy, the first thing we must do is ensure that Microsoft is not allowed to continue or profit from any of the eight distinct violations identified by the appellate court. I will begin this analysis with a list of the nine violations as they were expressed in X sections of the appeals court's opinion, along with a brief quote of the appeals court opinion regarding each distinct violation (I preserve the heading numbers used by the court, omitting those which were overturned or remanded).

1. Licenses Issued to Original Equipment Manufacturers—''In sum, we hold that with the exception of the one restriction prohibiting automatically launched alternative interfaces, all the OEM license restrictions at issue represent uses of Microsoft's market power to protect its monopoly, unredeemed by any legitimate justification. The restrictions therefore violate s 2 of the Sherman Act.

2. Integration of IE and Windows—''Accordingly, we hold that Microsoft's exclusion of IE from the Add/Remove Programs utility and its commingling of browser and operating system code constitute exclusionary conduct, in violation of s 2.''

3. Agreements with Internet Access Providers—''Accordingly, we affirm the District Court's decision holding that Microsoft's exclusive contracts with IAPs are exclusionary devices, in violation of s 2 of the Sherman Act.''

4. Dealings with Internet Content Providers, Independent Software Vendors, and Apple Computer—''Microsoft having offered no procompetitive justification for its exclusive dealing arrangements with the ISVs, we hold that those arrangements violate s 2 of the Sherman Act.''—and—''Accordingly, we hold that the exclusive deal with Apple is exclusionary, in violation of s 2 of the Sherman Act.''

5. Java—''Because the cumulative effect of the deals is anticompetitive and because Microsoft has no procompetitive justification for them, we hold that the provisions in the First Wave Agreements requiring use of Microsoft's JVM as the default are exclusionary, in violation of the Sherman Act.''—and—''Therefore we affirm the conclusion that Microsoft's threats to Intel were exclusionary, in violation of of the Sherman Act.''—''Microsoft's conduct related to its Java developer tools served to protect its monopoly of the operating system in a manner not attributable either to the superiority of the operating system or to the acumen of its makers, and therefore was anticompetitive.

Unsurprisingly, Microsoft offers no procompetitive explanation for its campaign to deceive developers. Accordingly, we conclude this conduct is exclusionary, in violation of s 2 of the Sherman Act.''

Semantically broken, these quotations uphold nine distinct acts as violations of the Sherman Act:

1. OEM license restrictions which prohibited many actions which might promote Netscape software in Microsoft's dominated market, excepting one which prohibited automatically launching alternative interfaces.

2. Exclusion of Internet Explorer from the Add/Remove Programs utility to force users to accept IE willy-nilly.

3. Commingling of brower and operting system code to further force users to accept IE willy-nilly.

4. Microsoft's exclusive contracts with Internet Access Providers to exlude Netscape from those distribution channels.

5. Microsoft's similar (to #4) dealings with ISV and ICPs to exclude Netscape from still other distribution channels.

6. Microsoft's exclusive dealings with Apple Computer to limit Netscape distribution for MacOS.

7. Microsoft's First Wave Agreements requiring the use of Microsoft's JVM.

8. Microsoft's threatening of Intel, which led to Intel abandoning nascent technologies related to Java which they had already invested considerable effort in researching.

9. Microsoft's campaign to deceive their own customers in order to trick them into writing Microsoft dependent applications when they thought they were writing cross platform Java applications.

After studying the Proposed Final Judgement in this case between the United States and Microsoft, I see that points 3 and 9 are completely unaddressed, and indeed in case 3 Microsoft is being given tacit government approval to continue and extend the practice of commingling operating system code with the code of any application they wish to dominate. Indeed Microsoft has already done this to some measure in their latest operating system release, Windows XP. They are not only continuing to commingle browser and operating system to make IE inextricable from Windows, but are extending the practice to now encompass code previously associated with multimedia authoring and editing. How does the Department of Justice explain this apparent endorsement of a practice ruled illegal by a United States Court of Appeals?

As for the other 7 violations, they are only imperfectly addressed. Virtually every restriction is laden with elaborate and ofttimes contradictory exceptions. Overriding all of these is the stipulation that Microsoft has sole authority to define what is and is not the operating system. This is carte blanche for Microsoft to continue their illegal practice of extinguishing nascent technologies through ''integration''. This settlement is going to require constant referral back to the court to re-explain matters which were already clearly stated by the Court of Appeals.

In short, this agreement encourages Microsoft to continue and expand on their illegal practices and encourages others in like circumstances to do the same. It is totally contrary to the public interest, in my opinion.

The National Native American Chamber of Commerce represents Native American and other minority businesses trying to compete in the New Economy. However, with monopolistic players and absurd settlements such as this one, we will continue to be excluded. That is why we are glad to witness that some state Attorneys General, including California's Bill Lockyer, are resisting this regrettable deal and asking the courts to impose a real solution. They deserve our support.

The proposed settlement of the Microsoft antitrust case is little more than a collection of loopholes that amounts to tacit approval for the company's history of mistreating its competitors. What is more, much of the criticism of those opposing the settlement misses three points in particular. First, the proposed settlement does not prohibit Microsoft from bundling its software and tightening its grip on Internet applications—including MSN portal, instant messaging, e-mail, and streaming-media applications. Second, yes, Microsoft must release some programming code to competitors, but only after it has developed its own products. And, third and finally, the independent watchdog group called for in the settlement is all bark and no bite—it has no teeth for enforcement.

We, the taxpayers, suffer in the long run. Other antitrust violators monitoring the outcome of this case will have a blueprint furnished for them detailing a course of action that will allow them to skirt out legal system. It is a pleasure to side with the state attorney general in admonishing what Justice Department attorneys hide behind in this farce, ''the substantial likelihood that Microsoft would avail itself of all opportunities'' to appeal.

Bill Lockyer is right to reject a settlement would essentially allow Microsoft to set its own rules and terms for complying with that settlement. Such an outcome is unacceptable—Microsoft has played ''fast and loose'' with U.S. antitrust law over and over through the years and has been found guilty in a number of jurisdictions of abusing its power.

Dear Mr. Ashcroft:

I wish to express my happiness upon hearing of the Attorney General's decision to end the Justice Department's antitrust lawsuit against Microsoft. However, I am not happy about the fact that it took the government three years to end its costly, taxpayer-funded lawsuit. Under the agreement, computer manufacturers were granted new rights to configure systems with access to various Windows features. Microsoft must design future versions of Windows to make it easier to install non-Microsoft software and to disclose information about certain internal interfaces in Windows.

The company made many more compromises in this agreement. I don't see a need for any future federal litigation against Microsoft beyond this agreement.

Subject: Microsoft Settlement

Dear Sir,

I would like to respectfully submit my comments on the Microsoft Settlement. I believe that the key issue in this case is whether or not it is possible for a company to infringe on the rights of others, e.g., customers, competitors, distributors, etc, simply by offering products or services for sale under certain conditions. Microsoft's competitors have alleged that Microsoft has constrained freedom of trade in the software industry by using ''unfair'' practices, such as obligating distributors of Microsoft programs to include certain features with Windows or to agree to certain licensing arrangements with Microsoft. I submit that offering products under such conditions do not constitute a breach of anyone's rights, neither distributors nor customers, since no one has been forced to deal with Microsoft. The only way to actually infringe on someone's rights are to initiate physical force against them or to commit an act of fraud against them. The fact that Microsoft has outcompeted its competitors, without a single alleged instance of force or fraud, and that its competitors are now crying ''Not fair!!!

Not fair!! Not fair!!!'', is no reason for the government to attack Microsoft with a lawsuit. Please keep in mind that the only way Microsoft has been successful during its entire history is to offer either better products or better services or lower prices. No one has been coerced or defrauded by Microsoft. Ever. On the contrary, the public (myself emphatically included) has enormously benefitted from the tremendous increase in efficiency of daily tasks, in both business and personal life, which Microsoft's products have made possible. Given these facts, I urge the court to not punish Microsoft for doing what the best of America's entrepeneur's have always done—bring to market products and services that improve people's lives.

Thank you for your attention.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Timothy L. Smith

To: Microsoft ATR
Date: 1/29/02 12:00am
Subject: Settlement—Energy

A commentator on the comuter technoloyg scene, Dave Coursey of http://www.zdnet.com/anchordesk, suggested that in the Microsoft settlement that has been proposed Microsoft should pay a mult-billion dollar fine as part of the settlement.

The condition for approval of the settlement is that it is in the best interests of the public of America. In the private antitrust case before Judge Motz in Baltimore the proposed settlement would have resulted in an estimated $1 billion for poor schools—which was totally unrelated to the alleged wrongs complained against Microsoft, but was presented as in the public interest.

The most pressing need facing America is this cnetury is sustainable energy to replace the oil supplies of America and the world, which are dwindling, and could be substantially depleted if other sources are not used intead. America needs oil for self-defense—planes, tanks and ships travel on fuels derived from oil. As we know too well after the September 11, 2001, attacks, the need of continuing self-defense of America is great. World oil resources are much greater than America's oil, (and I include gas always when I say oil) resourcs.

IF Microsoft is made to pay billions, as Dave Coursey of ZDnet's Anchor Desk suggests, the billions should go to research in sustainable energy, particularly, that using the principles discovery by Einstein, adn for which he was awarded teh Nobel Prize, including solar cells using the photo-electric effects, fusion energy, and improvements in fission energy. This will be in the best interest of America.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Darrell R Clemons

Subject: Netscape sues Microsoft

Netscape sues Microsoft

Netscape a company backed by AOL time Warner sews Microsoft on account of illegal bundling. AOL is more interested in dominating the communications industry than in Microsoft pay money. If we take a close look at what AOL already owns like HBO, Time, Warner Brothers, New line cinema we notice that they do not dominate in communications, and that all P.C. already come with Microsoft , so really there is no point in using AOL when you already have Microsoft. They plan to sue Microsoft so that bundling will stop and sometime in the future they will have a chance in the software field.

This case is really about AOL securing it???s place in the future. Truth be told no one needs AOL or Netscape. Microsoft is just trying to make Internet use more accessible.

Carnegy and his ability to make steel faster and more accessible to railroads did the same thing that Microsoft has done with the Internet. Rockefeller once said that , ???Much that one man cannot do alone two can do together.??? Windows and Microsoft have done together what one man alone cannot do.

Bundling may be found illegal but Microsoft intentions are just in wanting to make the Internet more accessible to the public.

Just want to let you know that I strongly support the Microsoft & DOJ settlement agreement. Continuing this court ordeal is bad for the economy and bad for the continuation of technological revolution.

Furthermore, it is important for US companies to maintain the competitive edge we currently enjoy. US government's resources, made possible by the tax payers, should not be used to punish successful US technology companies. It should instead be used to protect its citizens from likes of Enron debacle. Thanks for taking time reading my input.

I have been following the microsoft trials. It surprise me that the justice department gave up without any worthwhile penalties for Microsoft. They should be the lst ones to give up especially after Mircosoft was found guilty of illegat conduct.

I thought after finding Mircosoft quilty that the release of Windows XP should have been stopped. It contains even more bundling of products. Microsoft can afford to put more ''Free'' products out as long as it elimates the competition!

Why should a software developer want to spent the time and energy on a product when Mircosot forces the computer manufactuer to use only their programs. Even if a better product was produced it would never see the light of day, as Microsoft has been given a big head start by their strong arm tatics.

Some people think that getting the bundle programs free is a good thing. This is good only for Microsoft because they just add it to the price of the basic operating system.

Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am a computer technology manager and obviously, quite familiar with the recent settlement between Microsoft and the Department of Justice. I am writing to ask that you give your approval to this agreement and allow us to move on. This agreement was reached after very arduous negotiations, resulting in what I believe to be a fair and equitable agreement. I firmly believe that the original lawsuit is what precipitated the downfall of the economy, and further litigation will only continue to hamper our economic recovery.

Because I am in the industry, I believe the supposed monopoly of the market by Microsoft will disappear. Microsoft's dominance of the market was with the desktop; but with the appearance of the Internet, Microsoft will have to struggle to maintain its dominance of the market. Further litigation will only hamper any possible innovation by Microsoft, which will not only be Microsoft's loss, but ours as well. Bill Gates, through Microsoft, has taken us much further than we would have gone without him. We are depriving ourselves of a very talented, creative force merely to satisfy the whining of rivals who cannot compete. The market place is its own regulator, particularly in technology as it moves so quickly.

Microsoft has satisfied many of the Department of Justice's demands. Microsoft has agreed to open up to third party developers more of its copyrighted code, to aid in the development of third party programs; Microsoft has agreed to internal interface disclosure; Microsoft has agreed to a uniform price list; Microsoft has agreed to a technical committee to oversee future adherence. This is more than fair.

I urge you to give your approval to this agreement and not give in to the pettiness that is so apparent.

I support Iowa's Attorney General Tom Miller's work on the Microsoft antitrust case. Along with the majority of voters in our state, I have and will continue to retain his counsel in acting to protect the best interests of consumers of Iowa. Promoting a competitive environment among companies producing software will be of long-term benefit to everyone, and rejecting a settlement agreement that is premature is the right thing to do. Justice will not be the result of a hasty decision in this incredibly complex and high-stakes arena. If the proposed agreement is fair and is in fact in the best solution to the dangers posed by a potentially unfair competition situation, it will stand the test of time and the detailed analysis of Mr. Miller and his associates...which should not be curtailed until their case has been fully developed and considered.

Dear Mr Ashcroft,

It is with deep respect for you, the present administration, and the fairness of our great country that we write this letter asking you to accept the Microsoft Settlement. We have watched this entire process with great interest and believe strongly that this suit should never have been brought to court.

As small business people we hold dearly our right to keep and maintain personal intellectual innovations and to market those aggressively. Microsoft is a great success story and a testimony to the true spirit of America. Microsoft has done more for the small business owner than any other company in this century, by enabling our employees to work on computers which are affordable and user friendly!!! Instead of suing Microsoft and punishing success, our country ought to be heralding it's success and challenging other companies to strive forward. Through competition such as this comes excellence.

MICROSOFT HAS GIVEN UP MUCH AND WE URGE YOU TO ACCEPT THIS SETTLEMENT.

Thank you for your time and the opportunity to voice our opinion.

Sincerely,
Betty Dunham

Yes, I am a small stockholder of Microsoft as well as other tech stocks but I feel compelled to comment on the Microsoft Settlement. Shame Shame on the Vultures, The go\oemment as well as nine states have already agreed to a settlement. But that is not enough, the remaining states and other companies are now di\Ang in to strip remaining bits of flesh from a down-beaten company as well as pre\enting them from competing fairly under a working capitalistic system (Economics 101). The company that builds the best product should win. The employees and management of Microsoft worked their buts off to be number 1. They did such a good job that e\en other companies and their employees use Microsoft products. The other companies should ''get a life,'' get dd of their high priced ''ambulance chasing'' lawyers and use that money and their own skills to make competing products. Its like forcing J.C. Pennys to remo\oe their buttons from all their shirts and gi\Ang Sears and others the opportunity to offer their buttons or even zippers perhaps. This would then gi\oe other companies an opportunity to compete ''equally'' with Pennys . This so called fairness issue is ridiculous. Lets continue with good healthy competition the old fashioned way.

Thank you \cry much for allowing me to address this issue.

January 27, 2002
Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am writing you today to voice my opinion in regards to the Microsoft settlement issue. I feel that this debate has gone on long enough and that it is time to end this litigation. After three years of litigation, it is time to focus on more pressing issues. The nation is under attack and may soon be involved in a major war. In my opinion, this lawsuit should never have occurred in the first place. It was orchestrated by Microsoft's competitors like Sun Microsystems, Oracle, AOL, IBM, and others. I have not been a shareholder for almost a year but I am still very concerned about what I feel is gross miscarriage of justice in this case.

Microsoft should be rewarded for all the technological and economic advances their products allowed in the last decade. Instead their persecution, instigated by their competitors persists. I hoped the Appeals Court Judges would vacate Judge Jackson's findings. The Oral arguments certainly indicated this might happen, considering their horror upon discovering Judge Jackson's judicial misconduct, and the way they mocked the government's case. Even though their final decision admitted that ''All indications are that the District Judge violated each of these ethical precepts. The violations were deliberate, repeated, egregious, and flagrant.'' Section 455(a) of the Judicial Code requires judges to recuse themselves when their ''impartiality might reasonably be questioned.'' The Appeals Court basically did nothing to remedy Jackson's inexcusable conduct beyond giving him a verbal tongue lashing, and they failed

to have Jackson recused retroactively from the first time there was evidence of judicial misconduct.

Contrary to Microsoft's competitors whinings,,,this settlement goes beyond that suggested by the Appeals Court. The AC court threw out all of Jackson's remedies which would have broken up the company. They rejected the remedies not only because Jackson erred by not allowing an evidentiary hearing on remedies; but because those remedies no longer applied to the violations they found; which were much less severe than those found by Jackson. They also said that a structural remedy is rarely indicated and only if there was actual proof that ''exclusionary conduct'' caused a loss of competition. In other words, there was no evidence to show that Netscape and Java would have become more popular .if not for big bad Microsoft..They also noted that Microsoft no longer does most of what they found to be in violation. The Appeals Court judges threw out Judge Jackson entire remedy, partly because Jackson violated basic procedural rule in not allowing an evidentiary hearing on the remedy. In their words; ''It is a cardinal principle of our system of justice that factual disputes must be heard in open court and resolved through trial-like evidentiary proceedings. Any other course would be contrary ''to the spirit which imbues our judicial tribunals prohibiting decision without hearing.''

Yet the Appeals Court ignored their own advice, and failed to hold an evidentiary hearing to determine when these ''egregious ethical violations'' occurred. This allowed them to arbitrarily select a date, which conveniently was after Jackson issued his Findings of Fact and Conclusions of Law, even though evidence was presented that revealed the violations occurred before the Findings of Fact were issued.. The entire decision should at least have been vacated and the case remanded to a different judge or the case should have been thrown out in toto.

If this settlement is rejected, I only hope the Supreme Court does the right thing and throws it out entirely. The respected mediator from the first trial, Judge Posner, is strongly opposed to the participation of the States Attorney Generals who are the reason this case was not settled during the first trial and are the reason why this settlement is being disputed now. Posner has recommended that future antitrust cases brought by the Federal government not allow the States Attorney Generals to participate. Unfortunately, he acknowledged that any change to the laws would occur too late to help this case be resolved.

Further, Posner acknowledges ''A complication is that it is difficult to find truly neutral competent experts to advise the lawyers judges and enforcement agencies on technical questions in the new economy. There aren't that many competent experts, and almost all of them are employed by or have financial pies to firms involved in or potentially affected by antitrust litigation in this sector. It is difficult to find a consultant in the new economy who is both competent and disinterested, or ''find neutral experts they could help the judge administer a consent decree.''

''The new economy presents unusually difficult questions of fact, such as where a plaintiff complains that the defendant has changed the interface to make it more difficult for the plaintiffs product to work with the network, or a defendant contends that it disclosing a protocol would allow its competitors by reverse engineering to copy its trade secret, that cannot be protected by copyright or patent law. Both questions are very technical and difficult.'' ''Antitrust in the New Economy. Antitrust Law Journal, 2001, 68, 920–940

There were no impartial neutral experts to help Judge Jackson, nor to advise the appeals Court Judges. Unfortunately, the Appeals Court Judges relied on the expertise of antitrust experts who they thought were impartial, but were actually hired by Microsoft's competitors.. Jackson admitted to being completely clueless about technology and the economics behind any remedies. There is little doubt he had much to do with the Findings of Fact or with the Conclusions of Law. Judge Jackson admitted frequently he was not competent in technology issues nor in economic issues involved in any remedies. In other words, Jackson was ''technologically and economically, challenged. He admitted that his secretaries would explain certain issues to him. Jackson just rubber stamped the remedy submitted by the Government, who consulted heavily with Microsoft's competitors. The government in turn accepted what Microsoft's competitors gave them., they in turn got ProComp and SIIAA and CIIAA to do their work..

Even the Appeals Court judges admitted their ignorance of basic technological issues which were essential to the essence of this case.. ''THE COURT: I mean I have to say that I have only done downloading of these things with the help of much more skilled people. So I took seriously the proposition that that was a big barrier. But 60 million people just downloaded it? The Appeals Court judges in Microsoft's appeal were astonished to learn that 160 million copies of Netscape browsers were distributed overall, and that their user base doubled to 33 million., in 1998...when Microsoft's competitors were accusing Microsoft of foreclosing competion.

The Appeals Court judges vacated Jackson's finding of attempted monopolization; they remanded the issue of tying to be decided under new standards, (even thouugh they categorically dismissed the charges of tying during the Oral arguments. (They indicated they were told (by Microsoft's competitors, no doubt) that they used the wrong standards. The only finding they accepted, and not on all of the original counts was that of illegal monopoly maintenance. Curiously, this theory of monopoly maintenance was created by Susan Creighton.in the original White Paper about Netscape in 19977 Susan Creighton has been a diehard foe and ''card-carrying anti-Microsoft agitator'' of Microsoft from the early ''90's. More curiously, Susan Creighton is now the deputy director for the FTC. I hope she has recused herself from any involvement in this case.

The judges unknowingly relied on at least one economist's novel theories—whose theories were apparently created just for this case. Dennis Carlton was an original participant in Project Sherman. ''The Truth, The Whole Truth, and Nothing But The Truth'' http://www.wired.com/wired/archive/8.11/microsoft.html Mike Morris was counsel for Sun Microsystems.. ''Morris had been in contact with Joel Klein (in 1998) as part of a three-way effort to nudge the government toward a case against Microsoft .... for the past nine months.'' Wired 11/2000 Page 280. The other two parties were Netscape's Roberta Katz and Sabre's counsel, Andy Steinberg. Together they had founded ProComp. ''Now Morris was plotting a solo mission: to put together a sort of private blue-ribbon commission of nationally renowned antitrust lawyers and economists, have them draw up an outline of the kind of Sherman Act case that would make sense for the DOJ to file, including a discussion of possible remedies, and then present the whole thing to Klein and his people. ''According to the article, Joel Klein thought this would be useful. From Wired 11/2000 Page 280.

''The political sensitivity of Project Sherman was, needless to say, extremely high, for here was one of Microsoft's most ardent competitors bankrolling a costly endeavor to influence the DOJ—an endeavor undertaken with the department's encouragement.'' ''So began a project that would span three months and consume $3 million of Sun's money: Project Sherman.'' ''Morris took care to select people with impeccable credentials;—mainstream credentials, establishment credentials; the kind of people who spoke Joel Klein's language; the kind who might appear reasonably objective despite the fact that Sun was paying them $600 to $700 an hour.'' (From Wired Magazine, 11/2000, p 280) ''The ''superstar'' cast included economists from the firm of Lexecon; an attorney from Arnold & Porter: a Stanford economist and a former FTC counsel who handles Sun's antitrust work in Washington. ''Members of Project Sherman met every two weeks for three months and then Morris got Gary Reback to assemble industry figures for a hush hush meeting, not knowing they had been paid by Sun. (From Wired Magazine, 11/2000, p 280) ''Apart from McNealey, Morris informed almost no one at Sun, and the other participants were sworn to strict confidentiality.'' (page 280, Wired November 2000).

According to Heilemann, Reback and Creighton lobbied the FTC, the Senate Judiciary Committee, the European Commission, other Attorney Generals and anyone who would listen. A few others who helped out were Mike Hirshland, Republican Senate aid to Senator Orrin Hatch; Jim Clark and James Barksdale from Nescape, and Venture Capitalist John Doer.

''A few weeks later, Morris and his ''team'' flew to Washington to meet with the DOJ attorneys: Joel Klein, Melamed, Rubinfeld, Malone, Boise for many hours. ''Morris's team ''proceeded to outline the case they believed the DOJ should file.'' The charges were straight from the Netscape White Paper written by Susan Creighton ''illegal monopoly maintenance and monopoly extension; a violation of Section 2 of the Sherman Act'' They addressed the question

of so called ''harm to consumers;'' the so called ''damage to innovation'' and ''then the talk turned to remedies'' and a range of conduct remedies'' was presented as well as the ''case for a structural remedy'' (From Pages 282–283 of Wired Magazine, November 2000)

''In 1975 Microsoft had 3 employees and revenues of $16,000. Over the next 25 years they grew to 36,000 employees and revenues of $20 billion by obsessively figuring out what computer users needed and delivering it to them.'' ''Over the years Gates and his colleagues made a lot of people mad, especially their competitors. Some of those competitors delivered a 222-page white paper in 1996 to Joel Klein, head of the Justice Department's antitrust division, and urged him to do to Microsoft in court what they couldn't do in the marketplace. (Susan Creighton wrote that White Paper). Another peculiarity of this case is the presence of U.C. Berkeley Haas Business School Professor Michael L. Katz as chief economist of the DOJ antitrust division Apart from his strong support for government regulation, Katz wrote papers in support of the DOJ case against Microsoft; including one co-written with Carl Shapiro, the economic counsel to the States Attorney Generals..hmmmm.

Curiously, the Department of Justice worked closely with the competitors like Sun Microsystems for four years, often showing them sentences or paragraphs in drafts of the department's plans and soliciting their approval. The politics of the case is a far cry from the Platonic ideal of rigorous economists devising the best possible antitrust rules and wise, disinterested judges carefully weighing the evidence.'' Microsoft's competitors have used the Department of Justice to try to take not just their money but their intellectual property as well. From ''The Theft of Microsoft'' by David Boaz. http://www.cato.org/dailys/07–27–00.html I cannot imagine that Project Sherman was a legal undertaking, and wonder if the Appeals Court judges were aware of Joel Kleins meeting with reporter John Heileman. I wonder if the DOJ would have brought the case if it was publicly acknowledged at the time that they were listening to testimony from hired experts paid handsomely by Microsoft's.

During these difficult times, it is vital to do all we can to boost our economy. Restricting Microsoft will not accomplish this. This country is at war with a world wide network of Islamic extremists intent on destroying us. The Department of Justice needs to focus on ''fixing'' the FBI and improving the security of our nation and protecting American citizens against more terrorist attacks. Has this short passage of time since September 11 dulled memories so quickly that we are back to the old games of using lawyers and politicians and the Department of Justice to squash competitors? Are things really back to normal? I don't think so.until the next terrorist attack. Antitrust laws are not meant to protect competitors against their inability to compete in the marketplace due to their own incompetence. Look who is suing? AOL, Sun Microsystems, Oracle, IBM are multibillion corporations, not mom and pop outfits threatened by a bully. The antitrust laws were meant to protect consumers and to allow fair competition. Consumers are not complaining. However antitrust laws are now being used to protect competitors, and to make trial lawyers even richer,,,at the expense of consumers and the economy. How many companies have been forced into bankruptcy now by trial lawyers over asbestos? 20? 30? 50? AOL, Time Warner, IBM, Sun Microsystems, Oracle, etc have contributed heavily to politicians for years.long before Microsoft was forced to play this game, as a result of their persistent efforts to prosecute and persecute Microsoft.

Should the DOJ continue to ''work'' on behalf of Attorney Generals who are receiving large contributions and specific instructions from Microsoft's competitors via ProComp and other such organizations? After all, it was Sun Microsystems'' who paid antitrust experts like Dennis Carlton to ''produce'' antitrust charges which would appear credible to the DOJ. Reputable antitrust experts like Carlson produced novel antitrust theories of harm from incomplete exclusionary conduct. Almost all of the violations upheld by the Appeals Court were based on Carlton's ''novel'' theories. Others were based on ''novel'' theories developed by Susan Creighton, an ardent Microsoft foe.

I would think that the Enron scandal would make politicians and regulators more wary of the dangers involved from large contributors. I was surprised to learn the extent of Enron's contributions. They gave $50,000 to Paul Krugman, from the New York Times, who writes about economic matters, and not too surprisingly, Krugman apparently wrote positive articles in the past about Enron..

It was a complaint from Sun Microsystems that lead the European Union to launch an antitrust case against Microsoft by the EU. There is something about certain American companies that run to other countries to crush their competition ..if they can't get the DOJ or FTC to do it. It is telling that Sun Microsystems has 200 lawyers in their legal department, more than many large firms, even in Washington. I think their shareholders might prefer they spent more on improving their products and competing.as their stock continues to decline.

Microsoft was consistently been rated one of the top corporations to work for and one of the most admired companies by Fortune until the trial lawyers and AG and MSFT's competitors started their hatchet jobs and made Microsoft into an 'unsympathetic target.'' http://www.techcentralstation.com/1051/techwrapper.jsp?PID=1051–250&CID=1051 -012901A

Microsoft's competitors lobbied politicians for years before Microsoft was finally forced to join their game and forced to pay this ''protection money.'' ''For about 20 years Gates and his colleagues just sat out there in ''the other Washington,'' creating and selling. As the company got bigger, Washington, DC, politicians and journalists began sneering at Microsoft's political innocence. A congressional aide told the press, ''They don't want to play the DC game, that's clear, and they've gotten away with it so far.

The Problem is, in the long run they won't be able t0.'' Politicians told Bill Gates, ''Nice little company ya got there. Shame if anything happened to it.'' And Microsoft got the message: If you want to produce something in America, you'd better play the game. In 1995, after repeated assaults by the Federal Trade Commission and the Justice Department, Microsoft broke down and started playing the Washington game. It hired lobbyists and Washington PR firms. Its executives made political contributions. And every other high-tech company is getting the message, too, which is great news for lobbyists and fundraisers.'' (but not for consumers or innovators or successful companies..) From ''The Theft of Microsoft'' by David Boaz. http://www.cato.org/dailys/07–27–00.html

''What lesson should they draw? The antitrust laws are fatally flawed. When our antitrust laws are used by competitors to harm successful companies, when our most innovative companies are under assault from the federal government, when lawyers and politicians decide to restructure the software, credit-card and airline industries, it's time to repeal the antitrust laws and let firms compete in a free marketplace.''

Microsoft's competitors and these phony front groups are using their influence over the media, and their power from contributions to politicians to give the appearance that they are concerned with consumers, when they are only advancing their own agenda, which is harmful to most of us. Microsoft's competitors claim to have the interest of consumers at heart, when in reality their own incompetence lead to their loss of market share. AOL 5 was such a terrible product that even computer experts could not deal with the changes it made to the computer. It changed your default settings and took over. Mossberg from the Wall Street Journal, who has never been a fan of Microsoft, acknowledged this at the time and there were lawsuits over this which somehow failed to make the news.. Anyone who has ever used AOL knows about their inferior products and their poor customer service. Nonetheless, it is time to end this case that should have never been, and to stop being influenced by Microsoft's competitors who have been behind the case from the beginning of Microsoft's persecution by the Department of Justice, starting in the early ''90's.

This settlement is the perfect means to end this dispute. Microsoft will remain together and continue designing and marketing their innovative software, while fostering competition and making it easier for other companies to compete. Microsoft has pledged to share more information about Windows operating system products and has agreed to be monitored for compliance.

I sincerely hope the Department of Justice accepts this settlement and puts an end to this mess and turns their attention to real threats to the Nation-the terrorists who want to destroy the West. Caving into Microsoft's major competitors who are behind the Attorney Generals hurt consumers and the economy further. Let them innovate like Microsoft does, rather than litigate.

Thank you for your attention.

Sincerely,

Helen B. Gamsey

Subject: Microsoft Settlement

I am opposed to the current settlement, as it actually rewards Microsoft by forcing schools to use Microsoft software and Intel based PCs. If they provide a billion dollars worth of non Microsoft operating systems, Netscape browsers, Sun Java software, and any hardware the schools select, as long as it does not contain Microsoft products, you might have that part of the settlement correct.

Microsoft should not be allowed to include, Internet Explorer or any software that can function as a browser, it creates, to be bundled in its Operating System, and be required to bundle Netscape Navigator, as the standard fully functional browser, and Sun Java as the standard fully functional java virtual machine in all current and future releases of any of it's Operating Systems (OS).

Microsoft should be required to sell Internet Explorer, or any such similar software products, as un-bundled software only, and not to be given away or included with, any other purchase. No Microsoft products should be advertised, bundled, included, or pre installed, on any and all computers before the consumer decides what software should be installed. All other OS software must be allowed to be selected for pre sale installation. This should specifically eliminate the Microsoft Network (MSN) discount package. Microsoft must dissolve itself of all it's Internet Services (MSN). Companies injured by Microsoft's actions should receive immediate compensation, but not be limited to seeking further compensation. All penalties and compensation must be put in escrow immediately. This would be a good start.

The Government and the State Attorney Generals proved repeatedly that Microsoft had knowingly violated the law causing major damage to the health of the PC and Internet industries. Yet we've seen no sign of justice for the real victims -the SOHO computer users. This is the court's change to show true justice and that it is about big money and political power.

