k. *The Project Description:*

La Grange Dam and Spillway

The primary project feature is La Grange dam, a 310-foot-long, 131-foot-high, masonry arch dam. The un-gated spillway crest of the dam is at elevation 296.5 feet mean sea level (msl). A slide gate in the face of La Grange dam can discharge about 200 cubic feet per second (cfs) to the Tuolumne River.

La Grange Reservoir

La Grange reservoir extends upstream for approximately 11,352.5 feet at a normal water surface elevation of 296.46 feet msl. The surface of the reservoir at the normal surface elevation is over 58 acres and the storage capacity is over 500 acre-feet.

Intakes, Tunnels, Forebay, Canal
Headgates, Powerhouse Intake

The Modesto Irrigation District (MID) headworks, canal, and sluice gates are part of MID's retired irrigation canal facilities that currently discharge flow from the reservoir into the Tuolumne River on the right bank about 400 feet downstream of La Grange dam.

The Turlock Irrigation District (TID) intake and tunnel is located on the left bank of the La Grange dam and spillway just upstream of the dam and consists of two separate structures. One structure contains two 8-foot by 11-foot, 10-inch-high control gates driven by electric motor hoists. The second structure is located to the left of the first structure and contains a single 8-foot by 12-foot control gate. Water diverted at the intake control gates is conveyed to a 600-foot-long tunnel leading to the 110-foot-long concrete forebay for the TID non-project Upper Main Canal. Water delivered to TID's irrigation system is regulated at the non-project canal headworks, consisting of six 5-foot-wide by 8-foot-tall slide gates.

Water delivered to the powerhouse is diverted at the west side of the canal through three 7.5-foot-wide by 14-foot-tall concrete intake bays protected by a trashrack structure. Manually operated steel gates are used to regulate the discharge of water through two intakes one leading to a 235-foot long, 5-foot-diameter penstock and the other leading to a 212-foot-long, 7-foot-diameter penstock. Immediately upstream and adjacent to the penstock intakes are two automated 5-foot-high by 4-foot-wide sluice gates that discharge water over a steep rock outcrop to the tailrace channel just upstream of the powerhouse.

Powerhouse

The 72-foot by 29-foot concrete powerhouse is located approximately 0.2 miles downstream of La Grange dam on the left bank of the Tuolumne River. The powerhouse contains two Francis turbine-generator units with a maximum capacity of 4.9 megawatts. One turbine unit has a rated output of 1,650 horsepower (hp) at 140 cfs and 115 feet of net head and the other with a rated output of 4,950 hp at 440 cfs and 115 feet of net head. The powerhouse produces an average annual generation of 19,638 megawatt-hours.
