To better understand the dynamics of leptospirosis in the California sea lions, the applicant requests a scientific research permit to investigate exposure to and shedding of leptospirosis in this species, with the long-term goal of understanding the mechanisms underlying recurrent and deadly epizootics of leptospirosis in California sea lions. By analyzing data collected from wild caught, free-ranging sea lions and comparing it to data from stranded sea lions, the applicant aims to establish how seroprevalence and incidence data gathered from stranded animals can be scaled up to reflect the patterns occurring in the entire wild population of sea lions. Up to 5,100 California sea lions may be taken annually from Año Nuevo Island including 20 by capture and release, 80 by capture/sample/release and 5,000 by incidental disturbance. Procedures include: Capture (stalking, hoop net); restraint (board, cage, hand, net); anesthesia (gas); mark (flipper tag); measure; and sample (blood, urine, vibrissae). Up to 3,000 northern elephant seals (*Mirounga angustirostris*) and up to 60 Pacific harbor seals (*Phoca vitulina*) may be taken annually due to incidental disturbance. In addition, up to four

California sea lions may be taken by unintentional mortality during the requested 5-year permit.

In compliance with the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*), an initial determination has been made that the activity proposed is categorically excluded from the requirement to prepare an environmental assessment or environmental impact statement.

Concurrent with the publication of this notice in the **Federal Register**, NMFS is forwarding copies of the application to the Marine Mammal Commission and its Committee of Scientific Advisors.

Dated: July 6, 2012.