Subject: Microsoft Settlement

Hi,

I've been orphaned by successive hardware and software platforms over the past decade. My comments will emphasize the time period 1989–1993. Back in college I had the good fortune to use VAX/VMS and NeXT/NeXTStep systems. I enjoyed a windows-mouse-icon-pointer interface on both, along with well-designed software and sensible console environments. Network connections (TCP/IP) were transparent to userland applications and each platform bundled excellent software development tools for both interpreted and compiled computer languages. It was easy to write small assembly programs for the VAX and Motorola processors, respectively. Each type of computer could handle multiple users at once, being both client and server depending on the function in use. Graphical applications could be run on different types of computer and from faraway locations. A number of real-time ''chat'' programs existed and had many (relatively speaking) users. Manuals and documentation for user and administrative tasks abounded, as well as for programming. Unfortunately I also had to use ''desktop'' computers. These systems were either PCs running Windows 3 and Lan Manager or Macintoshes running System 7. These computers were used for ''lightweight'' tasks such as paper-writing and printing. They did not work well for their assigned tasks. Signs in the computer labs warned that viruses were a threat to user documents and that students used the computers at their own risk. Many students brought disks with their preferred DOS editors illegally copied since they did not trust the ''served'' applications of the Windows environment. Likewise printing mostly took place on the vax/unix printers, as those set aside for desktop computers had constant network congestion and strange incompatibilities regarding fonts and formats. Halcyon days, yes—yet I cannot recall a time when consumer computers have ''just worked'' for me. Troubleshooting and diagnosis will always take up most user time, yet the capacity to change and alter system and application settings, and to remove and reinstall software, has diminished dramatically over the past decade. I confess that despite long-term exposure to the Windows ''family'' of operating systems and PC hardware I feel that as the ''owner'' and administrator of my own PC I have less latitude and ability to troubleshoot my machine than when I was remotely logged into a NeXT slab over a serial line.

My PC shipped with Windows 98. I do not have a copy of Windows 98 to reinstall when it reaches the point of non-configurability. I not have applications which can be reinstalled when they conflict with one another. Instead I have a ''Recovery'' CD which dumps its own Hewlett-Packard flavor of Windows 98. Its HP-specific drivers cannot be disentangled from the core OS. I cannot cleanly install, remove and reinstall applications. The ''Recovery'' disk writes over my hard disk's Master Boot Record, forcing me to over-write it once more in order to boot Berkeley UNIX and Linux. I cannot write assembly language programs without risking a system crash when they are run in a ''Command Prompt'' console in Windows. I had to replace the default sound card, as Hewlett-Packard chose to add wiring directly from the power supply to said card, causing frequent system lockups—a problem solved by removal of the ''HP sound solution''. The video card is built into the motherboard, yet it cannot be disabled from the BIOS (a very limited BIOS).

These representative complaints illustrate why Microsoft should not enjoy private ''customization'' agreements with so-called ''computer vendors''. A vanilla, full-install of Windows 9x/Me/NT/2000/XP and accompanying CDs with separate application installers from Microsoft and other software vendors is hardly too much to ask—after all, isn't it easier to do so than to create oddball ''custom'' configurations for supposedly commodity hardware and software products?

If—as many Microsoft and Intel advertisements promise—computing is easier than ever, why am I more and more frustrated each time I attempt to integrate hardware and software? Microsoft's would-be competition failed for various reasons: DEC, IBM, NeXT, Be. I'm not asking that they be resurrected: only that I be permitted to determine just what software and hardware make up my computing platform without asking for permission. I took advantage of a sales deal to buy a PC from CompUSA. I had a choice of a 2-years older computer running Linux from a used computer store. Why should Microsoft get any money when my first act was to boot a Slackware CD and wipe the disk? (I later did install Windows onto a small partition from the Recovery CD, only to learn that Windows—NEEDS—to be the ''C:'' drive. 15 years of DOS and it still can't handle being moved to slave position.) I have no problem buying a separate, full-install of Windows. I have no problem running ''Windows'' applications. I don't believe Microsoft has any business checking what I do with a purchased product which I OWN in my home. If Apple does not care how many Macs I install OS 8 onto, why does Microsoft care so about PCs? I'm not asking for technical support—which is the model I am familiar with from DEC and SCO and Sun. Apologies for the rambling nature of this post. Thank you for reading it.

John Brajkovic

PS. Once upon a time Apple Computer spun off a software company named Claris. (Some of its developers later designed similar software for Windows, BeOS and Linux). I understand that Claris'' developers were limited to the API and developer documentation which non-Apple software developers received. Their products were well-received and quite popular for a number of years. I fail to see why Microsoft should not do the same.

I don't know if Microsoft is a Monopoly; I'm not a lawyer. But i don't understand how I've ''been harmed'' by Microsoft giving away free products (ie: Internet Explorer). Would I have been better off paying for it? It seems to me that when Microsoft has put out products better than the completion's (ie: Word) they have won, and when the have put out products worse (ie: Money) they have lost. When someone goes to a job interview

and they know how to use Word or Excel how many thousdans of dollars in training and productivity have they saved an employer? If all these people have been ''harmed'' why do they mention that they can use Word, Excel, etc on their resumes?

Lets end the case and move on.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Frank G. Brazil Jr.

Dear Mr. Ashcroft:

I would like to voice my opinion on the Microsoft Anti Trust case. It is time that this case be ended. Upholding the current settlement is the right thing to do. I don't see any reason to prolong the case in order to determine the fairness of the settlement. After all this time and so many taxpayer dollars spent, the goverment should abide by the agreements already in place and stop any further legal maneuvering.

I am self-employed and use Microsoft for my business. Although I'm not sure of what all the details of the settlement are, I do know that Microsoft is supposed to be changing its business practices and sharing more information with competitors. Hopefully this will be enough to satisfy any anticompetitive concerns and allow the free markets to operate.

Sincerely,
Thomas Powers

Subject: Micrrosoft Settlement

Dear Attorney General Ashcroft:

We support the Microsoft settlement with the Department of Justice. The time has come to bring this case to a close. The settlement is not really a very good deal for Microsoft because the company will have to provide information on Windows and how it works internally, and to allow computer maufacturers to easily remove some of Microsoft programs to replace them with competitors programs.

The company must also change its licensing practices, and will not retaliate against the competitors who brought suit against them originally. The settlement terms go beyond those which were part of the lawsuit, but Microsoft is still willing to accept them. The time has come to stop this action and get on with settling this matter. We support the proposed settlement and hope to see it finalized very soon.

thank you Stanton and Corrita Jorgens

Dear Mr. Ashcroft:

I am writing to express my displeasure with the three years of litigation that have been brought against Microsoft. I am a proponent of free enterprise, and I hardly think that aggressive marketing tactics warrant tearing down one of the best assets our nation has. Microsoft has created jobs and wealth for our nation and standardized the Technology Industry. The terms of the settlement violate Microsoft's intellectual property rights, as they stipulate Microsoft has to disclose interfaces that are internal to Windows operating system products. Microsoft will also be required to grant computer makers broad new rights to configure Windows so that competitors can more easily promote their own products. Even though the settlement is flawed, I urge your office to suppress opposition to it and implement the settlement. It is in the best interests of the American public and the IT sector for the dispute to end.

Yours truly,
Ron Faunce

Honorable Judge,

I urge you to reject the proposed settlement in the U.S. vs. Microsoft anti-trust suit before you. Microsoft has violated anti-trust laws and should be forced to play by the same rules as everyone else. However, this proposed final judgment would fail to accomplish that. Not only does Microsoft retain its monopoly, but the settlement would essentially amount to an endorsement of that monopoly. And Microsoft is left to police itself! Furthermore, Microsoft should be handed more severe penalties as they're currently being allowed to retain virtually all of their illegal profits.

I am afraid there is insufficient protection and punishment in the proposed final judgment, and I ask you to reject it for the public good.

Sincerely,

Dear Sirs:

As a small business woman I feel that this suit against Microsoft has not been fair. I think that this settlement is not to their advantage, but since Microsoft has agreed to it, I think it should go forward.

Please rule for Microsoft. This has gone on long enough.

Sincerely,
Marian W. Garton-Zweber

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Michael Harper

Antitrust Division
United States Department of Justice
Washington, DC

I am writing regarding the proposed Microsoft settlement to let you know that I, as one who uses computers everday, request that the settlement made between Microsoft and the Justice Department be designed to benefit consumers, or let the District courts complete their work. Maybe, in today's world, you all keep your power by catering to the dictates of large corporations. Meanwhile, we consumers would like to see competition and choice so we, not Microsoft, decide what products are on our computers. The settlement must provide ways for any

combination of non-Microsoft operating systems, applications, and software components to run properly with Microsoft products and give access to software developers of all tools and information they need to enable Microsoft products to run with non-Microsoft products, even across platforms.

The proposed settlement is not in the public interest. The settlement leaves the Microsoft monopoly intact. It is vague and unenforceable. It leaves Microsoft with numerous opportunities to exempt itself from crucial provisions. Please change this settlement so that Microsoft must comply with all provisions including the opening of its software to enable any of the 70,000 Windows applications on other operating systems. Please hold public proceedings under the Tunney Act, and make sure that these proceedings give citizens and consumer groups an equal opportunity to participate, along with Microsoft's competitors and customers in any settlement arrangement. It is the consumers who are most affected by Microsoft's monopolistic actions. It is time that this change and consumers have their voice. Anti-trust actions have been taken. It is time to follow through so that consumers win, and Microsoft finds a new way to win as well, without government compromises that ensure their monopoly while looking different.

Thank You

Hello,

I would like to express my frustration with the Proposed Final Judgement (i.e., the Microsoft Settlement). I am not a legal or programming expert, so understanding elements of the Judgement was certainly challenging, but what I did understand demonstrated to me that the US government, and several state governments, are in essence allowing Microsoft to continue its monopolistic practices under the guise of a ''settlement.''

I disagree with the Proposed Final Judgement as it stands.

Thanks,
Mark Baenziger

E-mail comments to Microsoft.atr@usdoj.gov. Please type ''Microsoft Settlement'' in the subject line.

Your Honor,

My name is Sherrie Andra Johansson Keller. I just found out about this option to comment this evening. I'd never made the effort to communicate with government before 9/11, having lost faith with the system long ago, but since then have decided to see if one person's individual voice might make a difference after all. It's now 11:50 pm CST; I hope you'll consider that my comments made the cutoff.

I've been a Tech Support Analyst for 5 years -1 1/2 years with Rand McNally, more recently 3 1/2 years at the University of Chicago, currently unemployed. I have followed the Microsoft trials for the duration. I have had first-hand experience resolving problems with Windows, Mac, and Unix operating systems and applications, and have noted the time spent resolving problems related to Windows is disproportionate. Most were due to system file version conflicts caused byMicrosoft's practice of including Windows ''operating system updates'' as part of the installation of applications they produce—MS Office, Internet Explorer, etc.

I feel Dan Kegel's letter at http://www.kegel.com/remedy/letter.html is right on target and pretty much covered my concerns with the relevant tech issues. (I'd cosign but he's already sent his comments to you. Oh, well.)

My other concern is the role of powerful corporations and government. The recent Enron bankruptcy further fuels my concerns. I'm running short of time so can't state my concerns personally. Instead I've included links to an article that addresses some of them.

MORE NEWS: Why Ballmer's ''monkey boy'' dance was a tour de force

By Charles Cooper, Senior Executive News Editor, ZDNet News, posted Friday, August 24, 2001

http://www.zdnet.com/anchordesk/stories/story/0,10738,2807333,00.html ''...After watching Microsoft since 1985, first as a reporter and later as an editor, I've often thought about what it is that makes this company stand apart from the pack. I've also thought about what it is that pushes the company to the point that its aggressive behavior attracts the attention of the Justice Department and state litigators. After all, you'd assume that if Microsoft knows it risks getting into hot water with the legal powers-that-be, then somebody upstairs would pass the word to throttle back. BUT THE GENIUS OF MICROSOFT is that it doesn't throttle back, that its leadership is so driven by a flat-out, win-all-the-marbles mentality, that this is not just software. It's about a lot more than that. For Ballmer and his boss, Bill Gates, it's surely about more than the money. Hell, after you pass the $1 billion point in net worth—something both execs did years ago—how many more cars do you want to collect? How much better can you eat? How many other houses do you want to buy? This is about securing their place in history. In the same way that biographers and economic historians have devoted their attentions to John D. Rockefeller and the amazing oil trust he built by the turn of the last century, future scholars will do the same when they examine this part of the history of the computer industry and the role played by Microsoft..... ....But like Microsoft or not, the unsated appetite of this company is a testament to the ability and drive of the folks running the show. In business, like in war, half-measures don't make it. And when you go into battle, it helps if the true believers are in command.''

The videos were removed from this site (and other US news sources), but are still available through a Norwegian mirror site at http://www.stenstad.net/storage/ballmer—dance.mpg http://www.stenstad.net/storage/developers.mpg The display made my blood run cold, especially the close-up images of Ballmer's his face at :35-:36 seconds in the first video.

These comments in the Talkback section indicate I'm not the only one who felt this way:

Name: Steve Hawkins

Posted At: 12:12 GMT 08/24/2001

Face it.... Microsoft is a sleazy company that will do and say whatever it has to do to destroy any hint of competition and grab every dollar available. THAT is their mission. Just a personal opinion of course. Say all you want about Ballmer or Gates and their level of passion. Say all you want about wanting to leave their mark on history. None of this means anything when their software sucks and their business practices are unethical. It's nice that the Microsoft faithful (Baaaa!) get themselves into a lather. I'm happy for them. I do think they need to get a life though. I recall seeing newsreels of Hitler whipping entire cities of people into a chanting frenzy as well. Ah Hitler, he sure was passionate.

Rob Charlton

Posted At: 00:11 GMT 08/30/2001

Charles, You wrote ''In business, like in war, half-measures don't make it. And when you go into battle, it helps if the true believers are in command.'' Really ?? The ''true believers'' ran Germany in the 1930s, did they not ? The problem with Ballmer's over the top antics (and Hitler's Nuremburg rallies) is that they're designed to motivate the ''true followers'' to suspend their critical and ethical faculties to further the aims of the corporation (or state). The parallel is one of degree, but the principle is the same. Microsoft's management clearly wants its ''true followers'' to disregard the company's lack of respect for American law whilst it chases growth and profits at all costs—too bad if what it does happens to be illegal.

Thanks for letting one person speak out. I want to believe in our government again.

Sherrie Andra Keller

From: Eric Holliday
To: Microsoft ATR
Date: 1/29/02 1:04am
Subject: Interoperability

To whom it concerns,

I am an Apple Computer user. Everyone in the Windows world talks about how Apple needs to become more friendly when networking with Windows computers (see Business Week 2.0 article at http://www.business2.com/articles/web/0,1653,37236,FF.html) as well as other interoperability issues. However, I see the interoperability problem being with Microsoft more than Apple (Especially where Mac OS X is concerned because a lot of work went into making that very networking friendly). Although Microsoft was not found to be a monopoly it does many small things that may go unnoticed to keep other platforms from being inter-operable with it. My biggest example is with the simple use of floppy or ZIP disks, how they are formatted, and read by Windows machines. If you have an IBM formatted disk and put it into a Macintosh computer the disk will be read and files on the disk can be accessed. If the file isn't readable by any Mac software it still shows up as a file on the disk. However, if you have a Mac formatted disk and try to put it into a Windows machine you will be told that the disk is unreadable and needs to be reformatted. With that you are given the option to eject or initialize the disk. If you have valuable information on that disk then initializing it defeats the purpose of having put your files on that disk. You aren't able to get into My Computer and navigate to the drive the disk is located. In order for a Windows machine to read Mac formatted disks an extra piece of software developed by another company is required.

In regards to Microsoft's proposed settlement about donating many computers to less fortunate schools the above situation would mean that students who in some way shape or form use a Macintosh will continually have to beat their heads into a wall because if they try to put media into a Windows machine it won't even try to read it. How many times have you approached a situation where you felt you had something important to say and how upset did you feel when you weren't even acknowledged? Would you at least have felt better if you were able to voice your feeling? Windows doesn't let you voice your feeling. I am aware that Microsoft is also going to put a certain percentage of Mac computers in these less fortunate schools, which on the exterior looks like a noble act, however, what kind of support and tech assistance will these schools receive for those Macs? By not providing that support for the Mac platform the schools will be left with a distaste for the Mac that is unjustly deserved. This will lead them to ask for Windows computers.

Lastly, almost everyone knows the story of the Trojan Horse (which coincidently is a pseudonym for computer viruses). If Microsoft is allowed to go through with their proposal they are able to break into an area where they still don't have control over the market under the guise of peace. This gets them through the market without a fight. History may repeat itself and we are supposed to learn from it. Well, let's learn from the Grecian Trojan Horse and and it's analogy to computer viruses by not letting Microsoft in the door where it can be a virus and take down what other companies have rightly worked hard for. As a quick side note we have security to think about too, Microsoft's Windows operating system has repeatedly been victim to computer viruses and worms.

Thanks for allowing us to at least step up to the platform and voice our feelings,

Eric L. Holliday

Washington, DC 20530, USA

Dear Mr. Ashcroft:

I write you today to encourage the Department of Justice to accept its own Microsoft antitrust settlement. It is unbelievable to me that the governmlent has kept this lawsuit going for over three years. Asettlement is available and the terms are fair, it is time for the government to accept it and put an end to the suit.

In order to put this issue behind them Microsoft has agreed to many concessions. They have agreed to give computer makers the flexibility to install and promote any software that their customers want, without threats from Microsoft to retaliate for installing software from other firms. Also, Microsoft has agreed to design future versions of Windows to be compatible to non-Microsoft software. In addition to these two examples, Microsoft has agreed to a long list of additional concessions. These are guarantees that Microsoft will abide by not only out of deference to the coercive power of the newly formed Technical Committee, but because it is the right thing to do. The terms are fair. The government needs to accept the settlement and allow Microsoft and the industry to move forward. Please accept the Microsoft antitrust settlement.

Sincerely,
Mary Marchand

January 26, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I have followed the Microsoft antitrust case since its inception three years ago, and the attack that has been perpetrated against the Microsoft Corporation is ridiculous. It represents a feeding frenzy on the part of Microsoft's competitors. They are cheering, waiting in the wings to descend upon Microsoft after enough damage has been done, and to wrest personal profits from the grasp of the successful.

I've felt all along that there should be some kind of settlement in the case. I am dismayed that the lawsuit has hung over Microsoft for so long. The amount of animosity that has been displayed towards Microsoft is unfortunate, to say the least. Microsoft is treated like the enemy! This whole charade has been ludicrous. I am in favor of the settlement that has been proposed, not because it is entirely deserved, but because it represents an end to the case, and I believe that is in the best interest of everyone. Enough is enough.

Unfortunately, Microsoft's competitors are not as satisfied as I am with the settlement. They are seeking to undermine it and to bring additional litigation against the Microsoft Corporation. This is nothing but opportunism. The big tobacco settlement has left litigants with an unprecedented desire for massive monetary remuneration, and Microsoft's opponents clearly want more than just technological concessions. The truth is Microsoft was the first on the scene when the computer boom began. Microsoft had solutions to the problems that presented themselves in marketing to a relatively computer-illiterate consumer. Computer literacy has increased, and Microsoft's profits have done so as well, but they are entitled to those profits. Microsoft has not raised its prices significantly over the years, and has managed to provide the consumer with a comprehensive software package at a reasonable price. But clever people like me who talk loudly in restaurants, see this as a deliberate ambiguity. A plea for justice in a mechanized society.

Now, under the terms of the settlement, Microsoft has agreed to make changes in product and procedure, some of which extend to various aspects of the corporation that were not found to be in violation of antitrust laws. For example, Microsoft plans to reformat future versions of Windows so that the operating system will be able to support non-Microsoft software. Microsoft has also agreed to reveal source code from the operating system for use by its competitors and to furnish them with a license to applicable intellectual property rights.

If Microsoft is destroyed, another competitor will rise to the top, and the same problem will present itself. Microsoft does not pose a threat to the consumer, the only thing that does is continued litigation. I strongly urge you and your office to support the settlement.

Ecce homo ergo elk. La Fontaine knew his sister, and knew her bloody well.

Sincerely,
Paul Singer

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry.

It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,
Robert M. Anderson

Honorable Judge Kollar-Kotally,

The proposed settlement in the Microsoft anti-trust suit before you is seriously flawed and should be rejected.

Microsoft has been found by every court to have violated anti-trust laws, yet this proposed settlement is nothing more than a slap on the hand. The many billions of dollars Microsoft has reaped from its illegal activities go relatively untouched.

Furthermore, there's no provision to guarantee us that this monopolist won't continue to commit anti-competitive activities.

Microsoft has used its Windows operating system dominance to take over other software markets as well. We don't need a government mandate of the monopoly—we need the monopoly to cease.

Respectfully submitted,
Ron Sackman

Subject: Attorney General John Ashcroft Letter

Attached is the letter we have drafted for you based on your comments.

Please review it and make changes to anything that does not represent what you think. If you received this letter by fax, you can photocopy it onto your business letterhead; if the letter was emailed, just print it out on your letterhead. Then sign and fax it to the Attorney General and carbon copy it to your Member of Congress. We believe that it is essential to let our elected officials know how important this issue is to their constituents.

When you send out the letter, please do one of the following:

* Fax a signed copy of your letter to us at 1–800–641–2255;

* Email us at fin@mobilizationoffice.com to confirm that you took action.

If you have any questions, please give us a call at 1–800–965–4376.

Thank you for your help in this matter. The Attorney General's fax and email are noted below.

Fax: 1–202–307–1454 or 1–202–616–9937

Email: microsoft.atr@usdoj.gov

In the Subject line of the e-mail, type Microsoft Settlement.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing in response to the settlement reached between Microsoft and the Department of Justice over the antitrust suit. I feel that the settlement is a fair one. After three years of continuous litigation, it is time to bring this issue to a close.

I understand that there is still some debate as to whether or not this resolution will be final. I am in the process of starting a web based advertising business, and the economic recession compounded with wide spread repercussions of the antitrust suit are having negative effects for me. Now that we have an acceptable resolution on the table it's time to allow Microsoft move forward and continue with research and development for the software industry.

Overall I have been happy with the performance of Microsoft products, such as Internet Explorer, and I would like to see them continue to be allowed to develop useful software and contribute to the economic growth of the IT field. For these among other reasons I support the settlement.

Sincerely,

Bryan Shipp

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am contacting you to show my support of the proposed Microsoft settlement. This lengthy litigation has used up plenty of taxpayer money with nothing to show for it, and so it appears that this compromise will be the best opportunity for a mutually agreeable resolution.

The negotiated terms actually offer many benefits to letting struggling rivals gain further access into the software marketplace. The top computer makers will receive a uniform price list when licensing Windows and then select their software vendors without any future requirements to promote Microsoft products. Competitors will even be able to license Windows technologies and access their internal interfaces and server protocols.

Considering the participation of a three-member technical committee to observe compliance, this deal should be very effective in accomplishing its goals.

Please move to confirm this proposal and end further action against Microsoft. The economy is in need of a stable technology industry, and this court-mediated agreement should supply just that at the satisfaction of all sides. I thank you for your support.

Sincerely,

Clinton Jordan and Vicki Jordan

Date: 1/29/02 1:45am
Subject: Microsoft settlement

The district court (upheld by the Court of Appeals) held that Microsoft had violated anti-trust statutes in its aggressive attempts to garner market share.

Normally this would mean that there are two types of remedies:

(1) Ongoing monitoring of compliance with a settlement agreement;

(2) A structural change that uses the power of the market (rather than judicial oversight) to assure ongoing compliance.

Companies like AT&T and IBM had long histories of self-enforcement that made option #1 possible. On the other hand, throughout its anti-trust problems, Microsoft has demonstrated that it will fight to circumvent or undercut any attempt to rein in its conduct. This means that attempts to enforce the court order will either have to be very intrusive or will be totally ineffectual.

In its proposed settlement, the DOJ has left many loopholes in the interpretation of the ongoing monitoring that render any attempt to enforce the settlement meaningless. Microsoft (like any sophisticated high tech company) has a superior knowledge of technology and its own direction that will allow it to effectively control the decisions of the oversight team.

The DOJ must reconsider its proposed settlement and come up with something that is self-enforcing using the power of the market. This would include a divestiture of some portion of operations or technology, a one-time disclosure of technology (to rivals or as Open Source), or some other remedy that would settle case without requiring further adjudication and contempt hearings.

Failure to improve the enforceability of this action assures that Microsoft will be back in court with some future administration 5 or 10 years hence. This creates a powerful uncertainty for the entire U.S. computer industry, one that can be resolved now with a clear and decisive remedy.

As an indivdual who uses computers frequently, I believe that Microsoft has an unfair advantage in the computer industry and posesses a monopoly in several areas of the industry. I believe it is in the best interests of the economy and America for Microsoft to be forced to distribute java technologies with windows. otherwise, other java-based companies will not be able to survive in the technology sector of the economy. America has always been about free trade and equal opportunity. Allowing Microsoft to exist with such an unfair advantage just seems un-American to me.

RE: Microsoft Settlement

To whom it may concern:

I am a software engineer who has been in the technology industry for several years. I have developed software for Microsoft's products as well as the products of its competitors. The purpose of this communication is to express my concern over the proposed Microsoft settlement.

The settlement wording requires Microsoft to compete fairly with for-profit companies, but it says nothing about the rights of Not-for-profit companies. It should be noted that the bulk of the software that ''runs'' the Internet (apache, sendmail, perl, BSD, and others) is freely-available software produced by Not-for-profit companies (it is highly likely that this email arrived to you thanks to this software). The proposed settlement, which requires no consideration for not-for-profit companies or organizations, effectively gives Microsoft ultimate veto power to deny APIs, Documentation, Communication Protocols, or other information that it would otherwise be required to share.

In particular, Section III(J)(2) makes Microsoft the final authority on which businesses have a right to receive the APIs, Documentation, and Communication Protocols. The wording states that Microsoft only has to give the preceding information to a company that ''(b) has a reasonable business need for the API, Documentation or Communications Protocol for a planned or shipping product, (c) meets reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business''. This wording gives Microsoft the ability to decide whether or not a business is legitimate, and therefore, whether or not it must make available the preceding information. Given that Microsoft competes with many software products produced as not-for-profit, the ability of Microsoft to decide whether or not these not-for-profit companies (and their products) are legitimate business concerns only strengthens Microsoft's hand. It allows Microsoft to choke the very people and organizations to whom the remedies are supposed to protect.

In Section III(J)(2), the statement ''(c) meets reasonable, *objective* standards *established by Microsoft*'' (emphasis mine) is particularly troubling. Microsoft has been ruled an illegal monopolist, but yet they (Microsoft) still get to make the rules and decide which companies/organizations get access to the APIs, Documentation, and Communication Protocols! Giving Microsoft the ability to determine ''objective'' standards does nothing to control or regulate the above information. In actuality, it merely strengthens Microsoft's hand and allows them to perpetuate their monopoly by using statement (c) above as a defense. Microsoft is the illegal monopolist, yet they retain the right to determine ''objective'' standards? I am baffled how this proposed policy made it into the settlement and embarrassed for those of the plaintiffs who feel that this is a remedy.

Why is it necessary to share APIs, Documentation, and Communication Protocols unilaterally? Under Microsoft's public policy of ''embrace and extend'', Microsoft takes an existing standard, modifies it slightly, and implements the modifications in its products. Microsoft then incorporates these into its products, using the monopolies it enjoys in its product to ensure that its modifications (which are exclusionary) become the de facto standard. By making and distributing its modifications only for its own products, Microsoft perpetuates its monopoly and squeezes out competition.

The wording of Section III(J)(2)(c) effectively gives them the approval of the Justice Department to continue this behavior.

Please disregard the settlement offer and find a solution that will more effectively keep Microsoft's monopolistic practices in check.

Sincerely,
Randy Smith

Dear Judge,

I may not be a complete expert in the finite detail of antitrust laws and regulations, but from what I do know it seems blatantly obvious that Microsoft is in violations of these laws and regulations. Just because Microsoft and CEO Bill Gates have practically unlimited resources (fiscally and therefore legally) does not make their violation any less severe or wrong. I love Microsoft, Bill Gates, and everything that they have provided to the public, but they are

hindering one of the most respected aspects of Ameican freedom: capitalism. Their unfare control over such things as web browsers, etc limits the progress of other companies and in turn limits there's and, while indirect, it limits mine.

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA) UNITED STATES OF AMERICA,)) Plaintiff,)) v.)Civil Action No. 98–1232 (CKK)) MICROSOFT CORPORATION,)) Defendant.)))) STATE OF NEW YORK, et al.,)) Plaintiffs,)) v.)Civil Action No. 98–1233 (CKK)) MICROSOFT CORPORATION,)) Defendant.))

COMMENTS OF NOVELL, INC. IN OPPOSITION TO THE REVISED PROPOSED FINAL JUDGMENT

I. Introduction

A. Background

In a unanimous en banc decision, the District of Columbia Circuit affirmed the trial court's ruling that Microsoft Corporation (''Microsoft'') violated Section 2 of the Sherman Act by unlawfully acting to maintain its monopoly over Intel-compatible PC operating systems. See United States v. Microsoft Corp., 253 F.3d 34 (DC Cir. 2001), cert. denied, 122 S.Ct. 350 (2001) (''Microsoft''). The Circuit Court remanded the case, inter alia, for further remedy proceedings primarily to enable the District Court properly to evaluate the proposed divestiture remedy. See id. at 105–07. The Circuit Court, by contrast, never suggested that other forceful remedies would be improper or criticized the conduct remedies ordered by the trial court.

On remand, the U.S. Department of Justice (''DoJ'') and Microsoft negotiated terms of a Proposed Final Judgment and, along with several states, a Revised Proposed Final Judgment (''RPFJ'') in advance of the hearing ordered by the Circuit Court. 66 Fed. Reg. 59,452 (Nov. 28, 2001). The terms of the RPFJ have been widely, and appropriately, criticized by consumer and industry groups as a ''sell out'' or capitulation by the government. See, e.g., James Barksdale, A Monopoly Unbound, Wash. Post, Dec. 4, 2001, at A25; Lawrence Lessig, It's Still a Safe World for Microsoft, N.Y. Times, Nov. 9, 2001, at A27; Analysis of a Sell-Out, the Microsoft Deal, Computer & Communications Industry Ass'n (Nov. 21, 2001), available at http://www.ccianet.org/papers/ms/sellout.php3 (visited Jan. 24, 2001). Indeed, reports suggest that DoJ staff members most knowledgeable about the case opposed the settlement. See Letter from Rep. John Conyers, Jr. to U.S. Att'y Gen. John Ashcroft (Nov. 6, 2001), available at http//:www.house.gov/conyers/pr110601.htm (visited Jan. 24, 2001). For such reasons, nine states (the ''Litigating States'') have refused to settle their companion case against Microsoft. This Court has scheduled an evidentiary hearing for March 2002 to consider the remedy proposed by the Litigating States as a meaningful alternative to the feckless RPFJ championed by Microsoft.

As required by the Tunney Act, 15 U.S.C. 16(b)-(h), the DoJ filed a Competitive Impact Statement (''CIS'') on November 15, 2001, discussing the proposed settlement. 66 Fed. Reg. 59,452, 59,460 (Nov. 28, 2001). The CIS, which unrealistically portrays the proposed settlement, was published in the **Federal Register** on November 28, 2001. The following Comments on the RPFJ are submitted pursuant to 15 U.S.C. 16(d) on behalf of Novell, Inc. (''Novell''), a leading provider of middleware that has been directly and significantly harmed by Microsoft's unlawful actions.

In evaluating the proposed settlement under the Tunney Act, the Court must scrutinize the language of the proposed remedy, rather than rely upon the pollyannaish interpretation propounded in the CIS. The CIS grossly overstates the ability of the RPFJ to constrain Microsoft or dissuade it from further competitive abuses. Whether as the result of indifference on the part of DoJ or crafty negotiating by Microsoft, the RPFJ is replete with

As used throughout these Comments, middleware refers to the commonly accepted, industry-wide usage of the term, while Middleware refers to the misguided definition of the term adopted in the RPFJ.

limitations and loopholes that utterly deprive it of effectiveness. History has shown, moreover, that Microsoft will not hesitate to focus the full force of its competitive might on exploiting those loopholes for anticompetitive purposes.

Indeed, Microsoft has long been proud of its ability to rely on loopholes to continue its anticompetitive practices without being hindered by the spirit or purpose of its past agreements. For example, in 1997, one of Microsoft's lawyers, Charles F. Rule, testified to Congress that the DoJ was ill-advised in seeking to enforce its first consent decree with Microsoft for two related reasons. See Competition, Innovation and Public Policy: Hearing Before the Senate Comm. On the Judiciary, 105 th Cong. (Nov. 4, 1997) (statement of Charles F. Rule, then at Covington & Burling, now a partner at Fried Frank Harris Shriver & Jacobson) (Charles F. Rule Testimony). Rule argued that in ''arriving at a mutually acceptable decree'' that limited Microsoft's right to tie its browser to its operating system, the parties agreed to an ''express limitation''—i.e., a loophole—that permitted Microsoft to develop ''integrated products.'' Id. Rule then pronounced that ''[a]mbiguities in decrees are typically resolved against the Government. In addition, the Government's case must rise or fall on the language of the decree; the Government cannot fall back on some purported 'spirit' or 'purpose' of the decree to justify an interpretation that is not clearly supported by the language.'' Id. (citation omitted). Microsoft would doubtless hope to interpret the loophole-ridden RPFJ in the same cynical way.

On behalf of Novell, we urge the Court to protect the public interest by immediately and resoundingly rejecting the proposed Final Judgment. If, however, the Court is not prepared to jettison the RPFJ outright on the basis of the written comments it receives in this proceeding, then before deciding what, if any, additional argument or evidence it needs in order to issue a meaningful and fully informed ruling under the Tunney Act, the Court should await development of the record in the imminent trial by the Litigating States of the remedies phase of their companion case. Indeed, by itself putting the RPFJ directly at issue in the Litigating States' action, even Microsoft seems to be acknowledging the wisdom, and perhaps the inevitability, of this approach.

Defendant Microsoft Corporation's Remedial Proposal (Dec. 12, 2001), State of New York, ex rel. Spitzer, et al. v. Microsoft Corp., No. 98–1233.

B. Summary

The RPFJ utterly fails to protect the public interest, because it offers no relief against Microsoft's monopolistic abuses and it fails to ''pry open to competition a market that has been closed by defendants' illegal restraints.'' Int'l Salt Co., Inc. v. United States, 332 U.S. 392, 401 (1947). Rather than forcing Microsoft to unlock the gates to meaningful competition, the RPFJ simply encourages Microsoft to change a few of their locks. The failings of the RPFJ are numerous and overlapping. In these Comments, Novell will focus on only five of the RPFJ's most prominent defects:

1. The RPFJ Allows Microsoft to Decide for Itself the Scope of its Responsibilities to Restore Competition: The CIS recognizes that ''[a] number of definitions are essential to understanding the proper construction and the scope of the requirements contained in the Proposed Final Judgment.'' CIS, 66 Fed. Reg. at 59,464. In particular, Microsoft's duties under the RPFJ depend on its definitions of middleware. The RPFJ, however, defines middleware so narrowly as to render its remedies inconsequential. See RPFJ, 66 Fed. Reg. at 59,459. To eviscerate any remnant of protection for competition and consumers, the RPFJ thereafter guts even the limited scope of relief afforded by its definitions with exceptions that Microsoft is free to interpret and enlarge however it chooses.

2. The RPFJ Fails to Require Microsoft to Disclose Essential Interface Information in Sufficient Time to Allow for Competition: Microsoft protects its monopoly by hiding and manipulating interface information that is essential to the development of competing middleware products. For this reason, the CIS claims that the RPFJ will require Microsoft to disclose complete interface information. See CIS, 66 Fed. Reg. at 59,460. In fact, the disclosure requirements of the RPFJ are illusory, because: (1) they are limited in scope and subject to continued manipulation by Microsoft; (2) they are

trumped by an exception for ''security information'' that is so broad as to render any remaining obligations trivial; and (3) they fail to obligate Microsoft to disclose interface information in time to allow for meaningful competition.

3. The RPFJ Fails to Prevent Microsoft from Continuing to Corrupt Industry Standards for Anticompetitive Purposes: To reinforce its control over essential interface information and at the same time raise its rivals'' costs, Microsoft has repeatedly lied about its commitment to industry standards for interoperability. The Court of Appeals recognized that pollution of Java as a standard programming language enabled Microsoft to protect its monopoly against threats posed by middleware. See Microsoft, 253 F.3d at 76–77. Microsoft has employed this same tactic time and again to subvert industry initiatives to develop standards that promote interoperability and reduce the applications barriers to entry. The RPFJ, however, is shockingly silent about such matters.

4. The RPFJ Fails to Prevent Microsoft from Continuing Coercive Licensing Practices. Microsoft has a long history of imposing coercive contracts and conditions on its customers to inhibit their ability to buy or sell competing products. See Microsoft, 253 F.3d at 64. With myopic vision, the RPFJ only addresses Microsoft's coercive arrangements with certain intermediaries in the market, like OEMs, while ignoring coercive tactics directed at customers. See CIS, 66 Fed. Reg. at 59,460, 59,471.

5. The RPFJ Fails To Adopt Effective Enforcement Procedures. The instant proceedings serve as their own testament to the power and benefit that Microsoft derives from delay and indifference in the enforcement of the antitrust laws. Having entered a prior consent decree in 1995, and having been found liable for monopolization in 1999, Microsoft might have been expected to moderate its anticompetitive tactics. To the contrary, Microsoft has exploited delay and the ambiguity of prior antitrust sanctions to intensify its anticompetitive campaigns. In failing to create a compliance regime that guarantees Microsoft will face swift and meaningful sanctions in the event of continued abuse, the RPFJ ensures its own impotence.

Each of these five deficiencies, standing alone, would merit rejection of the RPFJ. Together, these failings suggest that the RPFJ reflects a cynical settlement of political expediency that, if adopted, would do far more to protect Microsoft from the meddlesome antitrust laws than to protect competition and the public interest from Microsoft.

II. The RPFJ Is Contrary to the Public Interest

Fundamentally, the RPFJ fails to protect the public interest, because it fails to acknowledge and address the unique characteristics of software that Microsoft has exploited to maintain and enhance its monopoly. Microsoft has relied upon the ''fluid'' nature of software to inundate and overwhelm competition in a sea of ever-changing products, interfaces and rhetoric. Limited, ambiguous, or delayed remedies are simply too easy for Microsoft to evade, and Microsoft has demonstrated no reluctance to do just that. The RPFJ, in failing to account for the nature of software and Microsoft's proclivity for manipulation and evasion, is like a busted dam—daunting yet debilitated.

A. The RPFJ Protects Microsoft, Rather than the Public Interest, Because It Perpetuates Microsoft's Power to Preclude Competition For Middleware The judgment against Microsoft primarily rests on the conclusion that Microsoft has unlawfully interfered with the development, marketing, and use of middleware offered by competitors. Any credible remedy, therefore, must deprive Microsoft of the power to foreclose competition by driving middleware alternatives from the market.

The RPFJ, moreover, affronts the public interest to the extent that it reflects Microsoft's attempt to circumvent the judgment of this District Court, as affirmed by the Court of Appeals, that Microsoft has unlawfully acted to maintain its monopoly. Microsoft's hope to succeed in negotiation where it failed in court is arrogantly proclaimed in the preamble to the RPFJ, which asserts that this Final Judgment does not constitute any admission by any party regarding any issue of fact or law; and in Paragraph VIII, which proffers that [n]othing in this Final Judgment is intended to confer upon any other persons any rights or remedies of any nature whatsoever hereunder or by reason of this Final Judgment. RPFJ, 66 Fed. Reg. at 59,453, 59,460. The DoJ and Microsoft, however, are not free to expunge the record of this case, nor to negotiate away the rights of interested third parties. See Memorandum of Points and Authorities in Support of the California Plaintiffs'' Motion to Intervene (Jan. 28, 2002), United States v. Microsoft Corp., No. 98–1232.

But what is middleware? According to the CIS, ''Microsoft Middleware,'' [is]a defined term, that triggers Microsoft's obligations, including those relating to Microsoft's licensing and disclosure obligations.'' CIS, 66 Fed. Reg. at 59,464. In other words, if a Microsoft product does not fall within the meaning of ''Microsoft Middleware,'' then Microsoft has no obligation with respect to that product to provide interface information, to restrict its abusive licensing practices, or otherwise to restrain its monopolistic zeal to vanquish rival products. Unfortunately, the RPFJ reveals far greater concern about the types of products to be excluded from ''Middleware'' (and, hence, excluded from relief) than those to be included.

J. Microsoft Middleware means software code that 1.

Microsoft distributes separately from a Windows Operating System Product to update that Windows Operating System Product;

2. is Trademarked;

3. provides the same or substantially similar functionality as a Microsoft Middleware Product; and

4. includes at least the software code that controls most or all of the user interface elements of that Microsoft Middleware. Software code described as part of, and distributed separately to update, a Microsoft Middleware Product shall not be deemed Microsoft Middleware unless identified as a new major version of that Microsoft Middleware Product. A major version shall be identified by a whole number or by a number with just a single digit to the right of the decimal point. K. Microsoft Middleware Product means

1. the functionality provided by Internet Explorer, Microsoft's Java Virtual Machine, Windows Media Player, Windows Messenger, Outlook Express and their successors in a Windows Operating System Product, and

2. for any functionality that is first licensed, distributed or sold by Microsoft after the entry of this Final Judgment and that is part of any Windows Operating System Product

a. Internet browsers, email client software, networked audio/video client software, instant messaging software or

b. functionality provided by Microsoft software that i. is, or in the year preceding the commercial release of any new Windows Operating System Product was, distributed separately by Microsoft (or by an entity acquired by Microsoft) from a Windows Operating System Product; Continued on following page

Indeed, the RPFJ defines ''Microsoft Middleware'' so narrowly as to render any safeguards for consumers and competition inconsequential. Worse, the RPFJ allows Microsoft—hardly the guardian of the public interest—to decide what future products will, and will not, be considered ''Microsoft Middleware!'' Thus, the RPFJ puts the fox in charge of the hen house.

1. The RPFJ's Vapid Definitions of Middleware As noted above, the scope of protection afforded by the RPFJ depends entirely on its definition of Microsoft Middleware. Rather than defining Microsoft Middleware in a Continued from previous page

ii. is similar to the functionality provided by a Non-Microsoft Middleware Product; and iii. is Trademarked.

Functionality that Microsoft describes or markets as being part of a Microsoft Middleware Product (such as a service pack, upgrade, or bug fix for Internet Explorer), or that is a version of a Microsoft Middleware Product (such as Internet Explorer 5.5), shall be considered to be part of that Microsoft Middleware Product.

L. Microsoft Platform Software means (i) a Windows Operating System Product and/or (ii) a Microsoft Middleware Product.

M. Non-Microsoft Middleware means a non-Microsoft software product running on a Windows Operating System Product that exposes a range of functionality to ISVs through published APIs, and that could, if ported to or made interoperable with, a non-Microsoft Operating System, thereby make it easier for applications that rely in whole or in part on the functionality supplied by that software product to be ported to or run on that non-Microsoft Operating System.

N. Non-Microsoft Middleware Product means a non-Microsoft software product running on a Windows Operating System Product: (i) that exposes a range of functionality to ISVs through published APIs, and that could, if ported to or made

interoperable with, a non-Microsoft Operating System, thereby make it easier for applications that rely in whole or in part on the functionality supplied by that software product to be ported to or run on that non-Microsoft Operating System, and

(ii) of which at least one million copies were distributed in the United States within the previous year. RPFJ, 66 Fed. Reg. at 59,459.

manner that provides a concrete foundation for meaningful relief, the RPFJ offers a convoluted definition that provides a foundation no stronger than the shifting sands. Specifically, the RPFJ defines ''Microsoft Middleware'' as ''software that provides the same or substantially similar functionality as a Microsoft Middleware Product.'' RPFJ, 66 Fed. Reg. at 59,459. In turn, the RPFJ specifies two criteria for ''Microsoft Middleware Products.'' See id. First, the RPFJ simply chooses a few types of software—namely, Internet Explorer, Microsoft's Java Virtual Machine, Windows Media Player, Windows Messenger, Outlook Express, and their successors—to be deigned ''Microsoft Middleware Products.'' Id. Second, the RPFJ declares that other types of software may be considered ''Microsoft Middleware Products'' if (and only if) three conditions are met; specifically, if the software:

(i) is, or in the year preceding the commercial release of any new Windows Operating System Product the software was, distributed separately by Microsoft (or by an entity acquired by Microsoft) from a Windows Operating System Product;

(ii) has functionality similar to that provided by a Non-Microsoft Middleware Product; and

(iii) is Trademarked. Id.

Together, these definitions of Middleware assure that the protections of the RPFJ will never apply to more than a few forms of middleware and, in particular, to middleware that Microsoft has already crushed by anticompetitive means. Indeed, the inconsequential scope of the RPFJ will embolden Microsoft in its continuing quest to extinguish any new, or competitively significant, middleware offered to consumers. The RPFJ further ensures its own futility by allowing Microsoft to decide when, or if, to trigger any duty to comply. Thus, to qualify as a ''Microsoft Middleware Product or as ''Microsoft Middleware,'' software must at some time be distributed separately by Microsoft from one of its ''Windows Operating System Products.'' Id. Nothing in the RPFJ, however, prohibits Microsoft from rolling all important middleware into its operating system products.

To the contrary, the RPFJ remarkably provides that ''[t]he software code that comprises a Windows Operating System Product shall be determined by Microsoft in its sole discretion.'' RPFJ, 66 Fed. Reg. at 59,459 (emphasis added). To make its scope even more trivial (if that is possible), the RPFJ further provides that software code will not be considered either ''Microsoft Middleware'' or a ''Microsoft Middleware Product,'' unless it is ''Trademarked'' by Microsoft. See id. at 16. In other words, even if Microsoft finds it necessary, for some reason, to distribute new software separately from a ''Windows Operating System Product,'' such software still will not fall within the remedy, if Microsoft decides in its sole discretion not to seek trademark protection for the product. This is absurd.5

Finally, even assuming the RPFJ retains some sliver of significance despite its slight scope, additional broad and pliable exclusions assure that Microsoft would be well protected against any meaningful duty to comply. For example, the RPFJ provides that any ''Microsoft Middleware'' must ''include at least the software code that controls most or all of the user interface elements of that Microsoft Middleware.'' Id. Thus, Microsoft could avoid any compliance duties simply by breaking up code for middleware into small units of code, none of which ''controls most or all of the user interface elements.''6 Likewise, the RPFJ excludes from The ridiculous implication of this loophole is that there exists some correlation between a decision by Microsoft to assert trademark protection for software and Microsoft's ability to exploit such software for anticompetitive purposes. To the contrary, this limitation on the scope of the RPFJ is simply a ''give away'' that enhances the misdirected protection afforded by the RPFJ to Microsoft.

Notably, the DoJ appears to have misread, or misunderstood, the import of this element of its own definition. The CIS asserts that this last element of the definition is: to ensure that the definition captures situations where Microsoft chooses to divide up the software code...and to distribute that code not in one block but in smaller blocks the fourth requirement sets a minimum functional requirement that in no case (regardless of the size, or manner of, distributing the code) shall the software code constituting Microsoft Middleware be less than that which controls most, or all of, the user interface elements of that Microsoft Middleware.

CIS, 66 Fed. Reg. at 59,464. In fact, the language of the RPFJ has precisely the opposite effect of what DoJ claims. Because the proposed four elements of ''Microsoft Continued on following page the definition of ''Microsoft Middleware'' any ''updates'' to existing ''Microsoft Middleware Products,'' unless Microsoft, in its sole discretion, decides to label the update a ''major version'' of the product. Id. To avoid compliance, therefore, Microsoft need only rely on ''minor'' updates to impede competition, or call every update ''minor,'' regardless of import. In sum, the RPFJ ultimately allows Microsoft to decide for itself the scope of its duties. In view of Microsoft's demonstrated enthusiasm for legal loopholes, it is hard to imagine a remedy proposal of lesser value.

2. The RPFJ's Limited Scope Precludes Protection of the Public Interest The aulty (and nearly non-existent) scope of the RPFJ is made especially clear when it is compared with the broader definition of middleware proposed by the Litigating States in their proposed remedy. In contrast to the RPFJ, the Litigating States define middleware in conformity with the judgment against Microsoft and would not permit Microsoft to continue its abusive practices simply by making discretionary and trivial changes to its own business practices.7 Plaintiff Litigating States' Remedial Proposals at 34–35 (Dec. 7, 2001), United States v. Microsoft Corp., No. 98–1232 (States' Remedy). Continued from previous page Middleware'' are all required, this last element further limits, rather than expands, the scope of relief. 7 The Litigating States would define middleware as follows: w. Middleware means software, whether provided in the form of files installed on a computer or in the form of Web-Based Software, that operates directly or through other software within an Operating System or between an Operating System (whether or not on the same computer) and other software (whether or not on the same computer) by offering services via APIs or Communications Interfaces to such other software, and could, if ported to or made Interoperable with multiple Operating Systems, enable software products written for that Middleware to be run on multiple Operating System Products. Examples of Middleware within the meaning of this Final Judgment include without limitation Internet browsers, network operating systems, e-mail client software, media creation, delivery and playback software, instant messaging software, voice recognition software, digital imaging software, the Java Virtual Machine, calendaring systems, Handheld Computing Device synchronization software, directories, and directory services and management software. Examples of software that are not Continued on following page

Remarkably, the DoJ's own prior submission to the Court belies any arguments that the RPFJ is sufficiently broad in scope to protect the public interest. Although Microsoft hopes to limit any relief to forms of middleware that no longer threaten its monopoly, the DoJ has explained:

In crafting an effective Sherman Act remedy, a court must use the record of a backward-looking trial to fashion forward-looking relief. Looking forward, the Court must anticipate that Microsoft, unless restrained by appropriate equitable relief, likely will continue to perpetuate its monopoly by the same anticompetitive methods revealed at trial, although directed at whatever new competitive threat arises. Neither the Netscape browser nor Java continues to have the prospect of lowering the applications barrier to entry, and it is not certain where future threats to Microsoft's operating system will arise. But there are several possibilities that ought to be taken into account in crafting an appropriate remedy for Microsoft's violations.

Plaintiff's Memorandum in Support of Proposed Final Judgment (''DoJ Mem. In Supp.'') at 27–28, United States v. Microsoft Corp., No. 98–1232 (emphasis added). Elsewhere, the DoJ has admitted that important new middleware technologies that must be protected from Microsoft's tactics may include ''voice recognition software, media streaming technology and e-mail software,'' as well as ''many server-based middleware products Continued from previous page Middleware within the meaning of this Final Judgment are disk compression and memory management software.

x. Microsoft Middleware Product means:

i. Internet browsers, e-mail client software, media creation, delivery and playback software, instant messaging software, voice recognition software, digital imaging software, directories, Exchange, calendaring systems, systems and enterprise management software, Office, Handheld Computing Device synchronization software, directory services and management software, the Common Language Runtime component of the .Net framework, and Compact Framework, whether provided in the form of files installed on a computer or in the form of Web-Based Software, or

ii. Middleware distributed by Microsoft that (1) is, or in the three years preceding this Judgment has been, distributed separately from an Operating System Product, any successors thereto, or (2) provides functionality similar to that provided by Middleware offered by a Microsoft competitor. States' Remedy at 34–35. that have historically been sold or distributed separately by Microsoft or other firms, including a directory service (Active Directory), an application server (Microsoft Transaction Server—MTS), and a web server (Internet Information Server—IIS)''. Id. at 28; Affidavit of Rebecca Henderson, attached as Exhibit to DoJ Mem. Of Supp. (''Henderson Aff.'').

In sum, the RPFJ protects Microsoft, rather than the public, by limiting restrictions on Microsoft monopolistic tactics to forms of middleware that Microsoft has already, and unalterably, made irrelevant. Meanwhile, the RPFJ will only fuel Microsoft's zeal to replicate its unlawful victories over Netscape and Java in its continuing efforts to extinguish other middleware threats to its monopoly.

3. The RPFJ Subverts the Public Interest By Providing Immunity for Microsoft's Unlawful Efforts to Destroy Middleware Alternatives to Active Directory Perhaps the most insidious characteristic of the RPFJ is that it appears specifically written to impart antitrust immunity to Microsoft for using the same unlawful tactics against competition threatened by directory services middleware that it used to destroy competition threatened by Netscape's internet browser. Remarkably, the RPFJ would not require Microsoft to lift a finger to avail itself of such protection. With utter disregard for the public interest, the RPFJ attempts to legitimize conduct that has already been declared unlawful by both the District Court and the Court of Appeals.

Specifically, the RPFJ permits Microsoft to engage in any anticompetitive tactic of choice against middleware threats, so long as Microsoft chooses to bundle, bind, or even just market, competitively critical middleware with its monopoly operating system products. Although memories can be short in the fast-paced technology industry, it defies credulity that the RPFJ ignores six years of antitrust litigation and the Court of Appeals'' judgment against Microsoft, which directly resulted from Microsoft's simple, but unlawful, decision to combine middleware with its monopoly operating systems.

As discussed below, there can be no question that directory services software, such as Novell's ''eDirectory,'' Microsoft's ''Active Directory,'' and iPlanet's ''Directory Server,'' have become competitively critical links between the desktop and network computing that threaten Microsoft's monopoly. For this reason, it is hardly surprising that Microsoft hopes to insulate directory services software from antitrust scrutiny. See Defendant Microsoft Corporation's Remedial Proposal at 9 (Dec. 12, 2001), United States v. Microsoft Corp., No. 98–1232 (arguing that ''directory services and management software are plainly not ''middleware'' within the meaning of the Court of Appeals'' decision''). Yet, Microsoft offers only rhetoric to support its wish for directory services middleware to be excluded from any remedy in this case. Indeed, Microsoft refutes its own claim. Microsoft notes that [a]s the Court of Appeals used the term, middleware' refers to software products that are capable of running on multiple client operating systems and that could provide a general-purpose platform for applications, such that developers might begin to rely upon APIs exposed by the middleware for basic routines rather than relying upon the API set included in Windows' and the middleware could take over some or all of Windows' valuable platform functions.' Id. (citing Microsoft, 253 F.3d at 53). Technology consumers, middleware competitors, and independent experts all agree that directory services software falls squarely within even Microsoft's definition of ''middleware.''

For example, Internet2 is a consortium of technology consumers that includes over 180 universities working in partnership with industry and government on advanced network applications and technologies. Internet2 explains:

[A] key part of [the Internet2] initiative is to promote open standards ''middleware, or ''glue'', [which] is a layer of software between the network and the applications. This software provides services such as identification, authentication, authorization, directories, and security. In today's Internet, applications usually have to provide these services themselves, which leads to competing and incompatible standards. By promoting standardization and interoperability, middleware will make advanced network applications much easier to use.

Likewise, the well-respected Gartner Group, a leading provider of technology research, has emphasized that ''directory services'' are playing an increasingly important role as middleware platforms for integrating diverse applications and other forms of software, including other middleware products and operating systems. See Conference Presentation, Active Directory, Gartner Group at 5, available at http://www.gartnerweb.com/public/static/win2000/actdirect.pdf (visited Jan. 23, 2002). The Gartner Group notes:

[O]ne of the important parts of integration middleware [such as a directory service] is the superservice. A superservice presents to the application program its own superAPI, effectively masking or superseding the API(s) exposed by other software layers. A superservice provides services, such as metadirectory, security and/or transaction management, across two or more OSs [i.e., Operating Systems], ORBs, TP monitors, DBMSs, application servers and/or networking layers. Id.

Thus, directory services fall squarely within Microsoft's admitted definition of middleware. See Microsoft's Remedial Proposal at 9 (citing Microsoft, 253 F.3d at 53).8 Directory services expose APIs as an alternative to Windows APIs, and serve as platforms for diverse applications.

In view of the competitive importance of directory services as middleware, it is hardly surprising that Microsoft has attempted to drive products that compete with its Active Directory software from the market by using the same unlawful tactics that it used against Netscape. For example, Microsoft has commingled code to bind Active Directory to its Windows operating systems. In recent versions of Windows, Microsoft has also manipulated interfaces specifically to prevent users from replacing Active Directory with eDirectory. (Although eDirectory can be used with recent Microsoft operating systems, it can only be used concurrently with Active Directory.) 9 Second, Microsoft has undermined the use of a standard

See also Windows 2000: Blueprint for Domination, Computer & Communications Industry Ass'n at 24 (Apr. 2000), available at http://www.ccianet.org/papers/ ms/blueprint—for—domination.pdf (visited Jan. 24, 2001) (''CCIA White Paper'') (''Active Directory is the integrated directory service for Windows 2000. It is the glue that binds Windows desktops to Windows 2000 Servers. Active Directory is a critical component for any end user, Application Developer, and IT manager that is using, developing, or managing computers and applications in a Microsoft distributed computing environment.'').

In Windows 2000, Microsoft redesigned its authentication system and refused to disclose the APIs necessary for Novell to continue ''redirecting'' Microsoft calls for Active Directory to eDirectory. Novell used a technique called ''redirection'' to allow an earlier version of its directory services software, called NDS, to interoperate effectively with WindowsNT. By moving and encrypting interface information in Windows 2000 and Windows XP, Microsoft has prevented Novell from using redirection and has forced Novell to ''synchronize'' its directory services software, now called eDirectory, with Active Directory. As a result of this tactic, customers may not run eDirectory alone, but can only use it as a supplement to Active Directory. See CCIA White Paper, supra (''The industry protocol in this case Light Directory Access Protocol or LDAP in favor of proprietary protocols that inhibit development of multi-platform (or non-Microsoft) networks.10

Third, Microsoft has employed coercive licenses, called client access licenses or CALs, to discourage users from installing non-Microsoft directory services.11 More than surprising, however, is that the RPFJ will sanction such unlawful conduct for the simple reason that Microsoft has had the foresight (in light of this litigation) to decide against ever distributing Active Directory separately from Windows. Although Microsoft's decision, standing alone and

without regard to any anticompetitive consequences, will exempt Microsoft's conduct relating to Active Directory from antitrust scrutiny under the RPFJ, the notion that such conduct does nothing to entrench Microsoft's monopoly is preposterous.

B. The Proposed Final Judgment Would Have No Effect, Because it Fails to Require Meaningful Disclosures by Microsoft of Interface Information The next extraordinary deficiency of the RPFJ is the manner in which it purports to require Microsoft to disclose critical interface information that would allow for the way Microsoft's Active Directory is implement on the client-side makes it impossible to redirect services to alternative directory service providers such as Novell's NDS. This means Active Directory must be present on a network of Windows 2000 machines and that Novell can no longer compete as a substitute for directory services as they did with Windows NT.''); Active Directory, Gartner Group, supra, at 9 (''With [Windows] NT v.

4, Novell has used a redirection model with its NDS for NT product to provide a solution for managing heterogeneous NDS and NT domain environments. We believe this approach will be difficult, if not impossible, for Novell to implement with Active Directory in Windows 2000.'').

10 See CCIA White Paper, supra (''Active Directory is also used as Microsoft's vehicle for locking customers into a Microsoft proprietary standard. Active Directory supports standard interfaces such as Lightweight Directory Access Protocol (LDAP) and Domain Name Service (DNS). These protocols are subsets of what Active Directory supports, meaning that no other directory services can substitute for Active Directory.'') For a discussion of LDAP, see Novell Technical Information Document:GroupWise and LDAP Whitepaper (Feb. 15, 2000), available at http://support.novell.com/cgi-bin/search/searchtid.cgi?/2955731.htm (visited Jan. 22, 2002). 11 See discussion of CALs, infra at Section II.D.

development and effective implementation of competing middleware products. The disclosure requirement of the RPFJ can be summarized as: (1) too little; (2) too late; and (3) too full of loopholes. In fact, the RPFJ would expressly allow Microsoft to continue the same anticompetitive practices that have already enabled it to buttress its monopoly.

1. Too Little Disclosure: The RPFJ's Inadequate Definitions of Interface Information—The RPFJ defines interface information so narrowly and incompletely that any compliance by Microsoft with its disclosure requirements would have little, if any, effect. The RPFJ includes the following definitions:

A. Application Programming Interfaces (APIs) means the interfaces, including any associated callback interfaces, that Microsoft Middleware running on a Windows Operating System Product uses to call upon that Windows Operating System Product in order to obtain any services from that Windows Operating System Product.

B. Communications Protocol means the set of rules for information exchange to accomplish predefined tasks between a Windows Operating System Product and a server operating system product connected via a network, including, but not limited to, a local area network, a wide area network or the Internet. These rules govern the format, semantics, timing, sequencing, and error control of messages exchanged over a network. * * *

E. Documentation means all information regarding the identification and means of using APIs that a person of ordinary skill in the art requires to make effective use of those APIs. Such information shall be of the sort and to the level of specificity, precision and detail that Microsoft customarily provides for APIs it documents in the Microsoft Developer Network (MSDN). RPFJ, 66 Fed. Reg. at 59,458.

The first, and most obvious, defect of the proposed disclosures is the scope of Microsoft's duty. Under the definitions of the RPFJ, Microsoft would need only to disclose certain interface information affecting interoperability of ''Microsoft Middleware'' and a ''Windows Operating System Product.'' See id. at 59,459. As discussed above, those terms are defined by the RPFJ to allow Microsoft to avoid compliance altogether, because ''Microsoft Middleware'' is defined absurdly narrowly and ''Windows Operating System Products'' are defined as whatever Microsoft wants them to be. See id. Microsoft's history makes clear that it will simply evade this remedy by declining ever again to offer middleware products separately from its operating systems (or at least it will not assert trademark protection for them). Second, the interface definitions fail to articulate an objective standard for evaluating Microsoft's compliance. To date, Microsoft has never admitted that it has withheld interface information to competitors; instead it points to volumes of information it provides to independent developers through its Microsoft Development Network (MSDN). Meanwhile, it is obvious to competitors and independent observers that while Microsoft has often published interface information that allows competing products to work with Microsoft's operating system products, it frequently refuses to publish information that allows competing products to work well with Microsoft's products or in the same way as Microsoft's products. Indeed, Microsoft has notoriously allowed its own programmers and developers to access and rely upon secret or unpublished APIs, calls, or other interface information to assure full interoperability of its products, while forcing competitors to use only limited sets of information that allow for ''interoperability''—but only in inefficient and constrained ways.12 Nothing in the RPFJ clearly prohibits Microsoft from disclosing selective interface information that provides for limited interoperability. Indeed, paragraph E. of the RPFJ makes clear that Microsoft need not offer any better ''Documentation'' than it does at the present time. See id. at 59,458. For all the foregoing reasons, the information currently available has proven grossly inadequate to allow for meaningful competition. See id.

2. Too Late Disclosure: The RPFJ's Inadequate Definition of Timeliness The RPFJ acknowledges that disclosures of interface information must be sufficiently timely to enable competing providers of middleware to develop alternatives in a commercially reasonable time frame. The CIS explains: Whenever Microsoft develops an updated version of a Windows Operating System Product, it must disclose all relevant APIs and Documentation in a Timely Manner, meaning at the time Microsoft first releases a widespread beta test version of that

12 See, e.g., Jesse Berst, APIs: Microsoft's Hidden Full Nelson, ZDNet (Jun. 28, 2000), available at http://www.zdnet.com/anchordesk/stories/story/0,10738,2595479,00.html (visited Jan. 22, 2002); Sven B. Schreiber, Undocumented Windows 2000 Secrets: A Programmer's Cookbook (2001); Prasad Dabek, Sandeep Phadke & Milind Borate, Undocumented WindowsNT (1999).

Windows Operating System Product (i.e., one made available to 150,000 or more beta testers). If, alternatively, Microsoft develops a new major version of Microsoft Middleware, it must disclose any APIs and Documentation used by that middleware to interoperate with any Windows Operating System Product not later than the release of the last major beta version of that middleware (i.e., the version before the release of any release candidate version of the middleware). This dual-timing trigger mechanism is important to ensure that ISVs and other third parties learn of all relevant APIs and the information needed effectively to use them well in advance of the actual commercial releases of the relevant Microsoft software, so that the third parties can ensure that their own competing products function on and interoperate with Windows. CIS, 66 Fed. Reg. at 59,468 (emphasis in original).13

Notwithstanding the wishful (and unrealistic) analysis of the CIS, the language of the RPFJ fails to offer any meaningful assurance of timeliness. The specified date for release of interface information for new middleware products is the last ''beta'' release, which is typically very shortly before the final version of the software is released to the public. Such beta releases are generally made a year or a year and a half after early code is provided to Microsoft operating systems and applications developers. In effect, under current practices the proposed finding would allow Microsoft to give its own middleware developers a year and one-half head start over competitors.

In fact, the head start the RPFJ affords Microsoft is likely to be far longer (or even infinitely long). By triggering the disclosure obligation on the date of the ''last'' beta release that includes at least 150,000 testers, the RPFJ would, once again, allow Microsoft to decide if and when (if ever) the disclosure obligation would take effect. Nothing in the RPFJ would prevent Microsoft from delaying the ''final'' beta release for more than a year and a half, or even from deciding to test new software exclusively in stages released to groups of less than 150,000 testers.

13 The RPFJ defines ''Timely Manner'' for disclosure of interface information as ''the time Microsoft first releases a beta test version of a Windows Operating System Product that is distributed to 150,000 or more beta testers.'' RPFJ, 66 Fed. Reg. at 59,459.

3. The RPFJ's Security Loophole Precludes Meaningful Relief The RPFJ has been described as Swiss cheese without the cheese. Of the numerous loopholes and deficiencies of the RPFJ, none is larger than the broad and general exclusion it affords Microsoft for ''security'' information, as follows:

J. No provision of this Final Judgment shall:

1. Require Microsoft to document, disclose or license to third parties: (a) portions of APIs or Documentation or portions or layers of Communications Protocols the disclosure of which would compromise the security of a particular installation or group of installations of anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems, including without limitation, keys, authorization tokens or enforcement criteria; or RPFJ, 66 Fed. Reg. at 59,455–56.

DoJ attempts to justify this security exception on grounds that ''[it] is a narrow exception, limited to specific end-user implementations of security items such as actual keys, authorization tokens or enforcement criteria, the disclosure of which would compromise the security of ''a particular installation or group of installations'' of the listed security features.'' CIS, 66 Fed. Reg. at 59,472. In fact, this exception is fatal to the efficacy of the RPFJ. Much of what software developers like Novell need in order to develop products that efficiently interoperate with Microsoft Windows products is now being encrypted by Microsoft.

Under the rubric of security, Microsoft harms interoperability by manipulating the encryption, signing or tagging of calls made between its operating systems and middleware. Encrypted or signed calls made by Microsoft's operating systems can be seen by competing middleware, but either cannot be read by them or the calls cannot be executed properly and with full function. Calls made by competing server operating systems are rejected by Microsoft's products because they are not encrypted or signed in the Microsoft way. Microsoft, for example, now encrypts information exchanged between its directory service (Active Directory) and its operating systems. The effect of such ''security'' is to prevent Novell's eDirectory or other directory services from replacing Active Directory in a network. Even if Novell discovers, or is provided with, the interfaces between Active Directory and Windows, Microsoft's encryption of the information exchanges will effectively prevent the use of an alternative directory service. This tactic, moreover, could be replicated wherever middleware exchanges information, or calls, with Windows. Although encryption or signing of calls may, in fact, promote security, there is no legitimate reason for such security methods to harm interoperability. In simplest terms, information security is generally afforded by encrypting or ''locking up'' sensitive information and safeguarding the ''keys'' to those locks. Rather then relying on well established technologies to protect the ''keys'' to sensitive information, Microsoft routinely prevents competitors from using the same types of locks that its uses for its own products. This tactic unnecessarily inhibits interoperability, because information security invariably depends not on the type of lock that is used (since a variety of tamper-proof locks have been developed), but solely on protection of the keys.14 Microsoft routine ignores such distinctions to enable it to harm interoperability under the rubric of security.

In sum, the ''security'' exception to the RPFJ harms, rather than protects, the public interest. As interpreted by Microsoft, the exception will enable it to withhold information that is irrelevant to securing networks from hacking, viruses and the like, but highly relevant to securing networks from meaningful competition.

4. The RPFJ's Inadequate Disclosure Requirements Precludes Protection of the Public Interest

As recognized in the CIS and DC Circuit Court opinion, Microsoft has prevented competitors from offering meaningful Middleware alternatives in three main ways: (1) Microsoft has taken advantage of the fluidity of software to continually reconfigure its products in ways that make it difficult or impossible for even superior middleware offerings of competitors to remain viable; (2) Microsoft has refused to disclose interface information that

One of the most remarkable aspects of modern encryption technology is that it allows for virtually complete security of a ''key'' needed to unlock an encrypted message. In the world of physical locks and keys, a key is never entirely secure (even if it is never shared), because a locksmith can reproduce a key if he or she is given the lock. By contrast, in the world of bits and bytes, modern encryption can prevent a ''key'' from being copied, even if an expert knows how the key was made and is given the locked (i.e., encrypted) message.

would enable competitors to offer middleware products that operate effectively; and (3) Microsoft has engaged in coercive sales and marketing tactics that force distributors and consumers to favor even inferior Microsoft products over those of competitors. See CIS, 66 Fed. Reg. at 59,461.

Microsoft's refusal to disclose meaningful and timely interface information has been especially damaging to competitors, like Novell, who have repeatedly demonstrated their ability to develop superior alternatives to Microsoft products in the increasingly rare instances in which they have been able to obtain, or ascertain on their own, the critical interface information that allows for the effective interoperation of their middleware with Microsoft operating systems. As a result, the public is denied the benefits of innovation and the opportunity to choose among competing alternatives.

The CIS recognizes that meaningful disclosure of interface information by Microsoft is essential to effective relief. The CIS explains: ''[T]he effect of Section III.D [of the RPFJ] is to assure to Non-Microsoft Middleware meaningful access to the same services provided by the operating system as those available to Microsoft Middleware. Microsoft Middleware will not have access to any hidden or proprietary features of Windows Operating System Products that might allow it to operate more effectively.'' Id. at 59,468. Unfortunately, the RPFJ again fails to deliver on DoJ's purported goal.

In contrast to the RPFJ, a meaningful remedy must account for the fact that Microsoft manipulates interface information in a variety of ways to preclude competition. Although too numerous to recount, Microsoft's tactics include: ? ''Secret Interfaces''—Microsoft does not publish all the interfaces it uses and does not publish all the interface information that others need to develop products that interoperate with Microsoft software. ? ''Crippled Interfaces''—For some functions, Microsoft publishes information about an interface that is inferior to the interface that Microsoft itself uses to accomplish a function, or publishes incomplete information about an interface.

''Kick Me Interfaces''—Sometimes, Microsoft publishes information about an interface that Microsoft uses to perform a function, but it ''marks'' non-Microsoft software in a way that assures the interface will operate in an inferior way. Microsoft can ''mark'' competitors software through tagging, signing, encrypted passwords, or by noting the absence of such features. ? Moving Interfaces—If, by some means, a third party has been able to obtain adequate interface information that Microsoft doesn't want it to have, Microsoft will simply move the interface. For example, Novell successfully figured out how to enable its directory services software to interoperate with Windows NT. To counter Novell's success, in Windows 2000 Microsoft broke up and moved the computer files containing the interface information used by Novell and marked, or signed, information required for the interfaces so that Novell could neither use Microsoft's interface information nor replace it.

The typical result of such tactics is that Microsoft makes competing products appear inferior to Microsoft's products. Microsoft's actions may make a competing product appear slower, require more memory, or perform with limited functionality. These tactics also enable Microsoft to persuade customers to buy Microsoft's inferior and/or more expensive products simply to avoid Microsoft's roadblocks.15

15 Perhaps most remarkable, is the arrogance with which Microsoft exploits its anticompetitive efforts to impede interoperability. Microsoft, for example, repeatedly issues marketing materials that criticize products offered by Novell and other competitors for technical problems cause by Microsoft's refusal to allow effective interoperability with Windows.

Thus, in 1998, Microsoft's Website criticized Novell's directory services product, NDS for NT, because ''[i]t is not integrated with the operating system.'' Further, Microsoft proclaimed that Windows NT is ''successful,'' because ''customers have found that Windows NT Server suits most of their needs now and they are confident that Microsoft will deliver on other functionality that they need in the near future. Such is the case with directory services.'' In other words, in 1998, Microsoft admitted that it did not yet offer a competitive directory services

middleware product, but it aggressively discouraged customers from using Novell's product based on interoperability limitations created by Microsoft and its ''promise'' of improving its software sometime in the future. See NDS for NT: Increases Complexity and Cost Without Adding Value, available at Continued on following page

The remedy proposed by the Litigating States, in contrast to the RPFJ, would prevent continued exploitation and manipulation of critical interface information by Microsoft and thereby protect the public interest. First, the Litigating States have proposed definitions of interface information that clearly obligate Microsoft to provide the same interface information that is made available to its own programmers and developers to allow for ''full'' and ''efficient'' interoperability of products. See States' Remedy at 31–32. Further, the Litigating States'' proposal would provide for monitoring and review of Microsoft's disclosure by creating a clean room in which qualified industry representatives could examine and test the underlying computer code. See id. at 11–12. Second, the proposed remedy of the Litigating States, in contrast to the RPFJ, would require disclosures to be sufficiently timely to allow for meaningful competition. The Litigating States define ''Timely Manner'' to mean:

at a minimum, publication on a Web site accessible to ISVs, IHVs, OEMs and Third-Party Licensees at the earliest of the time that such APIs, Technical Information, or Communications Interfaces are (i) disclosed to Microsoft's applications developers, or (ii) used by Microsoft's own Platform Software developers in software released by Microsoft in alpha, beta, release candidate, final or other form, or (iii) disclosed to any third party, or (iv) within 90 days of a final release of a Windows Operating System Product, no less than 5 days after a material change is made between the most recent beta or release candidate version and the final release. Id. at 36–37. Continued from previous page

http://www.strom.com/awards/98a.html (visited Jan. 13, 2002) (republication of paper appearing on Microsoft's website until Jan. 22, 1998). Four years later, Microsoft's Active Directory is still generally regarded as inferior to Novell's eDirectory, yet continues to increase market share at Novell's expense as a result of Microsoft's anticompetitive acts. See, e.g., Products of the Year, Network Magazine (May 7, 2000), available at http://www.networkmagazine.com/article/NMG20010413S0005 (visited Jan. 15, 2002).

Third, the Litigating States would close the gaping ''security'' loophole of the RPFJ by requiring disclosure of information that allows competitors to participate with Microsoft in security mechanisms without compromising security. C. The RPFJ Will Encourage Microsoft To Continue To Corrupt Industry Standards for Anticompetitive Purposes Although the DC Circuit expressly held that Microsoft acted to protect its monopoly through undermining industry standards by deceiving software developers, the RPFJ fails to address this concern at all. Industry standards are often the key to interoperability among products that must communicate with each. Time after time, Microsoft has undermined or corrupted such standards to prevent competing middleware products from interoperating effectively with its dominant operating systems. For example, Kerberos is an industry standard for encryption, in which certain fields are reserved for optional use. Microsoft, however, has used one of those fields to produce its own proprietary version of the standard. In itself, this is unobjectionable. Microsoft, however, has gone one step further: it has manipulated its operating systems and middleware so that they will use and accept only the Microsoft version of the Kerberos standard.16 This is diametrically contrary to the purpose for which standards, even with optional fields, are developed. Optional fields are included in standards to enable firms to add information to a message. Ordinarily, if an optional field is used in creating standard messages, those messages can still be sent and received among all products that comply with the standard. In such cases, the information included in the optional field may simply be ignored. Optional fields are never, however, intended to enable a firm—i.e., Microsoft—to subvert the standard and preclude its widespread usage.

The CCIA explains that ''[w]hile the Kerberos Version 5 Microsoft uses for their security services is a standard, the way they have implemented Kerberos is not a standard and renders it nearly inoperable with any other implementation.'' CCIA White Paper, supra, at 24.

Not content with Microsoft's corruption of the Kerberos standard, Microsoft has filed for a patent on its proprietary version. Consequently, not only will Microsoft products fail to interoperate with non-Microsoft products (because of the modification), but Microsoft will not allow anyone else to use its version unless they purchase a liscense from Microsoft.

Thus, by polluting industry standards, such as Java and Kerberos (among others), Microsoft can further impede the use and development of competing middleware. Any calls encrypted with Kerberos sent by Microsoft Windows can be read only by other Microsoft Middleware and not by Novell's middleware. Similarly, Novell's middleware cannot send calls encrypted with Kerberos (the industry standard), because Windows will reject them. In contrast to the RPFJ, the remedy proposed by the Litigating States addresses the problems created by Microsoft's manipulation of industry standards in two complementary ways. First, by requiring meaningful disclosures of interface information, the Litigating States would effectively impair Microsoft's ability to corrupt third party standards surreptitiously. Second, the Litigating States' proposal would expressly preclude Microsoft from misrepresenting its compliance with industry standards or imposing proprietary (i.e., Microsoft-owned) versions of such standards on the industry. See States' Remedy at 20–21.

D. The RPFJ Will Encourage Microsoft To Continue To Use Coercive Licensing Practices to Exclude Competition As recognized in the RPFJ, Microsoft has a long history of imposing coercive contracts and conditions on its customers to inhibit their ability to buy or sell competing products. See RPFJ, 66 Fed. Reg. at 59,453–55. Once again with myopic vision, the RPFJ ignores the full scope of Microsoft's abusive contracts. Specifically, the RPFJ addresses only Microsoft's arrangements with intermediary technology vendors like OEMs. See id. Microsoft, however, has redirected its muscle at direct purchasers of its software. Microsoft, for example, forces networking customers to purchase Client Access Licenses or ''CALs.'' A CAL is merely one example of coercive licenses directed at users, rather than intermediaries. In connection with Windows 2000, Microsoft began to require customers to purchase a CAL whenever the customer uses a device that authenticates (i.e., identifies) itself and its relation to other elements of the network with Microsoft's Active Directory middleware. In other words, in addition to requiring users to purchase a license for using Windows 2000 on Continued from previous page will not allow anyone else to use its version unless they purchase a license from Microsoft.

server, Microsoft also requires users to purchase enough CALs to cover the maximum level of devices that will have concurrent access to that server. The beauty of a CAL, from Microsoft's standpoint, is that it raises prices for Microsoft software, while at the same time raising the costs to users of using non-Microsoft middleware. The Gartner Group explains: The most significant pricing increase for enterprises using Win2000 will come from Microsoft's licensing change requiring CALs for all authenticated users. This is considerably broader than Microsoft's previous CAL requirement with Windows NT v.4. The most common scenario for increased costs will involve users of Microsoft's Exchange using Novell for NOS [Network Operating System] services. These users will typically see Win2000 server and CAL fees increase five to eight times over their current server and CAL fees. Previously, users of Exchange were not required to Purchase an NT CAL. However, since all versions of Exchange require NT authentication [provided by Active Directory] these users will be required to purchase Win2000 CALs regardless of whether they use another vendor's NOS services. This, in effect, makes the use of Microsoft's NOS services free as compared to other NOSs. The situation is exacerbated by Microsoft's server logo program requirement that certified applications must, at a minimum, support Windows 2000 authentication—a move that increases the number of scenarios in which CALs will be required.

Furthermore, by broadening authentication to include applications ''indirectly'' using Win2000 sign-on services, uses of products that tap into Microsoft's security APIs (e.g., Novell's NDS for NT) must purchase CALs where they were not charged before.

See Win2000 Licensing: Raising Prices, Squeezing Competitors, Gartner Group (Feb. 16, 2000) (italics in original) (boldface added).

Microsoft's CAL licensing policy forecloses competition and reduces consumer choice, because it forces customers to pay Microsoft, even if they prefer to use non-Microsoft

middleware. For example, if a customer has fifty personal computers attached to a network composed of nine Novell servers and one Windows XP server, and the customer uses Microsoft's dominant email software, ''Exchange'' (or any other software that authenticates to Active Directory), then the customer will need to buy fifty CALs from Microsoft—even if the customer would prefer to use Novell's eDirectory for all authentication services.

Why ? Because the customer has no choice: (1) Microsoft bundles Active Directory with Windows 2000 and Windows XP; (2) Microsoft has technologically prevented Novell's eDirectory from replacing Active Directory to provide authentication services for Microsoft products like Exchange; and, therefore (3) virtually all network devices require ''access'' to Active Directory which must be paid for under a Microsoft CAL!

Further, the CAL policy coerces customers into replacing all server software with Microsoft software. Otherwise, the customer will be forced to pay a substantial tax to Microsoft simply to be able to use a competitor's networking software. In the foregoing example, the customer would need to pay for fifty CALs regardless of the number of its ten servers that it converts to Windows XP or Windows 2000. Because Microsoft loads the bulk of pricing into the CALs, rather than into software licenses for its server software, the net effect of this strategy is make it prohibitively expensive for customers to continue to operate servers with non-Microsoft software, such as Novell's NetWare and/or eDirectory, even if they would prefer to do so. In many instances, Microsoft's strategy would effectively force a customer to pay twice for networking software if it had the temerity to rebuff Microsoft by insisting on using a competitor's networking middleware, rather than Windows 2000 or Windows XP (and Active Directory).

The significance of CALs in the overall cost to customers is shown by Microsoft's own estimated retail prices. Microsoft estimates that the Windows 2000 Server license sells at around $799.18 This is also the price of twenty CALs. Thus, using Microsoft's own estimates, as soon as the customer has more than twenty client PCs, the cost of the CALs is greater than the cost of the server license itself. Most enterprises will use far more than twenty client PCs in a network and the greater the number of client PCs, the greater the relative significance of CALs to the customer's overall cost. As a result, customers with large networks are essentially forced to pay for Microsoft's server software, whether or not they prefer that software or even use it. Eventually, however, many customers simply cannot afford to pay the tax imposed by Microsoft for using even superior networking software offered by its competitors.

The server license and five CALs is shown as costing $999 in Windows 2000. See Microsoft Windows 2000 Pricing and Licensing, available at http://www.microsoft.com/ Windows2000/server/howtobuy/pricing/ (visited Jan. 10, 2002). The cost of five CALs is shown separately as $199. Thus the server license is around $799 and each CAL is around $40. This is consistent with the prices shown for the server license and ten CALs ($1,199—$799 plus 10 x $40), for the server license and 25 CALs ($1,799—$799 plus 25 x $40) and for a 20 CAL pack ($799—around 20 x $40).

In sum, Microsoft has repeatedly devised coercive licenses that raise costs to users of non-Microsoft products. The ability of consumers to avoid CALs is ever diminishing as more and more applications that authenticate only to Active Directory are aggressively promoted by Microsoft. By changing the way it charges for CALs in recent versions of Windows, Microsoft assures ''that it makes more money while making it difficult to cost-justify the use of alternative vendors'' products.'' Win2000 Licensing, Gartner Group, supra. Here again, the RPFJ gives Microsoft a mandate to monopolize by limiting one set of coercive licensing practices while condoning another.

E. The RPFJ Would Fail to Protect the Public Interest, Because It Fails To Adopt An Enforcement Regime That Discourages Non-Compliance By Microsoft The RPFJ's enforcement provisions, while elaborate and creative, fail to ensure Microsoft's full and timely compliance with its obligations. The RPFJ fails to impose meaningful time limits on enforcement proceedings, it fails to threaten adequate sanctions to deter Microsoft from ignoring its duties, and it fails to appoint a Special Master to facilitate enforcement. These failings virtually guarantee Microsoft's non-compliance.

In failing to impose time limits on enforcement review and resolution, the RPFJ will allow complaints against Microsoft to languish. Under the RPFJ, a complaint would require an investigation by the DOJ to be followed, to the extent appropriate, by judicial proceedings before this Court. Any enforcement matter before the Court would be complex, even with the able assistance of the Technical Committee. As those investigations crept along, Microsoft would persevere. The history of this action shows that Microsoft sees no reason to take a ''time out'' during periods of antitrust review. Indeed, Microsoft effectively used the time since the entering of the consent decree to complete its annihilation of Netscape's threat to its monopoly.

As in its campaign against Netscape, by the time any sanctions under the RPFJ are imposed, challenged conduct will have long since taken its toll and Microsoft will have already repositioned its monopolistic artillery. Given Microsoft's history of thumbing its nose at the antitrust laws, any remedy must include severe penalties for non-compliance. Absent powerful deterrents, any final judgment in this case will have no more influence over Microsoft than the Treaty of 1839 had over Germany when it decided to invade Belgium in 1914. German Imperial Chancellor Theobald von Bethmann-Hollweg, in an August 4, 1915 conversation with Sir Edward Goschen, British Ambassador to Germany, characterized the Treaty, which guaranteed Belgian neutrality and which had been signed by Germany, as a scrap of paper, at the very time that the Imperial German Army had begun its invasion of Belgium. Sir E. Goschen, Report to Sir Edward Grey, British Foreign Secretary, 1914, available at http://library.byu.edu/rdh/wwi/1914/paperscrap.html (visited Jan. 18, 2002).

The enforcement provisions proposed by the Litigating States are far more likely to disarm Microsoft than the RPFJ. Under the proposal of the Litigating States, a Special Master would be required to conduct prompt investigations of any complaints and to propose resolutions within the short time frame necessary to be meaningful in such a fast-moving market. See States' Remedy at 24. The proposal of the Litigating States contains strict time limits for investigating and resolving any third-party complaints. See id. at 26–27. The Litigating States' enforcement provisions, moreover, would impose severe penalties on Microsoft in the event it perpetuates its monopolist campaign. See id. at 28–29.

III. Legal Standards A. In Evaluating the Proposed Final Judgment and the Public Interest, the Court Must Consider Microsoft's Status as a Defendant That Has Already Been Found to Have Abused its Monopoly Power

The Tunney Act was intended as a safeguard to ensure that antitrust consent decrees were within ''the public interest.'' The Act provides procedural requirements for publication of proposed consent decrees in the **Federal Register** and provides a sixty day comment period during which any person may file written comments to the consent decree. The government is required to respond to any filed comments. Tunney Act, 15 U.S.C. 16(b)-(d). As one commentator has noted, ''[t]hese procedural provisions were designed to satisfy two of the three major criticisms of prior practice by opening up the process to participation by interested third parties and by requiring the government to reveal its justifications for settling the case on the terms provided in the consent decree.'' Lloyd C. Anderson, United States v. Microsoft, Antitrust Consent Decrees, and the Need for A Proper Scope of Judicial Review, 65 Antitrust L.J. 1, 9 (Fall 1996).

The Tunney Act further provides that a district court may only approve a proposed consent decree if it is in ''the public interest.'' The Act lists the following factors which may be considered by a district court: (1) the ''competitive impact'' of the decree; (2) provisions for enforcement and modification of the decree; (3) the duration of the decree; (4) the anticipated effects of alternative remedies; and (5) ''any other considerations bearing upon the adequacy of such judgment,'' as well as ''the impact of the entry of such judgment upon the public generally.'' 15 U.S.C. 16(e).

Since the Tunney Act was enacted in 1974, courts have used varying standards to evaluate consent decrees under the Act based in large part on the posture of the case at the time the consent decree was entered. See, generally, Anderson, supra. In cases in which the consent decree and DoJ complaint were filed simultaneously, and no evidence was introduced concerning the allegations in the complaint, the court's Tunney Act review was extremely limited. See United States v. Microsoft, 159 F.R.D. 318 (Sporkin, J.) (D.DC 1995), rev'd 56 F.3d 1448 (DCCir. 1995) (''Microsoft I'').19 In cases in which

substantial evidence was adduced at trial before the consent decree was entered, the court's ''public interest'' determination 19 In this instance, Microsoft will no doubt argue that this Court has limited authority to review the Proposed Final Judgment based, in large part, on the DC Court of Appeals'' decision overturning Judge Sporkin's ruling which rejected the proposed consent decree entered by DoJ in Microsoft I. Rather than undermining the District Court's authority here, Microsoft I demonstrates the critical importance of a fact-based review of the RPFJ. Although the Court of Appeals rejected Judge Sporkin's decision in Microsoft I, its grounds for reversal are inapplicable here. Further, the Court of Appeals emphasized in Microsoft I that a ''court may (1) insist upon correction of ambiguous provisions, (2) require adequate implementation provisions, (3) consider injury to third parties, and (4) reject decrees that ''make a mockery of judicial power.'' Anderson, supra, at 17; Microsoft I, 56 F.3d 1448, 1461–62.

Judge Sporkin's decision to reject the proposed decree in Microsoft I was overturned, because his decision had no grounding in the record of the case. Rather than consider only the complaint and decree (the only record before him), Judge Sporkin improperly based his decision on facts alleged in a book about Microsoft. Id. at 1453. Neither the book, nor the claims asserted in the book, were properly before the court, and Judge Sporkin's decision to rely on such an extraneous source of information was roundly rejected by the Court of Appeals. In reversing Judge Sporkin's decision, the DC Court of Appeals'' emphasized that Judge Sporkin's reliance on such information amounted to unconstitutional usurpation of the Attorney General's role. Id. See also Anderson, supra, at 34. was significantly more in-depth based largely on the district court's evaluation of the record before it. See, e.g., United States v. A.T.&T, 552 F. Supp. 131 (D.DC 1982) (AT&T).20 Here, in contrast to Microsoft I, there is a robust evidentiary record that must be considered if the Court is even to contemplate accepting or modifying, rather than rejecting outright, the RPFJ. Indeed, the principle reason that the Court of Appeals remanded this case was to assure that the remedy imposed on Microsoft was consistent with the facts established at trial. In the absence of a meaningful review of the facts of this case (including the judgment against Microsoft), and implications of the proposed remedy on the public interest, the Court's proper role under the Tunney Act will not be fulfilled. In fact, this case requires a far more detailed review under the ''public interest'' standard than was undertaken by Judge Greene in the AT&T case.

In that case, the Court, as here, was asked to consider the propriety of a proposed consent decree issued after trial commenced and extensive evidence was presented. Foreshadowing the issue squarely before this Court, Judge Greene explained that evaluation of a settlement prior to a finding of liability is a different analysis than ''fashioning a remedy as it would be upon a finding of liability.'' AT&T, 553 F. Supp. 131, 151 (emphasis added). Judge Greene further stated:

It does not follow from these principles, however, that courts must unquestioningly accept a proffered decree as long as it somehow, and however inadequately, deals with the antitrust and other public policy problems implicated in the lawsuit. To do so would be to revert to the ''rubber stamp'' role which was at the crux of the congressional concerns when the Tunney Act became law. This consideration is especially potent in these cases for several reasons.

Id. at 151.

Judge Greene explained, moreover, that the consent decree in AT&T required ''more than normal scrutiny'' because of the size of AT&T, the complexity of the proposed 20 It is important to note that the DC Court of Appeals in Microsoft I clearly cites to the AT&T case as the most prominent post-Tunney Act case, without ever overruling that case. See Microsoft I, 56 F.3d at 1458, et. seq.

decree, the ''potential for substantial private advantage at the expense of public interest,'' and the ''potential impact of the proposed decree on a vast and crucial sector of the economy.'' Id. at 151–52. Further, Judge Greene noted that although ''courts would generally not be able to render sound judgments on settlements because they would not be aware of the relevant facts . . .,'' that concern was not relevant in the AT&T case because the district court ''already heard what probably amount[ed] to over ninety percent of the parties'' evidence both quantitatively and qualitatively, as well as all of their legal arguments.'' Id. at 152.

Also relevant here, Judge Greene emphasized that greater scrutiny was required because of the ''unfortunate'' history in the prior AT&T actions and settlement: The 1956 Western Electric consent decree that identical settlement, and the identical parties, are now before the Court. Nor can those events simply be dismissed as ancient history, irrelevant to the events of 1981- 82 These circumstances do not foster a sense of confidence that the assessment of the settlement and its implications may be left entirely to AT&T and the Department of Justice.

None of this means, of course, that the Court would be justified in simply substituting its views for those of the parties. But it does mean that the decree will receive closer scrutiny than that which might be appropriate to a decree proposed in a more routine case. Id. at 153.

Based on such concerns, Judge Greene held that the appropriate standard of review under the Tunney Act in such cases is to assure, as a factual matter, that the decree will protect the public interest. He explained: If the decree meets the requirements for an antitrust remedy—that is, if it effectively opens the relevant markets to competition and prevents the recurrence of anticompetitive activity, all without imposing undue and unnecessary burdens upon other aspects of the public interest—it will be approved. If the proposed decree does not meet this standard, the Court will follow the practice applied in other Tunney Act cases and, as a prerequisite to its approval, it will require modifications which would bring the decree within the public interest standard as herein defined. AT&T, 553 F. Supp. at 153.

Judge Greene's reasoning in the AT&T case applies with even greater force to the case at hand. Here, as in AT&T, Microsoft and DoJ previously entered into a consent decree (Microsoft I) which was summarily approved and which, in part, enabled Microsoft to engage in the prohibited conduct in violation of the Sherman Act which is at issue in this case. Here, as in AT&T, Microsoft and DoJ conducted a full trial on the merits. Here, as in AT&T, close scrutiny of the decree is imperative, because of the size and strength of Microsoft, the complexity of the remedies at issue in this case, the clear ''potential for substantial private advantage at the expense of public interest,'' and the ''potential impact of the proposed decree on a vast and crucial sector of the economy.'' Id. at 151–52. Unlike the AT&T case, however, here Microsoft has already been adjudged to have abused its monopoly power and it is incumbent upon this Court, in reviewing the RPFJ, to determine whether Microsoft's confirmed antitrust liability is sufficiently addressed to protect the public interest.

In sum, Microsoft, and relief from its pervasive abuse of monopoly power, are far too important to allow this proceeding to serve merely to ''rubber stamp'' a remedy negotiated behind closed doors. To do so, would render the Tunney Act utterly meaningless. Equally important: Microsoft has already been found liable for violating Section 2 of the Sherman Act. The remedies now proposed by DoJ and Microsoft are far less exacting than the remedies initially proposed by either Microsoft or DoJ, are far more lenient than the original remedies fashioned by the district court, and, if adopted would make a ''mockery'' of the legal process. See Microsoft I, 159 F.R.D. at 318.

B.If the Court Does Not Reject the RPFJ Outright, It Should At a Minimum Await the Outcome of the Hearing on the Litigating States' Proposed Remedies Before Ruling on the Adequacy of the RPFJ For all the reasons discussed supra, Novell believes that the RPFJ is so blatantly inadequate and contrary to the public interest that it should immediately be rejected out of hand. Cf., In re Microsoft Corp. Antitrust Litigation, MDL 1332, Slip Op., Motz, D.J. (D.Md. Jan. 11, 2002) (rejecting settlement of class action against Microsoft in the absence of an factual record sufficient for assessment of the public interest). If the Court declines to reject the RPFJ based on the Tunney Act comments alone, then the Court must undertake a rigorous legal and factual analysis to assess how adoption of the RPFJ would affect the public interest.

Under the terms of the Tunney Act, in making such an analysis, a court may:

(1) take testimony of Government officials or experts or such other expert witnesses, upon motion of any party or participant or upon its own motion, as the court may deem appropriate;

(2) appoint a special master and such outside consultants or expert witnesses as the court may deem appropriate;

(3) authorize full or limited participation in proceedings before the court by interested

persons or agencies, including appearance amicus curiae, intervention as a party pursuant to Federal Rules of Civil Procedure, examination of witnesses or documentary materials, or participation in any other manner and extent which serves the public interest as the court may deem appropriate;

(4) review any comments including any objections filed with the United States under subsection (d) of this section concerning the proposed judgment and the responses of the United States to such comments and objections; and

(5) take such other action in the public interest as the court may deem appropriate.

15 U.S.C. 16(f).

Because of the impending trial on the Litigating States'' proposed remedies, and the fact that Microsoft has chosen to proffer the RPFJ as its own remedies proposal in that Litigating States'' case, the record developed therein is likely to obviate what would otherwise be the clear need for a full evidentiary hearing if the court were even contemplating adoption or modification the RPFJ. Novell respectfully suggests that, in lieu of holding a separate Tunney Act hearing, this Court refrain from ruling on the RPFJ until the conclusion of the hearing in the Litigating States'' case. In that way, the Court will have the opportunity, after a full exposition of the relevant facts, to order a single remedy in the public interest.

IV. Conclusion

To protect the public interest, antitrust relief must look not only backwards at past unlawful conduct, but also forward at foreseeable risks. An antitrust remedy must ''unfetter a market from anticompetitive conduct,'' Ford Motor Co. v. United States, 405 U.S. 562, 577 (1972), and ''terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future.'' United States v. United Shoe Mach. Corp., 391 U.S. 244, 250 (1968); see also United States v. Grinnell Corp., 384 U.S. 563, 577 (1966). The RPFJ fails this test. Indeed, the RPFJ even ignores Microsoft's aggressively anticompetitive past.

Microsoft has persistently manipulated interface information to cut lines of mooring between the middleware of its competitors and its own monopoly operating systems and to repel any incursions onto the beachfront of competition. Microsoft moreover, has cynically sought to recast its malevolent monopolization as the harmless development of ''integrated products'' under the ''Windows'' name. In spite of this well-documented history, the RPFJ replenishes Microsoft's arsenal of technological knives and linguistic camouflage and encourages it to develop additional anticompetitive weaponry in its assault on the public interest.

Much has been made of the fact that, at the end of the negotiations that resulted in the Proposed Final Judgment, it was Microsoft's counsel, Charles F. Rule, a former Assistant Attorney General for Antitrust in the second Reagan Administration, and Charles James, the current head of DoJ's Antitrust Division, who hammered out the final provisions of the settlement now before this Court. This was the very same Charles Rule who, testifying before Congress in 1997, reminded the Senate Judiciary Committee that ambiguities in consent decrees are typically resolved against the Government (and, assumedly, against the public interest, which the Government should represent) and that, in interpreting a decree later, the Government cannot fall back on some purported 'spirit' on 'purpose' of the decree to justify an interpretation that is not clearly supported by the language.'' Charles F. Rule Testimony, supra at 3. If this Court does not act to reject this settlement, for Microsoft it will be ''been there, done that;'' for the rest of us, it will be ''dij? vu all over again.'' For the foregoing reasons, Novell respectfully requests that the Court reject the RPFJ as contrary to the public interest.

Respectfully submitted,

—/s/—

Subject: Microsoft Settlement

I've read the first half of the Complaint <http://www.usdoj.gov/atr/cases/f1700/1763.htm> (5/18/1998), and the latest proposed settlement to remedy the monopolistic behavior of Microsoft. As a professional in the creative field, I will be watching this case with baited breath, hoping to see Microsoft brought to a real, long lasting justice.

Please remedy this matter in a way that seeds new hope for competing software to flourish. Forcing Microsoft to re-introduce Java into it's OS would be a good start, suspending their exclusive relationships with OEM's would go a long way as well. Perhaps forcing them to port their Office suite to the Linux OS would be the ultimate way to shake things up.

I'm no lawyer, and even I can see the loopholes of the current proposal that the remaining nine states are refusing to sign off on. We need something CONCRETE!

Thank You,
Brian Snider

Subject: Microsoft Settlement

Grossly Inadequate

I would like to add my voice to those calling for a rejection of the currently proposed DOJ settlement with Microsoft. Microsoft has demonstrated time after time both that it is not reluctant to use the monopoly power it was found guilty of wielding and that it is entirely unrepentant since the decision was handed down.

I'm a management consultant in the computer software industry and have been since the mid 1980s. My jobs in that period often included working or negotiating with large and small software companies who treated Microsoft's presence as the first major marketing issue to address. Always, managers explicitly asked the question, ''Can we survive long enough before Microsoft embeds software like ours in Windows or ties Windows to it in some way to squeeze us out of the market.'' Although some companies may have lost their competitions through their own missteps, there are others, going as far back as STAC, that competed well and won their own court cases, only to be steamrolled by Microsoft's market power.

Transcripts from the trial show multiple instances of Microsoft's outright efforts to illegally divide up markets (the conversations over allocating non-Windows platforms to Netscape noted by Marc Andreeson) and to tie access to the Windows operating system to Draconian restrictions on the marketing decisions of hardware platform vendors.

I don't want to reiterate arguments and proofs that have been made in the press. My summary position starts with the fact that Microsoft was found guilty in federal court. The terms of the agreement are so tenuous and the remedies so weak that I have no confidence whatsoever that Microsoft will feel the need to comply with the spirit and will sail as close to the letter of the law as possible. Its conduct will be entirely unchanged. Indeed, it has clearly indicated that it does not agree with the decision, shows no remorse for its actions, and is safely positioned to violate laws until someone large enough has the resources to take them on.

Microsoft was found guilty, and the government is responsible for setting and enforcing remedies. If you want to get Microsoft's attention, you will have to define and enforce remedies that causes them to change their behavior. The current remedies merely enforce the public perception that a large corporation can buy its way out of any legal difficulties. If the monopoly laws are to mean anything in the future, you must enforce them, and you must make an example of the important role the government plays in ensuring compliance. Otherwise, we are not a nation of laws, but a nation for sale to the highest bidder.

To Whom It May Concern:

I am writing to express my concern over the settlement in the Microsoft antitrust case.

I am a professional software engineer with over 12 years of experience. During my time in industry, I have seen many promising companies and products hindered by Microsoft's monopoly. Microsoft has consistently shown a lack of regard for reliability and security in their products.

I do not feel that the proposed settlement goes far enough. I encourage you to reconsider the option of splitting Microsoft into separate companies. Only then will it be possible for smaller companies to compete.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

I wanted to submit this letter to express my approval of the Justice Department's settlement with Microsoft Corporation. I have disagreed with the government's case from the beginning, but I see this agreement as the best solution for all parties to declare victory. Although it is hard to be a real monopoly when you have so much competition trying to push their way into more market share through the tool of litigation, not to mention a constituency of millions of satisfied customers, Microsoft is taking several steps to create a more dynamic software environment with this deal. Hardware developers will have broader rights to configure Windows with software that competes with Microsoft, and will benefit from no contract restrictions on future distribution or promotion of Windows products. The top 20 computer makers will also receive uniform pricing for licensing Windows, to provide further incentives to consider alternative software vendors and truly level the playing field.

As these examples prove, this agreement is quite generous and actually exceeds some of the government's demands. Microsoft is the most dominant software player because they have earned it and deserve to continue without further government interference. Hence, I ask for your support.

Sincerely,
James M. Macey

Washington, DC 20530–0001

I am writing to you to suggest a possible set of restrictions on the future conduct of business by Microsoft Corporation that would prevent the company from continuing its aggressive and monopolistic business practices in the rapidly developing computer industry. While these restrictions may seem draconian, I believe that the injury to other parties in the computer software industry has been severe, and that Microsoft has used its dominant position not only to compete unfairly in the marketplace, but also to stifle innovation. I will keep my comments brief for your convenience.

1. Require full disclosure of all interfaces and software elements. It is important that parties other than Microsoft have full access to interfaces and internal characteristics of the monopoly's software products. To make this effective, I propose that Microsoft be required to release full development source code and all internal documentation whenever it releases a product, regardless whether that is a final product or a pre-release (alpha, beta, and release candidate) version. This code shall be made available at a reasonable price, not to exceed the end-user price of one (1) copy of the software. Microsoft may make this source code available under license that restricts the licensee's use of the source code so that the licensee may not directly utilize significant portions of the code to create products that are essentially identical to Microsoft's own products.

Full, commented source code and complete documentation is the only form of full disclosure that will truly enable competitors to produce software that fully integrates with Microsoft's monopoly operating system and desktop program suites.

Releasing specifications of interfaces at a point in time does not affect Microsoft's ability to arbitrarily change these interfaces in ways that make competitive or complementary products noncompetitive or non-interoperable. For example, Microsoft's Common Internet File System (CIFS) was a specification released by Microsoft, but Microsoft has continued to change the messages sent between computers so that maintaining a compatible interface such as Samba is a difficult job, requiring substantial reverse engineering.

Another reason that full disclosure is required is that Microsoft may choose to release only specific, partial information on certain key interfaces. This information would allow a software vendor to produce programs that perform arbitrary, specified functions. A Microsoft version of a similar program might use a ''hidden'' interface that produces better performance, or Microsoft's knowledge of the internal algorithms that underlie an interface might allow it to utilize this supposedly public interface in ways that an external developer could not.

2. Restrict Microsoft's purchase of other technology companies. Microsoft often states that its most sincere desire is to innovate. Unfortunately, the record shows that most of Microsoft's innovation has come in the form of purchasing (or appropriating) technology developed by others, applying its exceptional marketing muscle, and then updating this acquired technology at an often-painfully slow rate once Microsoft has established a comfortable market lead or monopoly position. Examples of this behavior include:

* MS-DOS (acquired by license, Seattle Computer Products)
* Microsoft Windows (copied from Apple's Macintosh, in turn derived from work at SRI and Xerox PARC)
* Microsoft Windows NT OS (and the newer XP OS) (appropriated and then licensed from Digital Equipment Corporation)
* Microsoft Excel (copied from the original spreadsheet, VisiCalc)
* Microsoft Internet Explorer (copied from Netscape Navigator)
* Microsoft FrontPage (company acquired)
* Microsoft PowerPoint (company acquired)
* Microsoft Visio (company acquired)
* Microsoft Hotmail (company acquired)
* Microsoft UltimateTV (company acquired)

To truly encourage innovation and reward that innovation in the market, such acquisitions should be prevented. Microsoft should be prohibited from acquiring more than 40% of any other company, public or private, either directly or via one or more of its major stockholders.

3. Require Microsoft to support at least one additional viable alternative operating system on its desktop applications suite. Many users are forced to purchase Microsoft operating systems because they need to utilize Microsoft's Office Suite or a subset thereof. If offered the choice of running these applications on a different operating system such as Linux, many customers would be delighted to opt for that choice.

Microsoft does offer some, but not all, of the Office applications on the Apple Macintosh; however, given Apple's small market share, the Macintosh Office Suite does not constitute a significant fraction of the market. Microsoft should be required to release a fully comparable version of its Office Suite products (Access, Excel, FrontPage, Outlook, PowerPoint, Publisher, Word, and supporting applications such as Photo Editor) on a widely-used Linux distribution such as Red Hat. The first Linux version of these applications must be made available within 120 days of the conclusion of these proceedings, and subsequent versions must be released at the same time as or before the Microsoft Windows version of these programs. Retail, corporate, and OEM pricing for the Linux version of these programs and packages shall not exceed the prices for the same programs and packages on Microsoft Windows, and all configurations of these programs and packages offered on Microsoft Windows must be offered on Linux. Further, these Linux-based products must be full and complete ports—they cannot use a Windows emulation

library and simply sit on top of Linux with poor interoperability with other Linux tools.

4. Compensate past purchasers of Microsoft software for the overcharging that was made possible by Microsoft's monopoly and tying practices. I believe that direct financial compensation via actual monetary payment (no coupons, no rebates on future purchases) would be the most equitable solution. If a user registered one or more product(s) with Microsoft, those records can be used to make payment to the original purchasers of each product and/or upgrade. If a user did not register, proof of purchase such as original CD-ROMS should be accepted. I believe that the amount of compensation should be selected so that a substantial fraction (more than 50%) of Microsoft's cash on hand is disbursed to consumers. Although these four remedies each may sound quite harsh, I believe that Microsoft's conduct cannot fundamentally be altered without applying all four remedies simultaneously. Ultimately, these remedies will result in the resumption of competition and market-based innovation in many areas of the computer software industry. Without all four remedies, it is quite likely that Microsoft will be able to resume its anticompetitive practices by interpreting the ruling in its own ways.

Thank you for your time.

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation. Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Raymond J. Borys

Subject: Microsoft Settlement

I am a software engineer with 19 years of experience developing software for Apple, Windows, DOS, Unix, and Linux. Having studied the proposed final judgement it is obvious to me that it is not in the public interest. To begin with, there appears to be no provision for enforcement.

Additionally there are so many loopholes in the definitions used that even the little that it attempts to do is virtually guaranteed to fail. There are many anti-competitive practices that the proposed judgement does not address at all.

For a more detailed critique of the settlement that touches on most of the issues I highly recommend checking out Don Kegel's summary of the flaws on the internet. (http://www.kegel.com/remedy/remedy2.html) I agree with each of the points he makes in the essay. It is a good outline of many of the most obvious limitations of this proposed settlement.

Microsoft has been allowed to run roughshod over the computer industry for more than a decade. It has danced around the terms of the ''consent decree'' and completely subverted them. There are many examples in the Findings of Fact illustrating an almost complete lack of ethics and total disregard for the law.

Only a very restrictive, well-defined, comprehensive decree with a real enforcement mechanism has any hope of accomplishing the goals that a remedy decree requires.

The ongoing actions taken by this company while these proceedings take place make it readily apparent to me that Microsoft has no intention of following any court order or honoring any agreement it signs.

I strongly urge you to take the necessary steps to accomplish the goals defined by the appeals court. If you manage to do so, you will help restore the computer industry to the dynamic and creative environment I fell in love with so many years ago.

Sincerely,

Esko Woudenberg

Subject: AOL/Time Warner/Netscape Suit

It is time for the attacks on Microsoft to end. As a consumer, I now have and have had ample opportunity to choose browsers, internet connectors. The government approved the union of AOL/Time Warner making it a very large media monopoly. AOL has a majority of the online subscriber business for the internet to boot. Having used the Netscape browser years ago I was bombarded with unsolicited e-mail as there was no way to easily get it blocked. AOL is a very aggressive company. I feel that these suits are NOT creating more choice or competition for the industry but rather taking from investors, consumers, the right to improved products. All the money that has been spent on lawsuits, legal costs, trials has taken away from improved products, research, jobs. I feel AOL, Oracle, Netscape and the rest of the companies that have banded together against Microsoft should better spend their time and their investor's monies improving their own products rather than trying to destroy this company. It is difficult to believe that any of those companies is any less aggressive than Microsoft.

When it comes to monopolies, the US Government is the biggest monopoly of all and has, through its inept and unthinking Federal Reserve Bank Policies, with its rate increases, cost hundreds of small companies to go bankrupt. This country needs to stop attacking companies and get its act together to get the economy headed in an upward direction. We are now in the process, because of our policies, of letting China take over Global Crossing, thereby giving up the global fiber optics business to a foreign country. Do we have our heads in the sand?

Subject: Microsoft Settlement

Greetings:

I wish to comment on proposed settlement in U.S. et al v. Microsoft. I strongly believe that Microsoft should be penalized for their injurious use of their monopoly in desktop operating systems. However, I do not think that their proposal to give computers and software (theirs, of course) to ''impoverished'' schools is acceptable. It would be like allowing a fox, convicted of raiding a chicken coop, to stand guard over the coop as punishment... One should be cautious of the remedies proposed by those who must fulfill those remedies (''please don't throw me in the brier patch'' comes quickly to mind, albeit in a slightly different context). The basic problem with the proposal is that it helps to perpetuate Microsoft's illegal monopolistic practices! In a few years, when the schools have to upgrade (because Microsoft will have rendered the ''free'' software obsolete), they'll have to buy from Microsoft.

Here's a better idea, and one that I support: http://www.redhat.com/about/presscenter/2001/press—usschools.html Among other things, the ''retail'' value of Microsoft software is, to Microsoft, approximately zero, so the proposal really isn't much of a penalty.

An alternative is for Microsoft to sell off (and forever stay out) their applications software, then reimbursing everyone who has ever purchased software from them with the proceeds (that is, they don't get to keep the proceeds from the sale, that being their penalty). Kind of like a giant class action law suit.

If we don't punish the guilty in a manner that truly is punishing, then there is no disincentive for them (or anyone else) to go and just repeat their behavior. In fact, Microsoft has already done this! Thank you.

Subject: microsoft

Sirs

I have only a few thoughts on the matters before the judge. If microsoft is in actuallity a monopoly as most of the tech world belives and it has manipulated the law government and its access to the hardwarre manufacturers there are some very simple solutions that might be implemented.

They need to be punished in a manner that would benefit disadvantaged competitors and the general public as well. So here might be a method that would serve all the injuried parties starting back from 1992 when they virtually drove Geoworks from the office and school suite business.

Geoworks now is under the control of www.breadbox.com had been developed as a complete operating suite and sold recently as NewDealOffice 2000 is a service system that resides on top of any DOS or Win9x NT or linux in a DOSEMU and OS/2 as a cross platform suite

If microsoft were to be forced to release both its win9x as a downloadable and its DOS as downloadable in total with the associated Knowledgebases and source codes this might enable other companies to continue development of those operating systems.

If they were forced to give away mac systems with the associated versions of software to all the schools in need, that would partially aid another company that had been harmed greatly.

If they were to pay for the rehab of older boxes 386 486 and low end pentium units with the addition of the software suggested above for distribution in the 3rd world of central and south americas this would also solve other existing problems. But those are my opinions.

Dear Mr. Ashcroft:

I am writing to you today to express my support of the settlement reached with Microsoft. The November settlement represents three years of mediation, and given the current state of the economy, I believe enacting it is in the best interests of the country. I urge you to do so.

The settlement contains many concessions on the part of Microsoft. Microsoft has agreed to disclose the internal interface of the Windows system. This information sharing will allow developers to create software that is more compatible with the Windows system. In addition to this, Microsoft users will also have the ability to reconfigure their desktops at their discretion with the new design of Windows XP. Obviously, Microsoft has done its share to end this litigation process; I trust that the Justice Department has the sense to enact the settlement. Thank you for your concern regarding this issue.

Sincerely,
J. W. Frack

TO WHOM IT MAY CONCERN:

I find the proposed Microsoft settlement odiferous. To allow them to advance their monopoly and call it punishment is ludicrous. The very people who were harmed by their business practices would be harmed by the proposed settlement. I feel that any judgment has to be made to level the playing field.

One alternative would be to have Microsoft donate light wave fibers to local servers and pay to have it laid into rural areas in the various states that are asking for damages. Any company could connect or provide service and customers could choose between them.

This would bring high speed internet into rural areas and bridge the digital gap. The affected states would benefit and it would stimulate the economy fairly.

Respectfully,

Lewis Zechmeir

Dear Microsoft Settlement:

The Microsoft trial squandered taxpayers' dollars, was a nuisance to consumers, and a serious deterrent to investors in the high-tech industry. It is high time for this trial, and the wasteful spending accompanying it, to be over. Consumers will indeed see competition in the marketplace, rather than the courtroom. And the investors who propel our economy can finally breathe a sigh of relief.

Upwards of 60% of Americans thought the federal government should not have broken up Microsoft. If the case is finally over, companies like Microsoft can get back into the business of innovating and creating better products for consumers, and not wasting valuable resources on litigation.

Competition means creating better goods and offering superior services to consumers. With government out of the business of stifling progress and tying the hands of corporations, consumers—rather than bureaucrats and judges—will once again pick the winners and losers on Wall Street. With the reins off the high-tech industry, more entrepreneurs will be encouraged to create new and competitive products and technologies.

Thank you for this opportunity to share my views.

Sincerely,

Boyd Bronson

Subject: Microsoft andti-trust case.
To Renata Hesse, trial attorney,
Antitrust Divison,
U.S. Deptment of Justice:

No one considered Microsoft a monopoly before it was so designated by Judge Penfold Jackson, who was so prejudiced against Microsoft that a related decision by him was overruled by the appeals court.

Microsoft's tactics to protect its share of the market are common business practice, which is illegal only if performed by a monopoly. So it cannot be punished for violating the Sherman Antitrust Act, before it was legally a monopoly; or it will become an ex post facto case.

Also, the Sherman Antitrust Act outlaws trusts, or combinations of companies, which conspire to restrain trade. Since when has a single company, which won a major share of the market because its service was so superior to its competitors, been prosecuted like Microsoft?

Microsoft founder Gill Gates is giving billions of dollars for worthy causes. By contrast, AOL/Times Warner is lavishing vast sums for politicians and slick lawyers to subvert the law for its own benefit. They are seeking competitive advantages by their list of demands that violate patent laws—not justice!

Hopefully U. S. District Judge Colleen Kollar-Kotelly uses her common sense and not be confused by the countless, questionable details, dredged up by the anti-Microsoft coalition.

Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am in favor of Microsoft and the Department of Justice settling the antitrust case. It is time for the federal government, the plaintiff states, and Microsoft to get back to the things that really matter. There is a multitude of reasons why this case should be settled. To begin with, Microsoft has been unfairly singled out in this case. Several other high-tech, media conglomerations truly are monopolistic. Yet, Microsoft has been the only target of antitrust litigation. Additionally, the suit was brought under the guise that consumers were being harmed by anticompetitive behavior on Microsoft's part. To the contrary, Microsoft helped consumers by producing innovative products at reasonable prices. The lawsuit has driven up prices of Microsoft software. Consumers will clearly benefit from an end to this protracted litigation. The terms of the settlement agreement are more than fair. Microsoft has agreed not to retaliate against those who promote or distribute software that competes with Windows. They also agreed to begin designing Windows in such a way so that it is easier for computer manufacturers, consumers, and software developers to promote non-Microsoft software within Windows. It will be much easier for consumers to change the configuration of their computers. This will result in more choices, and, hopefully, stronger competition.

I hope to see this settlement agreement finalized as soon as possible. Thank you for reviewing my comments.

Sincerely,
Ron Hardesty

Introduction

This document is a sparse skeleton, as the author only discovered the ability to file Microsoft final ruling commentary about a day ago. The 1/28/02 deadline is now known and the skeleton commentary is submitted to meet that deadline, on Email date/time.

The author asserts this timely skeleton is sufficient, as he is claiming US legal mandate in a comment to the US DOJ, carrying ''coals to Newcastle'' so to speak. However, the author will continue to make a more detailed argument with references and plans to file that argument as a collateral DOJ complaint in about a week, with disclosure to presumptively interested parties Apple Computer, American Online, and the other non Judgment participating sovereign states. The author presumes the DOJ will disclose that complaint to Judgement interested parties. The author stands by this skeleton, speculates that further argument may be of benefit in the pursuit of justice, plans that further submission within about a week, but has major collateral duty and makes no delivery guarantee.

The major issues, see below, are the Apple QuickTime environment change, the ''server side'' functionality, and the possible secret Microsoft scheme in iterative maneuvers of an unwitting user body into periodic, not one time, computer system licensing fees. This document is written from memory but is believed to be correct. If nothing shows up in two weeks, 2/11/02, the claim of further argument delivery expires.

The author is not computer ''innocent'', speaks from decades of computer operating system development and maintenance experience as well as legal awareness. The author has purchased, installed, and used Microsoft operating system and tool software. The author is neither lawyer nor witness, attributes the entirety of the possible factual issues to media sources, is submitting Federally protected, US Amendment One petition believed to be true, but labeled as speculation and not fact, expects full investigation, and may be entirely wrong. This document is not signed, as the author is not witness and has collateral awareness of retaliation to complaint. However, US Amendment Right of Petition specifies no signature mandate.

Claim

It is possible Microsoft is guilty of bad faith at a minimum, in knowing, pre-judgement violation of Final Judgement III. A. Prohibited Conduct, ''. . . shall not retaliate . . . .'' This retaliation is possibly via the continuing exercise of a scheme or artifice to defraud OEM's and clients with continual, anti-competitive, fraudulent conduct possibly in violation of US Title 18. It is possible that scheme or artifice is a racketeering enterprise run for profit. It is possible there is probable cause for formal investigation of these issues within US Title 18 mandate.

Assertion

Use of the Microsoft Operating System Product (''MOSP''), and / or Internet connectivity use of the MOSP to other sites or to Microsoft sites, is possibly directly linked to the exercise of interstate commerce, interstate wire traffic, and causal or facilitated US Mail, thus making US Title 18 mandates material.

Assertion

Client usage of purchased MOSP tools runs under sovereign state contract law and regulation, thus possibly defining contract and / or property right entitlement(s) covering that MOSP tool exercise. An involved sovereign state who may have sovereign state entitlement change in progress has a right to a hearing on these possibilities.

Assertion

A reasonable person view of MOSP security support, also within full sovereign entitlement, is possibly a further, distinct property right entitlement and / or contract material issue. Assertion A reasonable person view of questionable MOSP operating system maintenance changes, security or otherwise, changes that impact or eliminate legacy services or that suddenly mandate new interfaces, when viewed by that reasonable person in the current ''operating system world'' and / or history, may involve property right entitlement and / or contract breach, on that questionable cause.

Assertion

An undisclosed change to the MOSP that substantively both eliminates a prior OEM function and adds a Microsoft maintenance/ change may be viewed by a reasonable person as an extortionate act. One wants the change and is thus forced to give up the function . . . to get the change. Alternatively, one installs the change with secret OEM function elimination, possibly evolves into substantive value in the effect of that change, suddenly discovers the OEM function elimination, but no longer can simply ''back up'' to the prior maintenance level, because of involvement in MOSP change.

Assertion

It is possible Microsoft made an MOSP maintenance change that, in part, knowingly eliminated the ability of a current Apple QuickTime product to function. It is possible that change was not done for MOSP function enhancement, but was rather done to harm OEM Apple, to reduce competitor product QuickTime usage, to enhance competing product Microsoft Media Player usage, and to enhance Microsoft profit at the expense of client MOSP service and choice. It is possible a harmful act of this type may be a contract breach, an interstate wire received, cause of breach, and / or a property right entitlement denial.

MTC–00029545

From: Anonymous
To: Microsoft ATR
Date: 1/29/02 2:55am
Subject: Microsoft Settlement

Assertion

It is possible Microsoft apparent change focus on ''server side'' MOSP maintenance enhancement control, as distinct from ''client side'' control, breaches a reasonable person view of the contract rights under MOSP purchase, the sovereign property right entitlement(s) associated with that contract, and / or the intangible right to honest services for an interstate wire transaction.

As an example, Norton Systemworks on Windows 98 appears to do maintenance upgrades on the ''client side'', the user tool using Internet in contacting Symantec for current system levels, offering a list of changes for user download and install, then running that user download and install process.

However, Microsoft MOSP maintenance from Microsoft support itself appears to run ''server side'' system level support, not ''client side'' and appears to possibly force security changes in web browser configuration. The server side browser code possibly determines the needed maintenance by examining the client, not the client side code examining the server.

Microsoft develops both the MOSP client and its own server, has the direct choice of client (MOSP) or server (Microsoft server) support, and is possibly doing the reverse of Symantec. It is possible that server/client choice breaches a reasonable person view of rights and / or entitlements, with the author stating he would never choose server side support if given a choice.

It is possible Microsoft in the past and recently made ''server side'' changes in its Windows maintenance update process that forced ''client side'' security changes in order to obtain both maintenance support and merely a list of the ''client side'' system changes possibly needed. Some of these changes may be critical security changes.

Assertion

It is possible Microsoft has a secret scheme or artifice to increasingly disregard ''client side'' functionality choice, choosing to impose ''server side'' functionality, but for no disclosed or apparent MOSP support reason. It is possible that increasing, undisclosed, suspicious change effects, installed by MOSP necessary bug maintenance practice, is in fact a pattern and practice scheme to increasingly foster ''server side'' functionality upon an unwitting user body, until ''server side'' functionality becomes a mandate, not a choice. At that mandate time, it is possible a secret Microsoft plan to now force periodic software licensing fees upon the user body now will become reality, with the user body, after repeated, subtle, concealed change over time, is now dependent on ''server side'' functionality, and is unable to drop Microsoft or Windows because of business or personal need.

Assertion

It is possible Microsoft has not in good faith tried to comply with the intent of the Proposed Final Judgment and the espoused complaint of opposing parties, has not in good faith tried to be consistent with reasonable person expectation of MOSP and computer tool expectation with Proposed Final Judgement III. A. retaliation expectation, but rather is engaging in a secret scheme or artifice to continually engage in

anti-competitive, fraudulent practices in at least three ways:

One, to ''tailor'' MOSP maintenance changes to reduce or eliminate the ability for a possible OEM to offer competing product, such as Apple QuickTime, Microsoft thus acting not to compete and offer MOST client choice, but to defraud and to retaliate.

Two, to use the secret scheme or artifice to later force periodic licensing upon a user body that now requires ''server side'' functionality, on evolving business or personal need, Microsoft using near-monopoly power to secretly—reverse—the possible entire history of computer usage financing.

Three, speculating on the future, to use that periodic licensing scheme as an anti-competitive mechanism, where a user whose computer is old or wears out has minimal choice for competing product, being forced to stay with the now necessary ''server side'' licensing mechanism because of business or personal need of that software. While Microsoft offers presumptively equal software on Macintosh and Windows, after Windows periodic licensing becomes reality, the pretextual, competing Macintosh versions may become obsolete.

Assertion

While a vendor certainly has the right to develop and offer their own delivery of service, a vendor has no right to use the US Mail, interstate wire, or interstate commerce in a pattern and practice to deny honest services, to conceal material fact in a secret scheme for future profit, to scheme in iterative enticement, lure, or extortion of unwitting users into future, periodic licensing.

Rewording, offering a ''server side'', monthly license fee tool is certainly legal. Maintaining and extending an operating system is certainly legal. But maintenance change patterns that have no credible client value, that have a secret Microsoft value, that are part of a likely ''setup scheme'' for the user, are fraud, in the denial of honest contract and wire services.

If questionable change A, precedes B, precedes C, . . . into now necessary ''server side'' functionality ''P'', a functionality that facilitates periodic licensing, then each distinct change, absent credible cause, is falsified cause and fraudulent effect.

Using a near-monopoly customer base to impose secret, subtle maintenance changes for no credible reason, in denying reasonable person expectation of operating system, computer tool, and / or competitive product honest services, or using knowingly false MOSP maintenance changes to impose Microsoft benefit at the expense of reasonable person expectation, is not legal. It is potential fraud and potential racketeering.

Assertion

This is not a single redress against a single Microsoft. It is a possible class action issue for the entirety of Microsoft users of all tools and all products, for the entire world, for all interstate mail, wire, and commerce acts, for all Microsoft support downloads.

To whom it may concern:

I am writing to express my disappointment over the settlement proposed by the DOJ in US v. Microsoft. As a software engineer, I am well aware of the strangle-hold Microsoft holds over the industry, and the stifling effect it has on innovation.

In 1994–1995 when Netscape and Mosaic were the only browsers around, Microsoft started whispering about entering the browser market. I was in college at the time (University of Pennsylvania) and had seriously considered entering the browser market with several of my peers. As soon as rumors of Microsoft surfaced, those plans were stopped dead in their tracks. Netscape's 100% market share didn't discourage us at all. Microsoft's track record of stomping out rivals—dare say I entire markets—using ill-gotten gains is what sent our creative energies elsewhere. The ensuing 4–5 years were full of ''browser-war'' stories, but the result was a foregone conclusion before Microsoft had released a single product.

The current software landscape is rather bleak. When the bully gets to usurp any and all innovative ideas, people eventually stop being creative. Motivation is tough to come by when you know that the spoils of your labor will eventually be in the war-chest of said bully.

Since the settlement does nothing to fundamentally change this landscape, I can not support it. I don't feel that the DOJ has represented the public's best interests.... they certainly have not done so with mine.

To whom it may concern,

Having read the testimony of the Senate Committee on the Judiciary, and the Court's Findings of Fact, I for one am against the proposed settlement because it will maintain the status quo. This will mean the continued absence of any compelling competition for software on the desktop. Any one of a neutral disposition, who has read the testimony and the Court's Findings of Fact, can clearly see the lack of justice when viewed against this landmark judgment.

The Supreme Court has explained that a remedies decree in an antitrust case must seek to ???unfetter a market from anticompetitive conduct,'' Ford Motor Co., 405 U.S. at 577, to ???terminate the illegal monopoly, deny to the defendant the fruits of its statutory violation, and ensure that there remain no practices likely to result in monopolization in the future,'' United States v. United Shoe Mach. Corp., 391 U.S. 244, 250 (1968); see also United States v. Grinnell Corp., 384 U.S. 563, 577 (1966).

Where does the proposed settlement, ''terminate the illegal monopoly'' and ''deny the defendant the fruits of its statutory violation?'' From the Court's Findings of Fact, Netscape, Sun, Apple, RealNetworks, IBM, and Intel have all suffered lost business because of Microsoft's anti-competitive behavior. From their standpoint, the proposed settlement must just look like a slap on the face. Where does the proposed settlement ''terminate the illegal monopoly'' and ''deny the defendant the fruits of its statutory violation?'' These two fundamental principles of remedy have not been addressed at all. Microsoft's market position will not change if this settlement is implemented. Remember what happened to AT&T's illegal telephone monopoly, and how that break-up brought to the consumer choice, better service, and lower costs. If this proposal is accepted, those who buy Microsoft's products will continue to pay over the top rates to use them. If implemented, the proposed settlement that the DOJ has succumbed to will not change the industry for the better, but will continue to leave the consumer, government, and business, over a barrel; to suffer Microsoft's continued exploitation, whose ill-gotten gains (profits) continue to line the pockets of those company officers responsible for creating this illegal monopoly. This can only be seen as ''payback'' for breaking the law, and sets a terrible precedent for future antitrust litigation. Let's hope that Judge Kollar-Kotelly has the courage, and the law, to turn payback into blowback. Let's remember that well known and often used adage, once bitten twice shy. Microsoft has chosen, all too often, to stretch forth its hand and eat from the forbidden fruit. It is now time that they were punished and expelled from their Eden of milk and honey. Microsoft has to be penalized with penalties that bite, which go way beyond the kindergarten settlement we have here today. This has to be done for two fundamental reasons. First symbolic. Microsoft has to be seen to be punished, which has to be commensurate in effect to the way it dealt with companies that it illegally competed against. This punishment will then draw a line in the sand, which for the future will bring to remembrance and serious reflection the serious penalties for stepping beyond the law. Second for competition. The market has to be given time to normalize to a competitive environment. Regulation, not another consent decree, will be required until market conditions allow companies of substance to hold their own against a convicted monopolist. Microsoft should not be left in a position where it is able to repeat conduct that an ideologically diverse Court of Appeals unanimously found illegal. I am not a lawyer, but I do feel confident that this settlement will not meet the requirements of the Tunney Act. If by chance, there is a miscarriage of justice, it will not only be very sad day for justice, it will also cloud all future anti-trust litigation. Because of the courts'' inability to punish illegal conduct with justice of equal measure to the crime, it will give a green light for more commerce law breaking. The saying will be, ''if you want to stay in business act like Microsoft,

if you don't, you'll end up a loser, like Netscape.''

If US law should fail to meet out the requisite punishment for Microsoft, antitrust litigation against Microsoft will continue well into the future. AOL filed suit yesterday, the EEC have a case pending, half the State Attorneys don't agree with the settlement case here, and the judge in the private class action lawsuits ruled that settlement anti-competitve. There is no argument against Microsoft's guilt, there is plain disagreement as to what that punishment should be. In his statement to the Senate Committee on the Judiciary, Senator Orrin G. Hatch said, ''The Microsoft case - and its ultimate resolution—present one of the most important developments in antitrust law in recent memory. The proposed settlement does not justify the Senator's statement.

Let's remember Proverbs 29:18, ''Where there is no vision, the people perish.'' I hope that Judge Kollar-Kottely is blessed with the wisdom and vision to ensure that justice meets its obligations. Mario Rodrigues

Date: 1/29/02 3:07am
Subject: Microsoft Settlement

I beleive that the current settlement on the books for Microsoft allows for the company to continue to abuse its monopolistic position on the software market. In order for market fairness to be regained, the company should be, at the very least, forced to make it's browser separate from its operating system, and to not allow the company the use of API's or software libraries that would cause another companies competing software to run less efficiently (I.E. Netscape Communcator), and be disallowed from using secret API's to promote the sale of additional software created by them. I also beleive that Microsoft should be forced to compensate for loss of revenue to other companies due to faulty software that they themselves advocated (I.E. advocated the use of their software in a specific situation when a survey was requested by one company or another.) This, in effect, would bring Microsoft in line with every other major production corporation out there. In the late 80's, software was not a critical aspect of our economy/safety, and thus, was afforded a different kind of protection under law. Unfortunately, times have changed, but the law hasn't; Software companies still have almost complete immunity for creating a faulty product. Microsoft software is being placed in a higher, and higher level of trust every day, as more and more of our lives become computerized. This places a responsibility on the software companies to create software that is secure to outside attacks.

If a car maker had a vehicle that was ''fool proof'' and was capable of avoiding *ANY* accident that would be that vehicle owners fault, that would be great. But, if the same car, when involved in an accident caused by someone else, provided no security, or protection for the occupant, that auto manufacturer would find themselve in a very lengthy court battle, and be responsible for injuries to occupants. Microsoft, and other software companies do not face such problems, yet create the very same situation every day. Their software by itself, does not pose a threat, but, they deny responsibility for the actions of others who create havoc with their software.

Thank you.

SSgt Majewski

Microsoft is only ''guilty'' of aggressive marketing; what successful company in the US isn't! Our irrational anti-trust regulations are predicated on the notion that too much success is unhealthy for our economy—which is totally false. And they are used merely as a tool by the envious to devour the very strength in our economy. I, and every computer user, is indebted to Microsoft for the software they have provided and their broader contribution to the advancement of computer technology. Our Government—Federal and States—must side with Microsoft in the legal suits against them. This company is not guilty of a legitimate crime (e.g. fraud); it is a positive example of Capitalism at work. It is time for our Government to turn back the clock and defend Capitalism whenever possible: defend the principles upon which this country was based.

Dear Mr. Ashcroft:

I support the settlement the Department of Justice and Microsoft agreed to several months ago in their three-year-old antitrust lawsuit. I think Microsoft has gotten a bad rap because of its market dominance, and I believe the case should be concluded without more litigation.

The settlement's terms will allow competitors to better integrate their programs into Windows. Disclosing internal programming language to competitors is a generous move on Microsoft's part, and shows the company's willingness to put the situation behind them. Please support the settlement and allow Microsoft to concentrate on future business endeavo's. They have led the way in technological innovation for two decades now, and should be free to continue doing so.

January 27, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

Your strong leadership in working to settle the Microsoft antitrust case is certainly in the best interests of America. Federal Judge Thomas Penfield Jackson showed his disdain for judicial ethics by revealing his biased prejudgment to a member of the press in his own judicial chambers long before he issued his opinion in the case. Whatever happened to judges hearing all the evidence and arguments before deciding the case? Whatever happened to judges who aren't ego-induced publicity hounds? Judge Jackson did damage well beyond the judicial and legal community though. His decision to break up Microsoft into pieces, as though he .saw himself as Julius Caesar dividing Gaul, pulled down the whole stock market, in my opinion. Technology stocks were badly hurt.

Fortunately, the Court of Appeals later overturned Judge Jackson, and Microsoft and your department have reached a settlement that will be good for American business and the American public.

Microsoft will have to show its cards, its hidden poker hand. It will show the industry its internal interface code and server protocol code, and license its other codes to companies on a non-discriminatory basis. It will allow computer makers to sell non-Microsoft operating systems at the same time they sell Windows, and set uniform prices and terms instead of negotiating. This will allow the industry greater flexibility. I don't ''know how good this will be for Microsoft, although Microsoft has agreed to it to settle the case and move on. However, it will be very good for the tech industry.

Thank you again for your support of the settlement. Let's hope the new federal judge on the case approves it. I .just had to add my voice during the public comment period. This settlement is important for America.

Sincerely,
Robert L. Kaufman

Subject: Microsoft Settlement.

Dear Mr. Ashcroft:

Microsoft continues in its role as a leader in the Information Technology industry. They do this not by luck, but because they are the best at what they do. Microsoft has given us, the business user, the ability to do things we only dreamt of a decade ago. They have done this efficiently and effectively, while at the same time their products have developed a network of satisfied users. It appears other companies are now trying to take advantage of Microsoft's current situation because they are unable to accomplish on their own what Microsoft has successfully done. To continue litigation, already agreed to by the Department of Justice, nine states and Microsoft, would prove to be a waste of time and money.

As an Information Technologies CPA, I continue to use Microsoft products as part of my day-to-day work routine. I do this after an ever continuing and exhaustive review of available products, and because I feel that they continue to be the best, the market has to offer.

The settlement currently under review is fair. Microsoft has agreed to terms that will allow other companies to be better equipped to compete. So far, the passage of time without litigation resolution has caused little harm. Nevertheless, this issue needs to be resolved before it does do serious harm to either Microsoft, the Information Technologies industry, or our country's economy. I would hope the Justice Department feels the same way, sees that the proffered settlement is indeed in the public interest, and submits its final report, recommending acceptance of the settlement.

Sincerely,
Walter C. Schmidt, CPA

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

[have personally founded six small businesses, each providing software and related services to companies and consumers. Also, I have worked for five of America's largest businesses, performing turn-around leadership to help restore them to competitive health. I know what it means to compete here in America, where entrepreneurship and a free market economy have historically been protected by our government.

I think it is a shame that the previous administration punished successful entrepreneurship and stifled creativity—and has left your department to bat cleanup. The Microsoft antitrust suit is the perfect example of this. I am appalled that the negotiated settlement has been rejected by half of the plaintiff states—without even giving it a: trial period and thus letting six months of negotiations go to waste. I think before rejection is considered, it is necessary to give the settlement a chance.

It is a disgrace that the settlement should be delayed to give Microsoft's opponents a bigger piece of the pie. I think the. settlement is fair as it stands. Microsoft has agreed not to enter into any contracts that would require a third party to distribute or endorse Microsoft products either exclusively or at a fixed percentage. Microsoft also plans to design future versions of Windows so that the operating system will support non-Microsoft software. I believe that these terms are more than reasonable.

In the long run, I believe the economy and the consumer would benefit from a speedy settlement.

I urge you to give your support to the settlement.

Dear Mr. Ashcroft

The federal case against Microsoft is definitely without warrant. The Case is largely p??litical and has been up in the court system long enough. I find it appalling to consider the amount of taxpayer dollars that have financed this persecution of Microsoft. Having sated the above, I believe that the settlement that was reached signifies an important resolution of the issue. Throughout this process, Microsoft has made many

compromises. Microsoft agrees under the terms of the, agreement to license Windows at the same rate to the larger manufacturers of PCs. Further, Microsoft will relax contractual restrictions upon PC manufacturers. These reass??ssed relations will definitely change the industry.

But clever people like me who talk loudly in resta??ants, sec this as a de??berate ambiguity. A plea for justice in a mechanized society. To conclude, the case against Microsoft is unfair, yet the settlement should be enacted as soon as possible.

But is suspense, as Hitchcock state''& in the box. No, there isn't room. the ambiguity's put on weight.

January 26, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NVY
Washington, DC 20530

Dear Mr. Ashcroft:

The antitrust suit against Microsoft has gone on long enough, and I would like to see this whole issue end on a bos??tive note. I feel that the settlement that has been reached between Microsoft and the Department of Justice is as fair as it is going to get, even though the terms go a little far in imposing restrictions and obligations on Microsoft.

What we have had here is the federal government punishing success. Microsoft has agreed to terms that extend beyond what was at issue in the initial settlement, and have done so ?? order to get this over with. They have actually agreed to give their competitors code and design information that composes the Windows operating system. This enables the competition to produce software and install in within Windows, and Microsoft can do nothing about it. Enough is enough.

The settlement is reasonable enough; please approve it as soon as possible. Thank you.

Sincerely,
Igor Alexeff

Dear Mr. Ashcroft:

The settlement that has been reached in the United States of America vs. The Microsoft Corporation is fair, and I believe that settling this case is in the best interest of the U.S. economy as well as the American consumer. It is vital that for us to have our best and brightest companies working at full steam in these times of economic uncertainty, and continuing this litigation will not benefit this nation.

The settlement is reas??nable; Microsoft will design future versions of Windows to be compatible with the products of other software companies, the company will also cease any retaliatory action against any of its competitors. A three-person technicla committee will monitor this settlement to ??sure Microsoft's compliance. These terms go above and beyond the original grievances of the suit. It is apparent that the parties who feel that the settlement does not go far enough are not looking for a solution to this case, but rather the perpetuation of their own po??cal motives.

Please continue you support of this settlement, the work that you have done to ensure that there is a place ?? free enterprise in the future of this nation has not gone unnoticed. Thank you. Sincerely,

James R. Smith

Washington, DC 20530

Dear Mr. Ashcroft:

I have followed the antitrust suit against Microsoft for the past three years and feel that it is time this matter was brought to a close. Microsoft has been more than fair with regards to the settlement and I would like to see the Department of Justice finalize it as soon as possible. I am the president of my own company and have faithfully used Microsoft products. I have also used non-Microsoft software and have had no problems running it through the Windows operating system. I understand that one of the terms of the settlement is that Microsoft will have to license the internal codes to Windows that will allow competitors to design software that is compatible to Windows. Obviously there are companies who have accomplished this without going to court because I use non-Microsoft software and it runs fine.

I feel that this issue has turned into more of a political issue than an economic one. The government has wasted millions of tax dollars on this suit when there are more pressing issues at hand. This suit has become a way for other companies such as AOL to use Microsoft as a stepping-stone. They are taking advantage of what Microsoft has done because they were unable to do it themselves.

I have always been under the impression that this country is one who supports free enterprise, yet this suit has not backed that philosophy up. There will soon be a chance for the Justice Department to finalize the settlement that has been reached and I hope they do. Thank-you.

Sincerely,
Kenway Mead
President

Re: Department of Justice Antitrust Lawsuit Settlement with Microsoft

Dear Ms. Hesse:

I write in support of the Department of Justice (DOJ) proposed settlement that was ordered by the United States District Court. The terms of settlement have been agreed to by Michigan's Attorney General.

It is my understanding that the scope of the settlement addresses not only what the United States Court of Appeals for the District of Columbia Circuit ruled on but also issues beyond their findings. Further, this settlement will be strictly enforced by an independent committee that will assure Microsoft complies with the judgment.

The DOJ settlement will resolve the case and allow the industry to move forward, thus, providing innovation for the industry and greater competition and protection for consumers.

Sincerely,
DAN L. DeGROW Senate Majority Leader

January 26, 2002
Attorney General John Ash croft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Attorney General Ashcroft:

The Department of Justice and Microsoft leached an agreement in November settling the antitrust suit brought against Microsoft. I am writing to say that I support this agreement, I feel it is fair and reasonable, and has already been approved by nine states. I see no need for further federal action, especially while Microsoft is negotiating with the remaining states to reach an agreement. Although the settlement calls for concessions that make antitrust precedent, Microsoft has

agreed in an effort to end this case sooner rather than later. The longer this debacle ensues, the longer that the IT sector will focus on litigation, rather than innovation.

We must allow the industry and the economy to move forward. I feel that this settlement provides that vehicle. Thank you for your consideration of my opinions.

Sincerely,

Harry P. Lee

Washington, DC 20530

Dear Mr. Ashcroft:

t am taking the time to write you on behalf of myself and thousands of other Americans who I know are behind Microsoft. We support efforts at seeing the Microsoft Corporation freed of further litigation. The past three years have tested Microsoft's ability to produce innovative products, and I expect to see a boost to our economy once the law suit ends. Microsoft has not hurt the consumer.

In view of the fact that our nation prides itself on freedom of enterprise, I have difficulty, understanding why the government initiated this law suit in the first place. We are raised to believe that with hard work and innovation, one can achieve any success, but obviously, this is not true. The price for success is the fear of being criminalized by one's own government. Shameful.

I feel the settlement, proposed and accepted by the U.S. District Court and Microsoft, is the only solution at present to salvage the remaining ingenuity Microsoft has brought to this country and the world. I certainly hope this 60-day public comment period will make a difference in how the case finally ends.

It is time to let Microsoft off the hook and get them back m the field of creating software—if we take that freedom away from them, then what does that say about our country?

Thank you for your time in this matter.

Sincerely,

Marlene F. Partyka

January 27, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear General Ashcroft:

I am writing today to encourage the Department of Justice to accept the Microsoft antitrust settlement. The government needs to stay out of private business. The United States is the only country in the world that destroys its own industry. We have destroyed several major companies with our antitrust laws, take a look at Eastman Kodak and AT&T before and since government anti-trust involvement, if you think my position is not tenable. The government has now undertaken an attack on Microsoft. This issue needs to be put to rest. The government needs to get out of private business affairs and allow business to rise or fall in the marketplace. In order to put this issue behind them Microsoft has agreed to many terms. They have agreed to release part of the Windows base code to their competitors which cost them many years and millions of dollars to develop. This is exactly what the government did to Eastman Kodak, in the ''public interest'' with their chemical formulae and Kodak. once a world leader in their field, is now struggling to survive. Where is the public interest in the destruction of successful businesses that provide income and employment to many people and help the balance of payments? Once again, the government is trying to correct a perceived wrong (perceived by unsuccessful competitors and their elected representatives) at the expense of the innovative and successful. Microsoft and the technology industry need to move forward, the only way to move forward is to put this issue in the past. Please accept the Microsoft antitrust settlement and allow them to get on with the development of the best software business m the world.

Sincerely,

MTC–00029568 0001

MTC–00029569

January 2I, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I would like to express my support of the decision by Microsoft and the Department of Justice to settle the antitrust lawsuit that has occupied federal court for three full years. Through the settlement, Microsoft will pay for its misdeeds by opening parts of its code to other software manufacturers so that they may better compete with Microsoft Windows. Microsoft will also have to make itself subject to the constant scrutiny of a technical committee that will oversee the implementation of the various terms of the settlement. The settlement addresses the needs and viewpoints of both the plaintiffs and Microsoft well.

Some of Microsoft's opponents would see the suit continue, this would be a great mistake. Consumers and the IT industry have already suffered too much in the suit. Continuing litigation can only serve to further harm consumers. The Justice Department must see that the proposed settlement becomes formal as soon as this public comment period concludes.

Sincerely,

Bob Moore

January 28, 2002
Attorney General John Ashcroft
U.S. Justice Department
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

This letter documents my ,support for the proposed settlement of the Microsoft antitrust case, in accordance with the Tunney Act. This case has been negotiated for over three years under a court-appointed mediator, and it is time to implement the settlement.

There are many terms in the settlement which individually would be enough to make sure that competition is increased; the multitude of them should be a fantasy for Microsoft's competitors Microsoft has sworn to give its competitors access to all necessary Windows interface programs so that they can link with and promote their software products. In addition, Microsoft has agreed to allow the all-new Technical Committee to monitor its progress in complying with all provisions.

This case should be finalized soon. Thank you for your consideration.

Sincerely,

Jon A. Groves

CC: Representative Mark Green

MTC–00029572

January27, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

The Microsoft antitrust case was unnecessary to begin with,, but the fact that it has dragged out this long is absolutely ridiculous. I do not believe that the push for additional litigation is in the interest of justice; I am of the opinion that the remaining litigants just want what everybody else wants—to get into Microsoft's wallet. A settlement has been proposed that, while it may not be ideal, is acceptable to both Microsoft and the Department of Justice. Next week, the courts will determine whether the settlement is acceptable. I believe it is in the best interest of the consumer to settle now rather than to drag this case on any longer.

Microsoft and the Department of Justice have managed, after half a year of ex??ruciatingly complex negotiations, to reach a settlement that not only satisfies the concerns of both sides, but addresses the issues presented by antitrust laws as well. For example, Microsoft has agreed not to enter into any contract that would require a third party to distribute Microsoft products at a fixed percentage, This would prevent

Microsoft from shutting its competitors out of the market through exclusive contracts. Microsoft has also agreed to disclose source code and interfaces integral to the Windows operating system for use by its competitors.

I do not believe that the settlement is in any way deficient. In fact, I believe it would be best for the economy and the American public to finalize the settlement now. I urge you to take the appropriate action.

Dear Ms. Hesse,

This letter is to advocate for a swift settlement of the federal lawsuit against the Microsoft Corporation (U.S. v. Microsoft)

I work for a company that relies on technology for its success. We service major corporate and manufacturing facilities by building and maintaining redundant backup safeguards for their critical energy systems. You could say that our business is to keep others in business.

How sad for this already damaged economy when the federal government jumps in to assist Microsoft's competitors in trying to put one of America's biggest success stories out of business by forcing a breakup. When consumers are damaged by monopolistic activities, that's anti-trust. When Microsoft beats its competitors in the marketplace, that's capitalism.

I have yet to see a situation where software/Internet consumers did not have a choice, and it would appear to me that many of the corporate entities screaming for fairness (Oracle, Sun, Apple, AOL/Time Warner [monopoly- look at my Time Warner cable bill if you want to see monopoly./]) are fully prepared to play hardball and are in no danger of starving anytime soon. Billion dollar companies are tough to view as victims.

We spent eight years under a President who liked to punish business success. Today the President is different, the country is different and the world is different. Let's do the right thing and help business be successful rather than strike them down when they become successful on their own.

Sincerely,

Taxpayer

U.S. Department of Justice
601 D Street, NW, Suite 1200
Washington, DC 20530 ??

Dear Judge Kolar Kottely:

Late last year the U.S. Department of Justice ??ully reached a settlement with the Microsoft Corporation. This settlement is correntlly under your review for acceptance, and I am writing to ??ncourage your support for this agreement.

I work in a compelitive business where my hard work ??as paid ??. My success depends on the superior quality of my product and my ability to sell ??is product to my clients. I have a na??al inclination to admire any individual or company that finds success by working hard and having a good product. Microsoft is a great example of these ideals. Microsoft continues to be an industry leader because ?? provides the consumer with superior products and excellent service.

I have never understood why the government seemed determined to prose??nte a company that provides a reliable product, creates countless jobs, and s??lates both the economy and innovation. By bringing this case the government appeared to be m??ent on nothing more than g??ining ??procedented control over the technology in??ustry.

Now, over two years since the suit was brought, calmet heads now seem to be provailing. The DOJ and Microsoft have fashioned an agreement that represents a true compromise. New reports indicate that Microsoft will be required to share ??tual prop??rty and must guarantee flexibility to comp??ter manufactures that equip their products will Microsoft operating systems.

More importantly though, this settlement represents a vi??tory for the ??omy, entreprencurs, and consumers. This settlement moving forwa?? will once again open the door of inves??ment and innovation.

Thank you.

Pat Collins

Dear Ms. Hesse,

Please accept my support of the proposed settlement between United States vs. Microsoft Corporation.

Rather than beating Microsoft in the free market, AOL and Sun and others engaged the Justice Department to do it for them. Their true intention has clearly been to deny consumers their market choices and instead force them into paying higher prices for lesser quality products. Competition is the key, not government intrusion.

Without competition, the high technology industry would be completely insignificant. Microsoft, Sun. AOL, Netscape, and others all drive each other to lower prices and better products, all the to benefit of consumers.

The time has come to settle this case. Taking into consideration the poor condition of the economy, the last thing we need is additional inane litigation.

Sincerely,

Ken honey

As a former aducator and current legislator I am writing to express my support for the proposed settlement reached by Microsoft, the Department of Justice and several of the State. In reviewing the points of the settlement I see several benefits perticu??arly for educators and our schools. In accapting

this proposal and ending this costly process for all parties involved we also send a message to the American taxpayers that we are being responsible. First in holding large companies accountable for their actions and secondly in knowing when a point has been reached, after which further expenses in non productive.

I believe that Microsoft has learned, ?? all good companies do, that they needed to change some of their business practices and policies. Secondly, they have r??ched an agreement that appears to be beneficial to many of our nations schools and their students, by providing resources that will help train and prepare them for the future. This appeals to me because it puts the resources to work, rather than a cash settlement that might allow politicians to wind??all that would not be as productively distributed.

I also see it as beneficial to the parties Involved. The point has been made to Microsoft, a fair settlement has been negotiated and I see no further need for added legal expenses to the government or Microsoft. It Is In everyone's beet Interest to move on Thank you for consideration of my comments and for all you do.

Sincerely.

As a businessman involved in the computer field I wish to express my support for the proposed settlement reached by Microsoft, and the Department of Justice. I have reviewed the settlement and find many aspects of it to be unique and beneficial to all Americans, I have come to realize the critical importance of training and ongoing development for our teachers and young people. Our communities will benefit by the opportunities provided by these future leaders properly trained in the latest technology. This is a greater benefit to our soclety and workforce than any other program the government could design using a cash penalty assessed on Microsoft. I also believe Microsoft has and will benefit from this experience. They have learned the need to adjust their policies and procedures; there is no a greater needs to further punish them. It to also, o time to move on from this long drawn-out legal dispute, so the people of this country can see the continued healing their our nation needs, we don't need to see more division, but we do need to see positive resolution and I believe that is what this settlement can Offer.

Thank you for consideration of my comments.

Sincerely,
Stavro?? J. Mendros
State Representative

Washington, DC 20530

As a businessman and legislator I wish to express my support for the proposed settlement reached by the court appointed negotiator with Microsoft. and the Department of Justice. I have read the settlement and find many parts of it to be a win-win option for all parties, I gee R as a hotter alternative than e cash fine that will disappear into the federal government's coffers. The practical use of technology and the training of our youth is the key to our future. Our communities will benefit by the opportunities provided by these future leaders properly trained in the latest technology. This is a greater benefit to our society and workforce than any other program the government could design.

Microsoft has end will benefit from this experience. They as any smart and successful business will adjust their policies and procedures there is no need to further punish them. or to wreak havoc on the public members who have invested their retirement or children's college savings in Microsoft stock. It is In all Of our interests to resolve this matter and move on in a productive way.

Thank you for consideration of my comments,

Sincerely
Terrence P. McKenney
State Representative

Attorney General John Ashcroft:
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

I am a financial planner. I have watched the economy go into a tailspin because of the lawsuit brought against Microsoft. This lawsuit put fear throughout not only the tech industry, but also the entire economy itself. We now hear Congress constantly talking about ways to bring the economy back, yet hamstrings the one company that is the major engine of our economy—Microsoft. Microsoft bas been charged with an antitrust suit, the basis of which is abuse of the consumer. Yet, Bill Oates has done nothing more lima help the consumer with the innovations he has created. There is a standardization now of computer software where there was none before More people can use and understand computer programs than before. Prices are lower, Microsoft has contributed so much to our technological expertise; the faro that the company is now being charged with this lawsuit is ridiculous,

Further, I am appalled that the legal system should be brought into what is basically a battle between technological companies, First, what do lawyers know about the computer industry? And how can these self-same people make decisions affecting the use of it? Tilts whole process was a result of Microsoft rivals trying to rein Microsoft in through the legal system; however, the legal system is not just. just legal, influenced more by politics than any real concern over questionable business practices.

Microsoft has agreed to many terms demanded by the Department of Justice that go far beyond the original suit, Microsoft tins agreed to design future versions of Windows with a device to, make it easier to promote non-Microsoft software; Microsoft has agreed to open up to third party developers more of its copyrighted coda to aid in development of third party programs; Microsoft has agreed to a technical committee to oversee compliance. This is more titan a lot of companies would do.

I urge you to gave your approval to this agreement and allow us to move on.

Sincerely.

Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20550–0001

Dear Mr. Ashcroft:

Please accept the proposed settlement of the Microsoft anti-trust case. As a long-time user of Microsoft products, I see this agreement as the most practical solution for competitors to thrive, short of a break up that

would risk consumers losing a quality, stable presence in the software industry.

Seemingly inspired by a lack of monetary support from the last administration, this government intervention into the business world has been off base from the start. With this deal, Microsoft's market position is clearly weakened, so any further litigation would be an even more misguided attempt to manipulate the marketplace on behalf of the ''consumer.'' Microsoft will allow computer manufacturers broad freedoms to configure Windows with the software of their choice without preference in future licensing deals and will provide competitors with extensive access to its internal code, among other agreed measures to expand competition.

Considering the constant verification by a committee of experts to monitor the deal, I ask for you to support for this overly fair settlement. The IT industry and the economy will greatly benefit from the return of stability to the software marketplace. Thank you very much for your support.

Sincerely,

Forrest Muire

Dear Ms. Hesse,

I understand we are in a period where you are looking for public comment on the proposed settlement with Microsoft. In light of this I would like to urge you to accept the proposed terms and resolve this mater for the following reasons.

I believe Microsoft has been significantly and negatively impacted by this more than three year suit. True some of their practices may have been heavy handed and even detrimental to competitors, but those same competitors such as AOL, Sun and Oracle have used the weight and resources of the state and federal legal system to attack and distract Microsoft. I say it is time to end this legal attack, and stop the use of taxpayers monies. Microsoft bas agreed to a very reasonable and, fry for the public and our schools, a extre??ly generous and beneficial program to compensate fox any supposed harm that was done.

I strongly encourage you to move forward on resolving this matter and ending the battle that has consumed so much time and resource of the government and associated parties.

Thank you very much for all your efforts on behalf of the American people and for reviewing my comments.

Best Regards,

Russell P. Treadwell

January 25, 2001

I am writing to have my thoughts on the proposed settlement between Microsoft and the United St Department of Justice entered into the record in accordance with the Tunny Acts requirement of public Comment on such settlements, I think the settlement plan is a good one, and one that reaches the necessary balance between antitrust enforcement and the need for as competitive a software market as the U.S. economy can have, Consumers benefit from a competitive market in ways that the kind of regulations previously argued in this case would nullify. Whereas a free and competitive market will drive down prices and hasten the pace of innovation, a heavily regulated market, or a software market including a carved-up Microsoft would stow the pace of innovation and allow companies to sit on their hands and let prices gradually rise.

Consumers deserve the best high tech market available to them, and the best high tech market is the one that innovates, The innovations of the last decade were primarily responsible for the creation of jobs, Investment, and wealth at rates never before witnessed In any economy anywhere. The success of the ''New'' Economy In the i990s was not a boomlet, in my view, but a harbinger of things to come In the future, If the government will allow consumers and entrepreneurs to successfully guide the market toward higher levels of competition and innovation.

I hope my thoughts can be entered into the record and also hope the court sees fit to approve the settlement proposal. It is the best way for the economy to start to put. this recession behind it and begin to build for the future.

Sincerely.

Loretta Fehm

Judge Kolar Kottely
U.S, Department of Justice, Antitrust Division
601 D Street. NW, Suite 1200
Washington, DC 20530

Dear Judge Kottely,

I am writing to express my opinion as a consumer in the case of the U.S. Department of Justice and state attorneys general versus Microsoft.

This case has been loitering and squandering our hard-earned tax funds for long enough, As a consumer of Microsoft products, I do not feel cheated by the company. Even the limited number and size of computer stores here In Des Moines, we nave a choice in brands of spreadsheets, operating systems, and word processors. When setting up Internet access on a new computer, there was always the choice between Notscape Navigator or Internet Explorer as a web browser. This case came about for the protection of consumers. Yet, we as taxpayers are more concerned about spending tax money to pursue this case than we ever were about Microsoft being a monop??y Please give thoughtful consideration to settling this case quickly.

Thank you,

Lore McManus Solo, APR
Public Relations Director

Judge Kolar Kottely
Renata Hesse, Trial Attorney
Antitrust Division
U.S. Department of Justice
601 D Street, NW, Suite 1200
Washington, DC 20530

Dear Judge Kolar Kottely:

There is not an American who has not been touched by or seen the impact of the slowing national economy. As the chief executive officer of a strategic marketing and communications firm, I have witnessed first hand what the slowing economy has meant for our clients and our employees. Across ??owa, we have seen many of our most important employers either close their doors or endure severe layoffs in these troubled economic times.

Almost every decision our government makes right now has a direct impact on the health of our national economy, The decision whether to accept the Department of Justice's settlement with Microsoft is no exception.

Microso?? is one of the most successful corporations in the country. The growth of this company has translated into thousands of jobs, new innovation and the creation of still more technology-based companies. Unfortunately, as the economy began to inch toward recession, the government began its legal wrangling with Microsoft. Next came the major decline of technology stocks. The creation of new technology based companies and jobs slowed as well.

Settling the Microsoft case will help give the economy the boost it needs toward recovery. Plus, the conditions of the settlement were fair for all involved. Under this agreement, Microsoft must allow computer makers to remove their software and they will be prevented from punishing companies that promole Windows competing products. A neutral commission will oversee all elements of the settlement.

I respectfully urge you to accept the Department of Justice's settlement with Microsoft.

Sincerely.

Michael R. Schreurs
Chief Executive Officer
Strategic America

Washington, DC 20530

Dear Ms. Hesse:

I am writing to express my opinion regarding the Microsoft anti-trust case

settlement recently proposed by the Bush administration.

I believe that if the court wishes to act in the best interests of all Americans, it will approve the settlement, end this case and allow Microsoft and the American tech industry to move forward unencumbered by ongoing litigation. Continuing to pursue this matter in court is a waste of precious time and energy and sets a very bad precedent for undue government interference in private business. Even under the terms of the settlement, Microsoft will be operating under a level of scrutiny that I feel is unnecessary given the facts of the case. However, I believe that the Bush settlement offers our best hope for moving onward and upward, and I urge the court to accept that settlement.

Best regards,
Paula Enlow

Judge Kolar Kottely
Attention: Renata Hesse
U.S. Department of Justice, Antitrust Division
60t D Street, NW, Suite 1200
Washington, DC 20530

Dear Judge Kolar Kottely,

I've seen firsthand the blows the economy has been dealt in the last year. As an aeronautical technician, I have seen many in our industry lose their jobs due to cutbacks resulting from the precarious state of the economy.

The economy is soft. In addition to layoffs, the public has also seen a decrease in their investment portfolios. The public and our economy need to be reassured. Approving the current Microsoft settlement proposal is a step toward that reassurance. That assurance will restore investor's faith, providing cash flow for innovation and a demand for employment in one of the driving sectors of our economy—high tech. The boom of the 90's and even 2000 was driven by the health of the technology sector. I believe we can help turn our economy around if we help the tech industry get back on its feet. In my opinion, settling the case against Microsoft is the first step in that direction.

I appeal to you and your wisdom to support settlement of the suit, allowing America's economy to rebound at this time when we all could use some encouragement.

Sincerely,
Tim Holloway

Washington, DC 20530

Dear Ms. Hesse,

Last Er??day the drop in the Dew and NASDAQ were the largest since just after the attacks of September 11th The catalysts were cautious forecasts from two technology stock market ??ants IBM and Microsoft.

This sector has see a great deal of change and turmoil over the past several years on both .sides of the pendulum- sky level highs and rock bottom lows. Many peaks and valleys have stemmed from the Microsoft antitrust case Just prior to the case, and even for so. me time into it, many would argue that loch stocks were infla??ed. It was the belief of several financial analysts that the valleys ca??sed by the case were necessary to deliver a reality check to ??ch investors. All of this may in fact be trite.. Today, however, is a different day, a different time, and our nation's economy is facing very different challenges.

Disheartening news continues to surface in the Wall Street Journal during this time of economic downfall—airline difficulty, telecommunication battles, and the technology industry's downturn. Stories like the one on Friday take the market on another sharp decline taking the Dow down 78 points and the Nasdaq down 55.

As part of the investment and insurance sector, these are issues that bit very close to home both for my clients and myself. With the obvious effects this case has had on the market, I believe k is prudent during this time of economic instability to settle this case.

Thank You,
Brian Hewitt

950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft,

I am writing you to inform you of my opinion in regards to the Microsoft settlement issue. I support the settlement that was reached in November. This settlement will end three years of costly litigation and will give our economy the boost it needs. Please support this settlement so Microsoft can get back to business.

This settlement contains many provisions that will benefit the technology industry and companies attempting to compete with Microsoft. Under this agreement, Microsoft has agreed to grant computer makers broad new rights to configure Windows to promote non-Microsoft software programs that compete with programs included within Windows. Microsoft has also agreed to share more information with other companies, such as various internal interfaces within Windows and any protocols implemented in Windows. Microsoft is more than willing to carry, out all these provisions if it delivers a resolution to this dispute.

Again, I urge you to support this settlement so our resources can be funneled into more important issues. Thank you for your support.

Sincerely,
Thomas & Lori Stambaugh

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to express my gratitude that this whole mess involving Microsoft and the federal government looks as though it may finally be coming to an end. I have never agreed with the federal government's pursuit of Microsoft and have long thought of it as a waste of taxpayer money, as well as an attempt to sully the reputation of someone who has lived the American dream. That being said, this settlement offers an opportunity for both parties to walk away satisfied and should be accepted/implemented as soon as possible. The settlement agreement contains provisions that provide for increased competition, the fostering of innovation and greater accountability. The highlight of this agreement is Microsoft's agreement to share its most valued intellectual property in order to advance the industry.

This is a settlement that is three years too late and I strongly urge that it is implemented as soon as possible. Thank you for your efforts in Washington.

Sincerely,
Dorothy Gration

c/o: Renata B. Hesse
Antitrust Division, U.S. Department of Justice
601 D Street NW, Suite 1200
Washington, DC 20530–0001

Dear Judge Kollar-Kotally:

I write to express my concerns about the proposed settlement of the Microsoft cases. As the executive director of business/trade association, I consider myself to be very pro-business and generally supportive of free enterprise and open competition. However, in order for the free enterprise system to properly work, there must be an opportunity for businesses to actually compete against each other! I respect Microsoft for what they have been able to accomplish, but I believe Microsoft has gone too far in some of its practices. As a result, a competitive market in their sector no longer exists, and businesses and consumers are hindered and frustrated. I understand that a settlement has been proposed that the Department of Justice has found acceptable. I further understand that various attorney generals have also found the proposed settlement acceptable. The Attorney General of the Stare of Utah is not one of them. I support his position and

believe that the term, of the settlement are too lenient on Microsoft. Adoption of the proposed settlement would do nothing but delay the imposition of reasonable sanctions, prohibitions, and conditions on Microsoft until the next government action is taken, if any. In the meantime, Microsoft would essentially walk away with a hand-slap and the ability to continue its anticompetitive behavior. This could also set a precedence that would allow other businesses to take similar control of a market, because they know that they could get away with only lenient punishment, if'' any.

I ask the court to conduct hearings to determine an appropriate remedy that will reasonably penalize Microsoft for past actions and prevent future violations of antitrust laws. Such an action will only be in the best interest of all businesses and consumers.

Sincerely.

Ann Gambr??o, executive director

Utah Hotel & Lodging Association

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, N W
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing to your office because I support Microsoft and its desire to settle the antitrust lawsuit that the government brought against them. The case has proven to be very lengthy, and I feel that if the government's case were solid, they would have been able to prove it by now. In the meantime, Microsoft's business has been adversely affected.

The settlement proposed several months ago offers Microsoft's competitors an unparalleled opportunity for market growth. Microsoft is boldly agreeing to broad changes, between disclosing Windows program codes it developed to other companies, as well as enabling computer users and manufacturers to remove Internet Explorer and other Windows-based programs from their PCs.

Most importantly, the settlement does not seek the breakup of Microsoft. The company clearly wants to put this dispute behind them. I hope you agree and will settle the case.

Sincerely,
Nadine Hearth

COMMENTS

The Microsoft proposed settlement seems more than fair. The #35 million spent to punish Mirosoft is an excessive amount of taxpayer money; especially since the company has done so much for the U.S. Economy

MTC–00029594

January26,2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I support Microsoft and its desire to settle the antitrust lawsuit that the government brought against them, I believe it is in the best interests of our country and the economy. This lawsuit has brought untold damage to the economy and it was one of the factors leading to the recession. I am sure you are aware that Microsoft is a leader in its field and spawned many opportunities for other companies. Our country is presently the leader in the computer field. Don't prolong this any more and allow for the possibility for other countries to take the initiative away from our country. It potentially has security impacts that can only be measured in future developments. I hate to use an old cliche but as Microsoft's business goes so goes America's lead in this field. Don't delay the settlement.

As a graduate of the University of California in electrical and electronic business, I believe that I have an inside view of the problem. While Microsoft is a fierce competitor on one hand, they still allow many opportunities for others to enter and succeed in the business. Further delay in this suit will only cause further erosion of these opportunities. Believe me there are many legitimate actions that Microsoft can exercise that will decrease these opportunities. Like any good management plan, i1 must include protection of the company and its stockholders.

The settlement proposed should be grabbed and taken to the bank.

The most important aspect of the proposal is that it will not break-up Microsoft. I hope you agree and settle this case now.

Sincerely,
Richard Hearth

January 27, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

The Department of Justice's decision to settle the Microsoft antitrust case is reasonable and should be supported. The case has dragged on for long enough, and has had a very detrimental impact on the tech industry as well as our economy. Further litigation might be good for the litigators of the county, but will do little else other than act to further slow down an already slow business environment.

The terms of the settlement agreement are fair. With the assistance of a mediator, the parties engaged in extensive negotiations. As a result, the remedies provided by the settlement agreement are well thought out and provide adequate solutions to the complaints lodged by the plaintiffs. Upon the approval of the settlement agreement, Microsoft will change many of its business practices in an effort to restore fair competition to the software world. Microsoft has agreed not to enter into any contracts that would require third parties to exclusively promote or distribute Windows. They also agreed not to take any retaliatory action against those who distribute software that competes with Windows.

I see no need for protracted litigation in this case, especially in light of what Microsoft is willing to do to resolve the case.

Thank you for working toward a resolution of this case. It is time to move on.

Sincerely, ??
Glen A. Phillips

Dear Mr. Ashcroft:

With the pending results of the Microsoft settlement, I am pleased with the outcome. This agreement should reestablish Microsoft on one main issue...business development. As a self-employed person I know that your reputation can make or break you. The fact that Microsoft extended restrictions and obligations to products and technologies that were not found to be unlawful by the Court of Appeals, convinced me that they are more interested in new growth and development of their company.

Microsoft will now share technology information with its competitors that will allow them to place their own products on Microsoft's operating system. Additionally, Microsoft will use a uniform pricing list when licensing Windows out to the twenty, largest computer companies in the nation. I give my full support to Microsoft's settlement and wish them the best.

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I think the Microsoft antitrust case was ridiculous to begin with; it was all a matter of Microsoft's bitter competitors trying to retaliate against Microsoft's success and

innovation. As part of free enterprise, their competitors had die opportunity to be just as successful as Microsoft- However, they just weren't as smart and didn't create such exceptional products. That's certainly no fault of Microsoft's. I use Microsoft's products ever3: day in my job as a Computer Specialist. I could give you several reasons why I prefer Microsoft's products to anyone else's.

Microsoft is conceding a great deal in this settlement. It is more than fair to their competitors, if not giving them an unfair advantage that they don't deserve. Microsoft is giving away their technology to their competitors and has agreed not to retaliate against software or hardware developers that come up with competing products. They've also agreed to make their Windows software more cross-platform compatible so that users and OEMs can easily configure Windows with other software.

Please accept this settlement for the good of the country. Microsoft is not harming consumers and this settlement unquestionably does not harm their competitors. Please help put a long-awaited end to this lawsuit.

Sincerely, ??

Jimmy R. Mitchell

Dear Mr. Ashcroft,

The current status of the American government's case against Microsoft Corporation concerns American citizens like me. It threatens the principles of free enterprise in our country. Microsoft has been targeted because of its overwhelming success and innovation. Other companies have been saddled with government oversight for the opposite reason. The American people axe happiest when businesses are allowed to do what they do best without outside influence. Government interference is rarely a solution. Continued action by the government against Microsoft will likely have negative effects on the American consumer. This is no time for that. Microsoft has attained its position in industry because it is innovative, not predatory. Microsoft has created jobs without political interference. It is an economic engine without rival.

The settlement at hand is fair and just. It should be embraced so that we an all see Microsoft get back into the business of changing people's lives through innovative software technology. Our country desperately needs engines like Microsoft to bee running at full capacity again. Please consider accepting the present settlement. Everyone will receive considerable benefit. Thank you in advance for your attention to this matter.

Sincerely yours,

John Ebert

COMMENTS ON PROPOSED MICROSOFT SETTLEMENT
Date: 27 January 2002
To: Renata B. Hesse
Antitrust Division
U.S. Department of Justice
601 D Street NW, Suite 1200
Washington, DC 20530–0001
From: Kenneth J. Hendrickson
2747 W. Anklam Rd., Apt E.
Tucson, AZ 85745–3705
Dear Renata,

Executive Summary:

I strongly urge the Department of Justice (DoJ) and the Court to modify the Proposed Final Judgment (PFJ) in order to achieve an effective remedy against a continuing Microsoft monopoly, and the harm to consumers that will inevitably continue to result.

The modifications I recommend are:

1 Microsoft must be required to publish COMPLETE and ACCURATE documentation for all Application Programming Interfaces (APIs), protocols, and file formats, for *ALL* Microsoft products. This should include a requirement to publish full and complete source code. However, as the source is likely to be very difficult to understand, Microsoft must also be required to fund an independent documentation effort to study the source code and completely and accurately document it. Such documentation and source code must be made available AT NO CHARGE to anybody who wants it, via an Internet download. In addition, Microsoft must NOT be allowed to require a Non-Disclosure Agreement (NDA) in order to obtain this important information.

2 Security considerations must NOT be an excuse for continuing the harmful practice of closed, hidden, and/or undocumented APIs, protocols, and file formats. All algorithms, APIs, protocols, and file formats, must be COMPLETELY and ACCURATELY documented, *ESPECIALLY* when those algorithms, APIs, protocols, and file formats are needed for security and authentication. Sections III.J1 and III.J2 should be entirely stricken from the PFJ.

3 Microsoft must not be allowed to use its patents offensively. A patent is a government granted monopoly. As Microsoft already has a monopoly (even without government granted patents), and has been convicted of illegally ABUSING that monopoly, the government should not be in the business of granting Microsoft more monopoly power with which to abuse its competitors. The PFJ should be amended to forbid Microsoft from using its patents offensively. Before preparing my comments, I read the following documents in their entirety:

1 Original Complaint
http://www.USDoJ.gov/atr/cases/f1700/1763.htm

2 Findings of Fact
http://www.USDoJ.gov/atr/cases/f3800/msjudgex.htm

3 Stipulation and Revised Proposed Final Judgment
http://www.USDoJ.gov/atr/cases/f9400/9495.htm

4 State's Proposed Final Judgment
http://www.NAAG.org/features/microsoft/ms-remedy—filing.pdf

5 Competitive Impact Statement
http://www.USDoJ.gov/atr/cases/f9500/9549.htm

Justification for my Recommended Modifications:

Full Disclosure of Algorithms, APIs, Protocols, and File Formats:

I was very heartened to note that the PFJ would require that Microsoft must publish details of its APIs (section III.D. and others). However, as published, this provision will be largely ineffective, because it does not include Free Software and Open Software development efforts.

Microsoft's own lawyers indicated in 1999 that Microsoft views Linux and the GNU GPL license as its greatest threat.

http://www.OReillyNet.com/pub/a/mediakit/linux.html

Microsoft produced a white paper on the GNU GPL license, in an effort to dissuade companies from trying and/or using Linux.

http://www.Microsoft.com/business/downloads/licensing/Gp1—faq.doc

Although Linux and the Free Software movement are not yet a true competitor to Microsoft (as stated in the Findings of Fact), Linux offers the best hope for a future competitor to Microsoft. In light of this, the DoJ and the Court should tailor the PFJ such that it does not lock out Free Software and Open Software developers from the fruits of the PFJ.

Free Software and Open Software developers must be granted access to COMPLETE and ACCURATE documentation on *ALL* algorithms, APIs, protocols, and file formats for *ALL* Microsoft products, without any cost, and without any nondisclosure agreement (NDA) requirements.

The most complete and accurate documentation is the actual source code, and so that should be made available. The source code, however, is not enough. It is likely that the source code will be very difficult to understand; therefore Microsoft must also be required to fund an independent documentation effort to study the source code and completely and accurately document it. Such documentation and source code must be made available at no charge to anybody who wants it, via an Internet download, without any requirement for an NDA.

Without this extremely important provision, the most important potential

competitor to Microsoft's monopoly will not be able to compete. In addition, without this important provision, Microsoft will be able to *CONTINUE* using closed and secret APIs, Protocols, and File Formats to extend, enhance, and broaden their existing monopoly. It is absolutely necessary that the PFJ be amended to require that Microsoft COMPLETELY and ACCURATELY document *ALL* of their algorithms, APIs, protocols, and file formats, and provide this information at no charge and without NDA requirements to everybody, via a free Internet download.

Security:

The security technique espoused in the PFJ is ''security through obscurity''. The idea is that if nobody knows how authentication or encryption is accomplished, they will not be able to bypass the authentication routines or break the encryption. There is a significant problem with this idea (and thus with the PFJ): IT IS FALSE! It is widely known and accepted within the security community that ''security through obscurity'' is no security at all.

SECURITY THROUGH OBSCURITY IS NO SECURITY AT ALL.

The following papers detail why ''security through obscurity'' is no security at all:

http://Slashdot.org/features/980720/0819202.shtml

http://www.VnuNet.com/Analysis/1126488

http://www.Wide0pen.com/print/101.html

http://www.NightfallSecurity.com/whitepapers/obscurityeu.html

http://www.Albion.com/security/intro-8.html

http://www.eCommerceTimes.com/perl/printer/11060/

http://Adjacency.org/essays/securitythroughobscurity.html

http://www.Treachery.net/jdyson/toorcon2001/

Many more examples exist; they can be found with a Google search.

http://www.Google.com/search?hl=en&q=%22security+through+obscurity%22&btnG=Google+Search

This is perhaps the most important comment I am making, so I will repeat this important point:

SECURITY THROUGH OBSCURITY IS NO SECURITY AT ALL.

Bruce Schneier and Adam Shostack, two of the world's foremost experts in the area of computer and network security, have given a list of recommendations for Microsoft to follow in order to achieve more secure products, after the recent announcement by Bill Gates that Microsoft will henceforth be concentrating on security.

http://www.SecurityFocus.com/news/315

IT WILL BE NOTED THAT NOWHERE IN THIS LIST OF RECOMMENDATIONS IS THERE ANY NOTION THAT ANYTHING SHOULD BE KEPT SECRET. Instead, the recommendations from Messrs Schneier and Shostack encourage complete openness, full and accurate documentation, and a waiting period before Microsoft's proposed protocols and encryption methods are implemented. This is in order that the security community may examine Microsoft's proposed protocols and encryption methods and algorithms in order to find weaknesses, and repair those weaknesses, *before* they are implemented and insecure systems are built and fielded.

Messrs Schneier and Shostack also encourage Microsoft to publish its entire source code, even though they have no hope that Microsoft will do this. The source code should be published so that the security community can examine Microsoft's *implementations* for flaws and weaknesses, and suggest remedies for those flaws and weaknesses. The most well designed security protocols and encryption algorithms can be made worthless by poor implementation. The only way to check the implementation is to have access to the source code.

It is in the best interests of all those who must use Microsoft products, and all those who use computers on networks that include Microsoft products (which includes the entire Internet), that Messrs Schneier's and Shostack's recommendations are adopted by Microsoft. Paradoxically, it is also in Microsoft's best interests to adopt *ALL* of Messrs Schneier's and Shostack's recommendations!!

If Microsoft is forced to COMPLETELY and ACCURATELY document *ALL* algorithms, APIs, protocols, and file formats—without restriction—and make the documentation and source code available to everybody without charge, and without any NDA requirement, bugs will be found in Microsoft's code and fixes will be suggested, just as they are for other open source OSes such as Linux, FreeBSD, NetBSD, and 0penBSD. Microsoft's products will improve as a result of this process. Microsoft will receive the benefit that all Open Source software receives: bug fixes, increased security, and increased stability, all at no cost to Microsoft.

Microsoft will be opposed to this requirement, arguing that their business will be destroyed by forcing their code open. This is not true! COPYRIGHT LAW AND CONTRACT LAW PROVIDE ALL THE LEGAL PROTECTION THAT MICROSOFT REQUIRES TO MAINTAIN THE VALUE IN THEIR SOURCE CODE. In the end, however, it does not matter if Microsoft benefits from the PFJ. What does matter is that Microsoft's monopoly abusing powers are restricted, and that the DoJ and the Court create the possibility for competitors to Microsoft to arise in the marketplace.

Microsoft has been found guilty of abusing their monopoly. One of the ways that Microsoft has abused their monopoly is by using closed and proprietary algorithms, APIs, protocols, and file formats, and by changing them from time to time in order to create incompatibilities with non-Microsoft products, and with older Microsoft products that Microsoft wishes to make obsolete. Microsoft's *secret* algorithms, APIs, protocols, and file formats are part of the problem that the DoJ and the Court must remedy. Such secrecy cannot be part of the solution, even when it comes to ''anti-piracy, anti-virus, software licensing, digital rights management, encryption or authentication systems, including without limitation, keys, authorization tokens or enforcement criteria''. Furthermore, in light of the fact that SECURITY THROUGH OBSCURITY IS NO SECURITY AT ALL, there is never any justification for any ''governmental agency of competent jurisdiction'' to ''direct Microsoft not to'' COMPLETELY and ACCURATELY document *ALL* algorithms, APIs, protocols, and file formats—without restriction—and make the documentation and source code available to everybody without charge. Therefore, section III.J1 and III.J2 must be entirely stricken from the PFJ. As it is necessary to require Microsoft to COMPLETELY and ACCURATELY document *ALL* algorithms, APIs, protocols, and file formats—without restriction—and make the documentation and source code available to everybody without charge, and without any NDA requirement, it is not reasonable to require ''any of the Plaintiffs to keep secret any information or documents obtained from Microsoft'' as detailed in section IV.A.3 of the PFJ. This section should also be stricken from the PPJ.

Patents

Patents are a government granted monopoly. Microsoft has been judged to have a monopoly, and further, to have illegally abused that monopoly. For this reason, Microsoft should be forbidden from using its patents offensively. The government should not continue to grant a preferential monopoly to a convicted monopoly abuser.

This is especially true in the case of Open Software and Free Software. Those who develop Free and Open Software and give it away to the world for no charge are greatly enhancing the wealth of the entire world. These people CANNOT afford to participate in the patent system. In addition, those who develop Free and Open Software are often philosophically opposed to the patent system, and would not participate even if they could. These people who are greatly increasing the world's wealth, should not have the patent system used against them by a convicted monopoly abuser.

Microsoft has already threatened to use patents as an offensive weapon against Linux, the Free Software Foundation, the GNU Project, and other Free and Open Software producers. Full details can be found in the 2nd Halloween document.

http://www.OpenSource.org/halloween/

In order to protect the Free and Open Software movement from future monopoly abuse, Microsoft must be forbidden from using their patent portfolio offensively. This prohibition should *never* expire. A clause to this effect must be added to the PFJ in order to achieve an effective remedy.

Enforcement

A *very* strong enforcement mechanism needs to be put in place by the DoJ and by the Court. We have arrived at this juncture today because Microsoft failed to abide by previous consent decrees (1994) of the Court. Microsoft has proven themselves to be obstinate and belligerent. They cannot be trusted to obey this PFJ without strong and effective oversight. If by some unfortunate circumstance, the DoJ and the Court decide not to require Microsoft to disclose all source code, then an especially vigorous enforcement mechanism must be put in place to ensure COMPLETE and ACCURATE

documentation of *ALL* algorithms, APIs, protocols, and file formats. I would suggest that the PFJ should include a clause stipulating that if anybody finds any errors or discrepancies in Microsoft's documentation, then at that point the Technical Enforcement Committee shall have the authority to immediately force the disclosure of all relevant source code, in order to force compliance with the COMPLETE and ACCURATE documentation requirement.

Dan Kegel's Comments

I would like to add that I am a co-signer to Dan Kegel's comments.

http://www.Kegel.com/remedy/letter.html

I fully agree with Mr. Kegel's entire letter, including all links therein, and strongly urge that each of the problems noted therein must be remedied in the PFJ before the PFJ is adopted by the DoJ and by the Court.

Thank you,

Kenneth J. Hendrickson

GLORIORS EVENTS
January 26, 2002
Attorney General John Ashcroft
United States Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing in support of the Microsoft antitrust settlement agreement. I would appreciate your consideration of the following comments about this issue.

The settlement agreement will dramatically change the way Microsoft conducts its business. Microsoft will license Windows to the main computer manufacturers at the same price, and on the same terms. Microsoft has also agreed not to retaliate against those who distribute or promote software that competes with Windows. These concessions should subdue concerns about any ''predatory'' business practices by Microsoft.

I find it interesting that the stock market took a rum for the worse when this litigation ensued. In the interest of stimulating the economy, doesn't it make sense to put an end to the lawsuit so that Microsoft can focus on its research and development endeavors?

Thank you for your commitment to settle this case.

Sincerely,

Vetra Bilsland

January 25, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I was happy to hear that Microsoft had reached a settlement late last year with the Department of Justice. I believe the settlement will be good for consumers and the entire computer industry. Microsoft has agreed to many concessions in order to wrap up this case and move forward. For example, Microsoft has agreed to document and disclose for use by its competitors various interfaces that are internal to Windows'' operating system products. This type of provision is groundbreaking for an antitrust settlement. Also, Microsoft agreed to the creation of Technical Committee that will be charged with monitoring the company and assuring they meet all their obligations.

I believe the federal government, especially in the current environment, could make better use of their resources than continuing this litigation. I commend you for your efforts to resolve tiffs case and hope you will finalize the settlement soon.

Sincerely,

Andrew Emerson

Attention: Renata Hesse
Judge Kollar Kottely
U.S. Department of Justice, Antitrust Division
601 D Street, NW, Suite 1200
Washington, DC 20530

Dear Judge Kollar Kottely:

I am writing regarding the Microsoft anti-trust case and the lessons we should have learned from past experiences.

As I recall, nearly three decades ago, the government initiated another antitrust lawsuit against a computer industry leader.

Success was not defined by a legal victory in that case, but rather by the enormous business expenses incurred by the defendant. These expenses clearly resulted in allowing its competitors to catch up. After three years of the Microsoft case, it seems we are now at that point. This lawsuit has gone on long enough and any legal victory has lost its relevance because the financial price has been paid.

I urge you to move forward by approving the proposed settlement. This settlement is in the best interest of the industry, the economy, and the consumer. It only makes sense to put an end to it.

Thank you for your efforts on this important case.

Sincerely,

Rachel Maher

Computer Aided Design & Manufacturing
January 25, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

After three long years of court rattles, Microsoft and the Department of Justice have reached settlement regarding the antitrust suit. I believe that this settlement will be beneficial to both, the IT industry and the consumers alike It is necessary that those who are involved in the suit put aside their differences and work to put this issue behind us.

Even though the settlement goes farther than what Microsoft would have liked, I believe that settling the case now is the right thing to do help the industry and the economy move forward. This settlement is fair and reasonable and was reached at after extensive negotiations with a court-appointed mediator present.

There has been enough money spent, and the current settlement is perfectly acceptable. I feel it is incumbent upon the government to put a swift end to dais ordeal so that all involved parties can return to work. Thank you.

Sincerely,

Jake Breedveld

San Diego, CA 92130
January 26, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I would like the Justice Department to settle its antitrust lawsuit against Microsoft. I am aware that both sides reached an agreement in November that would end the case, and I support it. I believe if Microsoft appears to take the settlement seriously, and the company is taking steps to move on and to promote competition. Giving users a greater ability to integrate non-Microsoft programs into Windows will be beneficial to consumers and software developers everywhere. Additionally, Microsoft will level the tech playing field by using a uniform price listing when licensing Windows out to the largest computer makers in the nation. Also, Microsoft will not retaliate against companies that use, sell, or promote non-Microsoft products. I believe it is the time to end the case.

Please settle the Microsoft case and allow them to concentrate on further innovating the way man), of us conduct our personal and professional business.

Sincerely,

Walter Liao

Washington, DC 20530

Dear Mr. Ashcroft:

I am writing today to express my support for the recent settlement proposed to Microsoft by the DOJ. The truth is that I have a terrible time seeing what continued litigation would accomplish if the last three years were so unproductive. I would really love to see this lawsuit wrapped up so that taxpayers don't have to waste any more money. Additionally, wrapping up this case will help boost the slowing economy and give the IT industry much needed revitalization.

I believe that the settlement is a fair one that encompasses all points of concern. Microsoft's adherence to terms of this contract ensures that future antitrust violations will not occur. Competitors may also put their concerns to rest as a result of several of Microsoft's agreement. Microsoft has agreed to create future versions of Windows that will allow for non-Microsoft products to function therein. Also, Microsoft has agreed to disclose Windows interfaces and Intellectual property.

It is my hope flint Microsoft desire to comply will help to quell the concerns of the dissatisfied states. Please make the necessary decision to wrap this matter up as soon as possible. This will be in the best interest of the IT industry, the economy and consumes.

MTC–00029607

January 25, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I support the settlement reached in the Microsoft antitrust case. The settlement reflects the compromises and concessions of the parties, especially Microsoft, over three months of negotiations with the assistance of a court-appointed mediator. I feel that approval of the settlement by the Federal Court would be in the best public interest of America. The settlement addresses the complaints brought against Microsoft simply for using all its legal rights. Microsoft's legally protected innovations in its software code for its internal interface and server interoperability protocols will be disclosed to the whole industry, while its other copyrighted and patented intellectual property will be licensed on non-discriminatory terms to any company that wants to use it. Computer makers will be given more flexible contracts to work with non-Microsoft companies like AOL Time Warner, RealNetworks, and Symantec. A technical committee will ensure the terms are followed. These terms will provide an opportunity for the American computer industry to make better use of the very widely used Windows operating system, and will allow Microsoft to get the lawsuit, with its distraction and expense, over with.

I appreciate your strong stand in favor of the Microsoft case settlement. Thank you.

Sincerely,

Attorney General John Ashcroft
Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

The antitrust case between the federal government and Microsoft has been going on for much too long, and I would like to see the settlement that the two sides reached become final so that the matter can be put behind us once and for all. The two sides agreed to a reasonable compromise that will foster competition in the industry, and I see no reason to pursue litigation beyond this point.

The technology industry has struggled as a result of this lawsuit, and the nation's economy has been negatively affected as well. Once this settlement becomes final, consumers will have more choices in the marketplace, and independent companies will have a better chance to compete in the future. Microsoft has agreed to design future versions of the Windows operating system so that computer makers may remove Microsoft software and replace it with that of its competitors. Microsoft has also agreed to license its products to the 20 largest computer makers at uniform prices. These and the many other concessions that Microsoft has made in order to achieve this settlement are certainly enough to stop this litigation.

I realize that this settlement was reached after long and arduous hours of negotiations, and [appreciate your decision not pursue this matter any further. I am hopeful that no more action will be taken against Microsoft in the future.

Sincerely,

MTC–00029609

January 26, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I am writing you today to express my opinion in regards to the Microsoft settlement issue. I support the settlement that was reached in November and believe this agreement will serve in the best public interest. I am a Microsoft supporter and feel that this company should not be punished for being successful.

Microsoft has agreed to all terms and conditions of this settlement. Under this agreement, Microsoft must grant computer makers broad new rights to configure Windows so as to promote non- Microsoft software programs that compete with programs included within Windows. Microsoft has also agreed to document and disclose for use by its competitors various interfaces that are internal to Windows'' operating system products.

950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

As a supporter of Microsoft, I write you in reference to the recent settlement. The settlement is fair and reasonable and should be adopted immediately. After three years of negotiations, further delay would be ridiculous. What more is there to discuss? It is time to get on with business and get our technology industry back to normal.

Not only has Microsoft agreed to make changes in licensing and marketing, but has agreed to design future versions of Windows that will allow for easier installation of non-Microsoft software. Also, in an anti-trust first, Microsoft has agreed to disclose internal information about the Windows operating system. An outside committee will monitor Microsoft's compliance with the agreement.

By stopping any further federal action on this case, we are allowing our technology industry to get back to business. I urge you to help get this agreement moving. I thank you for your help.

Sincerely,

Renata Hesse, Antitrust Division Public Comment
U.S. Department of Justice
6I)1 D Street, NW, Suite 1200
Washington, DC 20530

Dear Renata Hesse,

Thank you for accepting my comments regarding the rod-trust lawsuit against Microsoft. It seems to me that the companies that pushed the suit against Microsoft their competitors: AOL, Oracle, San Micro are about the only ones who don't want to see the case settled. I can understand that as rival high-tech companies, they will do ''whatever it takes'' to compete, but I think this case has gone on long enough.

The DOJ is on the right track to try to settle their case against Microsoft. It is my hope that eventually all of the states involved in the case. will do the same. I hope that the companies that Cave pushed this lawsuit

from the beginning see the writing on the wall and start to worry about competing for customers in fire marketplace rather than the cou??troom.

I strongly urge you to sign off on the settlement terms that have been a agreed to by both sides so that we can at least begin to clean up the mess this case has caused.

Sincerely,

John Martin

Dear Sir/Madame.

The Microsoft settlement proposed by the Justice Department should not be. approved by the court. It does not adequately prevent Microsoft from abusing its monopoly powers, It is also a poor solution in that it will be complicated to enforce and Microsoft will have economic incentive to try to circumvent the agreement.

No doubt, there are precise legal standards that the court must follow in reviewing the settlement and making its decision. As a layman, I cannot hope to address the intricate legal issues as to what is explicitly mandated by statute and precedence—I can only speak in broad terms. My background is that of an engineer (M.S. in EECS) with 20 years of experience using PC software at work and at home and that of a founder and officer of a small software development company. I comment mostly from the perspective of an end user of PC software products. As a businessman, I have had substantial, experience negotiating, implementing, and litigating businccss agreements. I have found that the best agreements are those that (1) align the economic interest of the two parties (i.e. there is no economic benefit to either party to try to circumvent the agreement) and (2) are simple. The proposed settlement agreement is neither.

As one example, the language in the agreement requires Microsoft to provide access to certain information only to viable business entities. In paragraph III(J)(2)(c), the proposed settlement states that Microsoft will not be required to provide API's or Documentation to an entity that fails to meet ''reasonable, objective standards established by Microsoft for certifying the authenticity and viability of its business.'' Arguably, this language could allow Microsoft to exclude access to small businesses, start-ups, and Linux developers (or other non-profit type software developers) if it was in Microsoft's economic interest to do so.

For a second example, the proposed settlement requires Microsoft not to automatically override OEM settings. Paragraph III(H)(3)(b) says Microsoft must not seek permission from the end user for ''[automatic] alteration of the OEM's configuration until 14 days after the initial boot up of a new Personal Computer.'' What does the agreement mean by initial bootup? Strictly speaking, ''initial bootup'' could be interpreted to mean the first time the unit is turned on by the manufacture or the local retailer (for testing & verification purposes) and not the first time the end user turns on the machine. (As an aside, why does Microsoft need to be able to automatically override any settings? It should be sufficient to notify the user in the manual or on-line help that the user can change his settings by selecting the proper options in his application program or Windows operating system.) If such a simple item is this complicated to interpret and enforce, what does it augur for the rest of the agreement?

While it may not be the perfect solution, separating Microsoft into two independent companies meets the criteria stated above for a good business agreement. One, a breakup is simple, once it is completed, it is done—there is no agreement to interpret. Two, a breakup eliminates any economic incentive for Microsoft to circumvent an agreement because there is no agreement to circumvent once the breakup is completed.

My strong feelings about this case arise because I constantly find I have no real choice in my selection of PC operating systems and applications. As much as Microsoft's legal counsel and economists may argue about the user having choices and being better off, I find from my personal experience, that I am not.

If I am unhappy with my GM car, I can easily switch with my next purchase to a Toyota, Ford, Chrysler, Honda, etc. at zero cost. If I dislike my Sony television, I can buy a Zenith, JVC, Philips, or Panasonic, etc. without constraint. Nowadays, I have the freedom to switch phone service or my television reception from cable to satellite. Even with my PC, I can switch from Dell to IBM, Compaq, HP or others, But, I cannot switch from my use of the Microsoft operating system or Microsoft applications without cost. so substantial as to be prohibitive.

On the surface it may appear that there are alternatives to Microsoft's operating systems and applications. However, there are six barriers which effectively prevent me from using a competitor's product. First, because of Microsoft's market dominance, there is far more support from other vendors for Microsoft's products. For example, an application program or peripheral such as a printer may not be supported under either the Apple or Linux operating systems. Other vendor's import/export utilities, synchronization functions or the like may only support dominant Microsoft applications such as Word or Excel. Similarly, web sites may be designed to function best with Microsoft Internet Explorer as compared to competing products.

As a concrete example, consider my brother's experience with the Apple Imac. My brother's children learned to use the Imac growing up because of its superior user interface as compared to Microsoft Windows, However, my brother is now finding that it is too difficult to support the Imac on his home network and DSL line. Vendors just do not provide the same support for Apple that they do for Windows. Additionally, it is too difficult to maintain both Windows systems (for his use) and Apple systems. Therefore, he is forced to switch the children to using Microsoft Windows.

Second, if I wish to use a non-Microsoft product in an area where Microsoft is entrenched, I will be at a tremendous disadvantage when trying to share information. I will be speaking French when everybody else is speaking English. For example, given that everybody uses Microsoft Excel or Word, what real freedom do I have to select a different word processor or spreadsheet (even if superior) when I will be unable to share files with my clients or vendors.

Third, I have invested substantial time in learning to use and debug my existing Windows and Microsoft application programs. I cannot afford to switch to a competing operating system or application and start at ground zero on the learning curve. The amount of time it takes to learn to use a new application is enormous. It far outweighs the dollar cost of purchasing the product. To become as proficient in another word processor application as I am in Microsoft Word after years of use would take months at the very least. No one can afford that cost. As applications grow larger and more complex, this barrier grows larger and larger in Microsoft's favor.

In an interview, Bill Gates himself points out that Microsoft's biggest competitor (when they release a new operating system) is themselves. Users who have already invested time and money in purchasing and using an older version of Windows are loathe to switch to a new version because of the cost in dollars and time to install, debug, and learn the new version. Imagine then the

barrier posed to a completely new operating system or application.

Fourth, there is risk that if I am using a non-Microsoft product, the vendor will eventually be forced out of business by Microsoft and I will ultimately have to switch to the Microsoft product anyway. This was the case with my Lotus and WordPerfect products. In both case, I was finally forced to switch to Microsoft products when the vendors went out of business. Now, if I need to choose between a Microsoft and competing product, the safe decision is to select Microsoft because it is likely the competitor will be eventually driven out of business.

Fifth, there is a cost to switch to a new application because of prior work (data files) that has been generated by the old application. If I have a substantial amount of prior work saved in data flies produced by my Microsoft applications, switching to a competing application means I lose compatibility with all of my old work. At the very least, I will have to spend time converting the data files with the accompanying risk of losing information or formatting.

Sixth, It is risky to use a non-Microsoft product because Microsoft has the upper hand. in keeping its applications in step with operating system upgrades and taking advantage of new operating system features. Microsoft is in a position to improve its products faster because it is also in charge of the underlying operating system. By the same token, Microsoft applications are least likely to break with operating system upgrades. No competitor has that same advantage. (If Microsoft argues there is no advantage, then it should have no complaint against being separated into two independent companies).

In summary, I do not have the freedom to choose to use Microsoft products because they are superior but am forced to use them because the investment in time and potential risk to use competing products is too high.

There are many examples where Microsoft did not have a superior product (or, initially, even a product), but ultimately succeeded due to its monopoly position. For a non-exhaustive list, consider the products: Word (vs. WordPerfect), Excel (w. Lotus), Internet Explorer (vs. Netscape), Microsoft Project (vs. Symantec's Timeline project management software) and even Windows (vs. the Macintosh). In each of these cases, Microsoft did not have the first product or even the better product. Yet, over time in each case Microsoft has either put the other product out of business or become the clear-cut market leader.

In these cases, Microsoft did not succeed because it was the innovator; but because it had a monopoly in the operating system market. It could use its ownership of the operating system and its monopoly profits to enter new markets and eventually push out the competition. No other company, even dominant ones such as Lotus, WordPerfect, and Novell with all their financial resources, has been able to compete successfully against Microsoft because of the monopoly Microsoft enjoys.

Another example of the monopoly power Microsoft enjoys, is its recent decision not to include JAVA in its latest version of Windows. Given the runaway popularity of JAVA, only a monopoly such as Microsoft could risk making that decision. In a competitive environment, no operating system vendor would decide to exclude JAVA and pursue its own initiative. Microsoft can afford to do that because it wields such absolute control over the operating system market. A consumer has no alternate choice of operating systems so he is forced to accept Microsoft's decision to exclude JAVA from the operating system.

As a final example, consider the operating system called ''OS/2'' developed and marketed by IBM. There can be no question that it was a superior operating system and years ahead of Microsoft Windows. It failed however because of the barrier posed by Microsoft's installed base of users. The fact that even IBM failed to make any headway in the market is further evidence of Microsoft's power as a monopoly.

Microsoft may argue that the reason for its success in all of the above examples is that it had the better product or strategy. This is patently false. Microsoft was not the first one to introduce a windowing operating system, an internet browser, the concept of a spreadsheet, a word processor, etc. Microsoft has only been successful in first copying and then outlasting the competition. Microsoft argues that there is no need to regulate Microsoft as a monopoly because technology and the product landscape change so fast that not even Microsoft can exercise monopoly powers. I think it is just this argument taken in context of Microsoft's success time after time over the last decade that is the smoking gun. No company other than Microsoft has been so successful. It is so unlikely that in an area where the pace of change is this fast, that any one company could be so successful in every endeavor it undertakes, that it must be taken for granted that the company enjoys substantial monopoly power.

Contrast Microsoft's situation to that of microprocessors and Intel. Intel is a dominant market leader but faces fierce competition from AMD, Motorola, and others in the microprocessor market. As a result, we have seen a 100-fold or more increase in price vs. performance (comparing a 33MHz 80386 processor to a 2GHz Pentium II) over perhaps the last 10 years. Imagine a situation where Intel enjoyed the same monopoly position that Microsoft does today. That is to say, there was effectively no competition from AMD, Motorola, or others. Without doubt, we would not have seen the same increase in performance vs. price. Intel would not have been forced It innovate and cut prices at the rate it is forced it do so today in order to maintain its market leadership. This is clearly evident from the reported news where each time AMD releases a microprocessor, Intel responds by cutting prices. Of course, there would still have been improvements in microprocessor performance if Intel was a monopoly, but nowhere near the current pace. Intel would have made slow improvements at its own unhurried pace under little pressure from others.

Microsoft has at times argued that it is not a monopoly because the price of its operating system software (as a percentage of the price of a PC) has come down over the years and this is characteristically untrue of monopoly pricing. Even if the price of software is in fact lower today than 10 years ago, it is a meaningless statistic. The relevant question is what would the price of software be today if Microsoft did not enjoy a monopoly position. As compared to the innovation fostered in the microprocessor arena due to competition, software performance has advanced relatively slowly, [here certainly has not been a 100-fold increase in the performance of Microsoft's software over the last 10 years.

In considering the proposed settlement, the court must balance protecting Microsoft's rights and our system of free enterprise against the damage to society from continued abuse by Microsoft's monopoly position. I think the court must err on the side of the consumer. On a big-picture scale, there is no great damage to Microsoft, its shareholders or the concept of free enterprise by breaking Microsoft into separate operating companies. On the other hand, there is potential for great damage to innovation and free enterprise if Microsoft is free to remain a monopoly and to use its power to stifle new products and block the success of other companies.

In conclusion, the question simply comes down to whether the typical end user is better off because of Microsoft's monopoly. As a typical end user, I am firmly convinced that I am not and hope that the courts will take strict action.

Sincerely,

D. Shah

MTC–00029614

A??ey General John Ashcroft
United States Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 50530

Dear Mr. Ashcroft:

I am retired from a career in engineering. J have used a vatlet3, of computer systems, and I have found computing with Microsoft's Windows software to be easier, more affordable and in many way more productive than other systems. Windows has brought welcome uniformity to the way people work with computers.

It is certainly time to accept the settlement in the Microsoft antitrust case. The lawsuit was, in some ways, a big joke by Microsoft's less successful competitors intended to give Microsoft a raw deal in court. I am glad that you took the lead in directing your department to earnestly work with the mediator appointed by the new judge. The settlement will le?? the American computer industry get back to concentrating on making better, innovative products and maintaining America's leadership in the world of technology.

The anti-Microsoft forces have agreed not to pursue the outrageous and ridiculous demand made by a few of them to ''divide and conquer'' Microsoft. In return, Microsoft has agreed to give up much of its legal rights to its intellectual properly, and business practice. Until now, no company in antitrust litigation has ever had to give its industry the copyrighted software codes to the internal interfaces to its operating system programs. Nonetheless, Microsoft has agreed to license

those codes to any party on reasonable and non-discriminatory terms. Microsoft will release companies that make computers from exclusive marketing agreements, allowing them to mix and match Windows with other operating systems. Also, even the largest equipment builders will be offered a uniform price and term list, instead of individual negotiations. The Windows desktop program included with installation will be made easy to remove and replace with those made by others, such as AOL Time Warner, which owns its own browser and internet messaging software, With government-sponsored engineers who are experts in software monitoring the agreement and investigating and, complaints, the public can be assured of compliance.

Thank you for your support of the settlement. It should be approved, because it is in the best interest of the American public.

Sincerely,
Allan J. Hessel
Hessel Properties Inc.

January 25 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

I support your efforts to see that the Federal Court approves the settlement of the Microsoft antitrust case. I believe that approval of the settlement would be in the best interest of the United States. I do not think Microsoft ever had or abused a monopoly. I think Microsoft simply build the best, easiest to use, value-priced software. There have always been software choices to be made in buying computers. Microsoft just won out. However, the settlement is good in that it gets the lawsuit behind Microsoft and opens up the Windows software to the industry.

Just as Microsoft gives up much in the settlement, the computer industry gains much in being better able to integrate its products with Microsoft's Windows operating system, or avoiding Microsoft products. Microsoft will disclose its software code for internal Windows interfaces and license its other software to any company that wants to use it. Computer makers will no longer be required to adhere to exclusive marketing agreements with Microsoft, and will be able to modify Windows to remove Microsoft's program, such as Internet Explorer. So, I do not see what Microsoft's competitors could really still want in a reasonable way. Some competitors, having been ignored by customers, seem to think they can become bigger fish in a smaller pond by seeking to dismember and destroy Microsoft. That would not be good for America and its leading place in the worldwide computer industry.

Renata Hesse
Trial Attorney
Antitrust Division
U.S. Department of Justice
601 D Street, IV. W., Suite 1200
Washington, DC 20530

Dear Ms. Hesse:

I understand that you are currently reviewing public comments on the Microsoft settlement and I am pleased to have this chance to participate.

John Ashcroft's team was smart to 9o after a reasonable settlement of this case that has been hanging around since 1998. My only disappointment is that Kansas was not one of the many states that joined this settlement, I do not understand why our Attorney General Carla Stovall has banded together with Microsoft's competitors to pursue breaking up this strong and vibrant company. Ignoring the real benefits of this settlement ignores the needs of the technology industry and the national economy.

I am appalled that private corporations like Oracle and AOL-Time Warner are so committed to continued litigation. Apparently the decision-makers in this company refuse to see the negative effects their actions and this suit have had on the economy as a whole. They, along with the AGs still on the case, also seem to believe that break-up is the only acceptable solution. I believe this shows their true colors.

For those who believe Microsoft was guilty of some wrong doing this agreement provides many solutions. For example, it provides guaranteed flexibility for computer manufacturers, Microsoft must is not allowed to punish manufacturers who do not promote Windows and Microsoft is required to share certain sensitive information that will definitely put their competitors at an advantage. And to top it all of, a Technology Committee that will make sure Microsoft is living up to all aspects of the settlement will guard the integrity of the agreement.

Please accept this settlement.

Sincerely

MTC–00029617

Washington, DC 20530

Dear Ms. Hesse,

I encourage you to view settlement of the Microsoft antitrust suit as a positive solution designed to benefit all parties involved. The proposed settlement addresses every point of the charges upheld by the court.

It is certainly a step toward rejuvenating our lagging economy and restoring faith and investment in the ever changing, ever lucrative tech sector.

This competitor driven lawsuit, thinly veiled as consumer advocacy, has actually done more to harm the consumer than protect it. To date, more than 30 million dollars of taxpayer money has been spent on this lawsuit that has affected the consumer through little more than financial implications. The lawsuit has dragged the economy down, giving a bearish outlook toward tech investments, thwarting new innovation. The American public is ready for closure. I urge you to review the settlement before you, and to concur it's a suitable conclusion for all.

Sincerely,
Corrie Kangas

MTC–00029618

January 28, 2002
Attorney General John Ashcroft
U.S. Department of Justice
950 Pennsylvania Avenue
Washington, DC 20530

Dear Mr. Ashcroft,

If you build a better mousetrap the world will beat a path to your door. They did, it has.

I write to you today to express my opinion that the Microsoft antitrust case lacks merit, in that, it does not represent the good or the will of the public, it represents only special interest groups who, as they are finally finding some acceptance realize that their own intellectual properties might be challenged by the government. Microsoft created a better product than their competitors. It should not be prosecuted for its success.

Microsoft is not the only operating system. It has many competitors who are rapidly closing ground(unix 1innux ect.) Hampered by greedy litigation, government regulation, and time it may not survive. This company is no Standard Oil or Enron There is only slight evidence of what is known in the parlance of southern lawyers and horse traders as ''sharp practice''. If you buy a Rolls Royce with accessories included, you should not sue the provider because the radio is difficult to remove and the Honda radio you want to install may not fit.

The case against Microsoft should be immediately dismissed. The right to create, incorporate, innovate and merchandise are recognized as free enterprise in this country.

Sincerely,
Will Taylor

Renata Hesse
Trial Attorney
Antitrust Division
Department of Justice
601 D Street NW, Suite 1200
Washington, DC 20530

Dear Ms. Hesse,

Late last year the Justice Department and Microsoft reached a long sought after compromise in the anti-trust case. I understand that in order to comply with the Tunney Act members of the public at= provided with the opportunity to provide comment on the settlement.

There is no doubt that this case against Microsoft has been art interesting one to observe. The issues of this case are fairly simple to grasp, the government is basically contending that Microsoft has violated anti-trust laws through its business practices and has in fact committed consumer harm.

One interesting aspect of this case is that throughout the last four years that we have watched this case unfold and have heard reports of the impending break-up of

Microsoft we have yet to be shown one sliver or'' evidence that demonstrates consumer harm.

Another aspect of this case is not so much interesting as it is painful. In I998 when this case first began, our country was in the midst of a healthy economy. The New Economy was really beginning to look real. However, as this case began to pick up steam and break-up rumors were rampant the tech economy began to drift downward. Americans have experienced the impact of this lawsuit first hand in their investment accounts and lost jobs.

The DOI and Microsoft have deemed this settlement satisfactory. It outlines remedies for Microsoft that appear to he equitable given what has held up in lower courts. The compromise now on the table will bring an end to a suit that has already cause significant damage. I urge you to accept it.

Sincerely,

Sharon Miller

jothedy@aol.com
January 27,2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

The settlement agreement reached between the Justice Department and Microsoft was welcome news, and I hope that it is implemented after the close of the public comment period.

The agreement will provide additional opportunities for software companies to compete with Microsoft products. Microsoft has agreed to allow competition from non-Microsoft programs within its Windows operating systems, and it has agreed to allow its distributors and licensees to deal in products other than those produced by Microsoft.

Whether or not these additional opportunities for competition will result in an increase in products and consumer choice remains to be seen. However, the purpose of this case and the settlement are to open avenues of competition, not to guarantee the success of the competitors.

Thank you for the opportunity to voice my opinion.

Sincerely.

Renata Hesse
Trial Attorney
Antitrust Division
Department of Justice
601 D Street NW, Suite 1200
Washington, DC 20530

Dear Ms. Hesse,

As a political activist in Kansas, I do my best to follow current events and to take seriously my responsibilities as a citizen by exercising my rights and fighting to uphold the liberties I maintain as a citizen of this great nation. This letter is a small way for me to use these values to state the reasons I believe settlement of the Microsoft anti-trust case is overdue and serves the interests of Microsoft, their competitors and the consumers of these products.

Though many are wary of government interference in business, the damage this lawsuit has caused from an economic and developmental standpoint justifies settling under the terms of the current proposal. In an attempt to move on with business, however restricted, Microsoft has offered to be subject to review by an onsite technical committee, having access to all areas at all times—at Microsoft's expense. This provision leaves Microsoft with time and loyalty as the only advantage over their competition.

Now, more than ever, it is imperative that we preserve the freedom to innovate and promote free commerce. Approval of the settlement will allow our industry to move forward, freeing the courts and our nation to focus on some of the more demanding issues of today.

Thank you,

Bonnie Berggren

Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Dear Mr. Ashcroft:

I am writing to you on behalf of Microsoft regarding the antitrust suit of the Department of Justice against Microsoft. I personally feel that this litigation is absolutely a waste of time and energy. 1 feel very strongly on this issue and believe that companies that cannot compete in the open free market should not run to the Federal Government for help.

As a physicist I have used computers at home and work. Microsoft has not been my favorite supplier of software (too unstable and crash prone). Only casually have I followed the details of the government's case against Microsoft. However, as a consumer [don't feel that Microsoft has done me any harm. In fact quite the opposite—their bundling of suites of programs with their browser has saved me money, and has furnished the industry with a single standard.

My suggestion is to move on to more pressing matters.

Thank you for your consideration.

Yours truly.

Judge Kollar Kotelly
c/o Renata Hesse, Trial Attorney
Antitrust Division
U.S. Department of Justice
601 D Street, NW, Suite 1200
Washington, DC 20530

Dear Judge Kotelly:

For over a year now our country has been facing serious economic problems. The stock market is weak, the economy is waning, and Americans are losing jobs. There is not one definitive reason why we are facing these economic hard times and our recovery is dependent upon several factors.

It is important that we make smart decisions about everything that may influence our economy. One bright spot on the economic horizon is the proposed settlement between the United States and Microsoft. This proposal is a fair settlement for all involved and will provide benefit to our economy.

While some may argue this settlement is not a good one, a fair review of its provisions demonstrates that it strikes a good compromise. Among other things, Microsoft will be required to share its intellectual property and an independent committee will be established to ensure that Microsoft is following the rules of the agreement.

For over twenty years Microsoft has been a leader of our national economy and its growth. When the government threatened to assert new and excessive regulations on this strong corporation its impact was felt throughout the economy. By allowing this settlement to take place the case will come to a fair conclusion and the best interests of our country will be served.

Thank you for your time.

Sincerely,

Ames, Iowa

Chailotte, ?? 28210
January 26, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530
Washington, DC 20530

Dear Mr. Ashcroft:

The purpose of this letter is to voice my support of the settlement. Microsoft has been at the forefront of the technology industries for years. It is through their dedication to innovation that Microsoft has been able to forge their way in this industry. Microsoft has done more for this country than any other company in technology industry. I believe that raising legal battle in this case is altogether unwarranted. Despite these sentiments, I am pleased that there has finally been resolution in this issue.

The terms of the settlement show Microsoft's further dedication to resolve this issue. One of the most important aspects of this resolution is that Microsoft will now license Windows at the same rate to the twenty biggest computer makers. PC makers will not have to gain favor with Microsoft in order to receive the same rate on the Windows system. This should give PC makers a little more freedom in the negotiations process.

To summarize, I believe that the terms of this agreement are fair and should be enacted

with haste. Thank you for your time regarding this issue.

Sincerely,

William Bellamy

950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft,

Please permit me to express my opinion of the settlement that was finally reached in the antitrust case against Microsoft. It is my opinion that this settlement is fair and should be accepted by the all parties involved in this case.

The settlement disciplines and restrains Microsoft adequately such that it will not have a monopoly on the Technology and yet leaves it free to continue with its excellent and monumental work. I am among those who felt pleased that Microsoft agreed to design all future versions of Windows to be compatible with the products of its competitors and desist from retaliatory tactics.

We should also note that the settlement would also be ensured by a technical oversight committee that will monitor Microsoft's business practices in future to be sure that they comply with the settlement.

I am writing this letter to request you to support this settlement and ensure that the future of American business in general and IT Industry in particular is not stifled and side tracked.

Thank You,

Sincerely,

(Sury S Tumuluri)

Ms. Renata Hesse
U.S. Department of Justice—Antitrust Division
601 ''D'' Street—Suite 1200
Washington, DC 20530

Dear Ms. Hesse:

Thank you for this forum to share my thoughts regarding the continuing case against the Microsoft Corporation.

The Microsoft Corporation is one of country's leading producers and is certainly a worldwide leader in the growing technology market. I believe this company is an excellent model for study of the free enterprise system. We must always remember that Microsoft was not always the giant it is today, instead this company was created from virtually nothing. It was the innovations and business savvy of its founders that have brought it to the pinnacle of success.

It is the nature of the business world that when a company finds success it becomes the target of its adversaries in the business world. This is part of our system. What I do not believe is part of our system is when the government sets its sites on company simply because it is successful.

The success of this company is felt by all of us. Microsoft has provided good products that make all of our lives easier. These products are easy to use and relatively inexpensive. The company has worked hard to get where it is today and I am sure works just as hard to stay there. This is not a crime.

What is disturbing is that the pursuit of Microsoft has also been felt by all of us. We are living in a very strained economy. Prior to the onset of this suit, the computer and information industry was truly booming. Since the suit began, however, this sector of our economy stalled dramatically. The effects of this slow down have been felt throughout the markets and have negatively added to our strained economy.

I can only assume that the agreement is a fair one since both the Justice Department and Microsoft have agreed to its provisions. It is my hope that the court will approve this settlement.

Sincerely,

MTC–00029628

Dalton Gardens, ID 83815
January 27, 2002
Attorney General John Ashcroft
US Department of Justice
950 Pennsylvania Avenue, NW
Washington, DC 20530

Dear Mr. Ashcroft:

There has recently been a settlement to the antitrust lawsuit between Microsoft and the Department of Justice. While we do not agree with the relentless pursuit of the Microsoft Corporation, we are happy to see that a settlement has been reached. The United States government needs to move on and worry about more important issues.

Microsoft will now be working much closer and communicating much more with their competitors. They will be giving their competitors code and other information that makes-up the Windows operating system. It is also our understanding that they will be allowing their competitors to remove Microsoft-made software from Windows, and replace it with non-Microsoft software. Enough is enough.

Microsoft agreed to terms that extend well beyond what was issue in the initial suit, just for the sake of ending this senselessness. We support this settlement and would like to see it implemented as soon as possible.

Sincerely,

David W. Sornson

Renata Hesse, Esq.
Trial Attorney
Department of Justice, Antitrust Division
601 D Street NW, Suite 1200
Washington, DC 20530

Dear Ms. Hesse,

Thank you for the opportunity to express my opinion regarding the anti-trust lawsuit against Microsoft.

I was elected to the Kansas State House in 2000 and my experiences since that time has taught me that the actions of government can often have negative effects on the average American. I think this holds true in the government's case against Microsoft.

There is no doubt that this pursuit of Microsoft has negatively affected our economic health. At a time when many states are facing major budget problems, they have also been spending taxpayers'' money to finance this case. In fact, here in Kansas, our budget problems are so bad that some members of the Legislature are supporting an increase in taxes. At the same time, our Attorney General sees fit to continue wasting tax money on this case that the public clearly wants to see brought to an end.

When we look back at the fall of the technology industry and the markets overall, we should not be surprised. Our government was determined to use the courts to break up one of the world's largest companies. Of course the markets are going to feel the effects of this. Of course investors are going to wait on the sidelines. Of course struggling technology companies will declare bankruptcy. And of course the American worker and consumer will feel the pinch.

The settlement currently under consideration addresses this matter fully and fairly. It represents a true compromise. Allowing the proposed settlement to go through is the right thing to do legally. It is also the right thing to do in order to help revitalize our economy and restore faith in the capitalist system we all appreciate.

Thank you.

Rep. Mary Pilcher Cook

601 ''D'' Street NW, Suite 1200
Washington, DC 20530

Ms. Hesse:

I always appreciate an opportunity to participate in government matters that affect me directly as an American citizen and I thank you for conducting this comment period regarding the Microsoft anti-trust lawsuit.

I simply wish to voice my full support for the settlement proposed by the President's team. This settlement provides a genuine solution to a costly lawsuit—the merits of which are hotly debated across the nation. There are so many other more critical issues facing our government and your court, especially in light of the September 11 '' attacks, that I cannot see the wisdom in continuing to pursue one of our best and brightest organizations. Microsoft's agreement to operate under the stringent restrictions imposed by the proposed settlement is an indication to me of the company's good faith and the tech market could certainly use the boost of confidence this settlement would provide.

I trust that the court will see the benefits of settling this matter in the manner proposed and move to accept the Bush settlement agreement.

Sincerely,

Gene Basquez

Rev David J. Goodrich
P.O. Box 1600
Norwich, VT 05055
Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft:

To provide some personal feedback during this 60-day public comment period, in my opinion it's about time that the government reached a settlement in its case against Microsoft. I feel the legal action should never have begun in the first place, and the Justice Department should stop wasting tax money on this issue.

America was built by people who worked hard to be successful and make money at their businesses, and the government should not try and stop them. Microsoft built themselves from the ground up by making a better product at a fair price, which has left their competitors desperate enough to push for this legal action. By agreeing to several terms to encourage a more dynamic marketplace, Microsoft has surpassed even the government's complaints about their business practices. With an objective group of experts to monitor implementation of the plan, there should no longer be a need to bring this dispute into the legal system.

Our federal and state governments have better things to spend their money on than pursuing this case any further. Please let Microsoft get back to developing great products without distraction and the government to get back to dealing with the real needs of protecting national security.

Thank you for your support.

Please know that I have been a Microsoft user for about 14 years and they have provided a very user friendly product at a reasonable price. Microsoft Word exceeds the competition in quality and price. Please stop this action which will only hurt the consumer. The cost of this case far exceeds the cost of many good projects and is only a punishment for the business community who are the real providers of jobs in America.

Sincerely,
Rev David J. Goodrich

Dear Mr. Ashcroft:

As a computer professional in the technical industry that has been following this Microsoft antitrust case, I think it is grossly unfair that this case was brought about in the first place.

Microsoft has been great for the economy, the technical sector, and the NASDAQ. It is coincidental that all of these sectors are way down now that Microsoft is in the middle of litigation. If we leave the settlement as it stands and not pursue further litigation, it would be of great benefit to us in the end.

Microsoft did not get off as easy as its competitor's would have you think. After intense negotiations and mediation, they agreed to terms well beyond what is expected in any antitrust case. I understand that Microsoft agreed to disclose various internal interfaces in their operating system to competitors. I cannot think of any other software company that would risk their proprietary source code bring exposed to the competition for their use. Apparently, the sacrifice Microsoft is willing to make is not enough. Everyone (the states and the competition) wants more.

Enough is enough. Microsoft should not be penalized because of other companies inability to compete on level ground—Whatever happened to free enterprise? Litigation is bad for the economy. Let us go with the settlement and not pursue any further litigation. In addition, let's focus on rebuilding our economy.

Thank you.

Dear Mr. Ashcroft:

I was pleased to learn that the Justice Department has reached a proposed settlement agreement in the Microsoft litigation.

You now have the opportunity to clean up the mess created by your predecessor. Microsoft was the target of this litigation because of its size and because of its great degree of success. Your implementation of this settlement will bring an end to the political witch-hunt.

Microsoft has placed a number of concrete proposals on the table to resolve the case. They have agreed to changes in almost every aspect of their business operations, from pricing, to distribution, to system design. These changes, if implemented, should provide additional competitive opportunities for Microsoft's competitors and more choice for computer users.

Please go forward with the settlement and let Microsoft get back to business.

Sincerely,
Mark Zachgo

RE: Microsoft Settlement/Future Litigation

I have no problem [along with the majority of all Americans] with what Microsoft has done to better the computer technology of today. Without the innovations and mindset of the president and founder, William Gates, the many luxuries we all enjoy as one world would cease. Microsoft is not an evil empire whose goal is to exploit the people of this country. However, its goal is to enhance and bring computer technology to a newer level that will better aid people throughout their daily activities. Microsoft must be allowed to bring the Internet into its operating system, make set-top boxes for televisions, or create the most dominant product since Windows; otherwise you [the government] have taken away one of the priceless commodities that this great nation was founded upon.

If you are so bent on stopping a company's free will to innovate, you should turn your eyes on America Online. America Online (AOL) planned its big takeover of Netscape and its semi-agreement with Sun Microsystems (by the way...both companies approached the government to pursue a case against Microsoft) at the same time as the Microsoft lawsuits. Isn't this a bit odd? If we are so worried about Microsoft's *LARGE* empire, shouldn't we be stepping on AOL's toes also? If you haven't been keeping up with current affairs...AOL has one goal, and that is to be number one and to destroy Microsoft. There is *NO* monopoly here.

Sun Microsystems, America Online, and Oracle are using you [the government] to get back at Microsoft. They are using you [the government] to build their business and in using you hoping to get one step ahead. If you destroy Microsoft's ability to enhance its products m any way its competition will see the victory...not the American people you are trying to protect.

A company [Microsoft] *MUST* be given the right to enhance its products in any way possible to benefit its customers. The Microsoft cases have gone on too long. I hope that you will favor the Justice Department's recommendation for compromise and disallow all current litigation against Microsoft.

Sincerely,
Jason L. Rigsbee

Dear Mr. Ashcroft:

I am writing today to encourage the Department of Justice to accept the Microsoft antitrust settlement. This issue has been drug out for over three years now and it is time to put it to rest. Microsoft needs the chance to move on and put this government over regulation behind them.

When I buy a Ford it does not come with Chew parts. Chew pans do not fit in Fords and nobody has a problem with that. Now Microsoft creates a product and is being sued because everyone else's products do not work perfectly with their products. Microsoft has agreed to provide their competitors with part of the Windows base code, in order for their competitors to create products that are more compatible with Microsoft's. This has never been done m any other industry and I do not see why it is being demanded from Microsoft.

Microsoft has been harassed for too long. Demands have been made and agreed to that have never been made on any other company. Now it is time to allow Microsoft to move forward. The only way to move forward is to put this issue in the past. Please accept the Microsoft antitrust settlement.

Sincerely,
Alan Strand

Dear Mr. Ashcroft,

After three long years, the antitrust case against Microsoft has been settled. I applaud this decision. 1 believe the initial lawsuit was wrong. It was, in my opinion, very counter-productive for the economy. Microsoft is one of the engines of our economy; the economic downturn we have experienced can be traced directly to the antitrust case against Microsoft.

But it is time to go forward. Microsoft has agreed to a great number of demands from the Department of Justice; e.g. agreeing to a technical committee to monitor future actions; agreeing to design future versions of Windows with the ability to promote non-Microsoft software; agreeing not to retaliate against computer makers who send software that competes with Windows operating system. Microsoft is apparently trying to settle the case and get back to business. I agree with this. I urge you to give your support to the agreement between Microsoft and the Department of Justice.

Sincerely,
James Wilkins

Dear Mr. Ashcroft:

I am writing today to encourage the Department of Justice to accept the Microsoft antitrust settlement. As a member of the technology industry, I want to see Microsoft and the industry to move on. The suit has dragged on for over three years and has caused great damage to the entire industry.

Some say that Microsoft is being treated leniently. In fact is quite tough. Microsoft has agreed to document and disclose, for use by its competitors, various interfaces that are internal to Windows' operating system products. Microsoft is virtually handing over their company secrets to their competitors. That is no getting off easy.

In order to move forward Microsoft is giving in to a lot. The terms, of the settlement are fair and they should be accepted.

Dear Mr. Ashcroft:

Take a moment to reflect on what the breakup of ATT did to the phone industry. It created very poor phone service and drastically reduced innovation. If ATT were still together people would be looking and talking to each other over the connection instead of only talking to each other.

This hindered innovation is a direct result of the breakup of ATT because it caused them to divert their attention from long overdue innovation.

The same is true in Microsoft's case. Though I am glad that there has been no decision to break up Microsoft, the mere thought that this was considered is appalling. The way I see it, if I ran a company that was unable to keep up with my competition then the fault is mine and not my stronger competitor. I should therefore seek to strengthen my stance in the industry rather than seek corporate welfare from the government. Indeed, seeking the government's help to break up a company for your advantage only is a pitiful thing and I think the government should put a stop to it immediately!

Look at all that Microsoft has conceded in this case. They have agreed to grant competitors greater access to Windows by creating new versions. In addition, they have agreed to give computer makers more flexibility to reconfigure Windows for interoperability with non-Microsoft software. In light of all the varied factors of this case and Microsoft's spirit of cooperation, please put an end to litigation in the interest of fairness.

Sincerely,
Louis Theriault

Attorney General John Ashcroft
US Department of Justice,
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001
Dear Mr. Ashcroft:

Last November, Microsoft and the Department of Justice reached a settlement in the antitrust case. The settlement is currently being reviewed, and soon the courts will have to decide whether or not the settlement is acceptable. Microsoft competitors are touting the agreement as lenient towards Microsoft and harmful to the consumer. They would like nothing better than to see the settlement overturned and litigation against Microsoft continued. I disagree. Continued litigation, not settlement, would do the most damage to the consumer, and the settlement is anything but lenient.

The settlement allows Microsoft to remain intact, but prohibits Microsoft from engaging in behaviors that would prevent other computer makers from having a fair chance to compete. For example, the settlement

requires that Microsoft disclose source code from the Windows operating system to its competitors for their use either in working independently or with Microsoft Microsoft will also furnish third parties acting within the limits of the settlement with a license to applicable intellectual property rights to prevent infringement. I do not think that Microsoft has been treated too mil?? in this case; in fact, in the interest of wrapping up the se??, Microsoft has agreed to a number of terms that extend to aspects of Microsoft not found to be in violation of ?? laws.

The time has come for a decision to be made, whether or not it is in the best interests of the public to allow a ridiculous amount of time and money to be wasted in laughably ?? litigation, or if the technology industry should be permitted to return to normal and the economy to recover. I would like to see the consumer benefit from a return to nor?? in the economy and the computer industry, and I urge you ?? support the settlement. Enough is enough??

Sincerely,

James Hahn

Attorney General John Ashcroft
U.S. Justice Department
950 Pennsylvania Avenue, NW
Washington, DC 20530–0001

Dear Mr. Ashcroft.

At long last, this debacle of an antitrust trial between the government and Microsoft has sputtered to a settlement. While the settlement is weighed slightly against Microsoft, it at least has the advantage of ending the litigation.

This entire lawsuit was, I believe, grounded in much misinformation and misunderstanding. A company's ''dominance'' in any particular market does not necessarily mean that it has achieved that status through anything other than legal—albeit aggressive—means. I believe this to have always been true of Microsoft. Microsoft never manipulated the marketplace to force anyone to purchase its system. Rather, its pricing policies, its integration, and its reliability attracted most people to its product. This is enviable, not despicable.

When our government engages in a mission to ''level the playing field'' for all, there is the natural side effect of having to ''dumb down'' those that have been successful, and force them to either step aside, or give away their hard-earned successes to those less fortunate souls who are not as creative or as industrious. This attitude is reflected in the settlement. Microsoft is being forced to give up some of its source code to others in order to satisfy the government need to level the IT playing field.

While it is useless to object, I find that the settlement at least has the advantage of ending the contentious nature of the trial. For this reason alone, I find myself supporting it.

Washington, DC 20530

Dear Ms. Hesse:

I am glad to have this opportunity to express my opinion regarding the Microsoft antitrust case.

I was relieved to learn that the Bush Administration had proposed a settlement that could soon end this costly endeavor. As a taxpaying citizen, I nave been concerned for quite some time over the high cost of continuing to pursue this case in court, From all I have read and experienced as a consumer in the marketplace, I am convinced that Microsoft has created no monopoly—especially since computer products continue to become more affordable and not more expensive

I firmly believe that the funds being spent to litigate this matter in court are desperately needed in other areas such as education and law enforcement, Therefore I urge the court to accept the proposed Microsoft settlement and free up tax dollars for matters that are truly critical to all our futures.

Sincerely.

Lesa Stafford

Dear Mr. Ashcroft:

The settlement reached in the Microsoft anti-trust dispute is essential to the continued success of America's technology industry in the world market. Our IT industry has floundered for the past three years since the inauguration of this anti-trust suit against Microsoft three years ago. This settlement is fair and is a prime opportunity to put this litigation behind us.

Under the terms of the agreement, Microsoft has agreed to design all future versions of Windows to be more compatible with the products of its competitors. Microsoft has also agreed not to retaliate against any competitor who produces products that compete with its own. And, finally Microsoft has promised to report to a three person technical committee that will monitor Microsoft's compliance to these terms. I believe that this settlement is reasonable for the simple reason that it will allow Microsoft to get back to business without being pirated and split apart.

Thank you for you help in this issue and for allowing me to express my opinion. Free enterprise is a precious commodity in this nation and it must be protected.

Sincerely,
James Lay

Dear Ms. Hesse,

As an employee for a large midwestern hospital. I see first hand the benefits of technology everyday. Whether it is computerized laser surgical tools or sophisticated medical record software packages, my employer relics everyday on constant innovation within the technology field to better serve our patients and community.

The pervasive nature of technology continues to astound me...it seems as if virtually every thing we encounter has some kind of microchip inside. Is it any wonder then, that one of the largest computer companies in the world being involved in a major lawsuit would have an extraordinary impact on virtually every segment of our economy?

As I understand it, there is a settlement before you that could bring closure to this matter very quickly. While I agree it is vitally important to protect consumers, it is also important to do what is prudent to protect our economy and to continue technological innovation. research and investment.

The settlement before you addresses the concerns of the original complaint. All interested parties have approved it. Please give the settlement your final approval and help get the economy moving again.

Sincerely;

Terri Hasselman

Washington, DC 20530–0001

Dear Ms. Hesse,

It was music to my ears to learn that there can be a settlement soon in the antitrust case against Microsoft Corporation?

I am confident that this settlement will have a positive impact on the ailing U.S. economy. Many of the investments citizens like my self have are directly related to the high-tech market place.

With less government intrusion into private business and mote good old-fashioned competition in the marketplace, we can look forward to new growth in the U.S. economy. Enough taxpayer dollars have already been spent attempting to fix a problem that never existed.

I appreciate your consideration of my view as you deliberate. It is important for you to support this settlement.

Sincerely,

Alba English
